Precautions for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

The Supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER", used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted. Information that is necessary to service the system safely is included in the RS section of this Service Manual.

WARNING:

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the RS section.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.

Precautions for Brake System

NHRR0002

- Recommended fluid is brake fluid "DOT 3".
- Never reuse drained brake fluid.
- Be careful not to splash brake fluid on painted areas.
- To clean or wash all parts of master cylinder, disc brake caliper and wheel cylinder, use clean brake fluid.
- Never use mineral oils such as gasoline or kerosene. They will ruin rubber parts of the hydraulic system.
- Use flare nut wrench when removing and installing brake tube
- When installing brake piping, be sure to check torque.
- Burnish the brake contact surfaces after refinishing or replacing drums or rotors, after replacing pads or linings, or if a soft pedal occurs at very low mileage.
 Refer to "Brake Burnishing Procedure", "ON-VEHICLE SERVICE", BR-7.

WARNING:

 Clean brake pads and shoes with a waste cloth, then wipe with a dust collector.

Wiring Diagrams and Trouble Diagnosis

NHBR000

When you read wiring diagrams, refer to the following:

- "HOW TO READ WIRING DIAGRAMS" in GI section
- "POWER SUPPLY ROUTING" for power distribution circuit in EL section

When you perform trouble diagnosis, refer to the following:

- "HOW TO FOLLOW TEST GROUP IN TROUBLE DIAGNOSIS" in GI section.
- "HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT" in GI section
- For trouble diagnoses of models with TCS. Refer to BR-36.
- For trouble diagnoses of models with VDC. Refer to BR-95.

BR-6

Checking Brake Fluid Level

Check fluid level in reservoir tank. It should be between Max

- and Min lines on reservoir tank. If fluid level is extremely low, check brake system for leaks.
- Release parking brake lever and see if brake warning lamp goes off. If not, check brake system for leaks.

MA

Checking Brake Line

NHRROOOS

CAUTION:

If leakage occurs around joints, retighten or, if necessary, replace damaged parts.

LC

- Check brake lines (tubes and hoses) for cracks, deterioration or other damage. Replace any damaged parts.
- Check for oil leakage by fully depressing brake pedal while engine is running.

AT

Changing Brake Fluid

CAUTION:

Refill with new brake fluid "DOT 3".

AX SU

BR

- Always keep fluid level higher than minimum line on reservoir tank.
- Never reuse drained brake fluid.
- Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.
- Clean inside of reservoir tank, and refill with new brake fluid.
- Connect a vinyl tube to each air bleeder valve.
- Drain brake fluid from each air bleeder valve by depressing brake pedal.
- Refill until brake fluid comes out of each air bleeder valve. Use same procedure as in bleeding hydraulic system to refill brake fluid. Refer to "Bleeding Brake System", BR-8.

HA

SC

EL

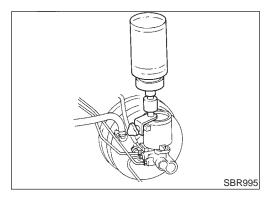

Brake Burnishing Procedure

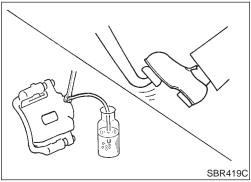

Burnish the brake contact surfaces according to the following procedure after refinishing or replacing drums or rotors, after replacing pads or linings, or if a soft pedal occurs at very low mileage.

Only perform this procedure under safe road and traffic conditions. Use extreme caution.

- Drive the vehicle on a straight smooth road at 50 km/h (31 MPH).
- 2. Use medium brake pedal/foot effort to bring the vehicle to a complete stop from 50 km/h (31 MPH). Adjust brake pedal/foot

- pressure such that vehicle stopping time equals 3 to 5 seconds.
- 3. To cool the brake system, drive the vehicle at 50 km/h (31 MPH) for 1 minute without stopping.
- 4. Repeat steps 1 to 3, 10 times or more to complete the burnishing procedure.

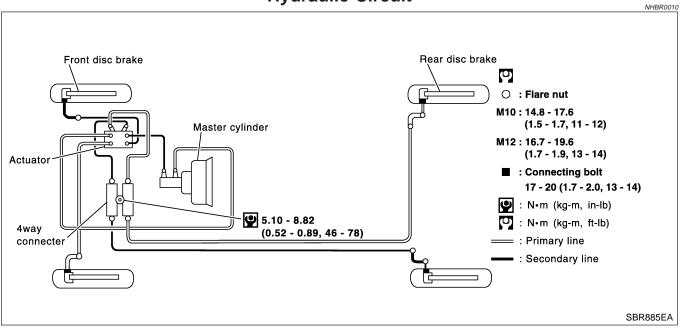

Bleeding Brake System

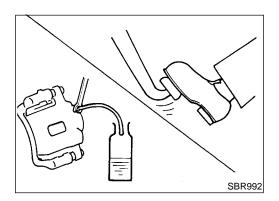

NURRAMA

CAUTION:

- Carefully monitor brake fluid level at master cylinder during bleeding operation.
- Fill reservoir with new brake fluid "DOT 3". Make sure it is full at all times while bleeding air out of system.
- Place a container under master cylinder to avoid spillage of brake fluid.
- For models with ABS, turn ignition switch OFF and disconnect ABS actuator connectors or battery ground cable.
- Bleed air in the following order.
 Right rear brake → Left front brake → Left rear brake → Right front brake
- 1. Connect a transparent vinyl tube to bleed valve.
- 2. Fully depress brake pedal several times.
- 3. With brake pedal depressed, open bleed valve to release air.
- 4. Close bleed valve.
- 5. Release brake pedal slowly.
- 6. Repeat steps 2. through 5. until clear brake fluid comes out of bleed valve.

Hydraulic Circuit

Removal

CAUTION:

Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.

All hoses must be free from excessive bending, twisting and pulling.

Connect vinyl tube to bleed valve.

- Drain brake fluid from each bleed valve by depressing brake
- Remove flare nut connecting brake tube and hose, then withdraw lock spring.
- Cover openings to prevent entrance of dirt whenever disconnecting brake line.

NHRR0011

MA

LC

FE

AT

AX

BT

SC

Inspection

Check brake lines (tubes and hoses) for cracks, deterioration or other damage. Replace any damaged parts.

Installation

CAUTION:

Refill with new brake fluid "DOT 3".

- Never reuse drained brake fluid.
- 1. Tighten all flare nuts and connecting bolts.

Specification:

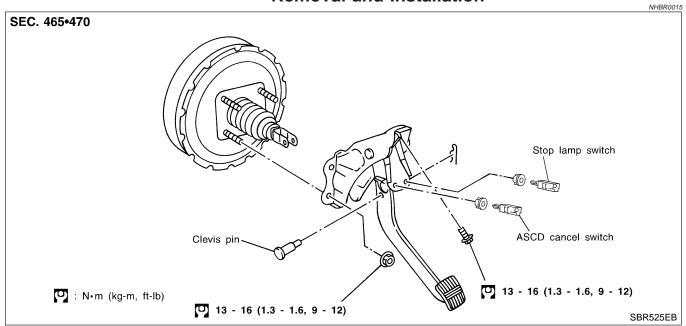

```
Flare nut
```

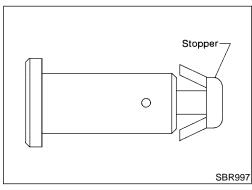

M10: 14.8 - 17.6 N·m (1.5 - 1.7 kg-m, 11 - 12 ft-lb)
M12: 16.7 - 19.6 N·m (1.7 - 1.9 kg-m, 13 - 14 ft-lb)
Connecting bolt
17 - 20 N·m (1.8 - 2.0 kg-m, 13 - 14 ft-lb)

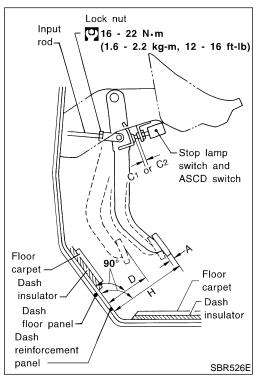

NHBR0013

- 2. Refill until new brake fluid comes out of each bleed valve.
- 3. Bleed air. Refer to "Bleeding Brake System", BR-8.

Removal and Installation

Inspection

Check brake pedal for following items.

Brake pedal bend

Clevis pin deformation

Crack of any welded portion

• Crack or deformation of clevis pin stopper

Adjustment

Check brake pedal free height from metal panel. Adjust if necessary.

H: Free height

Refer to SDS, BR-172.

C₁, C₂: Clearance between pedal stopper and threaded end of stop lamp switch and ASCD switch

0.74 - 1.96 mm (0.0291 - 0.0772 in)

D: Depressed height

82.5 mm (3.248 in)

Under force of 490 N (50 kg, 110 lb) with engine running.

8. Bleed air from brake system.

On-vehicle Service OPERATING CHECK

NHBR0023

Stop engine and depress brake pedal several times. Check that pedal stroke does not change.

Depress brake pedal, then start engine. If pedal goes down slightly, operation is normal.

AIRTIGHT CHECK

Start engine, and stop it after one or two minutes. Depress brake pedal several times slowly. The pedal should go further down the first time, and then it should gradually rise thereaf-

Depress brake pedal while engine is running, and stop engine with pedal depressed. The pedal stroke should not change after holding pedal down for **30 seconds**.

LC

MA

AT

Removal

NHRR0024

CAUTION:

Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.

AX

Be careful not to deform or bend brake pipes, during removal of booster.

BR

Inspection

OUTPUT ROD LENGTH CHECK

NHBR0025

Apply vacuum of -66.7 kPa (-500 mmHg, -19.69 inHg) to brake booster with a handy vacuum pump.

Add preload of 19.6 N (2 kg, 4.4 lb) to output rod.

Check output rod length.

Specified length:

10.275 - 10.525 mm (0.4045 - 0.4144 in)

SC

Installation

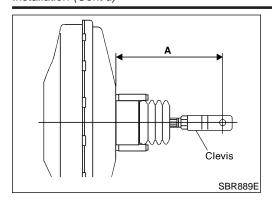

CAUTION:

Be careful not to deform or bend brake pipes, during installation of booster.

- Replace clevis pin if damaged.
- Refill with new brake fluid "DOT 3".
- Never reuse drained brake fluid.
- Take care not to damage brake booster mounting bolt thread when installing. Due to the acute angle of installation, the threads can be damaged with the dash

BR-19

HA

1. Before fitting booster, temporarily adjust clevis to dimension "A" shown.

Specification:

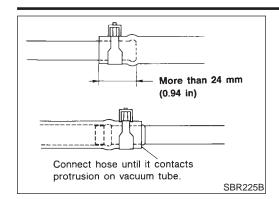

130 mm (5.12 in)

- 2. Fit booster, then secure mounting nuts (brake pedal bracket to master cylinder) lightly.
- 3. Connect brake pedal and booster input rod with clevis pin.
- 4. Secure mounting nuts.

Specification:

16 - 22 N·m (1.7 - 2.2 kg-m, 12 - 16 ft-lb)

- Install master cylinder. Refer to "Installation" in "MASTER CYLINDER", BR-15 or BR-18.
- 6. Bleed air. Refer to "Bleeding Brake System", BR-8.

Removal and Installation

CAUTION:

When installing vacuum hoses, pay attention to the following points.

- Do not apply any oil or lubricants to vacuum hose and check valve.
- Insert vacuum tube into vacuum hose as shown.
- Install check valve, paying attention to its direction.

MA

Inspection HOSES AND CONNECTORS

HBROOSE LG

NHBR0028S01

Check vacuum lines, connections and check valve for airtightness, improper attachment chafing and deterioration.

AT

AX

NHBR0028S02

Check vacuum with a vacuum pump.

Connect to booster side	Vacuum should exist.	
Connect to engine side	Vacuum should not exist.

- 17. Piston boot

Pad Replacement

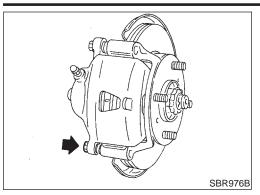

NHBR0029

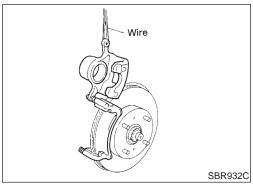

WARNING:

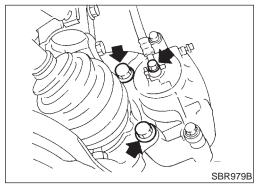

Clean brake pads with a vacuum dust collector to minimize the hazard of airborne particles or other materials.

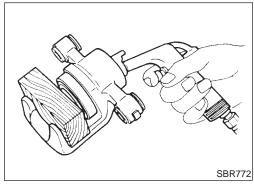

CAUTION:

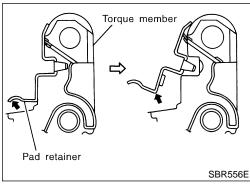

- When cylinder body is open, do not depress brake pedal because piston will pop out.
- Be careful not to damage piston boot or get oil on rotor.
 Always replace shims when replacing pads.
- If shims are rusted or show peeling of the rubber coat, replace them with new shims.
- It is not necessary to remove connecting bolt except for disassembly or replacement of caliper assembly. In this case, suspend cylinder body with wire so as not to stretch brake hose.
- Burnish the brake contact surfaces after refinishing or replacing drums or rotors, after replacing pads or linings, or if a soft pedal occurs at very low mileage.
 Refer to "Brake Burnishing Procedure", "ON-VEHICLE SERVICE", BR-7.

- 1. Remove master cylinder reservoir cap.
- 2. Remove pin bolt.
- 3. Open cylinder body upward. Then remove pad with retainers, inner shim.

Standard pad thickness:

9.5 mm (0.374 in)

Pad wear limit:

2.0 mm (0.079 in)

Carefully monitor brake fluid level because brake fluid will return to reservoir when pushing back piston.

Cylinder Body

- Check inside surface of cylinder for score, rust, wear, damage or presence of foreign materials. If any of the above conditions are observed, replace cylinder body.
- Minor damage from rust or foreign materials may be eliminated by polishing surface with a fine emery paper. Replace cylinder body if necessary.

CAUTION:

Use brake fluid to clean. Never use mineral oil.

Piston

NHBR0033S0102

CAUTION:

Piston sliding surface is plated. Do not polish with emery paper even if rust or foreign materials are stuck to sliding surface.

Check piston for score, rust, wear, damage or presence of foreign materials. Replace if any of the above conditions are observed.

Slide Pin, Pin Bolt and Pin Boot

NHBR0033S0103

Check for wear, cracks or other damage. Replace if any of the above conditions are observed.

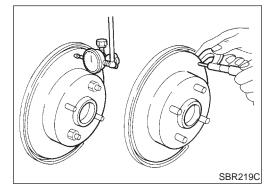

ROTOR

NHBR0033S02

Rubbing Surface

NHBR0033S0201

Check rotor for roughness, cracks or chips.

Runout

NHBR0033S020

- 1. Secure rotor to wheel hub with at least two nuts (M12 x 1.25).
- Check runout using a dial indicator.

Make sure that wheel bearing axial end play is within the specifications before measuring. Refer to AX section ("Front Wheel Bearing", "ON-VEHICLE SERVICE").

Maximum runout:

0.07 mm (0.0028 in)

- If the runout is out of specification, find minimum runout position as follows:
- a. Remove nuts and rotor from wheel hub.
- b. Shift the rotor one hole and secure rotor to wheel hub with nuts.
- c. Measure runout.
- Repeat steps a. to c. so that minimum runout position can be found
- 4. If the runout is still out of specification, turn rotor with on-car brake lathe ("MAD, DL-8700", "AMMCO 700 and 705" or equivalent).

Thickness

NHBR0033S0203

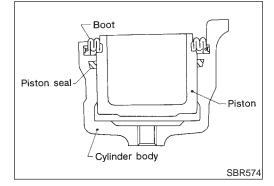

Thickness variation (At least 8 positions): Maximum 0.01 mm (0.0004 in)

If thickness variation exceeds the specification, turn rotor with oncar brake lathe.

Rotor repair limit:

22.0 mm (0.866 in)

Protrusions

Connecting bolt

Assembly

Insert piston seal into groove on cylinder body.

With piston boot fitted to piston, insert piston boot into groove on cylinder body and install piston.

LC

Properly secure piston boot.

AT

Installation

AX NHRR0035

1.

Install brake hose to caliper securely.

Never reuse drained brake fluid.

2.

BR

Install all parts and secure all bolts.

Bleed air. Refer to "Bleeding Brake System", BR-8.

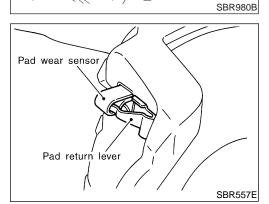

The upper pad retainer is built so the pad returns to its original position. Be careful to install the pad-return lever securely to the pad wear sensor, as shown in the left figure.

Pad Replacement

NHBR003

WARNING:

Clean brake pads with a vacuum dust collector to minimize the hazard of airborne particles or other materials.

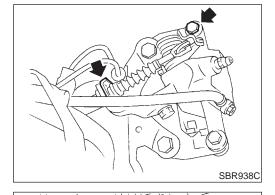

CAUTION

- When cylinder body is open, do not depress brake pedal because piston will pop out.
- Be careful not to damage piston boot or get oil on rotor.
 Always replace shims in replacing pads.
- If shims are rusted or show peeling of rubber coat, replace them with new shims.

- It is not necessary to remove connecting bolt except for disassembly or replacement of caliper assembly. In this case, suspend cylinder body with wire so as not to stretch brake hose.
- Burnish the brake contact surfaces after refinishing or replacing drums or rotors, after replacing pads or linings, or if a soft pedal occurs at very low mileage. Refer to "Brake Burnishing Procedure", "ON-VEHICLE

MA

Remove master cylinder reservoir cap.

Removal and Installation

- To remove parking brake cable, first remove center console.
- To remove parking brake pedal, remove lower instrument panel on driver side.
- 3. Disconnect warning switch connector.
- Remove bolts, slacken off and remove adjusting nut.
- Remove lock plate and disconnect cable.

Inspection

- 1. Check parking brake pedal assembly for wear or other damage. Replace if necessary.
- 2. Check wires for discontinuity or deterioration. Replace if necessary.
- 3. Check warning lamp and switch. Replace if necessary.
- 4. Check parts at each connecting portion and, if found deformed or damaged, replace.

=NHBR0131

Adjustment

Pay attention to the following points after adjustment.

- 1) There is no drag when control lever is being released.
- 2) Be sure that toggle lever returns to stopper when parking brake pedal is released.
- 1. Loosen parking brake cable.
- 2. Depress brake pedal fully more than five times.
- 3. Operate control pedal 10 times or more with a full stroke [203.5 mm (8.01 in)].
- 4. Adjust control lever or pedal by turning adjusting nut.
- 5. Depress pedal with specified amount of force. Check lever stroke and ensure smooth operation.

Number of notches:

4 - 5 [196 N (20 kg, 44 lb)]

6. Bend warning lamp switch plate. Warning lamp should come on when lever is depressed "A" notches. It should go off when the lever is fully released.

Number of "A" notches: 1

Purpose

The ABS consists of electronic and hydraulic components. It allows for control of braking force so that locking of the wheels can be avoided.

The ABS:

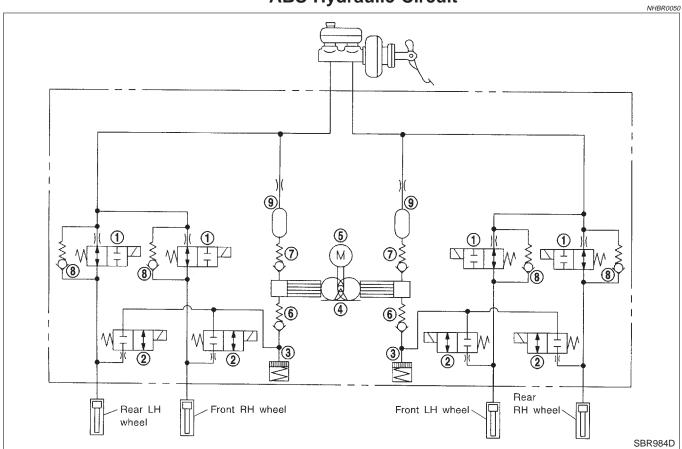

- 1) Ensures proper tracking performance through steering wheel operation.
- 2) Enables obstacles to be avoided through steering wheel operation.
- 3) Ensures vehicle stability by preventing flat spins.

ABS (Anti-Lock Brake System) Operation

NHBR0049

- When the vehicle speed is less than 10 km/h (6 MPH) this system does not work.
- The Anti-Lock Brake System (ABS) has self-test capabilities. The system turns on the ABS warning lamp for 1 second after turning the ignition switch ON. The system performs another test the first time the vehicle reaches 6 km/h (4 MPH). A mechanical noise may be heard as the ABS performs a self-test. This is a normal part of the self-test feature. If a malfunction is found during this check, the ABS warning lamp will come on.
- During ABS operation, a mechanical noise may be heard. This is a normal condition.

ABS Hydraulic Circuit

- 1. Inlet solenoid valve
- 2. Outlet solenoid valve
- 3. Reservoir

- 4. Pump
- 5. Motor
- 6. Inlet valve

Control System) Operation

MA

FE

AT

AX

SW

BR

HA

SC

TCS (Traction Control System) Operation

 This system is designed to limit wheel slip during acceleration by cutting fuel to selected cylinders and changing transmission shift schedule.

The ABS/TCS control unit monitors wheel speed slips through the ABS wheel sensors and determines the desired torque reduction needed to minimize wheel spin.

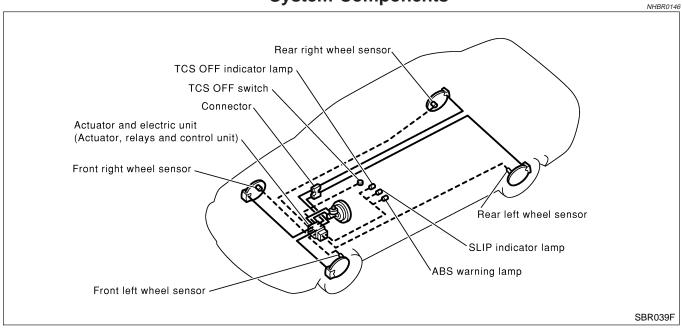

The torque reduction by the ABS/TCS control unit may result in a combination of fuel cutoff, throttle control, and change shift timing of the transmission.

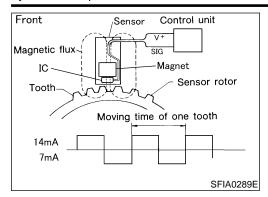

The torque reduction is sent from the ABS/TCS control unit through the data link to the ECM and TCM. The ECM will cut off fuel and/or close throttle valve little bit, and/or TCM change shift schedule to achieve torque reduction.

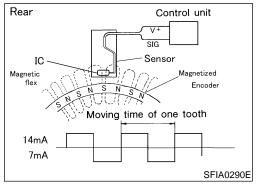

The TCS will be enabled when the TCS switch is in the ON position (TCS OFF indicator not illuminated), and if the catalytic converter temperature is within normal operating range.

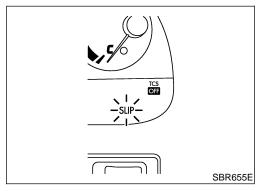

- This system has a self-diagnostic function. When the ignition switch is initially turned "ON", the SLIP indicator lamp and TCS OFF indicator lamp light. If there is no problem with the ABS and TCS, both indicator lamps will go out as soon as the engine starts.
- The TCS OFF switch cancels the TCS function. The TCS OFF indicator lamp then lights to indicate that the TCS is not operating.
- This system utilizes a fuel-cut function to control drive torque. If fuel cut continues for an extended period
 of time during high-speed operations, the catalyst may melt and deteriorate. During continued TCS
 operations, the system will sometimes suspend the drive torque control function, preventing catalyst melting and deterioration.

System Components

System Description SENSOR

NHBR0147

The front sensor units consist of a gear-shaped sensor rotor and a sensor element. the element contains a magnet and IC. The front wheel sensors are installed on the front of the wheel knuckles. As the wheel rotates, the sensor generates a square-wave signal. The frequency increase as the wheel speed increases.

CONTROL UNIT ABS Function

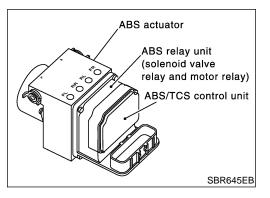

NHBR0147S02

The control unit computes the wheel rotating speed by the signal current sent from the sensor. Then it supplies a DC current to the actuator solenoid valve. It also controls ON-OFF operation of the valve relay and motor relay. If any electrical malfunction should be detected in the system, the warning lamp is turned on. In this condition, the ABS will be deactivated, and the vehicle's brake system reverts to normal operation.

TCS Function

NHBR0147S02

Drive wheel slippage is detected by the 4-wheel rotating speed signal. When the wheel slip becomes excessive, the TCS operates, causing the SLIP indicator lamp to flash. And, at the same time, fuel-cut and throttle opening signals are sent to the ECM and a signal requiring a change in the shift schedule is sent to the TCM. When the TCS OFF switch is used to cancel TCS function, the TCS OFF indicator lamp will light. (TCS does not activate.) In case of a malfunction in the TCS, both the SLIP indicator lamp and the TCS OFF indicator lamp will light, while shutting down the TCS system operation. The vehicle will operate in the same way as a vehicle not equipped with the TCS.

ACTUATOR

NHBR0147S03

The actuator contains:

- An electric motor and pump
- Two relays
- Eight solenoid valves, each inlet and outlet for
 - LH front
 - RH front
 - LH rear
 - RH rear

TCS

These components control the hydraulic circuit. The ABS control unit directs the actuator to increase, hold or decrease hydraulic pressure to all or individual wheels.

ABS Actuator Operation

NHBR0147S0301

		Inlet solenoid valve	Outlet solenoid valve	
Normal brake operation		OFF (Open)	OFF (Closed)	Master cylinder brake fluid pressure is directly transmitted to caliper via the inlet solenoid valve.
	Pressure hold	ON (Closed)	OFF (Closed)	Hydraulic circuit is shut off to hold the caliper brake fluid pressure.
ABS operation	Pressure decrease	ON (Closed)	ON (Open)	Caliper brake fluid is sent to reservoir via the outlet solenoid valve. Then it is pushed up to the master cylinder by pump.
	Pressure increase	OFF (Open)	OFF (Closed)	Master cylinder brake fluid pressure is transmitted to caliper.

CONSULT-II Functions

CONSULT-II MAIN FUNCTION

NHBR0151

In a diagnosis function (main function), there are "SELF-DIAGNOSTIC RESULTS", "DATA MONITOR", "CAN DIAG SUPPORT MNTR", "ACTIVE TEST", "FUNCTION TEST", "ECU PART NUMBER".

Diagnostic test mode	Function	Reference
SELF-DIAG- NOSTIC RESULTS	Self-diagnostic results can be read and erased quickly.	Refer to BR-46.
DATA MONITOR	Input/Output data in the ABS actuator and electric unit (control unit) can be read.	Refer to BR-49.
CAN DIAG SUP- PORT MNTR	The results of transmit/receive diagnosis of communication can be read.	_
ACTIVE TEST	Diagnostic Test Mode in which CONSULT-II drives some actuators apart from the ABS actuator and electric unit (control unit) and also shifts some parameters in a specified range.	Refer to BR-49.
FUNCTION TEST	Conducted by CONSULT-II instead of a technician to determine whether each system is "OK" or "NG".	_
ECU PART NUMBER	ABS actuator and electric unit (control unit) part number can be read.	_

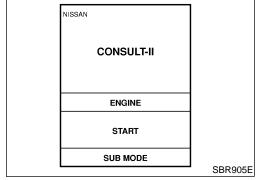

CONSULT-II Inspection Procedure SELF-DIAGNOSIS PROCEDURE

NHBR0152

NHBR0152S01

- 1. Turn ignition switch OFF.
- 2. Connect CONSULT-II to Data Link Connector.
- Start engine.
- 4. Drive vehicle over 30 km/h (19 MPH) or more for at least one minute.

5. Stop vehicle with engine running and touch "START" on CON-SULT-II screen.

^{*: &}quot;ON" lasts for 1 to 2 seconds after toutching screen, then it goes to "OFF".

TROUBLE DIAGNOSIS — INTRODUCTION

TCS

How to Perform Trouble Diagnoses for Quick and Accurate Repair

How to Perform Trouble Diagnoses for Quick and Accurate Repair INTRODUCTION

NHBR0153 NHBR0153S01

The ABS/TCS system has an electronic control unit to control major functions. The control unit accepts input signals from sensors and instantly drives actuator. It is essential that both kinds of signals are proper and stable. It is also important to check for conventional incidents: such as air leaks in the booster or lines, lack of brake fluid, or other incidents with the brake system.

MA

It is much more difficult to diagnose an incident that occurs intermittently rather than continuously. Most intermittent incidents are caused by poor electric connections or faulty wiring. In this case, careful checking of suspicious circuits may help prevent the replacement of good parts.

A visual check only may not find the cause of the incidents, so a road test should be performed.

2@

Before undertaking actual checks, take just a few minutes to talk with a customer who approaches with an ABS/TCS complaint. The customer is a very good source of information on such incidents; especially intermittent ones. Through the talks with the customer, find out what symptoms are present and under what conditions they occur.

FE

Start your diagnosis by looking for "conventional" incidents first. This is one of the best ways to troubleshoot brake incidents on an ABS/TCS controlled vehicle. Also check related Service Bulletins for information

Preliminary Check

CHECK BRAKE FLUID LEVEL

Check brake fluid level in reservoir tank.

Low fluid level may indicate brake pad wear or leakage from brake line.

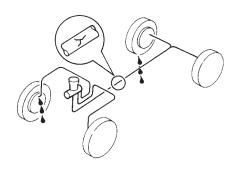

SBR451D

Is brake fluid filled between MAX and MIN lines on reservoir tank and/or has brake fluid been contaminated?

Yes	GO TO 2.
No •	Repair. GO TO 2.

2 CHECK BRAKE LINE

Check brake line for leakage.

SBR389C

Is leakage present at or around brake lines, tubes or hoses or are any of these parts cracked or damaged?

Yes	GO TO 3.
No >	Repair. GO TO 3.

X: Available —: Not available

^{*1:} Fail-safe operation does not activate. A signal from control unit suspends TCS and ABS control operation. Brakes operate conventionally. After specified power supply voltage resumes, TCS OFF and SLIP indicator and ABS warning lamp go out, allowing for TCS and ABS control operation.

^{*2:} If a wheel or wheels spin on bad or slippery road surfaces for a period of approximately 10 to 80 seconds, the ABS warning lamp and the TCS OFF indicator lamp light. But this is not a malfunction. When the ignition switch is turned "ON" after a shorted wheel sensor circuit has been repaired, the ABS warning lamp and the TCS OFF indicator lamp light. Drive the vehicle at about 30 km/h (19 MPH) or more to ensure these lamps go out within 1 minute.

^{*3:} TCS control stops due to fail safe operation, however ABS keeps operation.

^{*4:} For more detail, refer to BR-73.

^{*5:} For more detail, refer to BR-74.

TROUBLE DIAGNOSIS — GENERAL DESCRIPTION

TCS

Malfunction Code/Symptom Chart (Cont'd)

NOTE:

When a system part have electric malfunction, ABS warning lamp is illuminated by fail-safe function. According to malfunctioning condition, both ABS and EBD system become in following conditions.

- 1) ABS is not operated. EBD is operated.
- 2) Both ABS and EBD are operated. (Same condition as the vehicle without ABS and EBD)

On the condition 1), some sound for ABS system self-diagnosis can be heard same as usual, when key switch is turned ON or first starting.

System Description

NHBR0209

CAN (Controller Area Network) is a serial communication line for real time application. It is an on-vehicle multiplex communication line with high data communication speed and excellent error detection ability. Many electronic control units are equipped onto a vehicle, and each control unit shares information and links with other control units during operation (not independent). In CAN communication, control units are connected with 2 communication lines (CAN H line, CAN L line) allowing a high rate of information transmission with less wiring. Each control unit transmits/receives data but selectively reads required data only. Refer to EL-448, "System Description".

ABS ACTUATOR AND ELECTRIC UNIT (CONTROL UNIT)

Removal

Removal

NHBR0300S01

- Disconnect battery cable.
- Drain brake fluid. Refer to "Changing Brake Fluid" (BR-7).
- Remove air cleaner and duct.
- 4. Apply different colored paint to each pipe connector and actuator to prevent incorrect connection.
- 5. Disconnect harness connectors, brake pipes and remove fixing nuts and actuator ground cable.

Installation

NHBR0300S02

CAUTION:

- After installation, refill brake fluid. Then bleed air. Refer to "Bleeding Brake System" (BR-8).
- 1. Temporarily install actuator on the bracket.
- 2. Tighten actuator ground cable.
- 3. Connect brake pipes temporarily.
- 4. Tighten fixing nuts.
- 5. Tighten brake pipes.
- 6. Connect harness connectors and battery cable.
- 7. Install air cleaner and duct.

Precautions for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER

Precautions for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

The Supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER", used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted. Information that is necessary to service the system safely is included in the RS section of this Service Manual.

WARNING:

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the RS section.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.

Precautions for Brake System

NHRR0246

Be careful not to splash brake fluid on painted areas; it may cause paint damage. If brake fluid is splashed on painted areas, wash it away with water immediately.

Never use mineral oils such as gasoline or kerosene. They will ruin rubber parts of hydraulic system.

BR

AT

AX

BT

the connectors for the ABS actuator and VDC/TCS/ABS control unit or the battery terminals.

HA

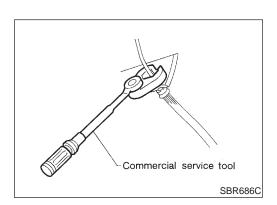

Burnish the brake contact surfaces after refinishing or replacing drums or rotors, after replacing pads or linings, or if a soft pedal occurs at very low mileage. Refer to Brake Burnishing Procedure.

WARNING:

Clean brakes with a vacuum dust collector to minimize risk of health hazard from powder caused by friction.

Precautions for Brake Control

- During the VDC/TCS/ABS operation, the brake pedal vibrates lightly and its mechanical noise may be heard. This is a normal condition.
- Just after starting the vehicle after ignition switch ON, the brake pedal may vibrate or the motor operating noise may be heard from the engine compartment. This is a normal status of the operation check.
- The stopping distance may be longer than that of vehicles without ABS when the vehicle drives on rough, gravel, or snowy (fresh deep snow) road.
- If a malfunction is indicated by the ABS warning lamp, or other warning lamps, collect the necessary information from the customer (what symptoms are present under what conditions) and find out the possible causes before starting the service. Besides the electrical system inspection, check the booster operation, brake fluid level, and oil leaks.
- If the tire size and type are used in a improper combination, or the brake pads are not NISSAN genuine parts, the stopping distance or steering stability may deteriorate.
- If there is a radio, antenna, or antenna lead-in wire (including wiring) near the control unit, the VDC/TCS/ABS function may have a malfunction or error.
- If aftermarket parts (e.g. Car stereo equipment, CD player) have been installed, check the electrical harnesses for pinches, open, and improper wiring.

Adjustment of Neutral Position of Steering Angle Sensor

Adjustment of Neutral Position of Steering Angle Sensor

• After replacing the VDC/TCS/ABS control unit, steering angle sensor, steering components, suspension components, or after adjusting the wheel alignment, make sure to adjust the neutral position of the steering angle sensor before running the vehicle.

MA

CAUTION:

To adjust the neutral position of the steering angle sensor, make sure to use CONSULT-II.

EM

(Adjustment cannot be done other than CONSULT-II.)

1. Stop the vehicle with the front wheels in the straight-ahead position.

LC

ĒC

FE

AT

. Connect CONSULT-II to data link connector on the vehicle, and turn the ignition switch to ON position (engine not running).

4. Touch "START".

CAUTION:

Do not touch the steering wheel while adjusting the steering angle sensor.

- 5. After approximately 10 seconds, touch "END". (After approximately 60 seconds, it ends automatically.)
- 6. Turn the ignition switch OFF, then turn it ON again.

CAUTION:

Make sure to carry out the above operation.

- 7. Run the vehicle with the front wheels in the straight-ahead position, then stop.
- 8. Select "DATA MONITOR", "ECU INPUT SIGNALS" on the CONSULT-II screen. Then check that the "ST ANGLE SIG" is within 0±2.5 deg. If the value is more than the specification, repeat steps 1 to 5.
- 9. Erase the memory of VDC/TCS/ABS control unit and ECM.
- 10. Turn the ignition switch OFF.

GENERAL INFORMATION

Fail-safe ABS SYSTEM

NHBR0256S01

If a malfunction occurs in the electrical system, the ABS warning lamp, VDC OFF indicator lamp, and SLIP indicator lamp in the meter will turn ON. In this condition, the VDC/TCS/ABS and EBD become one of the following conditions by the fail-safe function.

e G

 Only EBD operates. The same condition as that of models without VDC/TCS/ABS

MA

2. VDC/TCS/ABS and EBD do not operate. Only normal brake operates on 4 wheels.

NOTE:

In the step 1 shown above, the self-diagnosis is carried out at the ignition switch is turned ON and when the vehicle initial starts. ABS self-diagnosis noise may be heard as usual.

LC

VDC/TCS SYSTEM

EC

If a malfunction occurs in the electrical system, the VDC OFF indicator lamp and SLIP indicator lamp in the meter turn on. In this condition, VDC/TCS will be deactivated and it becomes equal to that of models without VDC/TCS. However, ABS is controlled normally.

Ē

If a malfunction occurs in the throttle control system, VDC/TCS control does not operate. Only ABS control operates normally.

AT

CAUTION:

AX

If the fail-safe function operates, carry out the self-diagnosis for VDC/TCS/ABS control system.

BR

ST

RS

RT

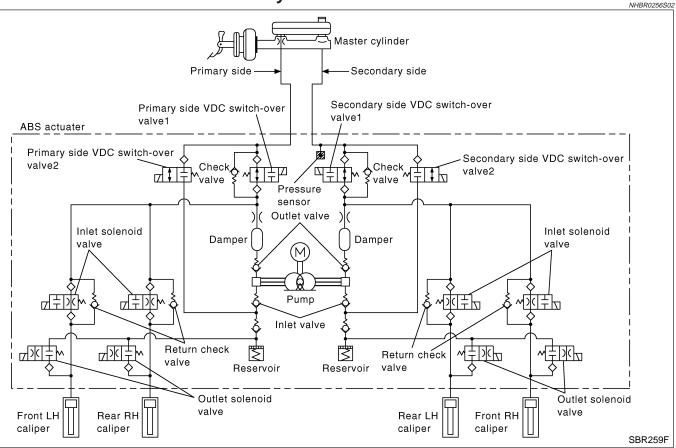

HA

SC

 $\mathbb{N}^{\mathbb{N}}$

Hydraulic Circuit

ABS Functions

NHBR0256S03

- In cases of braking suddenly or braking on slippery road (ice road), ABS functions prevent wheels from lock, improve the stability in sudden braking, and make efficient avoidance of obstacles with steering manipulation by detecting 4-wheel speed and controlling 4-wheel brake fluid pressure.
- 2. EBD is integrated in VDC/TCS/ABS system.

CALITION:

- During ABS operation, the brake pedal lightly vibrates and its mechanical noise may be heard. This is a normal condition.
- When starting the engine, or just after starting the vehicle, the brake pedal may vibrate or the motor operating noise may be heard from the engine compartment. This is a normal status of the operation check.
- The stopping distance may be longer than that of vehicles without ABS when the vehicle drives on rough, gravel, or snowy (fresh deep snow) road.

GENERAL INFORMATION

TCS Functions

1. With the wheel speed sensor signals from 4 wheels, the VDC/TCS/ABS control unit detects a wheel spin. If a wheel spins, the control unit controls brake fluid pressure to the spinning wheel, and cuts the fuel to the engine. It also closes the throttle valve to reduce the engine torque. Furthermore, throttle position is controlled to the appropriate engine torque.

MA

2. During TCS operation, it informs a driver of system operation by flashing SLIP indicator lamp.

CAUTION:

 During TCS operation, the body and the brake pedal lightly vibrate and the mechanical noise may be heard. This is a normal condition.

LC

 Depending on road circumstances, the driver may have a sluggish feel. This is not abnormal, because the optimum traction has the highest priority by TCS operation.

EC

 When the vehicle is passing through a road where the surface friction coefficient varies, downshifting or depressing the accelerator pedal fully may activate TCS temporarily.

FE AT

VDC Functions

 $\mathbb{A}\mathbb{X}$

1. In addition to the ABS/TCS function, VDC detects the driver's steering operation amount and brake operation amount from the steering angle sensor and pressure sensor. Using the information from the yaw rate/side G sensor and wheel speed sensors, VDC judges the driving condition (conditions of understeer and oversteer) to improve the stability by controlling the brake on 4 wheels and engine output.

SU

BR

2. During VDC operation, the SLIP indicator lamp flashes to inform the driver of the operation.

ST

CAUTION:

 During VDC operation, the body and the brake pedal lightly vibrate and their mechanical noise may be heard. This is a normal condition.

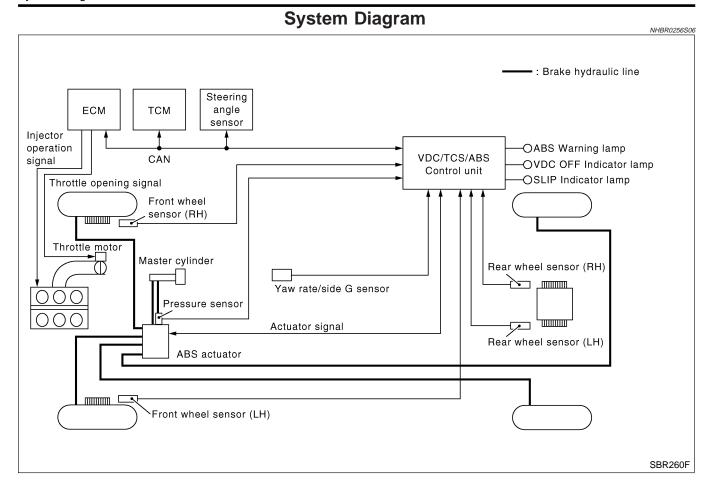

BT

 If the vehicle is rotated on a turn table, or rolled and rocked on a ship, the ABS warning lamp, VDC OFF indicator lamp, and SLIP indicator lamp may turn ON. In this case, start the engine on a normal road again. If the ABS warning lamp, VDC OFF indicator lamp, and SLIP indicator lamp turn OFF after the restart, it is normal.

HA

When driving in a steep slope such as a bank, the ABS warning lamp, VDC OFF indicator lamp, and SLIP indicator lamp may turn ON. In this case, start the engine on a normal road again. If the ABS warning lamp, VDC OFF indicator lamp, and SLIP indicator lamp turn OFF after the restart, it is normal.

CAN COMMUNICATION

VDC
System Description

System Description

CAN (Controller Area Network) is a serial communication line for real time application. It is an on-vehicle multiplex communication line with high data communication speed and excellent error detection ability. Many electronic control units are equipped onto a vehicle, and each control unit shares information and links with other control units during operation (not independent). In CAN communication, control units are connected with 2 communication lines (CAN H line, CAN L line) allowing a high rate of information transmission with less wiring. Each control unit transmits/receives data but selectively reads required data only. Refer to EL-448, "System Description".

How to Perform Trouble Diagnoses for Quick and Accurate Repair INTRODUCTION

The most important point to perform the trouble diagnosis is to understand the systems (control and mechanism) in the vehicle thoroughly.

It is also important to clarify the customer complaints before inspection.

First of all, reproduce the symptom, and understand it fully. Ask the customer about his/her complaints carefully. In some cases, it will be necessary to check the symptoms by driving the vehicle with the customer.

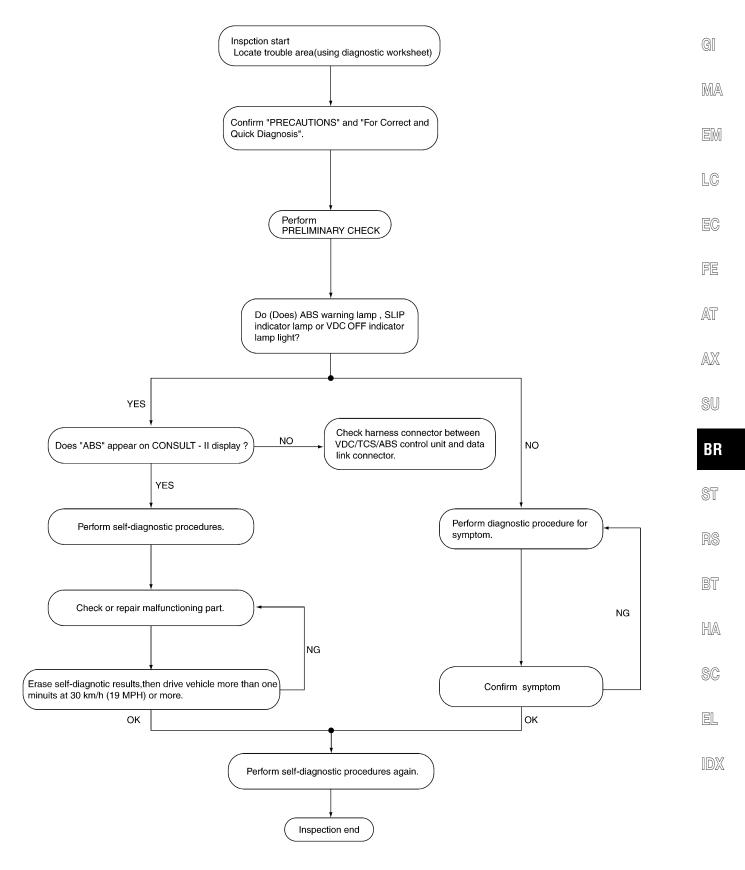

CAUTION:

Customers are not professional. It is dangerous to make an easy guess like "maybe the customer means that...," or "maybe the customer mentions this symptom".

- It is essential to check symptoms right from the beginning in order to repair a malfunction completely.
 - For an intermittent malfunction, it is important to reproduce the symptom based on an interview with the customer and past examples. Do not perform an inspection on an ad hoc basis. Most intermittent malfunctions are caused by poor contacts. In this case, it will be effective to shake the suspected harness or connector by hand. When repairs are performed without any travel diagnosis, repair work is not confirmed if it's done correctly.
- After the diagnosis, make sure to carry out "erase memory". Refer to Functions of CONSULT-II, BR-118.
- For an intermittent malfunction, move the harness or harness connector by hand to check the poor contact or false open circuit.
- Always read the "GI Section" PRECAUTIONS to check the general guidelines and to confirm the general precautions.

ASKING COMPLAINTS

NHBR0259S03

- Complaints against a malfunction vary depending on each person. It is important to clarify the customer complaints.
- Ask the customer about what symptoms are present under what conditions. Use the information to reproduce the symptom while driving.
- It is also important to use the diagnosis sheet to understand what type of trouble the customer having.

EXAMPLE OF DIAGNOSIS SHEET

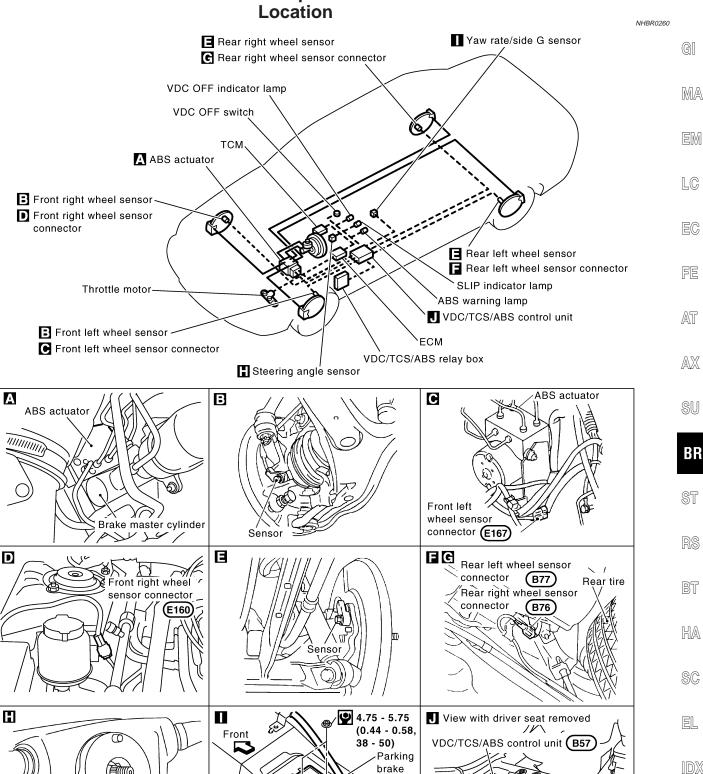

NHBR0259S04

Customer name MR/MS	Model & Year		VIN		
Engine #	Trans.		Mileage		
Incident Date	Manuf. Date		In Service Date		
Symptoms	□ Noise and vibration (from engine compartment) □ Noise and vibration (from axle)	☐ Warning / Indicator activate		☐ Firm pedal operation Large stroke pedal operation	
	☐ VDC/TCS dose not work (Rear wheels slip when accelerating)	☐ ABS dose not work. (wheels slip when braking)		☐ Lack of sense of acceleration	
Engine conditions	☐ When starting ☐ After starting				
Road conditions	□ Low friction road (□Snow □Gravel □Other) □ Bumps / potholes				
Driving conditions	□ Full-acceleration □ High speed cornering □ Vehicle speed: Greater than 10 km/h (6 MPH) □ Vehicle speed: 10 km/h (6 MPH) or less □ Vehicle is stopped				
Applying brake conditions	□ Suddenly □ Gradually				
Other conditions	☐ Operation of electrical equipment ☐ Shift change ☐ Other descriptions

SELF-DIAGNOSIS

NHRR0264S02

Description

If a malfunction is detected in the system, the ABS warning lamp, VDC OFF indicator lamp, and SLIP indicator lamp on the meter turn on. In this case, perform the self-diagnosis as follows:

LC

Procedure

Perform a Basic Inspection, BR-131, using information from the customer.

AT

After the ignition switch is turned OFF, connect the CON-SULT-II connector to the vehicle-side data link connector. (The

Start the engine and drive at Approx. 30 km/h (19 MPH) or more for approx. 1 minute.

data link connector is on the lower instrument cover).

BR

After stopping the vehicle, with the engine still idling, touch "START", "ABS", "SELF-DIAG RESULTS" on the CONSULT-II

BT

CAUTION:

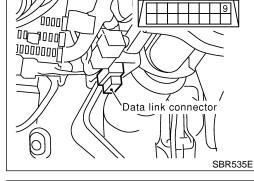

screen in this order.

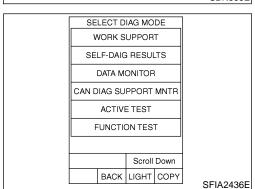

Just after starting the engine, or turning the ignition switch ON, "ABS" may not be displayed on the system selection screen even if "START" is touched. In this case, start the selfdiagnosis again from step 2. If it cannot be shown after several attempts, the VDC/TCS/ABS control unit may malfunction. Repair or replace the control unit.

EL

The self-diagnosis result is displayed. (If necessary, touch "PRINT" to print the self-diagnosis result.)

- When "NO FAILURE" is shown, check the ABS warning lamp, VDC OFF indicator lamp, SLIP indicator lamp. Refer to For Correct and Quick Diagnosis, BR-129.
- CONSULT-II self-diagnosis results are displayed without regard to occurrence timing. In some case, the later ones (timing value is small) appear on the next screen.
- Go to appropriate "Inspection" chart according to "Self-Diagnostic Items to Result Mode" and repair or replace as necessary.

7. Start the engine and drive at Approx. 30 km/h (19 MPH) or more for Approx. 1 minute.

CAUTION:

Check again to make sure that there is NO MALFUNCTION on other parts.

- 8. Turn the ignition switch OFF to prepare for erasing the memory.
- 9. Start the engine and touch "START", "ABS", "SELF-DIAG RESULTS" and "ERASE" on CONSULT-II screen in this order to ease the memory.

CAUTION:

If the memory cannot be erased, go to step 6.

10. Drive the vehicle at Approx. 30 km/h (19 MPH) or more and check that the ABS warning lamp, VDC OFF indicator lamp, and SLIP indicator lamp stay off.

CAUTION:

VDC OFF switch is not cancelled.

NOTE:

During the active test when "OFF" on the "ABS WARNING LAMP" screen is touched, all of the VDC OFF indicator lamp, SLIP indicator lamp, and ABS warning lamp flash once. This is not abnormal.

VDC

For Correct and Quick Diagnosis

For Correct and Quick Diagnosis PRECAUTIONS FOR TROUBLE DIAGNOSIS

NHBR0265

 Before performing the trouble diagnosis, always read the PRE-CAUTIONS to confirm the general precautions.

GI

 After replacement of VDC/TCS/ABS control unit, steering angle sensor, steering parts, suspension parts, or tires, and adjustment of alignment, always adjust the neutral position of steering angle sensor before driving.

MA

 When the VDC/TCS/ABS control unit is replaced, check that the label on the computer unit is identical color.

 After completing the trouble diagnosis, always erase the malfunctioning memory. CONSULT-II Functions, BR-118.

 When inspection of the continuity or voltage between units is performed, check the connector terminals for disconnection, looseness, bend, or collapse. If any malfunction is detected, repair or replace the applicable part.

LC

 Intermittent malfunctions may be caused by a malfunction on harness, connector, or terminal. Move the harnesses, harness connectors, or terminals by hand to make sure that there is no contact malfunction.

Ē

If a circuit tester is used for the check, be careful not to forcibly extend any connector terminal.

 For self-diagnosis, active test, and work support of VDC/TCS/ ABS control unit with CONSULT-II, stop and connect CON-

AX

SULT-II and select "ABS".
 CONSULT-II self-diagnosis results are displayed without regard to occurrence timing. In some case, the later ones (timing value is small) appear on the next screen.

SU

 While the self-diagnosis results of CONSULT-II shows a malfunction, if CONSULT-II active test is performed, an engine system malfunction may be indicated. In this case, start the engine to resume the normal screen.

__

BR

 VDC/TCS/ABS system electronically controls the brake operation and engine output. The following symptoms may be caused by the normal operations.

Symptom	Symptom description	Result	
Motor operation paice	During VDC, TCS, or ABS operation, sometimes a faint noise can be heard. This is a motor operation noise in the ABS actuator.	Normal	
Motor operation noise	Just after the engine starts, the motor operating noise may be heard. This is a normal status of the system operation check.	Nomai	
System operation check noise	When the engine starts, a "click" noise may be heard from the engine compartment. This is a normal status of the system operation check.	Normal

TROUBLE DIAGNOSIS — BASIC INSPECTION

Preliminary Check 1: (Brake Fluid Level and Leak Inspection)

Preliminary Check 1: (Brake Fluid Level and Leak Inspection)

- 1. Check the fluid level in the brake reservoir tank. If the fluid level is low, refill the brake fluid.
- Check the area around the brake piping, ABS actuator for leaks. If a leak or oozing is detected, check as follows:
- If the connections at the ABS actuator are loose, tighten the piping to the specified torque. Then check again for leaks, and make sure that there is no fluid leak.
- If the flare nuts at the connections and the threads of the ABS actuator are damaged, replace the damaged parts. Then check again for leaks, and make sure that there is no fluid leak.
- If a leak or oozing is detected on other parts than the ABS actuator connections, wipe the applicable part with a clean cloth. Then check again for leaks, and if there is still a leak or oozing, replace the damaged part.
- If a leak or oozing is detected on the ABS actuator body, wipe the applicable part with a clean cloth. Then check again for leaks, and if there is still a leak or oozing, replace the ABS actuator body.

CAUTION:

Do not disassemble the actuator body.

Check the brake disc rotor and pads.

BR

Preliminary Check 2: (Inspection for Loose Power Supply Terminal)

Check the battery for looseness on the battery positive/negative terminals and ground connection. If looseness is detected, tighten the piping to the specified torque. Check that the battery voltage does not drop and the alternator is normal.

Preliminary Check 3: (Inspection for ABS Warning Lamp, VDC OFF Indicator Lamp, and **SLIP Indicator Lamp)**

- 1. Check that the ABS warning lamp is ON for approx. 0.5 seconds when the ignition switch is turned ON. If it does not turn on, check the ABS warning lamp and the circuit, and the combination meter.
- 2. Check that VDC OFF indicator lamp is ON for approx. 0.5 seconds when the ignition switch is turned ON. If it does not turn ON, check the VDC OFF indicator lamp and the circuit, and the combination meter.

TROUBLE DIAGNOSIS — BASIC INSPECTION

VDC

Preliminary Check 3: (Inspection for ABS Warning Lamp, VDC OFF Indicator Lamp, and SLIP Indicator Lamp) (Cont'd)

- 3. Check that the SLIP indicator lamp is ON for approx. 0.5 seconds when the ignition switch is turned ON. If it does not turn ON, check the SLIP indicator lamp and the circuit.
- 4. With the engine running, check the VDC OFF indicator lamp turns ON and OFF when the VDC OFF switch turns ON and OFF. If it does not operate in accordance with the switch, check the VDC OFF switch and the circuit.
- Check that the VDC OFF indicator lamp turns OFF after approx. 2 seconds delay when the VDC OFF switch turned ON (The VDC/TCS system was not operated). If the VDC OFF indicator lamp does not turn OFF in 10 seconds from the engine start, perform the self-diagnosis of VDC/TCS/ABS control unit.

LC

Actuator Operation Check

Connect E165 and E600 terminals of actuator to VDC relay box.

2. Measure the motor voltage [No. 4 (R/B) terminal to body ground] with oscilloscope. Then check the motor reverse voltage occasioned time.

The motor reverse voltage occasioned time is more than 0.1 sec.

CAUTION:

 Perform checking of motor relay unit. Then confirm that relay functions.

• Driving actuator motor is within 4 sec. to prevent heating up.

Standard condition of the motor reverse voltage occasioned time is: Battery voltage is 12V. temperature 20°. when the battery voltage or temperature is lower than the standard, the motor reverse voltage occasioned time becomes slightly shorter.

Symptom 1: ABS Works Frequently

No

Symptom 1: ABS Works Frequently

Inspection procedure

NHBR0286

1	INSPECTION START			
	Check the wheel speed sensor system.			
	Sensor mounting inspection			
	Sensor pick-up inspection for iron chips			
Sen	Sensor rotor inspection (e.g. number of teeth, damaged teeth)			
• Sen	sor connector engageme	ent inspection		
	Is inspection result OK?			
Yes	•	GO TO 2.		

2	LOOSENESS INSPECTION	
Check the front axle for looseness.		
Is inspection result OK?		
Yes Symptom 2: Unexpected Pedal Action, BR-160.		
No	•	Axle inspection and repair

Refer to wheel speed sensor and rotor lines.

Symptom 2: Unexpected Pedal Action

Inspection procedure

NHBR0287

	1			
1	BRAKE PEDAL STROKE INSPECTION			
Check	Check the brake pedal stroke.			
	Is stroke excessively long?			
Yes	Yes Check the bleeding and brake system.			
No	•	GO TO 2.		

2	PEDAL FORCE INSPECTION				
Check	Check that the brake is effective with the pedal depressed.				
	Is the pedal heavy, but effective?				
Yes	Yes Normal				
No	•	GO TO 3.			

3	CONNECTOR AND PERFORMANCE INSPECTION		
Disco	Disconnect the actuator relay unit connector to deactivate the ABS function. Check that the brake is effective.		
	Is the brake effective?		
Yes	>	GO TO 4.	
No	>	Brake line inspection	

4	ABS WARNING LAMP INDICATOR INSPECTION			
Check	Check that the ABS warning lamp illuminates.			
	Does the ABS warning lamp illuminate?			
Yes	Yes Perform the self-diagnosis.			
No	•	GO TO 5.

4	SYMPTOM CHECK 4	
Check	that the symptom is repre	duce when the engine speed is increased with the vehicle stopped.
		Is inspection result OK?
Yes	•	GO TO 5.
No	•	Normal CAUTION: This symptom may appear with vehicle stopped.

5	SYMPTOM CHECK 5		
Check that the symptom is reproduce when any switch of electrical equipment is operated.			
	Is inspection result OK?		
Yes	>	Check that there are no radio, antenna, and antenna lead-in wires (including wiring) near control unit.	
No	>	GO TO 6.	

6	ABS WARNING LAMP INSPECTION		
Check that the ABS warning lamp turns on.			
Is inspection result OK?			
Yes	>	Perform the self-diagnosis.	
No	>	GO TO 7.	

7	WHEEL SPEED SENSOR INSPECTION			
Check the wheel speed sensor system. Sensor mounting inspection Sensor pick-up inspection for iron chips (e.g. Number of teeth, damaged teeth) Sensor connector engagement inspection Wheel speed sensor path harness and connector inspection				
Is inspection result OK?				
Yes	>	Normal		
No	•	Wheel speed sensor and rotor lines repair		

Symptom 6: VDC OFF Indicator Lamp Does Not Illuminate

NHBR0291

Inspection procedure

1	VDC OFF INDICATOR LAMP INSPECTION		
Discor	Disconnect the VDC/TCS/ABS control unit connector.		
	Does the ABS warning lamp and VDC OFF indicator lamp illuminate?		
Yes	•	VDC/TCS/ABS control unit malfunction. Repair or replace the control unit.	
No	•	Combination meter system malfunction. Check the combination meter.	

Symptom 7: SLIP Indicator Lamp Does Not Illuminate

Symptom 7: SLIP Indicator Lamp Does Not Illuminate

Inspection procedure

NHBR0292

1	SLIP INDICATOR LAMP BURNED-OUT BULB INSPECTION			
Check for continuity between the power supply terminal of meter and terminal of ABS warning lamp.				
Is inspection result OK?				
OK	OK ▶ GO TO 2.			
NG	•	Circuit malfunction in SLIP indicator lamp or combination meter		

2	SLIP INDICATOR LAMP POWER CIRCUIT INSPECTION			
	Disconnect the meter connector. Check that the voltage between the vehicle-side harness terminal and body ground is battery voltage (Approx. 12V).			
	Is inspection result OK?			
Yes	•	GO TO 3.		
No	*			

3	SLIP INDICATOR LAMP HARNESS INSPECTION			
_	 Disconnect connectors for the VDC/TCS/ABS control unit and meter vehicle-side harness. Check the harness between the meter and the VDC/TCS/ABS control unit for an open/shorted circuit. 			
	Is inspection result OK?			
OK	>	GO TO 4.		
NG	>	Repair or replace the disconnected harness.		

4	SLIP INDICATOR LAMP CONNECTOR INSPECTION			
Check	Check connectors for the VDC/TCS/ABS control unit and meter vehicle-side harness.			
	Is inspection result OK?			
Yes	Yes Connect connectors, and perform the self-diagnosis. The vehicle harness has the intermediate connector. Refer to the vehicle wiring diagram, always check it.			
No	>	Repair or replace the disconnected connector.		

Symptom 8: During VDC/TCS/ABS Control, Vehicle Behavior is Jerky

Inspection procedure

NHBR0293

1	1 ENGINE SPEED SIGNAL INSPECTION			
Perfor	Perform "DATA MONITOR" with CONSULT-II for the VDC/TCS/ABS control unit.			
	Is the engine speed at idle 400 rpm or higher?			
Yes	•	Normal		
No	•	GO TO 2.

NG	Repair or replace the applicable item and perform the VDC/TCS/ABS control unit self-diagnosis again.

Removal and Installation

REMOVAL

NHBR0294S01

1. Remove the front seat LH.

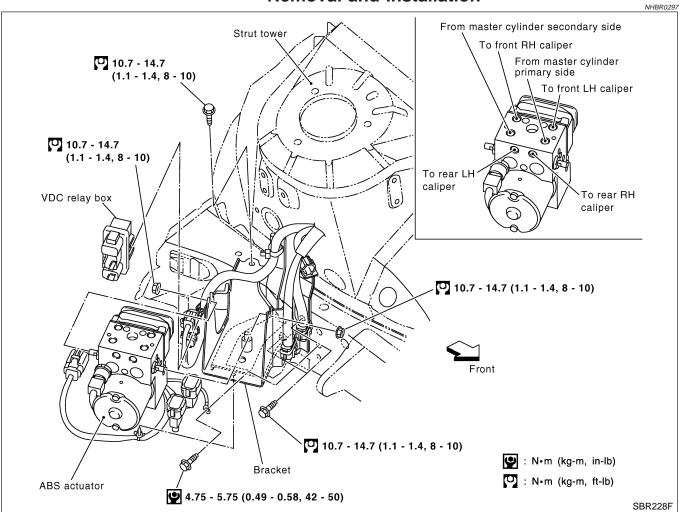

Remove the VDC/TCS/ABS control unit.

INSTALLATION

NHBR0294S02

Installation is the reverse order of removal.

Be careful of the following.

CAUTION:

- Before servicing, disconnect the battery terminals.
- To remove the brake tube, use a flare nut wrench to prevent the flare nuts and brake tube from being damaged. To install, use a brake tube torque wrench.
- Do not remove and install the actuator by holding the harness.
- After completing the work, bleed the brake piping of air.
 Refer to Brake Burnishing Procedure, BR-7.
- Make sure to connect the ground terminal securely.

Removal and Installation REMOVAL

NHBR0298

NHBR0298S01

- Remove the center console.
- 2. Disconnect the harness connector.
- Remove the mounting bolts, and remove the yaw rate/side G sensor.

CAUTION:

Do not drop or strike the yaw rate/side G sensor, because it has little endurance against impact.

INSTALLATION

NHBR0298S02

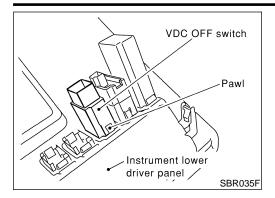

Installation is the reverse order of removal.

CAUTION:

Do not drop or strike the yaw rate/side G sensor, because it has little endurance against impact.

VDC OFF SWITCH

Removal and Installation

Removal and Installation REMOVAL

Installation is the reverse order of removal.

NHRR0200

 Remove the instrument lower driver panel. Refer to INSTRU-MENT LOWER DRIVER PANEL, BT-30.

Push the VDC OFF switch's pawls and remove the switch from the instrument lower driver panel.

CAUTION:

Be careful not to damage sensor edge and sensor rotor teeth. When removing the front or rear wheel hub assembly, first remove the ABS wheel sensor from the assembly. Failure to do so may result in damage to the sensor wires making the sensor inoperative.

Wheel Sensors

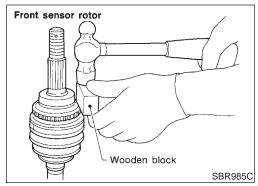

Sensor Rotor REMOVAL

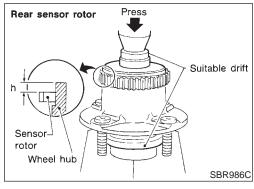

NHBR0199S02

- Remove the drive shaft and rear wheel hub. Refer to "Drive Shaft" and "Wheel Hub" in AX section.
- 2. Remove the sensor rotor using suitable puller, drift and bearing replacer.

REMOVAL AND INSTALLATION

INSTALLATION

Install the sensor rotor. For front sensor rotor, use hammer and wooden block. For rear sensor rotor, use suitable drift and press.

Always replace sensor rotor with new one.
