DIAGNOSIS AND REPAIR WORKFLOW

How to Perform Trouble Diagnosis For Quick And Accurate Repair

WORK FLOW

1.LISTEN TO CUSTOMER COMPLAINT

Listen to customer complaint. Get detailed information about the conditions and environment when the symptom occurs.

>> GO TO 2

2. CHECK FOR SERVICE BULLETINS

Check for any service bulletins.

>> GO TO 3.

3. VERIFY THE SYMPTOM WITH OPERATIONAL CHECK

Verify the symptom with operational check. Refer to HAC-125, "Operational Check".

Can a symptom be duplicated?

YES >> GO TO 4 NO >> GO TO 5

4.GO TO APPROPRIATE TROUBLE DIAGNOSIS

Go to appropriate trouble diagnosis. Refer to HAC-174, "Symptom Matrix Chart".

Can a symptom be duplicated?

>> GO TO 5.

5.PERFORM THE A/C AUTO AMP SELF-DIAGNOSIS

Perform A/C auto amp. self-diagnosis. Refer to HAC-24, "A/C Auto Amp. Self-Diagnosis".

>> If any diagnostic trouble codes set. Refer to <u>HAC-25</u>, "<u>A/C System Self-Diagnosis Code Chart</u>". >> Confirm the repair by performing operational check. Refer to <u>HAC-125</u>, "<u>Operational Check</u>".

INSPECTION AND ADJUSTMENT

< BASIC INSPECTION >

	BASIC INSPECTION > [// Crementer Comparison of Comparison	
-	NSPECTION AND ADJUSTMENT	А
	Dperational Check (Front)	A
	he purpose of the operational check is to confirm that the system operates properly.	В
	Conditions : Engine running and at normal operating temperature	
	CHECKING MEMORY FUNCTION . Set the temperature to 32°C (90°F). 2. Press the OFF switch.	С
	 Free the off off off. Turn ignition switch OFF. Turn ignition switch ON. 	D
	5. Press the AUTO switch.	Ε
	 Confirm that the set temperature remains at previous temperature. 	
	7. Press the OFF switch.	F
	f NG, go to trouble diagnosis procedure for <u>HAC-121, "Memory Function Check"</u> . f OK, continue with next check.	
	CHECKING BLOWER	G
	. Press the blower speed control switch (+) once, blower should operate on low speed. The fan display should have one bar lit (on display).	Н
	Press the blower speed control switch (+) again, and continue checking blower speed and fan display until all speeds are checked.	
	. Leave blower on maximum speed.	HAC
	f NG, go to trouble diagnosis procedure for <u>HAC-150, "Front Blower Motor Diagnosis Procedure"</u> . F OK, continue with next check.	
	CHECKING DISCHARGE AIR	J
	. Press MODE switch four times and the DEF $\widehat{\mathbf{w}}$ switch.	
	2. Each position indicator should change shape (on display).	Κ
	 Confirm that discharge air comes out according to the air distribution table. Refer to <u>HAC-18</u>, "<u>Discharge</u> <u>Air Flow (Front)</u>". 	
	Mode door position is checked in the next step. If NG, go to trouble diagnosis procedure for <u>HAC-139. "Mode Door Motor (Front) Diagnosis Procedure"</u> . If OK, continue the check.	L
	NOTE: Confirm that the compressor clutch is engaged (sound or visual inspection) and intake door position is at fresh when the FOOT, DEF or D/F is selected.	Μ
	CHECKING RECIRCULATION (🍞, 💝 ONLY)	Ν
	. Press recirculation (
	Press recirculation () switch one more time. Recirculation indicator should go off.	0
	b. Listen for intake door position change (blower sound should change slightly). NG, go to trouble diagnosis procedure for <u>HAC-147</u> , "Intake Door Motor Diagnosis Procedure".	
	f OK, continue the check. IOTE:	Ρ
	Confirm that the compressor clutch is engaged (sound or visual inspection) and intake door position is at fresh when the FOOT, DEF or D/F is selected. REC (\blacksquare) is not allowed in DEF (\blacksquare) D/F (\blacksquare) or FOOT (\blacksquare).	
	CHECKING TEMPERATURE DECREASE	

1. Rotate temperature control dial (drive or passenger) counterclockwise until 18°C (60°F) is displayed.

2. Check for cold air at appropriate discharge air outlets.

INSPECTION AND ADJUSTMENT

< BASIC INSPECTION >

[AUTOMATIC AIR CONDITIONER]

If NG, listen for sound of air mix door motor operation. If OK, go to trouble diagnosis procedure for <u>HAC-175</u>, <u>"Component Function Check"</u>. If air mix door motor appears to be malfunctioning, go to <u>HAC-33</u>, "Air Mix Door <u>Motor Component Function Check"</u>.

If OK, continue the check.

CHECKING TEMPERATURE INCREASE

- 1. Rotate temperature control dial clockwise (drive or passenger) until 32°C (90°F) is displayed.
- 2. Check for hot air at appropriate discharge air outlets.

If NG, listen for sound of air mix door motor operation. If OK, go to trouble diagnosis procedure for <u>HAC-183</u>, <u>"Component Function Check"</u>. If air mix door motor appears to be malfunctioning, go to <u>HAC-33</u>, "Air Mix Door <u>Motor Component Function Check"</u>.

If OK, continue with next check.

CHECK A/C SWITCH

- 1. Press A/C switch when AUTO switch is ON, or in manual mode.
- 2. A/C switch indicator will turn ON.
 - Confirm that the compressor clutch engages (sound or visual inspection).

NOTE:

If current mode setting is DEF or D/F, compressor clutch will already be engaged and cannot be turned off. If NG, go to trouble diagnosis procedure for <u>HAC-156</u>. "<u>Magnet Clutch Diagnosis Procedure</u>". If OK, continue with next check.

CHECKING AUTO MODE

- 1. Press AUTO switch.
- 2. Display should indicate AUTO.
 - If ambient temperature is warm, and selected temperature is cool, confirm that the compressor clutch engages (sound or visual inspection). (Discharge air and blower speed will depend on ambient, in-vehicle, and set temperatures.)

If NG, go to trouble diagnosis procedure for <u>HAC-164</u>, "Front Air Control Power and Ground Diagnosis Proce-<u>dure</u>", then if necessary, trouble diagnosis procedure for <u>HAC-156</u>, "<u>Magnet Clutch Diagnosis Procedure</u>". If all operational checks are OK (symptom cannot be duplicated), go to malfunction Simulation Tests in <u>HAC-124</u>, "<u>How to Perform Trouble Diagnosis For Quick And Accurate Repair</u>" and perform tests as outlined to simulate driving conditions environment. If symptom appears. Refer to <u>HAC-174</u>, "<u>Symptom Matrix Chart</u>", and perform applicable trouble diagnosis procedures.

Operational Check (Rear)

INFOID:00000003935871

The purpose of the operational check is to confirm that the system operates properly.

Conditions : Engine running and at normal operating temperature

CHECKING REAR BLOWER MOTOR

- 1. Turn the ignition switch ON.
- 2. Rotate rear air control (front) blower control dial to low speed.
- 3. Rotate the blower control dial clockwise and continue checking blower speed until all speeds are checked.
- 4. Leave blower on maximum speed.
- 5. Press the REAR CTRL switch from the rear air control (front).
- 6. Rotate rear air control (rear) blower control dial to low speed.
- 7. Rotate the blower control dial clockwise and continue checking blower speed until all speeds are checked.
- 8. Leave blower on maximum speed.

If NG, go to trouble diagnosis procedure for <u>HAC-53</u>, "<u>Rear Blower Motor Component Function Check</u>". If OK, continue with next check.

CHECKING REAR TEMPERATURE DECREASE

- 1. Press the REAR CTRL switch (indicator off).
- 2. Rotate the rear air control (front) temperature control dial counterclockwise to maximum cold.
- 3. Check for cold air at appropriate discharge air outlets.

INSPECTION AND ADJUSTMENT

< BASIC INSPECTION >

[AUTOMATIC AIR CONDITIONER]

- 4. Press the REAR CTRL switch (indicator on) from the rear air control (front).
- 5. Rotate the rear air control (rear) temperature control dial counterclockwise to maximum cold.
- 6. Check for cold air at appropriate discharge air outlets.

If NG, listen for sound of air mix door motor operation. If OK, go to trouble diagnosis procedure for <u>HAC-143</u>, <u>"Air Mix Door Motor Component Function Check"</u>. If air mix door motor appears to be malfunctioning, go to <u>HAC-65</u>, <u>"Rear Air Control (Rear) Diagnosis Procedure"</u>. If OK, continue with next check.

CHECKING REAR TEMPERATURE INCREASE

- 1. Press the REAR CTRL switch (indicator off).
- 2. Rotate the rear air control (front) temperature control dial clockwise to maximum heat.
- 3. Check for hot air at appropriate discharge air outlets.
- 4. Press the REAR CTRL switch (indictor on) from the rear air control (front).
- 5. Rotate the rear air control (rear) temperature control dial clockwise to maximum heat.
- 6. Check for hot air at appropriate discharge air outlets.

If NG, listen for sound of air mix door motor operation. If OK, go to trouble diagnosis procedure for <u>HAC-117</u>, <u>"Component Function Check"</u>. If air mix door motor appears to be malfunctioning, go to <u>HAC-65</u>, <u>"Rear Air</u> <u>Control (Rear) Diagnosis Procedure"</u>.

If NG, go to trouble diagnosis procedure for <u>HAC-183</u>, "Component Function Check".

If all operational checks are OK (symptom cannot be duplicated), go to <u>HAC-124, "How to Perform Trouble</u> <u>Diagnosis For Quick And Accurate Repair</u> and perform tests as outlined. If symptom appears, refer to <u>HAC-</u> <u>174, "Symptom Matrix Chart</u>" and perform applicable trouble diagnosis procedures.

REFRIGERATION SYSTEM

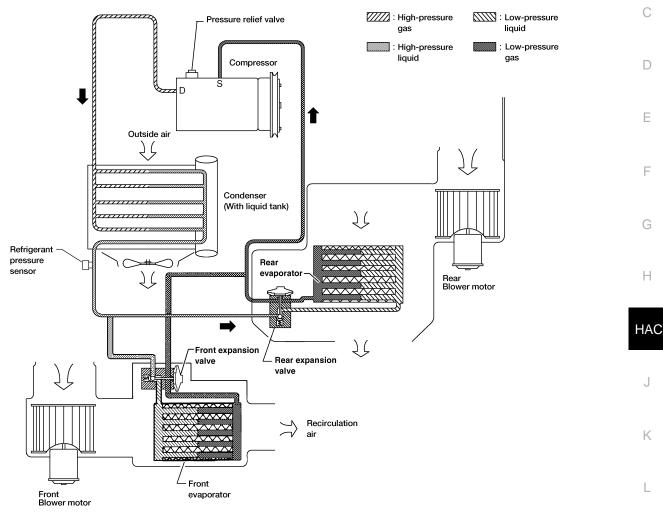

Refrigerant Cycle

[AUTOMATIC AIR CONDITIONER]

INFOID:000000004364427

В

А

W.IIA1342E

Μ

REFRIGERANT FLOW

The refrigerant flows in the standard pattern, that is, through the compressor, the condenser with liquid tank, through the front and rear evaporators, and back to the compressor. The refrigerant evaporation through the evaporator coils are controlled by front and rear externally equalized expansion valves, located inside the front and rear evaporator cases.

FREEZE PROTECTION

The compressor cycles on and off to maintain the evaporator temperature within a specified range. When the evaporator coil temperature falls below a specified point, the intake sensor interrupts the compressor operation. When the evaporator coil temperature rises above the specification, the intake sensor allows compressor operation.

Refrigerant System Protection

INFOID:000000004364428

REFRIGERANT PRESSURE SENSOR

REFRIGERATION SYSTEM

< FUNCTION DIAGNOSIS >

[AUTOMATIC AIR CONDITIONER]

The refrigerant system is protected against excessively high- or low-pressures by the refrigerant pressure sensor, located on the condenser. If the system pressure rises above or falls below the specifications, the refrigerant pressure sensor detects the pressure inside the refrigerant line and sends a voltage signal to the ECM. The ECM de-energizes the A/C relay to disengage the magnetic compressor clutch when pressure on the high pressure side detected by refrigerant pressure sensor is over about 2,746 kPa (28 kg/cm², 398 psi), or below about 120 kPa (1.22 kg/cm², 17.4 psi).

PRESSURE RELIEF VALVE

The refrigerant system is also protected by a pressure relief valve, located in the rear head of the compressor. When the pressure of refrigerant in the system increases to an abnormal level [more than 2,990 kPa (30.5 kg/ cm², 433.6 psi)], the release port on the pressure relief valve automatically opens and releases refrigerant into the atmosphere.

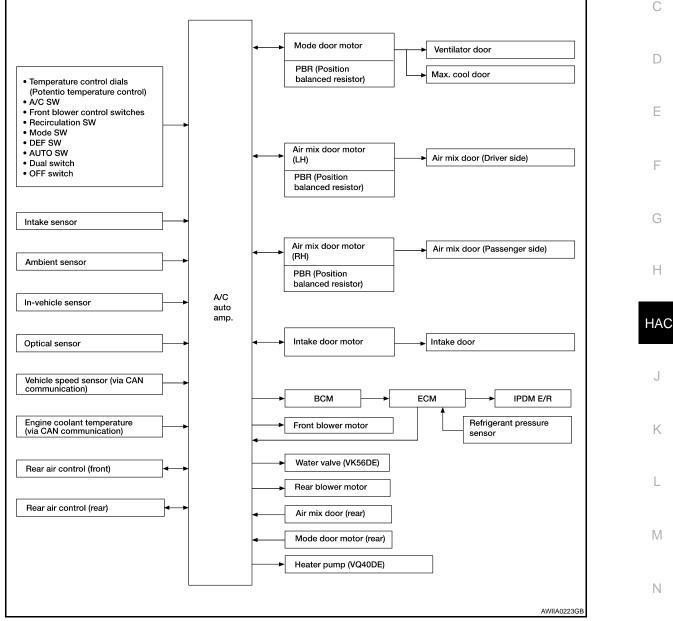

< FUNCTION DIAGNOSIS >

AUTOMATIC AIR CONDITIONER SYSTEM

Control System Diagram

CONTROL SYSTEM

The control system consists of input sensors, switches, the A/C auto amp. (microcomputer) and outputs. The relationship of these components is shown in the figure below:

Control System Description

CONTROL OPERATION

Ρ

INFOID:000000003935877

[AUTOMATIC AIR CONDITIONER]

A/C	\$; +		MODE	A Starting of the start of the
OFF	35 -			PUSH DUAL
			I	AWIIA0081ZZ

DISPLAY SCREEN

Displays the operational status of the system.

AUTO SWITCH

- Pressing the AUTO switch will illuminate the LED and "Auto" will be visible on the display. The A/C indicator will illuminate.
- The A/C compressor, intake door, air mix doors, outlet doors and blower speed are automatically controlled so that the in-vehicle temperature will reach, and be maintained at the set temperature selected by the operator.
- When pressing AUTO switch, air inlet, air outlet, blower speed, and discharge air temperature are automatically controlled.
- A partial AUTO mode can be achieved by only changing the blower speed or by changing the mode position. If both the blower speed and the mode positions are changed, the AUTO mode will be cancelled.

TEMPERATURE CONTROL DIAL (DRIVER)

Increases or decreases the set temperature.

TEMPERATURE CONTROL DIAL (PASSENGER)

Increases or decreases the set temperature.

RECIRCULATION (

- When REC switch is ON, REC switch indicator turns ON, and air inlet is set to REC.
- When REC switch is turned OFF, or when compressor is turned from ON to OFF, REC switch is automatically turned OFF. REC mode can be re-entered by pressing REC switch again.
- REC switch is not operated when DEF switch is turned ON, at the D/F position, or in floor position.

DEFROSTER (@) SWITCH

Positions the air outlet doors to the defrost position. Also positions the intake doors to the outside air position, and turns A/C compressor ON.

REAR WINDOW DEFOGGER SWITCH

When switch is ON, rear window and door mirrors are defogged.

OFF SWITCH

The A/C compressor and blower are OFF, the intake doors are set to the outside air position, and the air outlet doors are set to the foot (75% foot and 25% defrost) position.

A/C SWITCH

The compressor is ON or OFF. (Pressing the A/C switch when the AUTO switch is ON will turn off the A/C switch and compressor.)

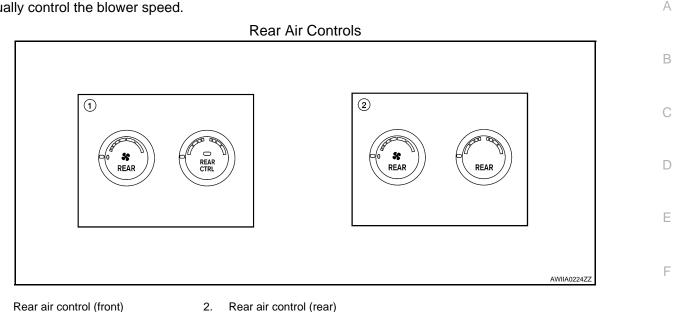

MODE SWITCH

Controls the air discharge outlets.

< FUNCTION DIAGNOSIS >

[AUTOMATIC AIR CONDITIONER]

FRONT BLOWER CONTROL SWITCHES Manually control the blower speed.

TEMPERATURE CONTROL DIAL (TEMPERATURE AND MODE CONTROL)

The temperature increases or decreases the set temperature. The mode also changes from foot at full hot setting, to foot/vent at mid-range (warm) setting, and then to vent at full cold setting.

REAR BLOWER CONTROL DIAL (FRONT)

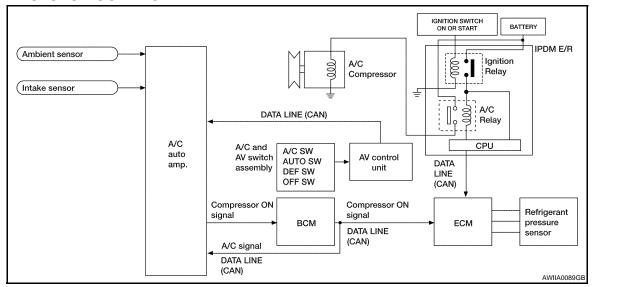

When the REAR CTRL switch is in the off (indicator off) the rear air control (front) controls the rear blower motor speed regardless of the rear air control (rear) blower control dial (rear) position. The rear air control (front) controls the blower motor speed.

REAR BLOWER CONTROL DIAL (REAR)

When the REAR CTRL switch is on (indicator on) the rear air control (rear) controls the rear blower motor speed regardless of the rear air control (front) blower control dial (front) position. The rear air control (rear) controls the blower motor speed.

MAGNET CLUTCH CONTROL

1.

When A/C switch or DEF switch is pressed, A/C auto amp. inputs compressor ON signal to BCM. BCM sends compressor ON signal to ECM and A/C auto amp., via CAN communication line.

HAC-17

K

L

M

Ν

Ρ

Н

< FUNCTION DIAGNOSIS >

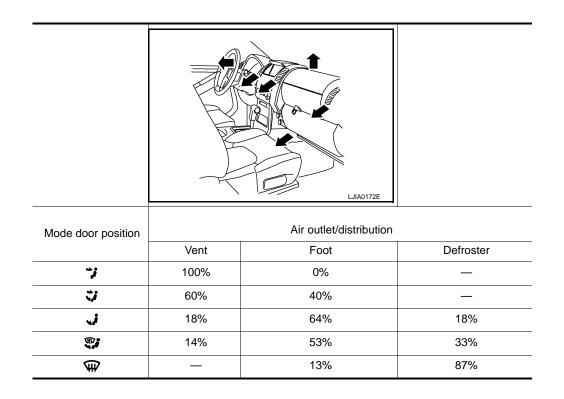

[AUTOMATIC AIR CONDITIONER]

ECM judges whether compressor can be turned ON, based on each sensor status (refrigerant pressure sensor signal, throttle angle sensor, etc.). If it judges compressor can be turned ON, it sends compressor ON signal to IPDM E/R, via CAN communication line.

Upon receipt of compressor ON signal from ECM, IPDM E/R turns air conditioner relay ON to operate compressor.

DIAGNOSIS SYSTEM (BCM)

CONSULT-III Function (BCM - COMMON ITEM)

APPLICATION ITEM

CONSULT-III performs the following functions via CAN communication with BCM.

Diagnosis mode	Function Description
WORK SUPPORT	Changes the setting for each system function.
SELF-DIAG RESULTS	Displays the diagnosis results judged by BCM. Refer to BCS-54, "DTC Index".
CAN DIAG SUPPORT MNTR	Monitors the reception status of CAN communication viewed from BCM.
DATA MONITOR	The BCM input/output signals are displayed.
ACTIVE TEST	The signals used to activate each device are forcibly supplied from BCM.
ECU IDENTIFICATION	The BCM part number is displayed.
CONFIGURATION	 Enables to read and save the vehicle specification. Enables to write the vehicle specification when replacing BCM.

SYSTEM APPLICATION

BCM can perform the following functions for each system.

NOTE:

It can perform the diagnosis modes except the following for all sub system selection items.

Cristerer		Diagnosis mode		
System	Sub system selection item	WORK SUPPORT	DATA MONITOR	ACTIVE TEST
BCM	BCM	×		
Door lock	DOOR LOCK	×	×	×

SELF-DIAGNOSIS FUNCTION

A/C Auto Amp. Self-Diagnosis

INFOID:000000003935884

A/C SYSTEM SELF-DIAGNOSIS FUNCTION

The self-diagnosis function is built into the A/C auto amp. to quickly locate the cause of malfunctions.

DESCRIPTION

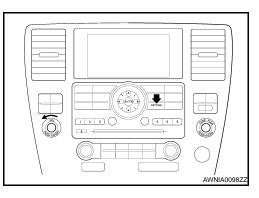

The self-diagnostic system diagnoses sensors, CAN system, and battery voltage on A/C auto amp. Refer to applicable sections (items) for details. Fault codes (if any are present) will be displayed in the ambient temperature display area. Refer to <u>HAC-25</u>, "A/C System Self-Diagnosis Code Chart".

SELF-DIAGNOSTIC MODE

NOTE:

Radio must be OFF.

- 1. Turn the ignition switch ON.
- On the A/C and AV switch assembly, press the "SETTING" button and twist the volume knob clockwise and counterclockwise until the Self-Diagnosis screen shows on the display.
- 3. Scroll down to "Confirmation/Adjustment" and press the "ENTER" button.
- 4. Scroll down to "Climate Control" and press the "ENTER" button.
- 5. The fan bars will flash on the display during the self-test, and then the fault codes will display in the ambient temperature area. They will continue scrolling until diagnostic mode is exited.
- Exit by pressing the "BACK" button on A/C and AV switch assembly until display returns to its normal operation screen. HVAC system will be OFF or by turning the ignition switch OFF.

[AUTOMATIC AIR CONDITIONER]

The self-diagnostic system diagnoses sensors, CAN system, and battery voltage on A/C auto amp. Refer to applicable sections (items) for details. Fault codes (if any are present) will be displayed in the ambient temperature display area. Refer to <u>HAC-25</u>, "A/C System Self-Diagnosis Code Chart".

A/C and AV Switch Assembly Self-Diagnosis

INFOID:000000003935885

A/C and AV switch assembly self-diagnosis function

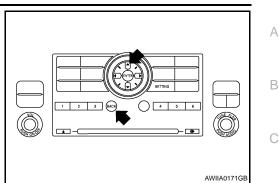

The ON/OFF operation (continuity) of each switch in the A/C and AV switch assembly can be checked.

Self-diagnosis mode

SELF-DIAGNOSIS FUNCTION

< FUNCTION DIAGNOSIS >

- Press the "BACK" switch and the "UP" switch within 10 seconds after turning the ignition switch from OFF to ACC and hold them for 3 seconds or more. Then the buzzer sounds, all indicators of the preset switch illuminate, and the self-diagnosis mode starts.
- The continuity of each switch and control dials (A/C and AV switch assembly only) at the ON position can be checked by pressing each switch and turning each control dial. The buzzer sounds and LED's will illuminate if the switch is normal.

Finishing self-diagnosis mode Self-diagnosis mode is canceled when turning the ignition switch OFF.

[AUTOMATIC AIR CONDITIONER]

COMPONENT DIAGNOSIS MODE DOOR MOTOR

System Description

INFOID:000000003935887

SYSTEM DESCRIPTION

Component Parts

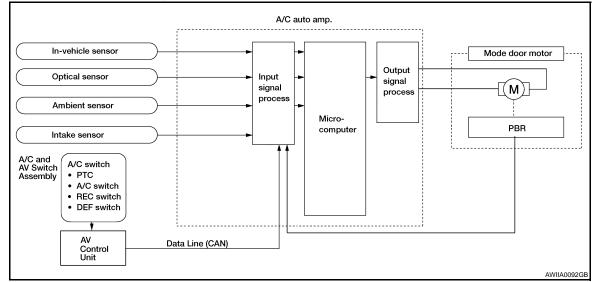

Mode door control system components are:

- A/C auto amp.
- A/C and AV switch assembly
- Mode door motor (front)
- PBR (built into mode door motor)
- In-vehicle sensor
- Ambient sensor
- Optical sensor
- Intake sensor

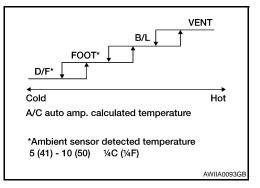

System Operation

The mode door position (vent, B/L, foot, D/F, and defrost) is set by the A/C auto amp. by means of the mode door motor (front). When a mode door position is selected on the A/C auto amp., voltage is applied to one circuit of the mode door motor (front) while ground is applied to the other circuit, causing the mode door motor (front) to rotate. The direction of rotation is determined by which circuit has voltage applied to it, and which one has ground applied to it. The A/C auto amp. monitors the mode door position by measuring the voltage signal on the PBR circuit.

In AUTO mode the mode door position is set by the A/C auto amp. which determines the proper position based on inputs from the in-vehicle sensor, ambient sensor, optical sensor, intake sensor, and the temperature selected by the driver or passenger.

< COMPONENT DIAGNOSIS >

7.CHECK THE MODE DOOR MOTOR (FRONT) PBR CIRCUIT

Perform diagnostic procedure for the mode door motor (front). Refer to <u>HAC-138</u>, "Mode Door Motor (Front) <u>Component Function Check"</u>.

Is the inspection result normal?

- YES >> GO TO 8.
- NO >> Repair PBR circuit or replace motor. Refer to <u>HAC-139</u>, "Mode Door Motor (Front) Diagnosis Procedure".

8.RECHECK FOR CODES

Perform A/C auto amp. self-diagnosis. Refer to HAC-24, "A/C Auto Amp. Self-Diagnosis".

Are any self-diagnostic codes present?

YES >> Refer to HAC-25, "A/C System Self-Diagnosis Code Chart".

NO >> GO TO 9.

9.RECHECK FOR SYMPTOMS

Perform a complete operational check and check for any symptoms. Refer to <u>HAC-125, "Operational Check"</u>. <u>Does another symptom exist?</u>

YES >> Repair as necessary.

NO >> Replace A/C auto amp. Refer to VTL-7, "Removal and Installation".

Mode Door Motor (Front) Diagnosis Procedure

INFOID:000000003935889

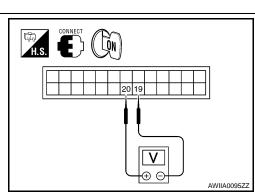

SYMPTOM:

- Air outlet does not change.
- Mode door motor does not operate normally.

1.CHECK A/C AUTO AMP. FOR POWER AND GROUND

- 1. Turn ignition switch ON.
- 2. Press the mode switch to the B/L (🗘) mode.
- Check voltage between A/C auto amp. harness connector M49 terminal 19 and terminal 20 while pressing the mode switch to the floor (1) mode.

Connector	Terminals		Condition	Voltage
Connector	(+)	(-)	Condition	(Approx.)
A/C auto amp.: M49	20	19	Press mode switch	Battery voltage

Is the inspection result normal?

YES >> GO TO 3.

NO >> GO TO 2.

2. Check mode door motor circuits for short to ground

- 1. Turn ignition switch OFF.
- 2. Disconnect the A/C auto amp. harness connector.
- 3. Check continuity between A/C auto amp. harness connector M49 terminal 19, 20 and ground.

19 - Ground

Is the inspection result normal?

- YES >> Replace A/C auto amp. Refer to <u>VTL-7, "Removal and</u> <u>Installation"</u>.
- NO >> Repair or replace harness as necessary.

< COMPONENT DIAGNOSIS >

$\overline{\mathbf{3.}}$ CHECK A/C AUTO AMP. FOR GROUND AND POWER

- 1. Press the mode switch to the D/F (.) mode.
- 2. Check voltage between A/C auto amp. harness connector M49 terminal 19 and terminal 20 while pressing the mode switch to the vent () mode.

Connector	Terminals		Condition	Voltage
Connector	(+)	(-)	Condition	(Approx.)
A/C auto amp.: M49	19	20	Press mode switch	Battery voltage

Is the inspection result normal?

YES >> GO TO 4.

NO >> Replace A/C auto amp. Refer to VTL-7, "Removal and Installation".

4.CHECK MODE DOOR MOTOR AND CIRCUITS FOR OPEN

- 1. Turn ignition switch OFF.
- Disconnect the A/C auto amp. harness connector.
- Check continuity between A/C auto amp. harness connector 3. M49 terminal 19 and terminal 20.

Continuity should exist.

Is the inspection result normal?

- YES >> GO TO 6.
- NO >> GO TO 5.

5. CHECK MODE DOOR MOTOR CIRCUITS FOR OPEN

- Disconnect the mode door motor harness connector. 1.
- 2. Check continuity between A/C auto amp. harness connector M49 (A) terminal 19, 20 and the mode door motor harness connector M142 (B) terminal 1, 6.
 - 6 19 1 - 20

: Continuity should exist.

: Continuity should exist.

Is the inspection result normal?

- >> Replace mode door motor. Refer to VTL-28, "Removal YFS and Installation".
- NO >> Repair or replace harness as necessary.

 $\mathbf{6}.$ CHECK A/C AUTO AMP. FOR PBR POWER AND GROUND

- 1. Reconnect A/C auto amp. harness connector.
- Turn ignition switch ON. 2.
- 3. Check voltage between A/C auto amp. harness connector M50 (A) terminal 28 and M49 (B) terminal 3.

System Description

SYMPTOM:

- Discharge air temperature does not change.
- Air mix door motor does not operate.

SYSTEM DESCRIPTION

Component Parts

Air mix door control system components are:

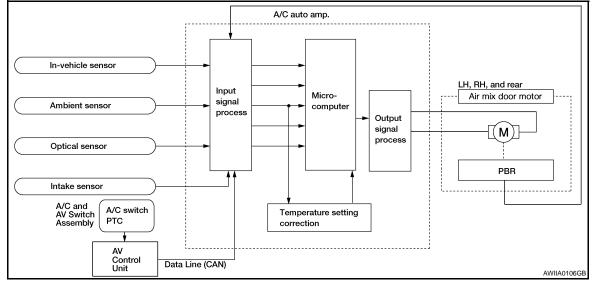

- A/C auto amp.
- A/C and AV switch assembly
- Air mix door motors (driver, passenger, and rear)
- PBR (built-into air mix door motors)
- In-vehicle sensor
- Ambient sensor
- Optical sensor
- Intake sensor

System Operation

The A/C auto amp. receives data from the temperature selected by the driver side, passenger side, and rear. The A/C auto amp. then applies a voltage to one circuit of the appropriate air mix door motor, while ground is applied to the other circuit, causing the appropriate air mix door motor to rotate. The direction of rotation is determined by which circuit has voltage applied to it, and which one has ground applied to it. The A/C auto amp. monitors the air mix door positions by measuring the voltage signal on the PBR circuits of each door.

In AUTO mode the air mix, intake, mode door, and defrost door positions are set by the A/C auto amp. which determines the proper position based on inputs from the in-vehicle sensor, ambient sensor, optical sensor, intake sensor, and the temperature selected by the driver and front and rear passengers.

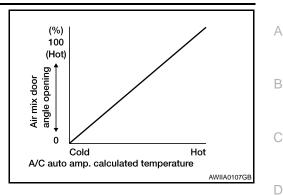

Subsequently, HOT/COLD or DEFROST/VENT or FRESH/RECIRCULATION operation is selected. The new door position data is returned to the A/C auto amp.

INFOID:000000003935890

< COMPONENT DIAGNOSIS >

Air Mix Door Control Specification

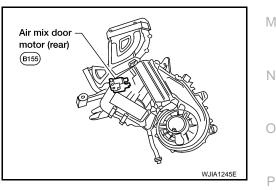

COMPONENT DESCRIPTION

Air Mix Door Motors (front)

The driver (2) and passenger (1) air mix door motors are attached to the front heater & cooling unit assembly. These motors rotate so that the air mix door is opened or closed to a position set by the A/C auto amp. Motor rotation is then conveyed through a shaft and the air mix door position is then fed back to the A/C auto amp. by the PBR built into the air mix door motors.

Air Mix Door Motor (rear)

The air mix door motor (rear) (1) is attached to the rear heater & cooling unit assembly. These motors rotate so that the air mix door is opened or closed to a position set by the front (or rear) air control. Motor rotation is then conveyed through a shaft and the air mix door position is then fed back to the A/C auto amp. by the PBR built into the air mix door motors.

Air Mix Door Motor Component Function Check

INSPECTION FLOW

1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - TEMPERATURE INCREASE

- 1. Turn the temperature control dial (driver) clockwise until 32°C (90°F) is displayed.
- 2. Check for hot air at discharge air outlets.

INTAKE DOOR MOTOR

System Description

SYMTOM:

- Intake door motor does not operate normally.
- Intake door does not change.

SYSTEM DESCRIPTION

Component Parts

Intake door control system components are:

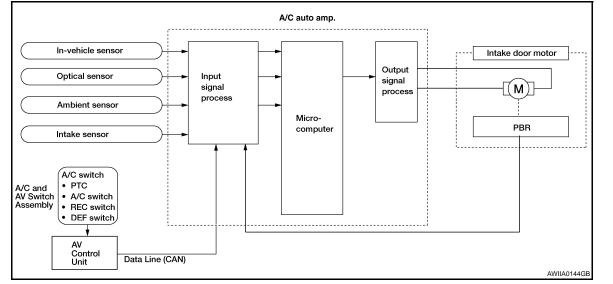

A/C auto amp.

- A/C and AV switch assembly
- Intake door motor (PRB built into the intake door motor)
- In-vehicle sensor
- Ambient sensor
- Optical sensor
- Intake sensor

System Operation

The intake door control determines the intake door position based on the position of the recirculation switch. When the recirculation switch is depressed the intake door motor rotates closing off the fresh air inlet and recirculating the cabin air. If the recirculation switch is depressed again, the intake door motor rotates in the opposite direction, again allowing fresh air into the cabin.

In the AUTO mode, the A/C auto amp. determines the intake door position based on the ambient temperature, the intake air temperature and the in-vehicle temperature. When the DEF, D/F, FLOOR or OFF switches are pushed, the A/C auto amp. sets the intake door at the fresh position.

RECIRCULATION	FRESH 40 - 60% FRESH/ RECIRCULATION Hot Hot

AWIIA0234ZZ

System Description

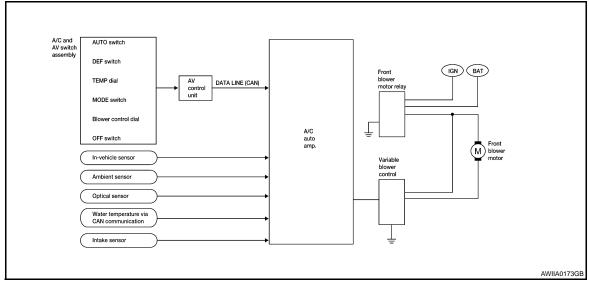

SYSTEM DESCRIPTION

Component Parts

Blower speed control system components are:

- A/C auto amp.
- A/C and AV switch assembly
- Variable blower control
- Front blower motor relay
- Front blower motor
- In-vehicle sensor
- Ambient sensor
- Optical sensor
- Intake sensor

System Operation

Automatic Mode

In the automatic mode, the blower motor speed is calculated by the A/C auto amp. and variable blower control based on input from the in-vehicle sensor, optical sensor, intake sensor and ambient sensor, and potentio temperature control (PTC).

When the air flow is increased, the blower motor speed is adjusted gradually to prevent a sudden increase in air flow.

In addition to manual air flow control and the usual automatic air flow control, starting air flow control, low water temperature starting control and high passenger compartment temperature starting control are available.

Starting Blower Speed Control

Start up from cold soak condition (Automatic mode).

In a cold start up condition where the engine coolant temperature is below 50°C (122°F), the blower will not operate at blower speed 1 for a short period of time (up to 210 seconds). The exact start delay time varies depending on the ambient and engine coolant temperatures.

In the most extreme case (very low ambient temperature) the blower starting delay will be 210 seconds as described above. After the coolant temperature reaches 50°C (122°F), or the 210 seconds has elapsed, the blower speed will increase to the objective blower speed.

Start up from usual operating or hot soak condition (Automatic mode).

The blower will begin operation momentarily after the AUTO switch is pushed. The blower speed will gradually rise to the objective speed over a time period of 3 seconds or less (actual time depends on the objective blower speed).

Blower

Blower Speed Compensation - Sunload

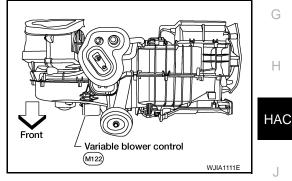

When the in-vehicle temperature and the set temperature are very close, the blower will be operating at low A speed. The speed will vary depending on the sunload. During conditions of low or no sunload, the blower operates at low speed. During high sunload conditions, the A/C auto amp. causes the blower speed to increase.

Blower Speed Control Specification

COMPONENT DESCRIPTION

Variable Blower Control

The variable blower control is located on the cooling unit. The variable blower control receives a gate voltage from the A/C auto amp. to steplessly maintain the blower motor voltage in the 0 to 5 volt range (approx.).

Front Blower Motor Component Inspection

COMPONENT INSPECTION

Front Blower Motor Relay

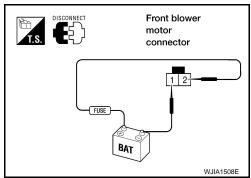

Check continuity between terminals 6-7 and 3-5 by supplying 12 volts to terminal 1 and ground to terminal 2 of relay.

Front Blower Motor

Confirm smooth rotation of the blower motor.

- Ensure that there are no foreign particles inside the blower unit.
- Apply 12 volts to terminal 2 and ground to terminal 1 and verify that the motor operates freely and quietly.

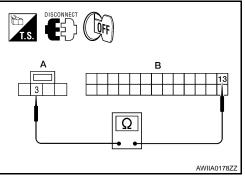

Rear Blower Motor Description

SYSTEM DESCRIPTION

Component Parts Rear blower speed control system components are:

A/C auto amp.

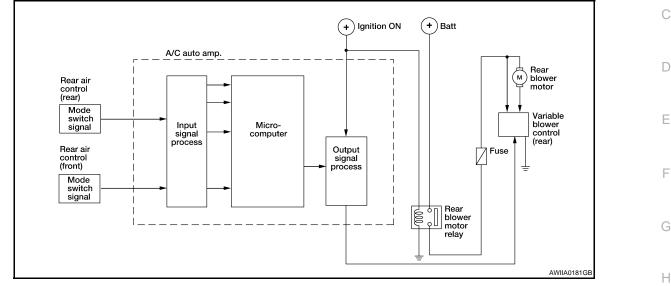

INFOID:000000003935900

INFOID:000000003935901

< COMPONENT DIAGNOSIS >

- A/C and AV switch assembly
- Rear air control (front)
- Rear air control (rear)
- Variable blower control (rear)
- Rear blower motor
- Rear blower motor relay

System Operation

Rear Blower Control

When the rear blower control dial (front) REAR CTRL switch is pressed (indicator on), it allows the rear air control (rear) to control the rear blower motor speed. If the REAR CTRL switch is off (indicator off), the rear air control (front) controls the rear blower motor speed regardless of the rear air control (rear) position.

Rear Blower Motor Component Function Check

SYMPTOM:

- Rear blower motor does not operate from the rear air control (front) and the rear air control (rear).
- Rear blower motor operates from rear air control (front) only.
- Rear blower motor operates from rear air control (rear) only.
- Rear blower motor speed does not match the rear air control (front) speed selected.
- Rear blower motor speed does not match the rear air control (rear) speed selected.
- Rear blower motor operates in high all the time when controlled from the rear air control (front).
- Rear blower motor operates in high all the time when controlled from the rear air control (rear).

INSPECTION FLOW

1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - REAR AIR CONTROL (FRONT)

- 1. Press AUTO switch.
- Turn the rear air control (front) blower control dial to the lowest speed and check for rear blower operation (REAR CTRL indicator off).
- 3. Continue checking that rear blower speed increases as the rear blower control dial is rotated clockwise.

Does the rear blower motor operate correctly?

YES >> GO TO 3. NO >> GO TO 2.

2.confirm symptom by performing operational check - rear air control (rear)

- 1. Press the REAR CTRL switch (indicator on) on the rear air control (front) to send control of the rear blower motor back the rear air control (rear).
- 2. Turn the rear air control (rear) blower control dial to the lowest speed and check for rear blower operation.
- 3. Continue checking that rear blower speed increases as the rear blower control dial is rotated clockwise.

Does the rear blower motor operate correctly?

YES >> • Rear blower motor does not operate at any speed from the rear air control (front). Refer to <u>HAC-54</u>, "Rear Air Control (Front) Diagnosis Procedure #1".

Rear Air Control (Rear) Diagnosis Procedure #2

TROUBLE DIAGNOSIS PROCEDURE

1.CHECK REAR AIR CONTROL (FRONT) POWER SUPPLY

- Disconnect rear air control (front) harness connector. 1.
- Turn ignition switch ON. 2.
- 3. Check voltage between rear air control (front) harness connector R2 terminal 10 and ground.

Battery voltage should exist.

Is the inspection result normal?

YES >> GO TO 2.

NO >> Repair harness or connector.

2.CHECK REAR AIR CONTROL (FRONT) FRONT AUX BLOWER POT REFERENCE VOLTAGE

- Disconnect rear air control (front) harness connector. 1.
- 2. Turn ignition switch ON.
- 3. Check voltage between rear air control (front) harness connector R2 terminal 6 and ground.

Connector	Terminals		Voltage (Ap-	
Connector	(+)	(-)	prox.)	
Rear air control (front): R2	6	Ground	5V	

Is the inspection result normal?

YES >> GO TO 3.

NO >> GO TO 4.

 $\mathbf{3.}$ CHECK REAR AIR CONTROL (FRONT) GROUND CIRCUIT

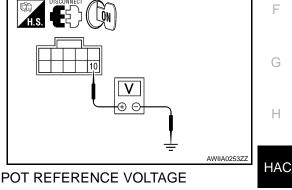

- 1. Turn ignition switch OFF.
- Check continuity between rear air control (front) harness con-2. nector R2 terminal 1 and ground.

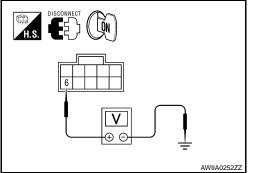

Continuity should exist.

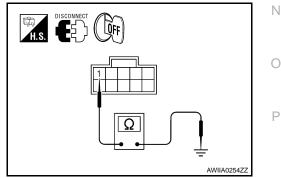

Is the inspection result normal?

- YES >> Replace rear air control (front). Refer to VTL-7, "Removal and Installation".
- >> Repair harness or connector. NO

4.CHECK REAR AIR CONTROL (FRONT) BLOWER POT CIRCUIT FOR OPEN

< COMPONENT DIAGNOSIS >

- 1. Turn ignition switch OFF.
- 2. Disconnect A/C auto amp. connector.
- Check continuity between A/C auto amp. harness connector M50 (A) terminal 38 and rear air control (front) harness connector R2 (B) terminal 6.

Continuity should exist.

Is the inspection result normal?

- YES >> Replace A/C auto amp. Refer to <u>VTL-7, "Removal and</u> <u>Installation"</u>.
- NO >> Repair harness or connector.
- Rear Air Control (Rear) Diagnosis Procedure #3

TROUBLE DIAGNOSIS PROCEDURE

1.CHECK REAR AIR CONTROL (FRONT)

- 1. Disconnect rear air control (front) connector.
- 2. Turn ignition switch ON.
- 3. Press AUTO switch.

Does rear blower motor operate in high speed?

YES >> GO TO 17.

NO >> GO TO 2.

2.CHECK REAR BLOWER MOTOR POWER SUPPLY

- 1. Turn ignition switch OFF.
- 2. Disconnect rear blower motor harness connector.
- 3. Turn ignition switch ON.
- 4. Press AUTO switch.
- 5. Rotate rear air control (front) blower speed control dial to maximum speed (REAR CTRL indicator off).
- 6. Check voltage between rear blower motor harness connector B201 terminal 2 and ground.

Battery voltage should exist.

Is the inspection result normal?

YES >> GO TO 3. NO >> GO TO 9.

3.CHECK VARIABLE BLOWER CONTROL (REAR) POWER SUPPLY

- 1. Turn ignition switch OFF.
- 2. Disconnect variable blower control (rear) connector.
- 3. Turn ignition switch ON.
- 4. Check voltage between variable blower control connector B133 terminal 4 and ground.

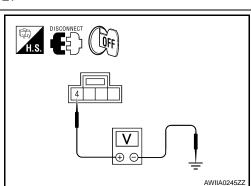

Battery voltage should exist.

Is the inspection result normal?

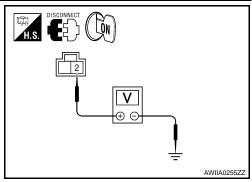

YES >> GO TO 4.

NO >> Repair harness or connector.

4.CHECK VARIABLE BLOWER CONTROL (REAR) AUX BLOWER SPEED SIGNAL CIRCUIT FOR SHORT

INFOID:000000003935905

[AUTOMATIC AIR CONDITIONER]

< COMPONENT DIAGNOSIS >

Check voltage between variable blower control (rear) harness connector B133 terminal 3 and ground.

Connector	Terminals		Voltage (Ap-	
Connector	(+)	(-)	prox.)	
Variable blower control: B133	3	Ground	4.5 V	

Is the inspection result normal?

YES >> GO TO 5. NO >> GO TO 8.

5.check variable blower control (rear) ground circuit

- 1. Turn ignition switch OFF.
- 2. Check continuity between variable blower control (rear) harness connector B133 terminal 1 and ground.

Continuity should exist.

Is the inspection result normal?

- YES >> GO TO 6.
- NO >> Repair harness or connector.

6.CHECK REAR BLOWER MOTOR

Check rear blower motor. Refer to HAC-60, "Rear Blower Motor And Relay Component Inspection".

Is the inspection result normal?

YES >> GO TO 7.

NO >> Replace rear blower motor. Refer to <u>VTL-12, "Removal and Installation"</u>.

7.CHECK VARIABLE BLOWER CONTROL (REAR) BLOWER MOTOR GROUND CIRCUIT

Check continuity between rear blower motor connector B501 (B) terminal 1 and variable blower control (rear) connector B133 (A) terminal 2.

Continuity should exist.

Is the inspection result normal?

- YES >> Replace A/C auto amp. Refer to <u>VTL-7</u>, "Removal and <u>Installation"</u>.
- NO >> Repair harness or connector.

$\mathbf{8}.$ Check variable blower control (rear) aux blower speed circuit for open

- 1. Turn ignition switch OFF.
- 2. Disconnect A/C auto amp. connector.
- Check continuity between A/C auto amp. harness connector M49 (A) terminal 12 and variable blower control (rear) harness connector B133 (B) terminal 3.

Continuity should exist.

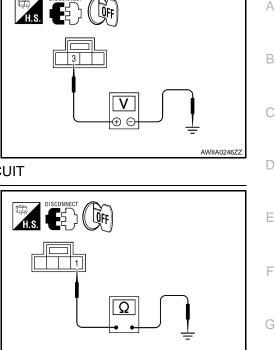

Is the inspection result normal?

- YES >> Replace A/C auto amp. Refer to <u>VTL-7</u>, "Removal and <u>Installation"</u>.
- NO >> Repair harness or connector.

9.CHECK FUSES

Check 15A fuses [Nos. 10 and 11, located in the fuse block (J/B)].

10.CHECK REAR BLOWER MOTOR RELAY

Check rear blower motor relay. Refer to HAC-60, "Rear Blower Motor And Relay Component Inspection".

Is the inspection result normal?

YES >> GO TO 11.

NO >> Replace rear blower motor relay.

11. CHECK REAR BLOWER MOTOR CIRCUIT BETWEEN REAR BLOWER MOTOR AND FUSE BLOCK (J/

B)

- 1. Turn ignition switch OFF.
- 2. Disconnect fuse block (J/B) M3 harness connector.
- Check continuity between fuse block (J/B) harness connector M3 (A) terminal 3N and 8N and rear blower motor harness connector B501 (B) terminal 2.

Continuity should exist.

Is the inspection result normal?

- YES >> GO TO 12.
- NO >> Repair harness or connector.

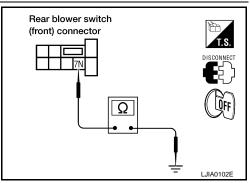

$12. {\sf check \ Rear \ Blower \ Motor \ Relay \ (coil \ Side) \ Ground \ Circuit}$

Check continuity between fuse block (J/B) harness connector M3 terminal 7N and ground.

Continuity should exist.

Is the inspection result normal?

- YES >> GO TO 13.
- NO >> Repair harness or connector.

О

AWIIA0250ZZ

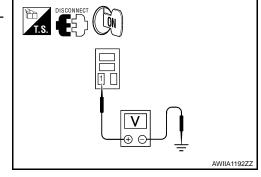

$13. {\sf check \ rear \ blower \ motor \ relay \ (coil \ side) \ power \ supply \ circuit \ for \ open}$

- 1. Turn ignition switch ON.
- Check voltage between rear blower motor relay harness connector J-1 terminal 1 and ground.

Battery voltage should exist.

Is the inspection result normal?

- YES >> Replace fuse block (J/B).
- NO >> Repair harness or connector.

14.REPLACE FUSE

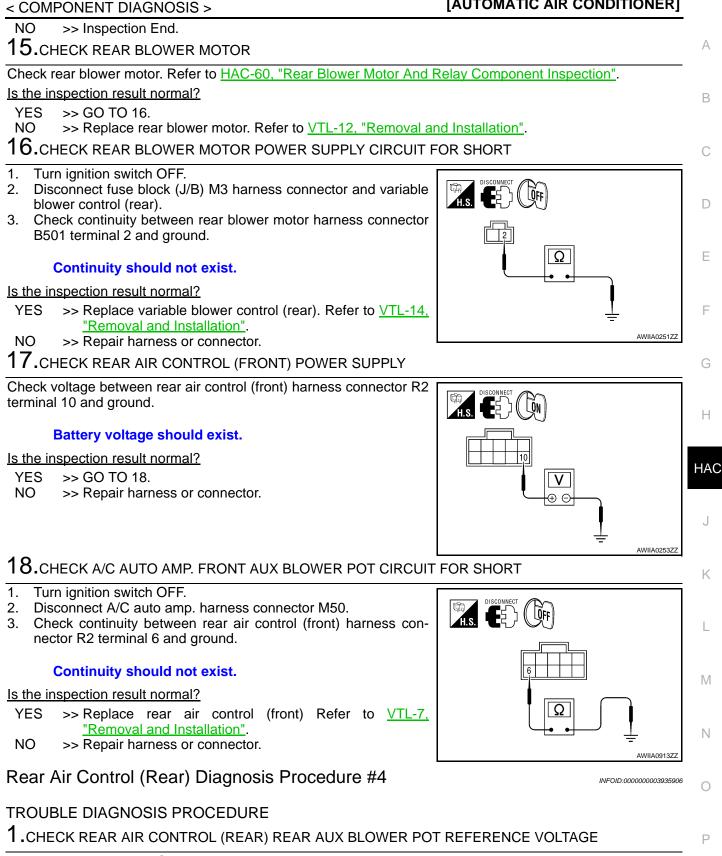

- 1. Turn ignition switch OFF.
- 2. Replace fuses.
- 3. Reconnect all disconnected parts.
- 4. Turn ignition switch ON.
- 5. Activate the rear blower motor from the rear air control (front).

Does the fuse blow?

YES >> GO TO 15.

HAC-58

1. Turn ignition switch OFF.

< COMPONENT DIAGNOSIS >

- 2. Disconnect rear air control (rear) harness connector.
- 3. Turn ignition switch ON.
- 4. Check voltage between rear air control (rear) harness connector M208 terminal 6 and ground.

Connector	Ter	Voltage (Ap-	
Connector	(+)	(-)	prox.)
Rear air control (rear): M208	6	Ground	5V

Is the inspection result normal?

YES >> GO TO 2.

2. CHECK REAR AIR CONTROL (REAR) GROUND CIRCUIT

1. Turn ignition switch OFF.

2. Check continuity between rear air control (rear) harness connector M208 terminal 1 and ground.

Continuity should exist.

Is the inspection result normal?

- YES >> Replace rear air control (rear). Refer to <u>VTL-7</u>, <u>"Removal and Installation"</u>.
- NO >> Repair harness or connector.

$\mathbf{3.}$ Check rear air control (rear) rear aux blower pot for short

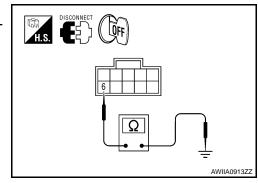

- 1. Turn ignition switch OFF.
- 2. Check continuity between rear air control (rear) harness connector M208 terminal 6 and ground.

Continuity should not exist.

Is the inspection result normal?

YES >> GO TO 4.

NO >> Repair harness or connector.

4.CHECK REAR AIR CONTROL (REAR) REAR AUX BLOWER POT BETWEEN A/C AUTO AMP. AND REAR AIR CONTROL REAR

- 1. Disconnect A/C auto amp. harness connector.
- Check continuity between A/C auto amp. harness connector M50 (A) terminal 52 and rear air control (rear) harness connector M208 (B) terminal 6.

Continuity should exist.

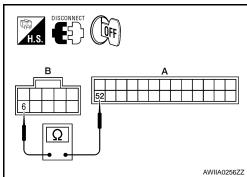

Is the inspection result normal?

- YES >> Replace A/C auto amp. Refer to <u>VTL-7, "Removal and</u> <u>Installation"</u>.
- NO >> Repair harness or connector.

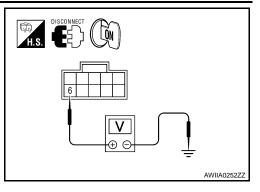

Rear Blower Motor And Relay Component Inspection

COMPONENT INSPECTION

Rear Blower Motor Relay

[AUTOMATIC AIR CONDITIONER]

H.S.

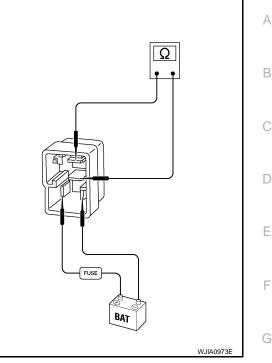

INFOID:000000003935907

AWIIA0254ZZ

< COMPONENT DIAGNOSIS >

Check circuit continuity between terminals by supplying 12 volts and ground to coil side terminals of relays.

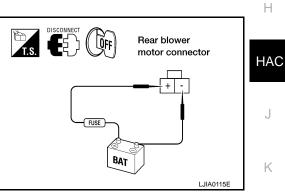

[AUTOMATIC AIR CONDITIONER]

Rear Blower Motor

Check that there are no foreign particles inside the intake unit. Apply 12 volts to terminal 2 and ground to terminal 1 and ensure that

the blower motor rotates freely and quietly.

Rear Air Control System Description

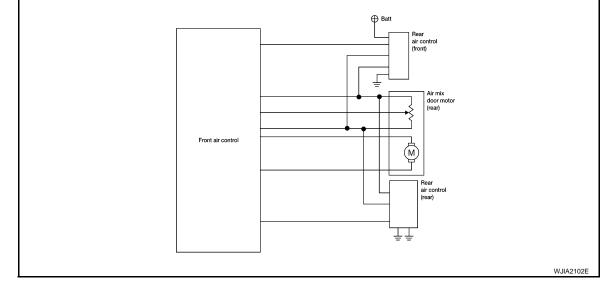

SYSTEM DESCRIPTION

Component Parts

Rear air control system components are:

- A/C auto amp.
- Rear air control (front)
- Rear air control (rear)
- Air mix door motor (rear)

System Operation

Rear Air Control

When the REAR CTRL indicator is off the rear air control (front) will control all rear blower motor speeds and the rear temperature/mode operations. When the REAR CTRL switch is pressed (indicator on), the rear air control (rear) will control all the rear blower motor speeds and the rear temperature/mode operations.

Rear Air Control Component Function Check

INFOID:000000003935909

SYMPTOM:

• Temperature cannot be adjusted from the rear air control.

INSPECTION FLOW

1.CONFIRM SYMPTOM BY PERFORMING REAR AIR CONTROL (FRONT) OPERATIONAL CHECK

- 1. Press AUTO switch (rear air controls only operate when front blower is on).
- 2. Turn the rear blower motor to maximum speed from the rear air control (front).
- 3. Turn rear air control (front) temperature/mode control dial clockwise and then counterclockwise (REAR CTRL indicator off).
- 4. Check for hot air at rear floor discharge air outlets in the maximum heat position and cold air at rear roof discharge air outlets in the maximum cold position.

Does the rear air control (front) operate properly?

YES >> GO TO 2.

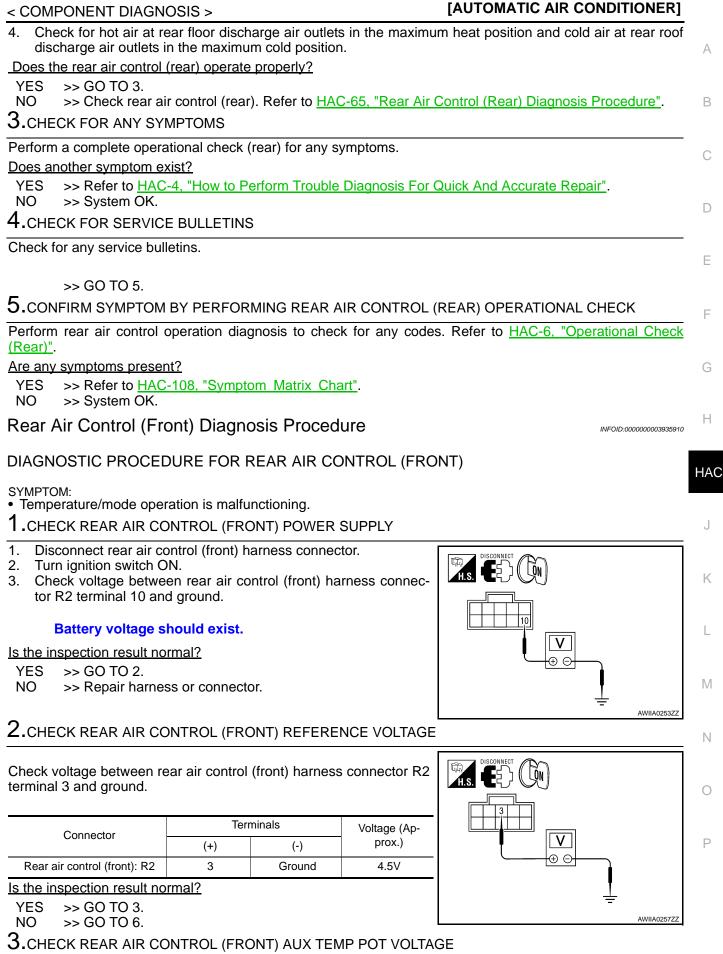

```
NO >> Check rear air control (front). Refer to HAC-63, "Rear Air Control (Front) Diagnosis Procedure".
```

2. CONFIRM SYMPTOM BY PERFORMING REAR AIR CONTROL (REAR) OPERATIONAL CHECK

- 1. Press the REAR CTRL switch on rear air control (front) to send control to the rear air control (rear).
- 2. Turn the rear blower motor to maximum speed from the rear air control (rear).
- 3. Turn rear air control (rear) temperature/mode control dial slowly clockwise and then counterclockwise (REAR CTRL indicator on).

[AUTOMATIC AIR CONDITIONER]

HAC-62

HAC-63

< COMPONENT DIAGNOSIS >

Check voltage between rear air control (front) harness connector R2 terminal 7 and ground.

Connector	Ter	Voltage (Ap-	
	(+)	(-)	prox.)

MAGNET CLUTCH

System Description

INFOID:000000003935912

[AUTOMATIC AIR CONDITIONER]

SYSTEM DESCRIPTION

The A/C auto amp. controls compressor operation based on ambient and intake temperature and a signal from ECM.

Low Temperature Protection Control

The A/C auto amp. will turn the compressor ON or OFF as determined by a signal detected by the intake sensor and the ambient sensor.

When intake air temperature is higher than the preset value, the compressor turns ON. The compressor turns OFF when intake air temperature is lower than the preset value. That preset value is dependent on the ambient temperature, refer to the following table.

	VK56D	E Model	VQ40DE Model	
Ambient temperature °C (°F)	Compressor ON intake temperature °C (°F)	Compressor OFF intake temperature °C (°F)	Compressor ON intake temperature °C (°F)	Compressor OFF intake temperature °C (°F)
0 (32)	6.0 (43)	5.5 (42)	5.5 (42)	5.0 (41)
10 (50)	5.0 (41)	5.0 (41)	4.5 (40)	4.5 (40)
20 (68)	3.5 (38)	3.0 (37)	3.0 (37)	2.5 (37)
30 (86)	3.0 (37)	2.5 (37)	2.5 (37)	1.5 (35)
40 (104)	3.0 (37)	2.5 (37)	2.0 (36)	1.0 (34)
50 (122)	3.0 (37)	2.5 (37)	2.0 (36)	1.0 (34)

Magnet Clutch Component Function Check

INFOID:000000003935913

INSPECTION FLOW

1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - MAGNET CLUTCH

1. Turn ignition switch ON.

- 2. Press the A/C switch.
- 3. Press vent switch (*).
- 4. Display shows 💙, A/C. Confirm that the compressor clutch engages (sound or visual inspection). (Discharge air and blower speed will depend on ambient, in-vehicle and set temperatures.)

Can the symptom be duplicated?

YES >> GO TO 3.

NO >> GO TO 2.

2. CHECK FOR ANY SYMPTOMS

Perform a complete operational check for any symptoms. Refer to <u>HAC-125. "Operational Check"</u>. <u>Does another symptom exist?</u>

YES >> Refer to <u>HAC-124, "How to Perform Trouble Diagnosis For Quick And Accurate Repair"</u>. NO >> System OK.

3.CHECK FOR SERVICE BULLETINS

Check for any service bulletins.

>> GO TO 4.

4.PERFORM SELF-DIAGNOSIS

Perform self-diagnosis to check for any codes. Refer to <u>HAC-24, "A/C Auto Amp. Self-Diagnosis"</u>. <u>Are any self-diagnosis codes present?</u>

YES >> Refer to <u>HAC-25</u>, "A/C System Self-Diagnosis Code Chart".

DIAGNOSTIC PROCEDURE FOR WATER VALVE

1.CHECK WATER VALVE POWER AND GROUND CIRCUITS

- 1. Disconnect water valve connector F68.
- 2. Turn ignition switch ON.
- 3. Rotate temperature control dial (driver) to 32°C (90°F).
- Check voltage between water valve harness connector F68 terminal 1 and terminal 2 while rotating temperature control dial (driver) to 18°C (60°F).

Connector	Те	erminals	Condition	Voltage	
Connector	(+)	(-)	Condition	(Approx.)	
Water valve: F68	2	1	Rotate temperature control dial	Battery voltage	

Is the inspection result normal?

YES >> GO TO 3.

NO >> GO TO 2.

2.check water valve control output circuit

1. Turn ignition switch OFF.

- 2. Disconnect A/C auto amp. connector M50.
- Check continuity between water valve harness connector F68 (A) terminal 2 and A/C auto amp. harness connector M50 (B) terminal 46.

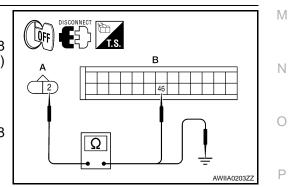

2 - 46 : Continuity should exist.

 Check continuity between water valve harness connector F68 (A) terminal 2 and ground.

2 - Ground : Continuity should not exist.

Is the inspection result normal?

- YES >> Replace A/C auto amp. Refer to VTL-7, "Removal and Installation".
- NO >> Repair harness or connector.
- ${
 m 3.}$ CHECK WATER VALVE POWER AND GROUND CIRCUITS

WATER VALVE CIRCUIT

< COMPONENT DIAGNOSIS >

- 1. Rotate temperature control dial (driver) to 18°C (60°F).
- Check voltage between water valve harness connector F68 terminal 1 and terminal 2 while rotating temperature control dial (driver) to 32°C (90°F).

Connector	Te	rminals	Condition	Voltage
Connector	(+)	(-)	Condition	(Approx.)
Water valve: F68	1	2	Rotate temperature control dial	Battery voltage

Is the inspection result normal?

YES >> Replace the water valve.

NO >> GO TO 4.

4. CHECK WATER VALVE CONTROL OUTPUT CIRCUIT

- 1. Turn ignition switch OFF.
- 2. Disconnect A/C auto amp. connector M50.
- Check continuity between water valve harness connector F68 (A) terminal 1 and A/C auto amp. harness connector M50 (B) terminal 45.

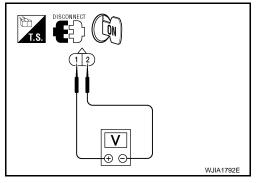

1 - 45 : Continuity should exist.

 Check continuity between water valve harness connector F68 (A) terminal 1 and ground.

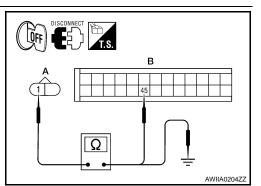

1 - Ground : Continuity should not exist.

Is the inspection result normal?

- YES >> Replace A/C auto amp. Refer to <u>VTL-7, "Removal and Installation"</u>.
- NO >> Repair harness or connector.

[AUTOMATIC AIR CONDITIONER]

HEATER PUMP

System Description (VQ40DE)

SYSTEM DESCRIPTION

Component Parts

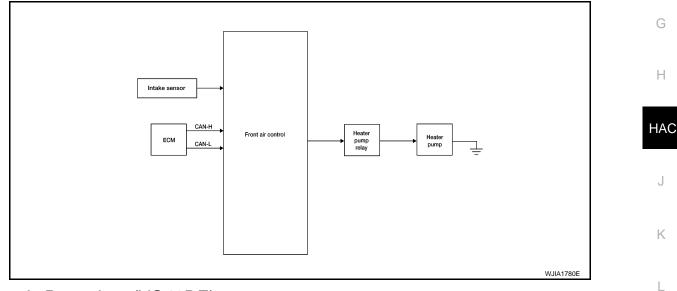

Heater pump control system components are:

- A/C auto amp.
- Heater pump relay
- Heater pump
- Intake sensor

System Operation

The heater pump improves heater performance specifically at idle conditions. It is designed to operate in either of the following 2 situations:

- 1. Front blower motor set to maximum speed and temperature control dial (driver or passenger) set to full hot 32°C (90°F) or
- 2. Engine coolant temperature (signal via CAN communication) minus heater core outlet temperature (intake sensor input to A/C auto amp.) is greater than 20°C (68°F). If the difference is less than 16°C (61°F), the heater pump will not operate unless the conditions in item No. 1 above are met.

Diagnosis Procedure (VQ40DE)

DIAGNOSTIC PROCEDURE FOR HEATER PUMP CIRCUIT

1.CHECK POWER SUPPLY TO HEATER PUMP

1. Disconnect heater pump connector.

- 2. Turn ignition switch ON.
- Set front blower motor to maximum speed. 3.
- Turn temperature control dial (passenger or driver) to full hot 32°C (90°F).
- 5. Check voltage between heater pump harness connector E141 terminal 1 and ground.

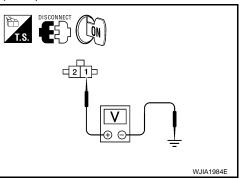

1 - Ground

: Battery voltage

Is the inspection result normal?

YES >> GO TO 2.

NO >> GO TO 3.

2. CHECK HEATER PUMP GROUND

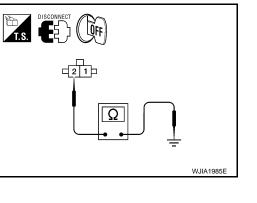

- 1. Turn ignition switch OFF.
- 2. Check continuity between heater pump harness connector E141 terminal 2 and ground.

2 - Ground

: Continuity should exist.

Is the inspection result normal?

- YES >> Replace heater pump. Refer to <u>HA-58, "Removal and</u> <u>Installation"</u>.
- NO >> Repair harness or connector.

3.CHECK HEATER PUMP RELAY

- 1. Turn ignition switch OFF.
- 2. Check heater pump relay. Refer to HAC-77, "Component Inspection (VQ40DE)".
- Is the inspection result normal?

YES >> GO TO 4.

NO >> Replace heater pump relay.

4.CHECK RELAY POWER SUPPLY

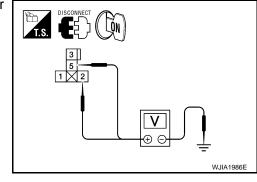

1. Turn ignition switch ON.

- 2. Check voltage between heater pump relay harness connector E144 terminals 2, 5 and ground.
 - 2 Ground

- : Battery voltage
- 5 Ground
- : Battery voltage

Is the inspection result normal?

- YES >> GO TO 5.
- NO >> Repair harness or connector.

5. CHECK HEATER PUMP MOTOR POWER CIRCUIT

- 1. Turn ignition switch OFF.
- Check continuity between heater pump relay harness connector (A) E144 terminal 3 and heater pump harness connector (B) E141 terminal 1.

3 - 1

: Continuity should exist.

 Check continuity between heater pump relay harness connector (A) E144 terminal 3 and ground.

3 - Ground

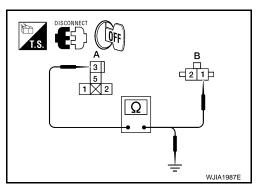

: Continuity should not exist.

Is the inspection result normal?

YES >> GO TO 6.

NO >> Repair harness or connector.

6.CHECK CIRCUIT BETWEEN HEATER PUMP RELAY AND A/C AUTO AMP.

HEATER PUMP

< COMPONENT DIAGNOSIS >

- 1. Disconnect A/C auto amp. connector.
- 2. Check continuity between A/C auto amp. harness connector M50 (A) terminal 50 and heater pump relay harness connector E144 (B) terminal 1.

1 - 50

: Continuity should exist.

3. Check continuity between heater pump relay harness connector E144 (B) terminal 1 and ground.

1 - Ground

: Continuity should not exist.

Is the inspection result normal?

- YES >> Replace A/C auto amp. Refer to VTL-7, "Removal and Installation".
- NO >> Repair harness or connector.

Component Inspection (VQ40DE)

AMBIENT SENSOR

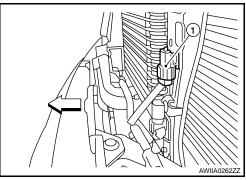

Component Description

COMPONENT DESCRIPTION

Ambient Sensor

Ambient sensor (1) is attached to the radiator core support (left side). It detects ambient temperature and converts it into a value which is then input into the A/C auto amp.

• ⇐: Front

AMBIENT TEMPERATURE INPUT PROCESS

The A/C auto amp. includes a processing circuit for the ambient sensor input. However, when the temperature detected by the ambient sensor increases quickly, the processing circuit retards the A/C auto amp. function. It only allows the A/C auto amp. to recognize an ambient temperature increase of 0.33° C (0.6° F) per 100 seconds.

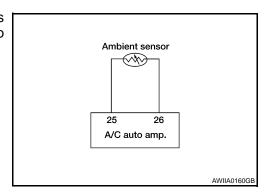

This prevents constant adjustments due to momentary conditions, such as stopping after high speed driving. Although the actual ambient temperature has not changed, the temperature detected by the ambient sensor will increase. This is because the heat from the engine compartment can radiate to the front grille area, location of the ambient sensor.

Ambient Sensor Diagnosis Procedure

INFOID:000000003935921

DIAGNOSTIC PROCEDURE FOR AMBIENT SENSOR

SYMPTOM: Ambient sensor circuit is open or shorted. (40 or 41 is indicated on A/C auto amp. as a result of conducting the A/C auto amp. self-diagnosis)

1. CHECK VOLTAGE BETWEEN AMBIENT SENSOR AND GROUND

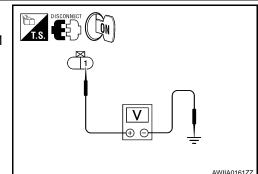

- 1. Disconnect ambient sensor connector.
- 2. Turn ignition switch ON.
- 3. Check voltage between ambient sensor harness connector E1 terminal 1 and ground.

1 - Ground

: Approx. 5V

Is the inspection result normal?

35 (95)	1.51
40 (104)	1.27
45 (113)	1.07

[AUTOMATIC AIR CONDITIONER]

If NG, replace ambient sensor. Refer to HA-57, "Removal and Installation".

< COMPONENT DIAGNOSIS >

IN-VEHICLE SENSOR

Component Description

COMPONENT DESCRIPTION

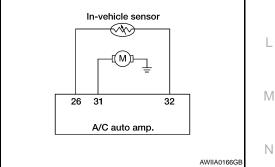

In-vehicle Sensor

The in-vehicle sensor (1) is located on the lower instrument panel LH. It converts variations in temperature of passenger compartment air (drawn in through the integrated fan) into a resistance value. It is then input into the A/C auto amp.

In-Vehicle Sensor Diagnosis Procedure

DIAGNOSTIC PROCEDURE FOR IN-VEHICLE SENSOR

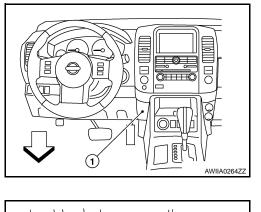

SYMPTOM: In-vehicle sensor circuit is open or shorted. Using the CONSULT-III, DTC B2578 or B2579 is displayed. Without a CON-SULT-III, code 30, 31, 44 or 46 is indicated on A/C auto amp. as a result of conducting self-diagnosis.

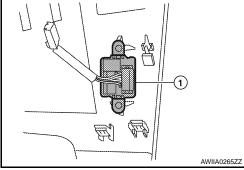

1. CHECK IN-VEHICLE SENSOR CIRCUIT

Is self-diagnosis DTC B2578 or B2579 (with CONSULT-III) or code 30, 31 44 or 46 (without CONSULT-III) present? YES or NO?

YES >> GO TO 6. NO >> GO TO 2. 2.CHECK VOLTAGE BETWEEN IN-VEHICLE SENSOR AND GROUND

INFOID:00000003935926

< COMPONENT DIAGNOSIS >

OPTICAL SENSOR

Component Description

COMPONENT DESCRIPTION

The optical sensor (1) is located in the center of the defroster grille. It detects sunload entering through windshield by means of a photo diode. The sensor converts the sunload into a current value which is then input into the A/C auto amp.

OPTICAL INPUT PROCESS

The A/C auto amp. includes a processing circuit which averages the variations in detected sunload over a period of time. This prevents adjustments in the ATC system operation due to small or quick variations in detected sunload.

For example, consider driving along a road bordered by an occasional group of large trees. The sunload detected by the optical sensor will vary whenever the trees obstruct the sunlight. The processing circuit averages the detected sunload over a period of time, so that the (insignificant) effect of the trees momentarily obstructing the sunlight does not cause any change in the ATC system operation. On the other hand, shortly after entering a long tunnel, the system will recognize the change in sunload, and the system will react accordingly.

Optical Sensor Diagnosis Procedure

DIAGNOSTIC PROCEDURE FOR OPTICAL SENSOR

SYMPTOM: Optical sensor circuit is open or shorted. Using the CONSULT-III, DTC B257F or B2580 is displayed. Without a CON-SULT-III, code 50 or 52 is indicated on A/C auto amp. as a result of conducting self-diagnosis.

1. CHECK CIRCUIT CONTINUITY BETWEEN OPTICAL SENSOR AND A/C AUTO AMP.

- 1. Turn ignition switch OFF.
- 2. Disconnect A/C auto amp. connector and optical sensor connector.

POWER SUPPLY AND GROUND CIRCUIT FOR CONTROLLER < COMPONENT DIAGNOSIS > [AUTOMATIC AIR CONDITIONER]

POWER SUPPLY AND GROUND CIRCUIT FOR CONTROLLER

Component Description

COMPONENT DESCRIPTION

A/C auto amp.

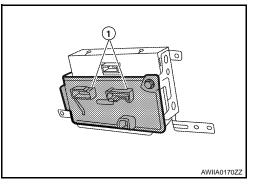

The A/C auto amp. (1) has a built-in microcomputer which processes information sent from various sensors needed for air conditioner operation. The air mix door motors, mode door motor, intake door motor, defroster door motor, blower motor and compressor are then controlled.

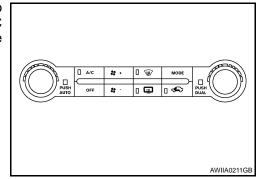

The A/C auto amp. is unitized with control mechanisms. When the various switches and temperature dials are operated, data is input to the A/C auto amp.

Self-diagnostic functions are also built into the A/C auto amp. to provide quick check of malfunctions in the auto air conditioner system.

Potentio Temperature Control (PTC)

There are two PTCs (driver and passenger) built into the A/C auto amp. They can be set at an interval of 0.5° C (1.0° F) in the 18° C (60° F) to 32° C (90° F) temperature range by rotating the temperature dial. The set temperature is displayed.

INFOID:000000003935932

A/C Auto Amp. Component Function Check

SYMPTOM: A/C system does not come on.

INSPECTION FLOW

1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - AUTO MODE

1. Press AUTO switch.

2. Display should indicate AUTO. Confirm that the compressor clutch engages (sound or visual inspection). (Discharge air and blower speed will depend on ambient, in-vehicle and set temperatures.)

Can a symptom be duplicated?

YES >> GO TO 3.

NO >> GO TO 2.

2. PERFORM COMPLETE OPERATIONAL CHECK

Perform a complete operational check and check for any symptoms. Refer to <u>HAC-125, "Operational Check"</u>. <u>Can a symptom be duplicated?</u>

YES >> Refer to <u>HAC-124, "How to Perform Trouble Diagnosis For Quick And Accurate Repair"</u>. NO >> System OK.

3.CHECK FOR SERVICE BULLETINS

Check for any service bulletins.

>> GO TO 4.

4.CHECK POWER AND GROUND CIRCUIT

Check main power supply and ground circuit. Refer to <u>HAC-164</u>. "Front Air Control Power and Ground Diagnosis Procedure".

SYMPTOM DIAGNOSIS AIR CONDITIONER CONTROL

Symptom Matrix Chart

INFOID:000000003935936

SYMPTOM TABLE

Symptom	Reference Page		
A/C system does not come on.	Go to Trouble Diagnosis Procedure for A/C System.	HAC-163	
A/C system display is malfunctioning.	Go to AV System.	<u>AV-192, AV-71</u>	
A/C system cannot be controlled.	Go to Self-diagnosis Function.	HAC-24	
Air outlet does not change.	Co to Trouble Diagnosis Droosdure for Mode Door Motor	114.0 429	
Mode door motor is malfunctioning.	Go to Trouble Diagnosis Procedure for Mode Door Motor.	<u>HAC-138</u>	
Discharge air temperature does not change.	Co to Trouble Diagnosis Droosdure for Air Mix Door Mater	1140 142	
Air mix door motor is malfunctioning.	Go to Trouble Diagnosis Procedure for Air Mix Door Motor.	<u>HAC-143</u>	
Intake door does not change.	Co to Trouble Diagnosis Drocedure for Intello Deer Mater		
Intake door motor is malfunctioning.	Go to Trouble Diagnosis Procedure for Intake Door Motor.	<u>HAC-146</u>	
Front blower motor operation is malfunction- ing.	Go to Trouble Diagnosis Procedure for Front Blower Motor.	<u>HAC-149</u>	
Rear blower motor operation is malfunction- ing.	Go to Trouble Diagnosis Procedure for Rear Blower Motor.	<u>HAC-53</u>	
Rear discharge air temperature and/or air outlet does not change.	Go to Trouble Diagnosis Procedure for Rear Air Control system.	<u>HAC-62</u>	
Magnet clutch does not engage.	Go to Trouble Diagnosis Procedure for Magnet Clutch.	<u>HAC-156</u>	
Insufficient cooling	Go to Trouble Diagnosis Procedure for Insufficient Cooling.	HAC-175	
Insufficient heating	Go to Trouble Diagnosis Procedure for Insufficient Heating.	HAC-183	
Noise	Go to Trouble Diagnosis Procedure for Noise.	HAC-185	
Self-diagnosis cannot be performed.	Go to Trouble Diagnosis Procedure for Self-diagnosis.	HAC-163	
Memory function does not operate.	Go to Trouble Diagnosis Procedure for Memory Function.	HAC-121	

INSUFFICIENT COOLING	٥
Component Function Check	A
SYMPTOM: Insufficient cooling	В
INSPECTION FLOW	
1.confirm symptom by performing operational check - temperature decrease	C
1. Press the AUTO switch.	0
 Turn temperature control dial (driver) counterclockwise until 18°C (60°F) is displayed. Check for cold air at discharge air outlets. 	_
Can the symptom be duplicated?	D
YES >> GO TO 3. NO >> GO TO 2.	
2. CHECK FOR ANY SYMPTOMS	E
Perform a complete operational check for any symptoms. Refer to <u>HAC-125</u> , "Operational Check".	
Does another symptom exist?	F
YES >> Refer to <u>HAC-174, "Symptom Matrix Chart"</u> .	
NO >> System OK. 3.CHECK FOR SERVICE BULLETINS	G
Check for any service bulletins.	Н
>> GO TO 4.	
4.PERFORM SELF-DIAGNOSIS	
Perform self-diagnosis Refer to HAC-24, "A/C Auto Amp. Self-Diagnosis".	HA
Is the inspection result normal?	
YES >> GO TO 5. NO >> Refer to <u>HAC-25, "A/C System Self-Diagnosis Code Chart"</u> .	J
5. CHECK DRIVE BELTS	
Check compressor belt tension. Refer to <u>EM-13, "Checking Drive Belts"</u> (VQ40DE) or <u>EM-155, "Checking Drive Belts"</u> (VK56DE).	K
Is the inspection result normal?	
OK >> GO TO 6.	L
NG >> Adjust or replace compressor belt. Refer to <u>EM-13, "Adjustment"</u> , <u>EM-13, "Removal and Installa-</u> tion" (VQ40DE) or <u>EM-155, "Removal and Installation"</u> (VK56DE).	
6. CHECK AIR MIX DOOR OPERATION	N
Check and verify air mix door mechanism for smooth operation. Refer to HAC-143, "Air Mix Door Motor Com-	
ponent Function Check" Does air mix door operate correctly?	Ν
YES >> GO TO 7.	
NO >> Check air mix door motor circuit. Refer to <u>HAC-144</u> , "Air Mix Door Motor Diagnosis Procedure" or <u>HAC-38</u> , "Air Mix Door Motor (Passenger) Diagnosis Procedure".	С
7. CHECK COOLING FAN MOTOR OPERATION	
Check and verify cooling fan motor for smooth operation.	Ρ
Does cooling fan motor operate correctly?	
YES >> GO TO 8. NO >> Check cooling fan motor.	
8. CHECK WATER VALVE OPERATION (VK56DE ONLY)	
Check and verify water value for smooth operation. Refer to HAC-73. "Water Value Description (V/K56DE)"	

Check and verify water valve for smooth operation. Refer to <u>HAC-73</u>, "Water Valve Description (VK56DE)". Does water valve operate correctly?

< SYMPTOM DIAGNOSIS >

YES >> GO TO 9.

NO >> Check water valve circuit. Refer to <u>HAC-73</u>, "Water Valve Diagnosis Procedure (VK56DE)".

9.CHECK RECOVERY/RECYCLING EQUIPMENT BEFORE USAGE

Check recovery/recycling equipment before connecting to vehicle. Verify there is no pressure in the recovery/ recycling equipment by checking the gauges. If pressure exists, recover refrigerant from equipment lines.

>> GO TO 10.

10.CHECK REFRIGERANT PURITY

1. Connect recovery/recycling equipment to vehicle.

2. Confirm refrigerant purity in supply tank using recovery/recycling and refrigerant identifier.

Is the inspection result normal?

YES >> GO TO 11.

NO >> Check contaminated refrigerant. Refer to <u>HAC-187, "Working with HFC-134a (R-134a)"</u>.

11.CHECK FOR EVAPORATOR FREEZE UP

Start engine and run A/C. Check for evaporator freeze up.

Does evaporator freeze up?

YES >> Perform diagnostic work flow. Refer to <u>HAC-176, "Diagnostic Work Flow"</u>.

NO >> GO TO 12.

12.CHECK REFRIGERANT PRESSURE

Check refrigerant pressure with manifold gauge connected. Refer to HAC-112, "Performance Chart".

Is the inspection result normal?

YES >> Perform diagnostic work flow. Refer to <u>HAC-176, "Diagnostic Work Flow"</u>.

NO >> GO TO 13.

13.CHECK AIR DUCTS

Check ducts for air leaks.

Is the inspection result normal?

YES >> System OK.

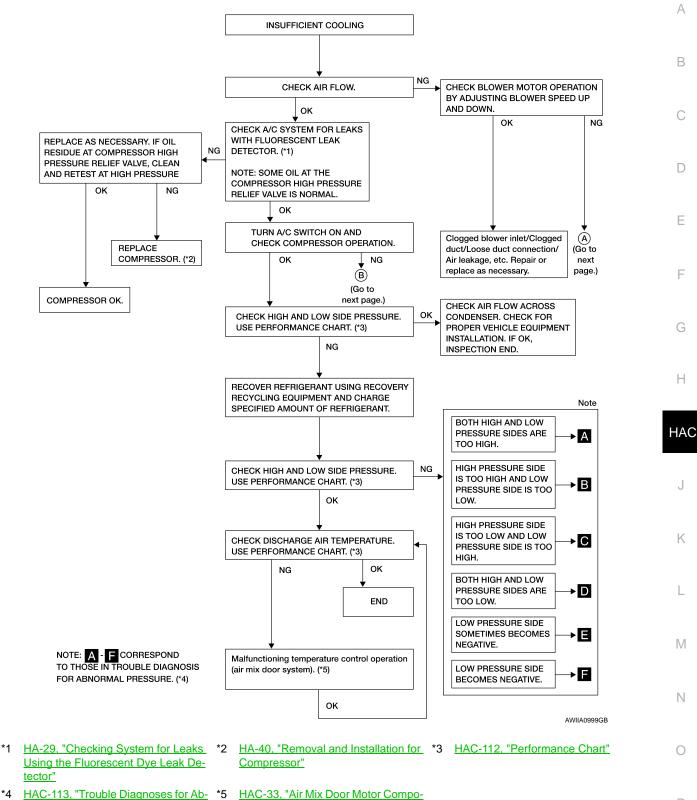

NO >> Repair air leaks.

Diagnostic Work Flow

Operate the air conditioning system	n for 10 minutes before taking measurements.	

TEST READING

Recirculating-to-discharge Air Temperature Table

Inside air (Recirculating air) at blower assembly inlet		Discharge eintemperature et center ventileter	
Relative humidity %	Air temperature °C (°F)	Discharge air temperature at center ventilator °C (°F)	
	20 (68)	5.3 - 6.5 (42 - 44)	
	25 (77)	9.7 - 11.5 (49 - 53)	
50 - 60	30 (86)	13.8 - 16.3 (57 - 61)	
	35 (95)	18.0 - 21.2 (64 - 70)	
	40 (104)	22.2 - 25.7 (72 - 78)	ŀ
	20 (68)	6.5 - 7.7 (44 - 46)	
	25 (77)	11.5 - 13.3 (53 - 56)	
60 - 70	30 (86)	16.3 - 18.8 (61 - 66)	
	35 (95)	21.2 - 24.0 (70 - 75)	
	40 (104)	25.7 - 29.2 (78 - 85)	

Ambient Air Temperature-to-operating Pressure Table

Ambie	ent air	High-pressure (Discharge side)	Low-pressure (Suction side)
Relative humidity %			kPa (kg/cm ² , psi)
	20 (68)	680 - 840 (6.94 - 8.57, 98.6 - 121.8)	160 - 198 (1.63 - 2.02, 23.2 - 28.7)
-	25 (77)	800 - 985 (8.16 - 10.05, 116.0 - 142.8)	198 - 245 (2.02 - 2.50, 28.7 - 35.5)
50 - 70	30 (86)	940 - 1,150 (9.59 - 11.73, 136.3 - 166.8)	225 - 278 (2.30 - 2.84, 32.6 - 40.3)
-	35 (95)	1,160 - 1,410 (11.83 - 14.38, 168.2 - 204.5)	273 - 335 (2.78 - 3.42, 39.6 - 48.6)
-	40 (104)	1,325 - 1,620 (13.52 - 16.52, 192.1 - 234.9)	325 - 398 (3.32 - 4.06, 47.1 - 57.7)

Trouble Diagnoses for Abnormal Pressure

INFOID:000000003935941

Е

F

Whenever system's high and/or low side pressure is abnormal, diagnose using a manifold gauge. The marker above the gauge scale in the following tables indicates the standard (usual) pressure range. Since the stan-

< SYMPTOM DIAGNOSIS >

dard (usual) pressure, however, differs from vehicle to vehicle, refer to above table (Ambient air temperatureto-operating pressure table).

Both High- and Low-pressure Sides are Too High

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
	Pressure is reduced soon af- ter water is splashed on con- denser.	Excessive refrigerant charge in refrigeration cycle	Reduce refrigerant until speci- fied pressure is obtained.
A Both high- and low-pressure sides are too high.	Air suction by cooling fan is in- sufficient.	 Insufficient condenser cooling performance ↓ 1. Condenser fins are clogged. 2. Improper fan rotation of cooling fan 	 Clean condenser. Check and repair cooling fan if necessary.
	 Low-pressure pipe is not cold. When compressor is stopped high-pressure value quickly drops by approximately 196 kPa (2 kg/cm², 28 psi). It then decreases gradually thereafter. 	Poor heat exchange in con- denser (After compressor operation stops, high-pressure decreas- es too slowly.) ↓ Air in refrigeration cycle	Evacuate and recharge system.
Д Д АС359А	Engine tends to overheat.	Engine cooling systems mal- function.	Check and repair engine cool- ing system.
	 An area of the low-pressure pipe is colder than areas near the evaporator outlet. Plates are sometimes cov- ered with frost. 	 Excessive liquid refrigerant on low-pressure side Excessive refrigerant dis- charge flow Expansion valve is open a lit- tle compared with the speci- fication. ↓ Improper expansion valve ad- justment 	Replace expansion valve.

High-pressure Side is Too High and Low-pressure Side is Too Low

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
High-pressure side is too high and low-pressure side is too low.	Upper side of condenser and high-pressure side are hot, however, liquid tank is not so hot.	High-pressure tube or parts lo- cated between compressor and condenser are clogged or crushed.	 Check and repair or replace malfunctioning parts. Check oil for contamination.

High-pressure Side is Too Low and Low-pressure Side is Too High

< SYMPTOM DIAGNOSIS >

[AUTOMATIC AIR CONDITIONER]

Gauge indication	Refrigerant cycle	Probable cause	Corrective action	
High-pressure side is too low and low-pressure side is too high.	High- and low-pressure sides become equal soon after com- pressor operation stops.	Compressor pressure opera- tion is improper. ↓ Damaged inside compressor packings.	Replace compressor.	
	No temperature difference be- tween high- and low-pressure sides.	Compressor pressure opera- tion is improper. ↓ Damaged inside compressor packings.	Replace compressor.	

Both High- and Low-pressure Sides are Too Low

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
	 There is a big temperature difference between liquid tank outlet and inlet. Outlet temperature is extremely low. Liquid tank inlet and expan- sion valve are frosted. 	Liquid tank inside is slightly clogged.	Replace liquid tank.Check oil for contamination.
	 Temperature of expansion valve inlet is extremely low as compared with areas near liquid tank. Expansion valve inlet may be frosted. Temperature difference oc- curs somewhere in high- pressure side. 	High-pressure pipe located be- tween liquid tank and expan- sion valve is clogged.	 Check and repair malfunc- tioning parts. Check oil for contamination.
D Both high- and low-pressure sides are too low.	Expansion valve and liquid tank are warm or only cool when touched.	Low refrigerant charge. ↓ Leaking fittings or compo- nents.	Check refrigerant system for leaks. Refer to <u>HA-29</u> , "Check- ing System for Leaks Using the Fluorescent Dye Leak Detec- tor" or <u>HA-31</u> , "Electronic Re- frigerant Leak Detector".
Image: Construction of the second	There is a big temperature dif- ference between expansion valve inlet and outlet while the valve itself is frosted.	 Expansion valve closes a little compared with the specification. ↓ 1. Improper expansion valve adjustment. 2. Malfunctioning expansion valve. 3. Outlet and inlet may be clogged. 	 Remove foreign particles by using compressed air. Check oil for contamination.
	An area of the low-pressure pipe is colder than areas near the evaporator outlet.	Low-pressure pipe is clogged or crushed.	Check and repair malfunc- tioning parts.Check oil for contamination.
	Air flow volume is too low.	Evaporator is frozen.	 Check intake sensor circuit. Refer to <u>HAC-161</u>, "Intake <u>Sensor Diagnosis Proce-</u> <u>dure"</u>. Repair evaporator fins. Replace evaporator. Refer to <u>HAC-149</u>, "Front <u>Blower Motor Component</u> <u>Function Check"</u>.

Low-pressure Side Sometimes Becomes Negative

< SYMPTOM DIAGNOSIS >

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
E Low-pressure side sometimes be- comes negative.	 Air conditioning system does not function and does not cy- clically cool the compart- ment air. The system constantly func- tions for a certain period of time after compressor is stopped and restarted. 	Refrigerant does not discharge cyclically. ↓ Moisture is frozen at expan- sion valve outlet and inlet. ↓ Water is mixed with refrigerant.	 Drain water from refrigerant or replace refrigerant. Replace liquid tank.

Low-pressure Side Becomes Negative

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
Low-pressure side becomes nega- tive.	Liquid tank or front/rear side of expansion valve's pipe is frost- ed or dewed.	High-pressure side is closed and refrigerant does not flow. ↓ Expansion valve or liquid tank is frosted.	 Leave the system at rest until no frost is present. Start it again to check whether or not the malfunction is caused by water or foreign particles. If water is the cause, initially cooling is okay. Then the water freezes causing a blockage. Drain water from refrigerant or replace refrigerant. If due to foreign particles, remove expansion valve and remove the particles with dry and compressed air (not shop air). If either of the above methods cannot correct the malfunction, replace expansion valve. Replace liquid tank. Check oil for contamination.

INSUFFICIENT HEATING А Component Function Check INFOID:000000003935942 SYMPTOM: Insufficient heating INSPECTION FLOW **1.** CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - TEMPERATURE INCREASE 1 Press the AUTO switch. Turn the temperature control dial (driver) clockwise until 32°C (90°F) is displayed. 2. Check for hot air at discharge air outlets. 3. Can this symptom be duplicated? YES >> GO TO 2. NO >> Perform complete system operational check. Refer to HAC-125, "Operational Check". E 2.CHECK FOR SERVICE BULLETINS Check for any service bulletins. F >> GO TO 3. ${f 3.}$ PERFORM SELF-DIAGNOSIS Perform self-diagnosis. Refer to HAC-24, "A/C Auto Amp. Self-Diagnosis". Is the inspection results normal? Н YES >> GO TO 4. NO >> Refer to HAC-25, "A/C System Self-Diagnosis Code Chart". 4.CHECK ENGINE COOLING SYSTEM HAC Check for proper engine coolant level. Refer to CO-11, "System Inspection" (VQ40DE) or CO-40, "System 1. Inspection" (VK56DE). Check hoses for leaks or kinks. 2. Check radiator cap. Refer to CO-18, "Checking Radiator" (VQ40DE) or CO-47, "Checking Radiator" 3. (VK56DE). 4. Check for air in cooling system. Κ >> GO TO 5. 5.CHECK AIR MIX DOOR OPERATION Check the operation of the air mix door. Is the inspection result normal? YES >> GO TO 6. M NO >> Check the air mix door motor circuit. Refer to HAC-143, "Air Mix Door Motor Component Function Check". **6.**CHECK AIR DUCTS Ν Check for disconnected or leaking air ducts. Is the inspection result normal? YES >> GO TO 7. NO >> Repair all disconnected or leaking air ducts. 7.CHECK HEATER HOSE TEMPERATURES P 1. Start engine and warm it up to normal operating temperature. Touch both the inlet and outlet heater hoses. 2. Is the inspection result normal? >> Hot inlet hose and a warm outlet hose: GO TO 8. YES NO >> • Inlet hose cold: GO TO 11.

• Both hoses warm: GO TO 9.

< SYMPTOM DIAGNOSIS >

8. CHECK ENGINE COOLANT SYSTEM

Check engine control temperature sensor.

Is the inspection result normal?

- YES >> System OK.
- NO >> Repair or replace as necessary. Retest.
- **9.**CHECK HEATER HOSES

Check heater hoses for proper installation.

Is the inspection result normal?

- YES >> System OK.
- NO >> 1. Back flush heater core.
 - 2. Drain the water from the system.
 - 3. Refill system with new engine coolant. Refer to <u>CO-12, "Changing Engine Coolant"</u> (VQ40DE) or <u>CO-41, "Changing Engine Coolant"</u> (VK56DE).
 - 4. GO TO 10 to retest.

10.CHECK HEATER HOSE TEMPERATURES

- 1. Start engine and warm it up to normal operating temperature.
- 2. Touch both the inlet and outlet heater hoses.

Is the inspection result normal?

- YES >> System OK.
- NO >> Replace heater core. Refer to <u>VTL-26</u>, "Removal and Installation".
- **11.**CHECK HEATER PUMP (VQ40DE ONLY)

Check the operation of the heater pump valve. Refer to <u>HAC-77. "Component Inspection (VQ40DE)"</u>. <u>Is the inspection result normal?</u>

- YES >> System OK.
- NO >> Replace heater pump. Refer to <u>HA-58, "Removal and Installation"</u>.

< PRECAUTION >

PRECAUTION PRECAUTIONS

Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSION-ER"

The Supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER", used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted. Information necessary to service the system safely is included in the SR and SB section of this Service Manual.

WARNING:

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the SR section.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.

Working with HFC-134a (R-134a)

INFOID:00000003935946

WARNING:

- CFC-12 (R-12) refrigerant and HFC-134a (R-134a) refrigerant are not compatible. If the refrigerants are mixed compressor failure is likely to occur. Refer to <u>HA-4</u>, <u>"Contaminated Refrigerant"</u>. To determine the purity of HFC-134a (R-134a) in the vehicle and recovery tank, use Refrigerant Recovery/ Recycling Recharging equipment and Refrigerant Identifier.
- Use only specified oil for the HFC-134a (R-134a) A/C system and HFC-134a (R-134a) components. If oil other than that specified is used, compressor failure is likely to occur.
- The specified HFC-134a (R-134a) oil rapidly absorbs moisture from the atmosphere. The following handling precautions must be observed:
- When removing refrigerant components from a vehicle, immediately cap (seal) the component to minimize the entry of moisture from the atmosphere.
- When installing refrigerant components to a vehicle, do not remove the caps (unseal) until just before connecting the components. Connect all refrigerant loop components as quickly as possible to minimize the entry of moisture into system.
- Only use the specified oil from a sealed container. Immediately reseal containers of oil. Without proper sealing, oil will become moisture saturated and should not be used.
- Avoid breathing A/C refrigerant and oil vapor or mist. Exposure may irritate eyes, nose and throat. Remove HFC-134a (R-134a) from the A/C system using certified service equipment meeting requirements of SAE J2210 [HFC-134a (R-134a) recycling equipment], or J2209 [HFC-134a (R-134a) recycling equipment], If accidental system discharge occurs, ventilate work area before resuming service. Additional health and safety information may be obtained from refrigerant and oil manufacturers.
- Do not allow A/C oil to come in contact with styrofoam parts. Damage may result.

CONTAMINATED REFRIGERANT

If a refrigerant other than pure HFC-134a (R-134a) is identified in a vehicle, your options are:

- Explain to the customer that environmental regulations prohibit the release of contaminated refrigerant into the atmosphere.
- Explain that recovery of the contaminated refrigerant could damage your service equipment and refrigerant supply.
- Suggest the customer return the vehicle to the location of previous service where the contamination may have occurred.
- If you choose to perform the repair, recover the refrigerant using only **dedicated equipment and containers. Do not recover contaminated refrigerant into your existing service equipment.** If your facility does

PRECAUTIONS

< PRECAUTION >

[AUTOMATIC AIR CONDITIONER]

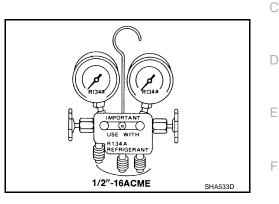

not have dedicated recovery equipment, you may contact a local refrigerant product retailer for available service. This refrigerant must be disposed of in accordance with all federal and local regulations. In addition, replacement of all refrigerant system components on the vehicle is recommended.

 If the vehicle is within the warranty period, the air conditioner warranty is void. Please contact NISSAN Customer Affairs for further assistance.

Precaution for Service Equipment

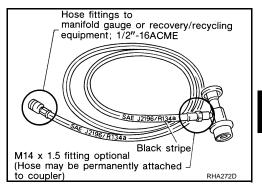

MANIFOLD GAUGE SET

Be certain that the gauge face indicates R-134a or 134a. Make sure the gauge set has 1/2"-16 ACME threaded connections for service hoses. Confirm the set has been used only with refrigerant HFC-134a (R-134a) along with specified oil.

SERVICE HOSES

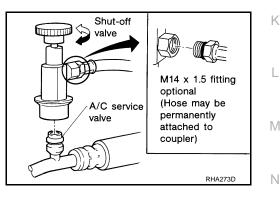

Be certain that the service hoses display the markings described (colored hose with black stripe). All hoses must include positive shutoff devices (either manual or automatic) near the end of the hoses opposite the manifold gauge.

SERVICE COUPLERS

Never attempt to connect HFC-134a (R-134a) service couplers to a CFC-12 (R-12) A/C system. The HFC-134a (R-134a) couplers will not properly connect to the CFC-12 (R-12) system. However, if an improper connection is attempted, discharging and contamination may occur.

1.LISTEN TO CUSTOMER COMPLAINT

Listen to customer complaint. Get detailed information about the conditions and environment when the symptom occurs.

>> GO TO 2.

2. CHECK FOR SERVICE BULLETINS

Check for any service bulletins.

>> GO TO 3.

 $\mathbf{3.}$ verify the symptom with operational check

Verify the symptom with operational check. Refer to HAC-125, "Operational Check".

Can a symptom be duplicated?

YES >> Go to trouble diagnosis. Refer to HAC-174, "Symptom Matrix Chart".

NO >> System OK.

INSPECTION AND ADJUSTMENT

INSPECTION AND ADJUSTMENT	
Operational Check	А
The purpose of the operational check is to confirm that the system operates properly.	В
Conditions : Engine running and at normal operating temperature	
CHECKING BLOWER	С
 Turn blower control dial clockwise. Blower should operate on low speed. Turn the blower control dial again, and continue checking each blower speed until all speeds are checked. Leave blower on speed 4. If NG, go to trouble diagnosis procedure for <u>HAC-150</u>. "Front Blower Motor Diagnosis Procedure". If OK, continue with next check. 	D
CHECKING DISCHARGE AIR	Е
1. Turn the mode switch to each position.	
 Confirm that discharge air comes out according to the air distribution table. Refer to <u>HAC-134</u>. "Discharge <u>Air Flow"</u>. 	F
Mode door position is checked in the next step. If NG, go to trouble diagnosis procedure for <u>HAC-139, "Mode Door Motor (Front) Diagnosis Procedure"</u> . If OK, continue with next check.	G
NOTE: Confirm that the A/C compressor clutch is engaged (sound or visual inspection) and intake door position is at fresh when the DEF (\mathfrak{P}) or D/F (\mathfrak{P}) is selected.	Η
CHECKING RECIRCULATION	HAC
1. Press recirculation (
2. Press recirculation (J
3. Listen for intake door position change (blower sound should change slightly).	0
If NG, go to trouble diagnosis procedure for <u>HAC-147</u> , "Intake Door Motor Diagnosis Procedure". If OK, continue with next check. NOTE: Confirm that the compressor clutch is engaged (sound or visual inspection) and intake door position is at fresh when the DEF or D/F is selected.	K
CHECKING TEMPERATURE DECREASE	L
 Rotate temperature control dial counterclockwise. Check for cold air at appropriate discharge air outlets. 	M
If NG, listen for sound of air mix door motor operation if OK, go to trouble diagnosis procedure for <u>HAC-175</u> , <u>"Component Function Check"</u> . If air mix door motor appears to be malfunctioning, go to <u>HAC-143</u> , "Air Mix <u>Door Motor Component Function Check"</u> . If OK, continue with next check.	Ν
CHECKING TEMPERATURE INCREASE	
1. Rotate temperature control dial clockwise.	0
2. Check for hot air at appropriate discharge air outlets.	
If NG, listen for sound of air mix door motor operation. If OK, go to trouble diagnosis procedure for <u>HAC-183</u> , <u>"Component Function Check"</u> . If air mix door motor (front) appears to be malfunctioning, go to <u>HAC-143</u> , "Air <u>Mix Door Motor Component Function Check"</u> . If OK, continue with next check.	Ρ
CHECK A/C SWITCH	

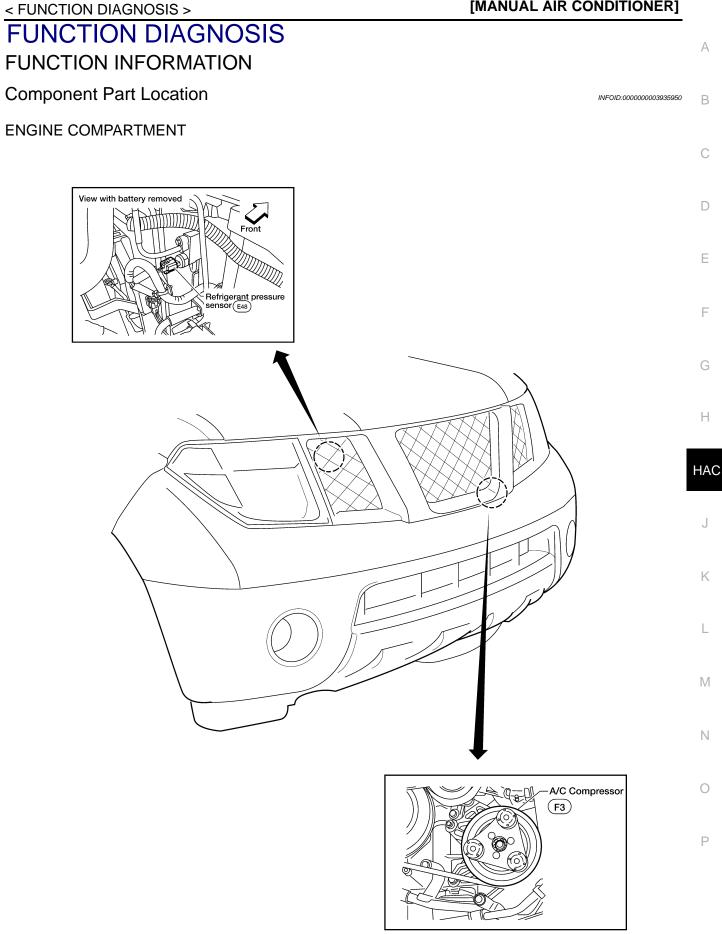

CHECK A/C SWITCH

< BASIC INSPECTION >

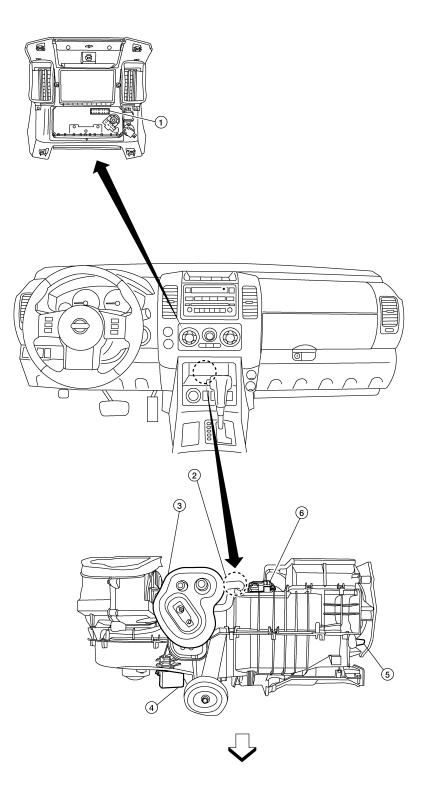

- 1. Press A/C switch with the blower switch ON.
- 2. A/C switch indicator will turn ON.
 - Confirm that the compressor clutch engages (sound or visual inspection).

< BASIC INSPECTION >

If NG, go to trouble diagnosis procedure for <u>HAC-156</u>, "<u>Magnet Clutch Diagnosis Procedure</u>". If OK, continue with next check.

REFRIGERATION SYSTEM

Refrigerant Cycle

INFOID:000000004375773

WJIA1342E

REFRIGERANT FLOW

The refrigerant flows in the standard pattern, that is, through the compressor, the condenser with liquid tank, through the front and rear evaporators, and back to the compressor. The refrigerant evaporation through the evaporator coils are controlled by front and rear externally equalized expansion valves, located inside the front and rear evaporator cases.

FREEZE PROTECTION

The compressor cycles on and off to maintain the evaporator temperature within a specified range. When the evaporator coil temperature falls below a specified point, the intake sensor interrupts the compressor operation. When the evaporator coil temperature rises above the specification, the intake sensor allows compressor operation.

Refrigerant System Protection

INFOID:000000004375774

REFRIGERANT PRESSURE SENSOR

REFRIGERATION SYSTEM

< FUNCTION DIAGNOSIS >

[MANUAL AIR CONDITIONER]

The refrigerant system is protected against excessively high- or low-pressures by the refrigerant pressure sensor, located on the condenser. If the system pressure rises above or falls below the specifications, the refrigerant pressure sensor detects the pressure inside the refrigerant line and sends a voltage signal to the ECM. The ECM de-energizes the A/C relay to disengage the magnetic compressor clutch when pressure on the high pressure side detected by refrigerant pressure sensor is over about 2,746 kPa (28 kg/cm², 398 psi), or below B about 120 kPa (1.22 kg/cm², 17.4 psi).

PRESSURE RELIEF VALVE

The refrigerant system is also protected by a pressure relief valve, located in the rear head of the compressor. When the pressure of refrigerant in the system increases to an abnormal level [more than 2,990 kPa (30.5 kg/ cm², 433.6 psi)], the release port on the pressure relief valve automatically opens and releases refrigerant into the atmosphere.

MANUAL AIR CONDITIONER SYSTEM

MAGNET CLUTCH CONTROL

Manually controls the four blower speeds.

HAC

Ρ

When the A/C switch is pressed, or the mode dial is turned to the DEF or D/F position, the front air control outputs a compressor ON signal to BCM.

The BCM then sends a compressor ON signal to ECM, via CAN communication line.

ECM judges whether compressor can be turned ON, based on each sensor status (refrigerant pressure sensor signal, throttle angle sensor, etc.). If it judges compressor can be turned ON, it sends compressor ON signal to IPDM E/R, via CAN communication line.

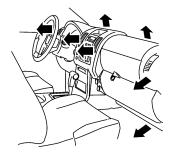

Upon receipt of compressor ON signal from ECM, IPDM E/R turns air conditioner relay ON to operate compressor.

DIAGNOSIS SYSTEM (BCM)

CONSULT-III Function (BCM - COMMON ITEM)

APPLICATION ITEM

CONSULT-III performs the following functions via CAN communication with BCM.

Diagnosis mode	Function Description
WORK SUPPORT	Changes the setting for each system function.
SELF-DIAG RESULTS	Displays the diagnosis results judged by BCM. Refer to BCS-54, "DTC Index".
CAN DIAG SUPPORT MNTR	Monitors the reception status of CAN communication viewed from BCM.
DATA MONITOR	The BCM input/output signals are displayed.
ACTIVE TEST	The signals used to activate each device are forcibly supplied from BCM.
ECU IDENTIFICATION	The BCM part number is displayed.
CONFIGURATION	Enables to read and save the vehicle specification.Enables to write the vehicle specification when replacing BCM.

SYSTEM APPLICATION

BCM can perform the following functions for each system.

NOTE:

It can perform the diagnosis modes except the following for all sub system selection items.

COMPONENT DIAGNOSIS MODE DOOR MOTOR

System Description

INFOID:000000003935960

SYSTEM DESCRIPTION

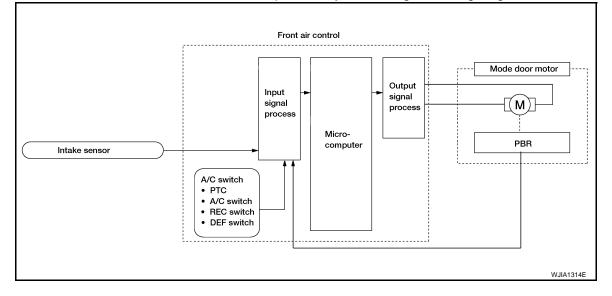

Component Parts

Mode door control system components are:

- Front air control
- Mode door motor
- PBR (built into mode door motor)
- Intake sensor

System Operation

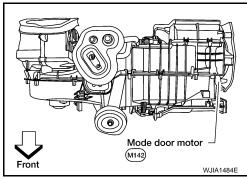

The mode door position (vent, B/L, foot, D/F, and defrost) is set by the front air control by means of the mode door motor. When a mode door position is selected on the front air control, voltage is applied to one circuit of the mode door motor while ground is applied to the other circuit, causing the mode door motor to rotate. The direction of rotation is determined by which circuit has voltage applied to it, and which one has ground applied to it. The front air control monitors the mode door position by measuring the voltage signal on the PBR circuit.

COMPONENT DESCRIPTION

Mode Door Motor

The mode door motor is attached to the heater and cooling unit assembly. It rotates so that air is discharged from the outlet as indicated by the front air control. Motor rotation is conveyed to a link which activates the mode door.

Mode Door Motor (Front) Component Function Check

AIR MIX DOOR MOTOR

System Description

SYSTEM DESCRIPTION

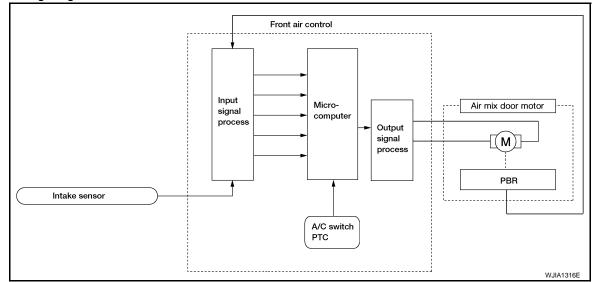

Component Parts

Air_mix door control system components are:

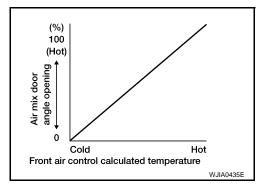

- Front air control
- Air mix door motor
- PBR (built into air mix door motor)
- Intake sensor

System Operation

The front air control receives data from the temperature selected by the driver. The front air control then applies a voltage to one circuit of the air mix door motor, while ground is applied to the other circuit, causing the air mix door motor to rotate. The direction of rotation is determined by which circuit has voltage applied to it, and which one has ground applied to it. The front air control monitors the air mix door positions by measuring the voltage signal on the PBR circuits of each door.

Air Mix Door Control Specification

COMPONENT DESCRIPTION

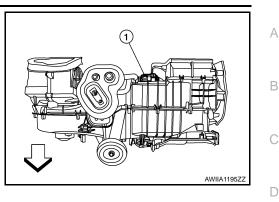

Air Mix Door Motors

INFOID:000000003935963

AIR MIX DOOR MOTOR

< COMPONENT DIAGNOSIS >

The air mix door motor (1) is attached to the front heater and cooling unit assembly. This motor rotates so that the air mix door is opened or closed to a position set by the front air control. Motor rotation is then conveyed through a shaft and the air mix door position is then fed back to the front air control by the PBR built into the air mix door motor (\Rightarrow : Front).

[MANUAL AIR CONDITIONER]

INTAKE DOOR MOTOR

System Description

SYSTEM DESCRIPTION

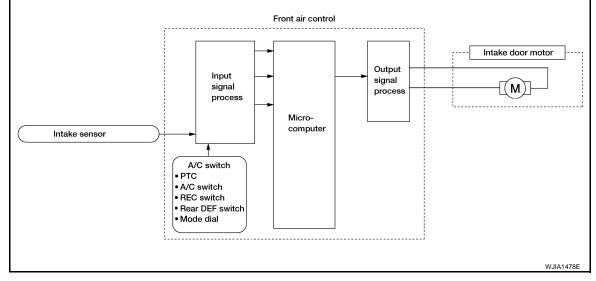

Component Parts

Intake door control system components are:

- Front air control
- Intake door motor
- Intake sensor

System Operation

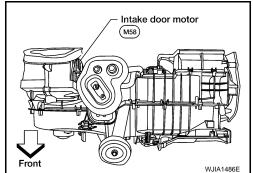

The intake door control determines the intake door position based on the position of the recirculation switch. When the recirculation switch is depressed the intake door motor rotates closing off the fresh air inlet and recirculating the cabin air. If the recirculation switch is depressed again, the intake door motor rotates in the opposite direction, again allowing fresh air into the cabin.

COMPONENT DESCRIPTION

Intake door motor

The intake door motor is attached to the intake unit. It rotates so that air is drawn from inlets set by the front air control. Motor rotation is conveyed to a lever which activates the intake door.

BLOWER MOTOR

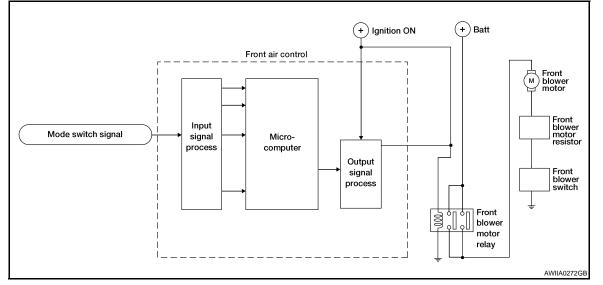

System Description

Component Parts

Blower speed control system components are:

- Front air control
- Front blower motor resistor
- Front blower motor
- Front blower relay

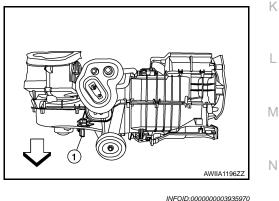

System Operation

COMPONENT DESCRIPTION

Blower Motor Resistor

The front blower motor resistor (1) is located on the heater and cooling unit assembly. The front blower motor resistor grounds the front blower motor through a series of 1, 2, or 3 resistors, depending upon speed selected. For high speed operation the front blower motor resistor is circumvented and the front blower motor grounds directly (\Rightarrow : Front).

Front Blower Motor Component Function Check

INSPECTION FLOW

1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - FRONT BLOWER

- 1. Rotate the blower control dial clockwise. Blower should operate.
- 2. Rotate the blower control dial clockwise, and continue checking blower speed until all speeds are checked.

MAGNET CLUTCH

System Description

SYSTEM DESCRIPTION

The front air control controls compressor operation based on ambient and intake temperature and a signal from ECM.

Low Temperature Protection Control

The front air control will turn the compressor ON or OFF as determined by a signal detected by the intake sensor and the ambient sensor.

When intake air temperature is higher than 3.5° C (38.3° F), the compressor turns ON. The compressor turns OFF when intake air temperature is lower than 2.5° C (36.5° F).

Magnet Clutch Component Function Check

hot or any intermediate position by rotating the temperature dial.

Potentio Temperature Control (PTC)

SYMPTOM: A/C system does not come on.

Front Air Control Component Function Check

INSPECTION FLOW

1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK

- 1. Turn blower control dial to position 1-4, then press A/C switch.
- Confirm that the compressor clutch engages (sound or visual inspection).

Can a symptom be duplicated?

YES >> GO TO 3.

NO >> GO TO 2.

2. PERFORM COMPLETE OPERATIONAL CHECK

Ν Perform a complete operational check and check for any symptoms. Refer to HAC-125, "Operational Check". Can a symptom be duplicated?

YES >> Refer to HAC-174, "Symptom Matrix Chart".

NO >> System OK.

3.CHECK FOR SERVICE BULLETINS

Check for any service bulletins.

>> GO TO 4.

4.CHECK POWER AND GROUND CIRCUIT

Check main power supply and ground circuit. Refer to HAC-164, "Front Air Control Power and Ground Diagnosis Procedure".

HAC-163

POWER SUPPLY AND GROUND CIRCUIT FOR CONTROLLER IENT DIAGNOSIS > [MANUAL AIR CONDITIONER]

< COMPONENT DIAGNOSIS >

Is the inspection result normal?

YES >> System OK.

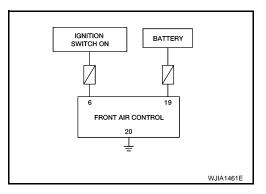

NO >> Replace front air control. Refer to <u>VTL-7, "Removal and Installation"</u>.

Front Air Control Power and Ground Diagnosis Procedure

INFOID:000000003935981

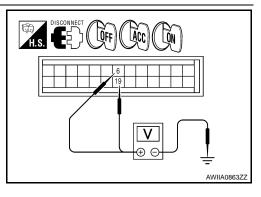

DIAGNOSTIC PROCEDURE FOR A/C SYSTEM

SYMPTOM: A/C system does not come on.

1. CHECK POWER SUPPLY CIRCUITS FOR FRONT AIR CONTROL

- 1. Turn ignition switch OFF.
- 2. Disconnect front air control connector.
- 3. Turn ignition switch ON.
- 4. Check voltage between front air control harness connector M52 terminals 6 and 19, and ground.

	Terminals		Ignit	tion switch pos	sition
	(+)				
Front air control connector	Terminal No.	(-)	OFF	ACC	ON
M52	6	Ground	Approx. 0V	Approx. 0V	Battery voltage
M52	19	Cround	Battery voltage	Battery voltage	Battery voltage

Is the inspection result normal?

YES >> GO TO 2.

- NO >> Check 10A fuses [Nos. 8 and 19, located in the fuse block (J/B)]. Refer to <u>PG-72, "Terminal</u> <u>Arrangement"</u>.
 - If fuses are OK, check harness for open circuit. Repair or replace as necessary.
 - If fuses are NG, replace fuse and check harness for short circuit. Repair or replace as necessary.

2. CHECK GROUND CIRCUIT FOR FRONT AIR CONTROL

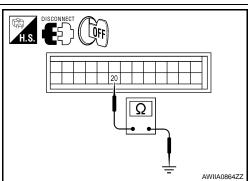

- 1. Turn ignition switch OFF.
- 2. Check continuity between front air control harness connector M52 terminal 20 and ground.

20 - Ground

: Continuity should exist.

Is the inspection result normal?

- YES >> Replace front air control. Refer to <u>VTL-7</u>, "Removal and <u>Installation"</u>.
- NO >> Repair harness or connector.

ECU DIAGNOSIS А AIR CONDITIONER CONTROL System Description INFOID:000000003935982 В The front air control provides regulation of the vehicle's interior temperature. The system is based on the position of the front air controls temperature switch selected by the driver. This is done by utilizing a microcomputer, also referred to as the front air control, which receives input signals from the following two sensors: Intake sensor PBR (position balanced resistor) The front air control uses these signals (including the set position of the temperature switch) to control: D Outlet air volume Air temperature Air distribution Ε System Operation INFOID:000000003935983 AIR MIX DOOR CONTROL F The air mix door is controlled so that in-vehicle temperature changed based on the position of the temperature control dial. BLOWER SPEED CONTROL Blower speed is controlled based on front blower switch settings. When blower switch is turned, the blower motor starts and increases air flow volume each time the blower switch is turned counterclockwise, and decreases air flow volume each time the blower switch is turned coun-Н terclockwise. When engine coolant temperature is low, the blower motor operation is delayed to prevent cool air from flowing. HAC INTAKE DOORS CONTROL The intake doors are controlled by the recirculation switch setting, and the mode (defroster) switch setting. MODE DOOR CONTROL The mode door is controlled by the position of the mode dial. DEFROSTER DOOR CONTROL Κ The defroster door is controlled by the defroster dial set to defroster. MAGNET CLUTCH CONTROL L (BAT) (IGN) ç g (A/C SW M Q IPDM E/R g Compressor CPU Ν DATA LINE MODE SW (defroster) Front (CAN) air control Compressor ON Compressor ON Refrigerant signal signal всм ECM pressure DATA LINE (Intake sensor sensor (CAN) Ρ OFF SW WJIA1293E

When the A/C switch is pressed, or the mode dial is turned to the defroster position, the front air control outputs a compressor ON signal to BCM.

The BCM then sends a compressor ON signal to ECM, via CAN communication line.

< ECU DIAGNOSIS >

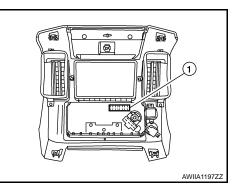

[MANUAL AIR CONDITIONER]

ECM judges whether compressor can be turned ON, based on each sensor status (refrigerant pressure sensor signal, throttle angle sensor, etc.). If it judges compressor can be turned ON, it sends compressor ON signal to IPDM E/R, via CAN communication line.

Upon receipt of compressor ON signal from ECM, IPDM E/R turns air conditioner relay ON to operate compressor.

Front Air Control Terminals Reference Values

Measure voltage between each terminal and ground by following Terminals and Reference Values for front air control.

WJIA2011E

FRONT AIR CONTROL HARNESS CONNECTOR TERMINAL LAYOUT

INSUFFICIENT COOLING	
Component Function Check	INFOID:00000003935987
SYMPTOM: Insufficient cooling	
INSPECTION FLOW	
1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK -	TEMPERATURE DECREASE
 Turn temperature control dial counterclockwise to maximum cold. Check for cold air at discharge air outlets. 	
Can the symptom be duplicated?	
YES >> GO TO 3. NO >> GO TO 2.	
2. CHECK FOR ANY SYMPTOMS	
Perform a complete operational check for any symptoms. Refer to HAC-	-125, "Operational Check".
Does another symptom exist?	
YES >> Refer to <u>HAC-174, "Symptom Matrix Chart"</u> . NO >> System OK.	
3. CHECK FOR SERVICE BULLETINS	
Check for any service bulletins.	
>> GO TO 4.	
4. CHECK DRIVE BELTS	
Check compressor belt tension. Refer to EM-13, "Checking Drive Belts"	
Is the inspection result normal?	
YES >> GO TO 5. NO >> Adjust or replace compressor belt. Refer to <u>EM-13</u> , "Checki	ng Drivo Polto"
5. CHECK AIR MIX DOOR OPERATION	ng Dive Beits .
Check and verify air mix door mechanism for smooth operation.	
Does air mix door operate correctly?	
YES >> GO TO 6.	
NO >> Repair or replace air mix door control linkage.	
6. CHECK COOLING FAN MOTOR OPERATION	
Check and verify cooling fan motor for smooth operation. Refer to <u>EC-39</u> <u>Does cooling fan motor operate correctly?</u>	91, "Component Inspection".
YES >> GO TO 7.	
NO >> Check cooling fan motor. Refer to EC-390, "Diagnosis Proce	edure".
7. CHECK RECOVERY/RECYCLING EQUIPMENT BEFORE USAGE	
Check recovery/recycling equipment before connecting to vehicle. Verify recycling equipment by checking the gauges. If pressure exists, recover	
>> GO TO 8.	
8.CHECK REFRIGERANT PURITY	
 Connect recovery/recycling equipment to vehicle. Confirm refrigerant purity in supply tank using recovery/recycling an 	d refrigerant identifier.

2. Confirm refrigerant purity in supply tank using recovery/recycling and refrigerant identifier.

Is the inspection result normal?

< SYMPTOM DIAGNOSIS >

YES >> GO TO 9.

NO >> Check contaminated refrigerant. Refer to <u>HA-4, "Contaminated Refrigerant"</u>.

< SYMPTOM DIAGNOSIS >

9.CHECK FOR EVAPORATOR FREEZE UP

Start engine and run A/C. Check for evaporator freeze up.

Does evaporator freeze up?

YES >> Perform diagnostic work flow. Refer to <u>HAC-176</u>, "Diagnostic Work Flow".

NO >> GO TO 10.

10. CHECK REFRIGERANT PRESSURE

Check refrigerant pressure with manifold gauge connected. Refer to <u>HAC-178, "Performance Chart"</u>. <u>Is the inspection result normal?</u>

YES >> Perform diagnostic work flow. Refer to <u>HAC-176, "Diagnostic Work Flow"</u>.

NO >> GO TO 11.

11.CHECK AIR DUCTS

Check ducts for air leaks.

Is the inspection result normal?

YES >> System OK.

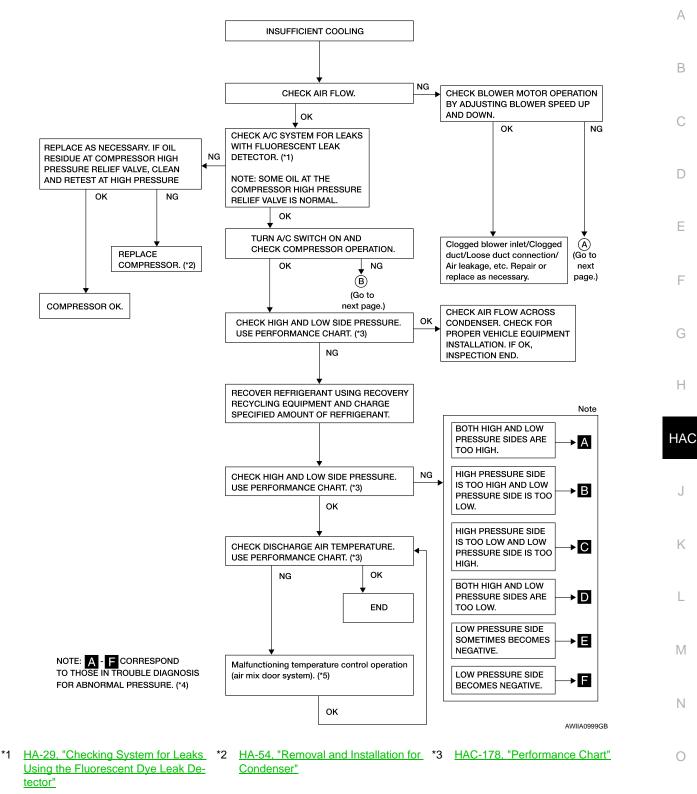

NO >> Repair air leaks.

Trouble Diagnoses for Abnormal Pressure

INFOID:000000003935991

F

L

Whenever system's high and/or low side pressure is abnormal, diagnose using a manifold gauge. The marker above the gauge scale in the following tables indicates the standard (usual) pressure range. Since the stan-

< SYMPTOM DIAGNOSIS >

dard (usual) pressure, however, differs from vehicle to vehicle, refer to above table (Ambient air temperatureto-operating pressure table).

Both High- and Low-pressure Sides are Too High

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
	Pressure is reduced soon af- ter water is splashed on con- denser.	Excessive refrigerant charge in refrigeration cycle	Reduce refrigerant until speci- fied pressure is obtained.
A Both high- and low-pressure sides are too high.	Air suction by cooling fan is in- sufficient.	 Insufficient condenser cooling performance ↓ 1. Condenser fins are clogged. 2. Improper fan rotation of cooling fan 	 Clean condenser. Check and repair cooling fan if necessary.
	 Low-pressure pipe is not cold. When compressor is stopped high-pressure value quickly drops by approximately 196 kPa (2 kg/cm², 28 psi). It then decreases gradually thereafter. 	Poor heat exchange in con- denser (After compressor operation stops, high-pressure decreas- es too slowly.) ↓ Air in refrigeration cycle	Evacuate and recharge system.
AC359A	Engine tends to overheat.	Engine cooling systems mal- function.	Check and repair engine cool- ing system.
	 An area of the low-pressure pipe is colder than areas near the evaporator outlet. Plates are sometimes cov- ered with frost. 	 Excessive liquid refrigerant on low-pressure side Excessive refrigerant dis- charge flow Expansion valve is open a lit- tle compared with the speci- fication. ↓ Improper expansion valve ad- justment 	Replace expansion valve.

High-pressure Side is Too High and Low-pressure Side is Too Low

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
High-pressure side is too high and low-pressure side is too low.	Upper side of condenser and high-pressure side are hot, however, liquid tank is not so hot.	High-pressure tube or parts lo- cated between compressor and condenser are clogged or crushed.	 Check and repair or replace malfunctioning parts. Check oil for contamination.

High-pressure Side is Too Low and Low-pressure Side is Too High

< SYMPTOM DIAGNOSIS >

[MANUAL AIR CONDITIONER]

Gauge indication	Refrigerant cycle	Probable cause	Corrective action	_
High-pressure side is too low and low-pressure side is too high.	High- and low-pressure sides become equal soon after com- pressor operation stops.	Compressor pressure opera- tion is improper. ↓ Damaged inside compressor packings.	Replace compressor.	
	No temperature difference be- tween high- and low-pressure sides.	Compressor pressure opera- tion is improper. ↓ Damaged inside compressor packings.	Replace compressor.	

Both High- and Low-pressure Sides are Too Low

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
	 There is a big temperature difference between liquid tank outlet and inlet. Outlet temperature is extremely low. Liquid tank inlet and expansion valve are frosted. 	Liquid tank inside is slightly clogged.	 Replace liquid tank. Check oil for contamination.
	 Temperature of expansion valve inlet is extremely low as compared with areas near liquid tank. Expansion valve inlet may be frosted. Temperature difference oc- curs somewhere in high- pressure side. 	High-pressure pipe located be- tween liquid tank and expan- sion valve is clogged.	 Check and repair malfunc- tioning parts. Check oil for contamination.
Dioth high- and low-pressure sides re too low.	Expansion valve and liquid tank are warm or only cool when touched.	Low refrigerant charge. ↓ Leaking fittings or compo- nents.	Check refrigerant system for leaks. Refer to <u>HA-31, "Check-</u> ing of <u>Refrigerant Leaks"</u> .
	There is a big temperature dif- ference between expansion valve inlet and outlet while the valve itself is frosted.	 Expansion valve closes a little compared with the specification. ↓ 1. Improper expansion valve adjustment. 2. Malfunctioning expansion valve. 3. Outlet and inlet may be clogged. 	 Remove foreign particles by using compressed air. Check oil for contamination.
	An area of the low-pressure pipe is colder than areas near the evaporator outlet.	Low-pressure pipe is clogged or crushed.	Check and repair malfunc- tioning parts.Check oil for contamination.
	Air flow volume is too low.	Evaporator is frozen.	 Check intake sensor circuit. Refer to <u>HAC-161</u>, <u>"Intake</u> <u>Sensor Diagnosis Proce-</u> <u>dure"</u>. Replace compressor. Replace evaporator fins. Replace evaporator. Refer to <u>HAC-149</u>, <u>"Front</u> <u>Blower Motor Component</u> <u>Function Check"</u>.

Low-pressure Side Sometimes Becomes Negative

< SYMPTOM DIAGNOSIS >

[MANUAL AIR CONDITIONER]

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
E Low-pressure side sometimes be- comes negative.	 Air conditioning system does not function and does not cy- clically cool the compart- ment air. The system constantly func- tions for a certain period of time after compressor is stopped and restarted. 	Refrigerant does not discharge cyclically. ↓ Moisture is frozen at expan- sion valve outlet and inlet. ↓ Water is mixed with refrigerant.	 Drain water from refrigerant or replace refrigerant. Replace liquid tank.

Low-pressure Side Becomes Negative

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
E Low-pressure side becomes nega- tive.	Liquid tank or front/rear side of expansion valve's pipe is frost- ed or dewed.	High-pressure side is closed and refrigerant does not flow. ↓ Expansion valve or liquid tank is frosted.	 Leave the system at rest until no frost is present. Start it again to check whether or not the malfunction is caused by water or foreign particles. If water is the cause, initially cooling is okay. Then the water freezes causing a blockage. Drain water from refrigerant or replace refrigerant. If due to foreign particles, remove expansion valve and remove the particles with dry and compressed air (not shop air). If either of the above methods cannot correct the malfunction, replace expansion valve. Replace liquid tank. Check oil for contamination.

< SYMPTOM DIAGNOSIS > [MANUAL AIR CO	NDITIONER]
INSUFFICIENT HEATING	
Component Function Check	A
SYMPTOM: Insufficient heating	В
INSPECTION FLOW	D
1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - TEMPERATURE INCR	EASE
 Rotate blower control dial clockwise. Turn the temperature control dial clockwise to maximum heat. Check for hot air at discharge air outlets. 	C
Can the symptom be duplicated?	
YES >> GO TO 2. NO >> Perform complete operational check (front). Refer to <u>HAC-125, "Operational Check</u>	<u>-</u> E
2. CHECK FOR SERVICE BULLETINS	
Check for any service bulletins.	F
>> GO TO 3.	1
3. CHECK ENGINE COOLING SYSTEM	
1. Check for proper engine coolant level.	G
2. Check hoses for leaks or kinks.	
 Check radiator cap. Refer to <u>CO-18. "Checking Radiator"</u>. Check for air in cooling system. 	Н
	_
>> GO TO 4. 4. CHECK AIR MIX DOOR OPERATION	HA
Check the operation of the air mix door. Is the inspection result normal?	J
YES >> GO TO 5. NO >> Check the air mix door motor circuit. Refer to <u>HAC-143</u> , "Air <u>Mix Door Motor Compo</u>	ment Function
Check".	K
5. CHECK AIR DUCTS	
Check for disconnected or leaking air ducts.	L
Is the inspection result normal? YES >> GO TO 6.	
NO >> Repair all disconnected or leaking air ducts.	M
6. CHECK HEATER HOSE TEMPERATURES	
1. Start engine and warm it up to normal operating temperature.	N
 Touch both the inlet and outlet heater hoses. Is the inspection result normal? 	14
YES \rightarrow Hot inlet hose and a warm outlet hose: GO TO 7.	
NO >> Both hoses warm: GO TO 8.	0
7.CHECK ENGINE COOLANT SYSTEM	
Check engine coolant temperature sensor. Refer to <u>EC-130, "Component Inspection"</u> .	P
Is the inspection result normal? YES >> System OK.	
YES >> System OK. NO >> Repair or replace as necessary. Retest.	
8. CHECK HEATER HOSES	
Check heater hoses for proper installation.	
Is the inspection result normal?	

< SYMPTOM DIAGNOSIS >

- YES >> System OK. NO
 - >> 1. Back flush heater core.
 - 2. Drain the water from the system.
 - Refill system with new engine coolant. Refer to <u>CO-12, "Changing Engine Coolant"</u>.
 GO TO 9 to retest.

 $9. {\sf CHECK} \; {\sf HEATER} \; {\sf HOSE} \; {\sf TEMPERATURES}$

- 1. Start engine and warm it up to normal operating temperature.
- Touch both the inlet and outlet heater hoses. 2.

Is the inspection result normal?

- YES >> System OK.
- NO >> Replace heater core. Refer to VTL-26, "Removal and Installation".

< PRECAUTION > PRECAUTION

PRECAUTIONS

Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSION-ER"

The Supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER", used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted. Information necessary to service the system safely is included in the SR and SB section of this Service Manual.

WARNING:

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the SR section.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.

Working with HFC-134a (R-134a)

WARNING:

- CFC-12 (R-12) refrigerant and HFC-134a (R-134a) refrigerant are not compatible. If the refrigerants HAC are mixed compressor failure is likely to occur. Refer to <u>HA-4</u>, <u>"Contaminated Refrigerant"</u>. To determine the purity of HFC-134a (R-134a) in the vehicle and recovery tank, use Refrigerant Recovery/ Recycling Recharging equipment and Refrigerant Identifier.
- Use only specified oil for the HFC-134a (R-134a) A/C system and HFC-134a (R-134a) components. If oil other than that specified is used, compressor failure is likely to occur.
- The specified HFC-134a (R-134a) oil rapidly absorbs moisture from the atmosphere. The following handling precautions must be observed:
- When removing refrigerant components from a vehicle, immediately cap (seal) the component to minimize the entry of moisture from the atmosphere.
- When installing refrigerant components to a vehicle, do not remove the caps (unseal) until just before connecting the components. Connect all refrigerant loop components as quickly as possible to minimize the entry of moisture into system.
- Only use the specified oil from a sealed container. Immediately reseal containers of oil. Without proper sealing, oil will become moisture saturated and should not be used.
- Avoid breathing A/C refrigerant and oil vapor or mist. Exposure may irritate eyes, nose and throat. Remove HFC-134a (R-134a) from the A/C system using certified service equipment meeting requirements of SAE J2210 [HFC-134a (R-134a) recycling equipment], or J2209 [HFC-134a (R-134a) recycling equipment], If accidental system discharge occurs, ventilate work area before resuming service. Additional health and safety information may be obtained from refrigerant and oil manufacturers.
- Do not allow A/C oil to come in contact with styrofoam parts. Damage may result.

CONTAMINATED REFRIGERANT

If a refrigerant other than pure HFC-134a (R-134a) is identified in a vehicle, your options are:

- Explain to the customer that environmental regulations prohibit the release of contaminated refrigerant into the atmosphere.
- Explain that recovery of the contaminated refrigerant could damage your service equipment and refrigerant supply.
- Suggest the customer return the vehicle to the location of previous service where the contamination may have occurred.
- If you choose to perform the repair, recover the refrigerant using only **dedicated equipment and contain**ers. Do not recover contaminated refrigerant into your existing service equipment. If your facility does

PRECAUTIONS

< PRECAUTION >

[MANUAL AIR CONDITIONER]

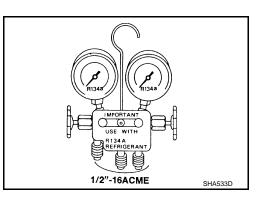

not have dedicated recovery equipment, you may contact a local refrigerant product retailer for available service. This refrigerant must be disposed of in accordance with all federal and local regulations. In addition, replacement of all refrigerant system components on the vehicle is recommended.

• If the vehicle is within the warranty period, the air conditioner warranty is void. Please contact NISSAN Customer Affairs for further assistance.

Precaution for Service Equipment

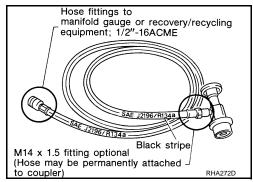

MANIFOLD GAUGE SET

Be certain that the gauge face indicates R-134a or 134a. Make sure the gauge set has 1/2"-16 ACME threaded connections for service hoses. Confirm the set has been used only with refrigerant HFC-134a (R-134a) along with specified oil.

SERVICE HOSES

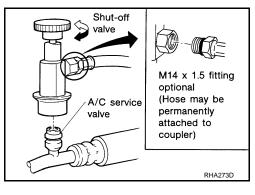

Be certain that the service hoses display the markings described (colored hose with black stripe). All hoses must include positive shutoff devices (either manual or automatic) near the end of the hoses opposite the manifold gauge.

SERVICE COUPLERS

Never attempt to connect HFC-134a (R-134a) service couplers to a CFC-12 (R-12) A/C system. The HFC-134a (R-134a) couplers will not properly connect to the CFC-12 (R-12) system. However, if an improper connection is attempted, discharging and contamination may occur.

Shut-off valve rotation	A/C service valve
Clockwise	Open
Counterclockwise	Close
