INSPECTION AND ADJUSTMENT

Operational Check (Front)

The purpose of the operational check is to confirm that the system operates properly.

Conditions : Engine running and at normal operating temperature

CHECKING MEMORY FUNCTION

- 1. Set the temperature to 32° (90°F).
- 2. Press the OFF switch.
- 3. Turn ignition switch OFF.
- 4. Turn ignition switch ON.
- 5. Press the AUTO switch.
- 6. Confirm that the set temperature remains at previous temperature.
- 7. Press the OFF switch.

If NG, go to trouble diagnosis procedure for <u>HAC-120</u>, "<u>Memory Function Check</u>". If OK, continue with next check.

CHECKING BLOWER

- 1. Press the blower speed control switch (+) once, blower should operate on low speed. The fan display should have one bar lit (on display).
- 2. Press the blower speed control switch (+) again, and continue checking blower speed and fan display until all speeds are checked.
- 3. Leave blower on maximum speed.

If NG, go to trouble diagnosis procedure for <u>HAC-48</u>, "Front Blower Motor Diagnosis Procedure". If OK, continue with next check.

CHECKING DISCHARGE AIR

- 1. Press MODE switch four times and the DEF \mathbf{G} switch.
- 2. Each position indicator should change shape (on display).
- 3. Confirm that discharge air comes out according to the air distribution table. Refer to <u>HAC-16. "Discharge</u> <u>Air Flow (Front)"</u>.

Mode door position is checked in the next step.

If NG, go to trouble diagnosis procedure for <u>HAC-26</u>, "<u>Mode Door Motor (Front) Diagnosis Procedure</u>". If OK, continue the check.

NOTE:

Confirm that the compressor clutch is engaged (sound or visual inspection) and intake door position is at fresh when the DEF or D/F is selected.

CHECKING RECIRCULATION (*, * ONLY)

- 1. Press recirculation (
- 2. Press recirculation (
- 3. Listen for intake door position change (blower sound should change slightly).

If NG, go to trouble diagnosis procedure for <u>HAC-40, "Intake Door Motor Diagnosis Procedure"</u>. If OK, continue the check.

NOTE:

Confirm that the compressor clutch is engaged (sound or visual inspection) and intake door position is at fresh when the DEF or D/F is selected. REC (\frown) is not allowed in DEF () D/F () or FOOT (\checkmark).

CHECKING TEMPERATURE DECREASE

- 1. Rotate temperature control dial (drive or passenger) counterclockwise until 18°C (60°F) is displayed.
- 2. Check for cold air at appropriate discharge air outlets.

INFOID:000000005147669

INSPECTION AND ADJUSTMENT

[AUTOMATIC AIR CONDITIONER]

< BASIC INSPECTION >

INSPECTION AND ADJUSTMENT

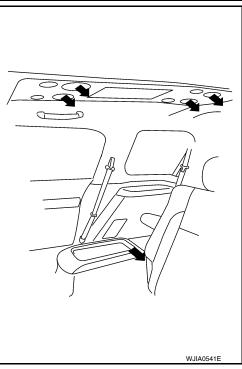

< BASIC INSPECTION >

- [AUTOMATIC AIR CONDITIONER]
- The REAR CTRL indicator must be off. Press each rear air control (front) mode door switches and confirm the discharge air comes out relative to the icon on each switch and according to the air distribution table. Refer to <u>HAC-16</u>, "<u>Discharge Air Flow</u> (<u>Rear</u>)".
- 2. Press the REAR CTRL switch (indicator on) from the rear air control (front).
- Press each rear air control (rear) mode door switches and confirm the discharge air comes out relative to the icon on each switch and according to the air distribution table. Refer to <u>HAC-</u><u>16</u>, "Discharge Air Flow (Rear)".

Air mix door position is checked in the next step.

If NG, go to <u>HAC-31</u>, "Air Mix Door Motor (Driver) Component Function Check".

If OK, continue with next check.

CHECKING REAR TEMPERATURE DECREASE

- 1. Press the REAR CTRL switch (indicator off).
- 2. Rotate the rear air control (front) temperature control dial counterclockwise to maximum cold.
- 3. Check for cold air at appropriate discharge air outlets.
- 4. Press the REAR CTRL switch (indicator on) from the rear air control (front).
- 5. Rotate the rear air control (rear) temperature control dial counterclockwise to maximum cold.
- 6. Check for cold air at appropriate discharge air outlets.

If NG, listen for sound of air mix door motor operation. If OK, go to trouble diagnosis procedure for <u>HAC-31</u>, <u>"Air Mix Door Motor (Driver) Component Function Check"</u>. If air mix door motor appears to be malfunctioning, go to <u>HAC-59</u>, "Air Mix Door Motor (Rear) Diagnosis Procedure".

If OK, continue with next check.

CHECKING REAR TEMPERATURE INCREASE

- 1. Press the REAR CTRL switch (indicator off).
- 2. Rotate the rear air control (front) temperature control dial clockwise to maximum heat.
- 3. Check for hot air at appropriate discharge air outlets.
- 4. Press the REAR CTRL switch (indictor on) from the rear air control (front).
- 5. Rotate the rear air control (rear) temperature control dial clockwise to maximum heat.
- 6. Check for hot air at appropriate discharge air outlets.

If NG, listen for sound of air mix door motor operation. If OK, go to trouble diagnosis procedure for <u>HAC-31</u>, <u>"Air Mix Door Motor (Driver) Component Function Check"</u>. If air mix door motor appears to be malfunctioning, go to <u>HAC-59</u>, "Air Mix Door Motor (Rear) Diagnosis Procedure".

If NG, go to trouble diagnosis procedure for <u>HAC-116</u>, "Component Function Check".

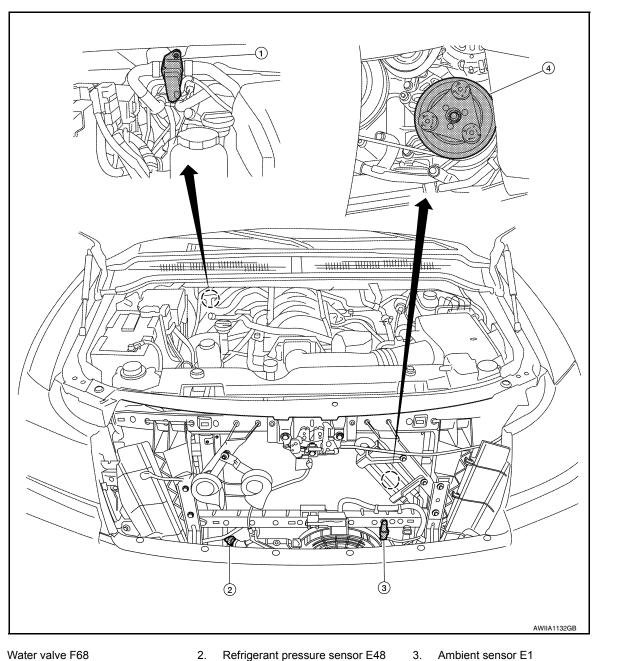

If all operational checks are OK (symptom cannot be duplicated), go to <u>HAC-3</u>, "<u>How to Perform Trouble Diag-nosis For Quick And Accurate Repair</u>" and perform tests as outlined. If symptom appears, refer to <u>HAC-107</u>, "<u>Symptom Matrix Chart</u>" and perform applicable trouble diagnosis procedures.

Н

А

D

Ε

REFRIGERANT FLOW

The refrigerant flows in the standard pattern, that is, through the compressor, the condenser with liquid tank, through the front and rear evaporators, and back to the compressor. The refrigerant evaporation through the evaporator coils are controlled by front and rear externally equalized expansion valves, located inside the front and rear evaporator cases.

Refrigerant System Protection

Front Blower motor

INFOID:000000005197358

W.IIA1342E

Р

Ο

REFRIGERANT PRESSURE SENSOR

The refrigerant system is protected against excessively high or low pressures by the refrigerant pressure sensor, located on the condenser. If the system pressure rises above or falls below the specifications, the refrigerant pressure sensor detects the pressure inside the refrigerant line and sends a voltage signal to the ECM. The ECM de-energizes the A/C relay to disengage the magnetic compressor clutch when pressure on the high pressure side detected by refrigerant pressure sensor is over about 2,746 kPa (28 kg/cm², 398 psi), or below about 120 kPa (1.22 kg/cm², 17.4 psi).

< FUNCTION DIAGNOSIS >

PRESSURE RELIEF VALVE

The refrigerant system is also protected by a pressure relief valve, located in the rear head of the compressor. When the pressure of refrigerant in the system increases to an abnormal level [more than 2,990 kPa ($30.5 \text{ kg/} \text{ cm}^2$, 433.6 psi)], the release port on the pressure relief valve automatically opens and releases refrigerant into the atmosphere.

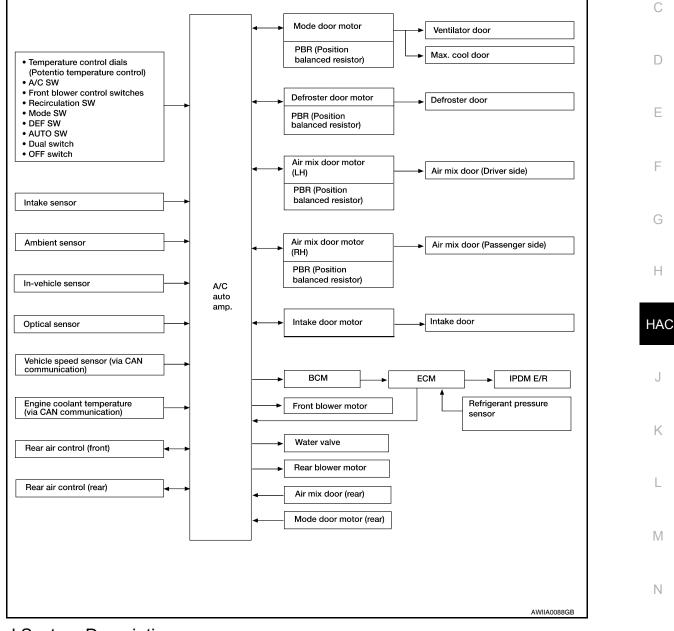

< FUNCTION DIAGNOSIS >

AUTOMATIC AIR CONDITIONER SYSTEM

Control System Diagram

CONTROL SYSTEM

The control system consists of input sensors, switches, the A/C auto amp.(microcomputer) and outputs. The relationship of these components is shown in the figure below:

Control System Description

PUSH AUTO	OFF	\$; -			PUSH DUAL
					AWIIA0081ZZ

DISPLAY SCREEN

Displays the operational status of the system.

AUTO SWITCH

- The compressor, intake door, air mix doors, outlet doors and blower speed are automatically controlled so that the in-vehicle temperature will reach, and be maintained at the set temperature selected by the operator.
- When pressing AUTO switch, air inlet, air outlet, blower speed, and discharge air temperature are automatically controlled.

TEMPERATURE CONTROL DIAL (DRIVER)

Increases or decreases the set temperature.

TEMPERATURE CONTROL DIAL (PASSENGER)

Increases or decreases the set temperature.

RECIRCULATION (

- When REC switch is ON, REC switch indicator turns ON, and air inlet is set to REC.
- When REC switch is turned OFF, or when compressor is turned from ON to OFF, REC switch is automatically turned OFF. REC mode can be re-entered by pressing REC switch again.
- REC switch is not operated when DEF switch is turned ON, at the D/F position, or in floor position.

DEFROSTER (@) SWITCH

Positions the air outlet doors to the defrost position. Also positions the intake doors to the outside air position, and turns A/C compressor ON.

REAR WINDOW DEFOGGER SWITCH

When switch is ON, rear window and door mirrors are defogged.

OFF SWITCH

The compressor and blower are OFF, the intake doors are set to the outside air position, and the air outlet doors are set to the foot (75% foot and 25% defrost) position.

A/C SWITCH

The compressor is ON or OFF. (Pressing the A/C switch when the AUTO switch is ON will turn off the A/C switch and compressor.)

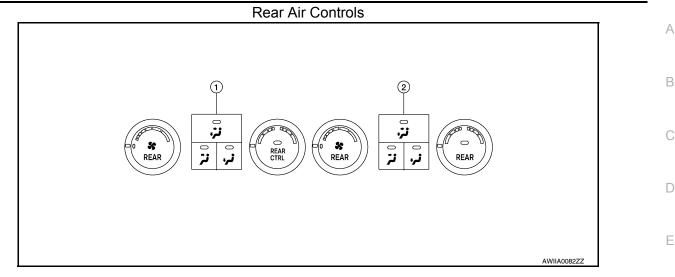

MODE SWITCH

Controls the air discharge outlets.

FRONT BLOWER CONTROL SWITCHES Manually control the blower speed.

< FUNCTION DIAGNOSIS >

[AUTOMATIC AIR CONDITIONER]

1. Rear air control (front)2. Rear air control (rear)

REAR TEMPERATURE CONTROL DIAL (FRONT/REAR)

The temperature increases or decreases the set temperature.

REAR MODE SWITCHES (FRONT/REAR)

Controls the air discharge outlets.

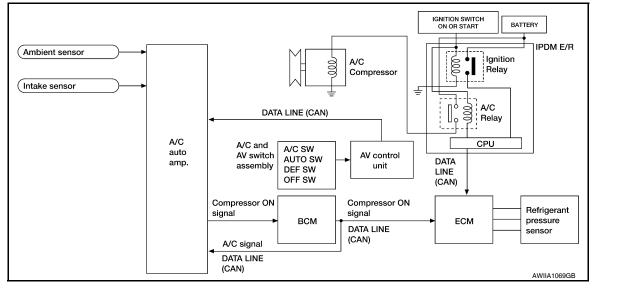

REAR BLOWER CONTROL DIAL (FRONT)

When the REAR CTRL switch is in the off (indicator off) the rear air control (front) controls the rear blower motor speed regardless of the rear air control (rear) blower control dial (rear) position. The rear air control (front) controls the blower motor speed.

REAR BLOWER CONTROL DIAL (REAR)

When the REAR CTRL switch is in the on (indicator on) the rear air control (rear) controls the rear blower motor speed regardless of the rear air control (front) blower control dial (front) position. The rear air control (rear) controls the blower motor speed.

MAGNET CLUTCH CONTROL

When A/C switch or DEF switch is pressed, A/C auto amp. inputs compressor ON signal to BCM. BCM sends compressor ON signal to ECM and A/C auto amp., via CAN communication line. ECM judges whether compressor can be turned ON, based on each sensor status (refrigerant pressure sensor signal, throttle angle sensor, etc.). If it judges compressor can be turned ON, it sends compressor ON signal to IPDM E/R, via CAN communication line.

RR FDBCK	"V"	Displays air mix door motor (rear) feedback signal.
DEF FDBCK	"V"	Displays defroster door motor feedback signal.

DIAGNOSIS SYSTEM (BCM)

CONSULT-III Function (BCM - COMMON ITEM)

APPLICATION ITEM

CONSULT-III performs the following functions via CAN communication with BCM.

Diagnosis mode	Function Description	С
WORK SUPPORT	Changes the setting for each system function.	
SELF-DIAG RESULTS	Displays the diagnosis results judged by BCM. Refer to BCS-54, "DTC Index".	
CAN DIAG SUPPORT MNTR	Monitors the reception status of CAN communication viewed from BCM.	D
DATA MONITOR	The BCM input/output signals are displayed.	
ACTIVE TEST	The signals used to activate each device are forcibly supplied from BCM.	E
ECU IDENTIFICATION	The BCM part number is displayed.	
CONFIGURATION	Enables to read and save the vehicle specification.Enables to write the vehicle specification when replacing BCM.	F

SYSTEM APPLICATION

BCM can perform the following functions for each system.

NOTE:

It can perform the diagnosis modes except the following for all sub system selection items.

Questeare			Diagnosis mode		Н

SELF-DIAGNOSIS FUNCTION

A/C Auto Amp. Self-Diagnosis

A/C SYSTEM SELF-DIAGNOSIS FUNCTION

The self-diagnosis function is built into the A/C auto amp. to quickly locate the cause of malfunctions.

DESCRIPTION

The self-diagnostic system diagnoses sensors, CAN system, and battery voltage on A/C auto amp. Refer to applicable sections (items) for details. Fault codes (if any are present) will be displayed in the ambient temperature display area. Refer to HAC-24, "A/C System Self-Diagnosis Code Chart".

SELF-DIAGNOSTIC MODE

NOTE:

Radio must be off.

- On the A/C and AV switch assembly, press the "SETTING" but-1. ton and twist the volume knob clockwise and counterclockwise until the Self-Diagnosis screen shows on the display.
- 2. Scroll down to "Confirmation/Adjustment" and press the "ENTER" button.
- Scroll down to "Climate Control" and press the "ENTER" button. 3.
- The fan bars will flash on the display during the self-test, and 4. then the fault codes will display in the ambient temperature area. They will continue scrolling until diagnostic mode is exited.
- Exit by pressing the "BACK" button on A/C and AV switch 5. assembly until display returns to its normal operation screen. HVAC system will be OFF.

SELF-DIAGNOSIS FUNCTION

< FUNCTION DIAGNOSIS >

- Press the "BACK" switch and the "UP" switch within 10 seconds after turning the ignition switch from OFF to ACC and hold them for 3 seconds or more. Then the buzzer sounds, all indicators of the preset switch illuminate, and the self-diagnosis mode starts.
- The continuity of each switch and control dials (A/C and AV switch assembly only) at the ON position can be checked by pressing each switch and turning each control dial. The buzzer sounds and LED's will illuminate if the switch is normal.

COMPONENT DIAGNOSIS А MODE DOOR MOTOR System Description INFOID:000000005147687 SYSTEM DESCRIPTION **Component Parts** Mode door control system components are: • A/C auto amp. D A/C and AV switch assembly Mode door motor (front) PBR (built into mode door motor) In-vehicle sensor Е Ambient sensor Optical sensor Intake sensor F System Operation The mode door position (vent, B/L, foot, D/F, and defrost) is set by the A/C auto amp. by means of the mode door motor (front). When a mode door position is selected on the A/C auto amp., voltage is applied to one circuit of the mode door motor (front) while ground is applied to the other circuit, causing the mode door motor (front) to rotate. The direction of rotation is determined by which circuit has voltage applied to it, and which one has ground applied to it. The A/C auto amp. monitors the mode door position by measuring the voltage signal Н on the PBR circuit. In AUTO mode the mode door position is set by the A/C auto amp, which determines the proper position based on inputs from the in-vehicle sensor, ambient sensor, optical sensor, intake sensor, and the temperature selected by the driver or passenger. HAC

Mode Door Control Specification COMPONENT DESCRIPTION

Mode Door Motor (Front)

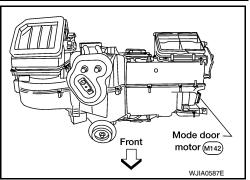

MODE DOOR MOTOR

< COMPONENT DIAGNOSIS >

The mode door motor (front) is attached to the heater & cooling unit assembly. It rotates so that air is discharged from the outlet as indicated by the A/C auto amp. Motor rotation is conveyed to a link which activates the mode door.

INSPECTION FLOW

1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - DISCHARGE AIR

- 1. Press mode switch four times and then press the 🗰 (DEF) switch. Each position indicator should change shape (on display).
- Confirm that discharge air comes out according to the air distribution table. Refer to <u>HAC-16</u>, "<u>Discharge</u> <u>Air Flow (Front)</u>".
 - NOTE:

Confirm that the compressor clutch is engaged (visual inspection) and intake door position is at FRESH when DEF (\mathfrak{P}) or D/F (\mathfrak{P}) is selected.

Is the inspection result normal?

- YES >> Inspection End.
- NO >> Go to diagnosis procedure. Refer to <u>HAC-26</u>, "<u>Mode Door Motor (Front) Diagnosis Procedure</u>".
- Mode Door Motor (Front) Diagnosis Procedure

INFOID:000000005147689

Regarding Wiring Diagram information, refer to HAC-91, "Wiring Diagram".

SYMPTOM:

- Air outlet does not change.
- Mode door motor does not operate normally.

1.CHECK A/C AUTO AMP. FOR POWER AND GROUND

- 1. Turn ignition switch ON.
- 2. Press the mode switch to the B/L (💙) mode.
- Check voltage between A/C auto amp. harness connector M49 terminal 19 and terminal 20 while pressing the mode switch to the floor (1) mode.

System Description

SYMPTOM:

- Discharge air temperature does not change.
- Air mix door motor does not operate.

SYSTEM DESCRIPTION

Component Parts

Air mix door control system components are:

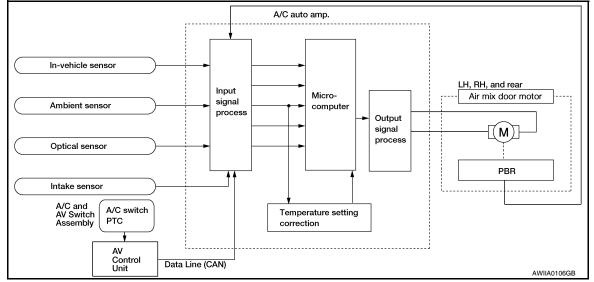

- A/C auto amp.
- A/C and AV switch assembly
- Air mix door motors (driver, passenger, and rear)
- PBR (built-into air mix door motors)
- In-vehicle sensor
- · Ambient sensor
- · Optical sensor
- Intake sensor

System Operation

The A/C auto amp. receives data from the temperature selected by the driver side, passenger side, and rear. The A/C auto amp. then applies a voltage to one circuit of the appropriate air mix door motor, while ground is applied to the other circuit, causing the appropriate air mix door motor to rotate. The direction of rotation is determined by which circuit has voltage applied to it, and which one has ground applied to it. The A/C auto amp. monitors the air mix door positions by measuring the voltage signal on the PBR circuits of each door.

In AUTO mode the air mix, intake, mode door, and defrost door positions are set by the A/C auto amp. which determines the proper position based on inputs from the in-vehicle sensor, ambient sensor, optical sensor, intake sensor, and the temperature selected by the driver and front and rear passengers.

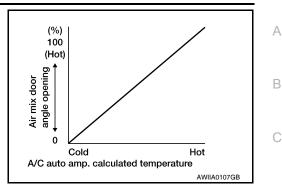

Subsequently, HOT/COLD or DEFROST/VENT or FRESH/RECIRCULATION operation is selected. The new door position data is returned to the A/C auto amp.

INFOID:000000005147690

< COMPONENT DIAGNOSIS >

Air Mix Door Control Specification

Front

COMPONENT DESCRIPTION

Air Mix Door Motors (front)

The driver (1) and passenger (2) air mix door motors are attached to the front heater & cooling unit assembly. These motors rotate so that the air mix door is opened or closed to a position set by the A/C auto amp. Motor rotation is then conveyed through a shaft and the air mix door position is then fed back to the A/C auto amp. by the PBR built into the air mix door motors.

Air Mix Door Motor (rear)

The air mix door motor (rear) (1) is attached to the rear heater & cooling unit assembly. These motors rotate so that the air mix door is opened or closed to a position set by the front (or rear) air control. Motor rotation is then conveyed through a shaft and the air mix door position is then fed back to the A/C auto amp. by the PBR built into the air mix door motors.

INSPECTION FLOW

1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - TEMPERATURE INCREASE

- 1. Turn the temperature control dial (driver) clockwise until 32°C (90°F) is displayed.
- 2. Check for hot air at discharge air outlets.

>> GO TO 2.

2.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - TEMPERATURE DECREASE

1. Turn the temperature control dial (driver) counterclockwise until 18°C (60°F) is displayed.

2. Check for cold air at discharge air outlets.

Is the inspection result normal?

YES >> Inspection End.

NO >> Go to diagnosis procedure. Refer to <u>HAC-32</u>, "Air Mix Door Motor (Driver) Diagnosis Procedure".

INTAKE DOOR MOTOR А System Description INFOID:000000005147694 SYSTEM DESCRIPTION В SYMTOM: Intake door motor does not operate normally. Intake door does not change. SYSTEM DESCRIPTION **Component Parts** D Intake door control system components are: A/C auto amp. Ε A/C and AV switch assembly Intake door motor (PRB built into the intake door motor) In-vehicle sensor

- Ambient sensor
- · Optical sensor
- Intake sensor

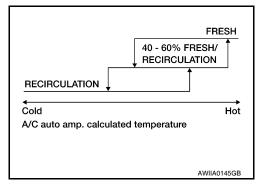

System Operation

The intake door control determines the intake door position based on the position of the recirculation switch. When the recirculation switch is depressed the intake door motor rotates closing off the fresh air inlet and recirculating the cabin air. If the recirculation switch is depressed again, the intake door motor rotates in the opposite direction, again allowing fresh air into the cabin.

In the AUTO mode, the A/C auto amp. determines the intake door position based on the ambient temperature, the intake air temperature and the in-vehicle temperature. When the DEF, D/F, FLOOR or OFF switches are pushed, the A/C auto amp. sets the intake door at the fresh position.

Intake Door Control Specification

Ρ

Н

HAC

< COMPONENT DIAGNOSIS >

COMPONENT DESCRIPTION

Intake door motor

The intake door motor is attached to the intake unit. It rotates so that air is drawn from inlets set by the A/C auto amp. Motor rotation is conveyed to a lever which activates the intake door.

Intake Door Motor Component Function Check

INSPECTION FLOW

1. CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - REC (\bigcirc)

- 1. Press the mode switch to vent mode(").
- 2. Press REC () switch. The REC () indicator should illuminate.
- 3. Press REC (() switch again. The REC () indicator should go out.
- 4. Listen for intake door position change (you should hear blower sound change slightly).

Is the inspection result normal?

- YES >> Inspection End.
- NO >> Go to diagnosis procedure. Refer to HAC-40, "Intake Door Motor Diagnosis Procedure".

Intake Door Motor Diagnosis Procedure

Regarding Wiring Diagram information, refer to HAC-91, "Wiring Diagram".

SYMPTOM:

- Intake door does not change.
- Intake door motor does not operate normally.

DIAGNOSTIC PROCEDURE FOR INTAKE DOOR MOTOR

1. CHECK A/C AUTO AMP. FOR POWER AND GROUND

1. Turn ignition switch ON.

 Check voltage between A/C auto amp. harness connector M49 terminal 21 and terminal 22 while placing the HVAC system into self-diagnostic mode.

DEFROSTER DOOR MOTOR CIRCUIT

System Description

SYSTEM DESCRIPTION

Component Parts

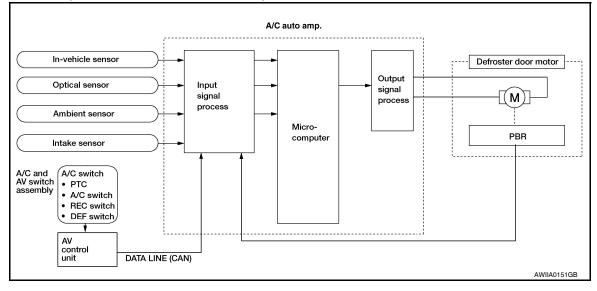

Defroster door control system components are:

- A/C auto amp.
- A/C and AV switch assembly
- Defroster door motor
- PBR (Built into defroster door motor)
- In-vehicle sensor
- Ambient sensor
- · Optical sensor
- Intake sensor

System Operation

The A/C auto amp. determines defroster door position based on the position of the defroster switch. When the defroster switch is depressed, the defroster door motor rotates directing air to the defroster ducts. When any mode other than defroster is selected, the defroster motor rotates in the opposite direction closing off air flow to the defroster ducts.

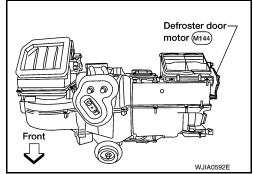

In the AUTO mode, the A/C auto amp. determines defroster door position based on the ambient temperature, the intake air temperature and the in-vehicle temperature.

COMPONENT DESCRIPTION

Defroster door motor

The defroster door motor is attached to the front heater & cooling unit assembly. The A/C auto amp. sends a voltage to rotate to the defroster door directing the air flow either to the defroster ducts, or to the floor ducts, depending on which way the voltage and ground are applied to the motor leads. Motor rotation is conveyed to a lever which activates the defroster door.

[AUTOMATIC AIR CONDITIONER]

< COMPONENT DIAGNOSIS >

BLOWER MOTOR CONTROL SYSTEM

System Description

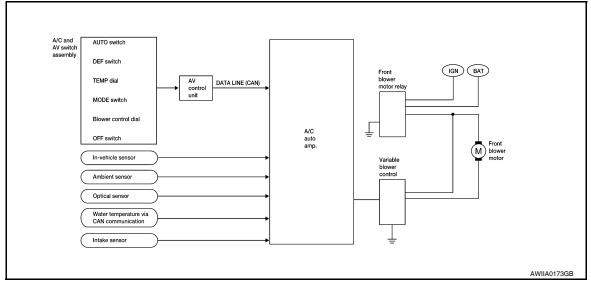

SYSTEM DESCRIPTION

Component Parts

Blower speed control system components are:

- A/C auto amp.
- A/C and AV switch assembly
- Variable blower control
- Front blower motor relay
- · Front blower motor
- · In-vehicle sensor
- · Ambient sensor
- Optical sensor
- Intake sensor

System Operation

Automatic Mode

In the automatic mode, the blower motor speed is calculated by the A/C auto amp. and variable blower control based on input from the in-vehicle sensor, optical sensor, intake sensor and ambient sensor, and potentio temperature control (PTC).

When the air flow is increased, the blower motor speed is adjusted gradually to prevent a sudden increase in M air flow.

In addition to manual air flow control and the usual automatic air flow control, starting air flow control, low water temperature starting control and high passenger compartment temperature starting control are available.

Starting Blower Speed Control

Start up from cold soak condition (Automatic mode).

In a cold start up condition where the engine coolant temperature is below 50°C (122°F), the blower will not operate at blower speed 1 for a short period of time (up to 210 seconds). The exact start delay time varies depending on the ambient and engine coolant temperatures.

In the most extreme case (very low ambient temperature) the blower starting delay will be 210 seconds as described above. After the coolant temperature reaches 50°C (122°F), or the 210 seconds has elapsed, the blower speed will increase to the objective blower speed.

Start up from usual operating or hot soak condition (Automatic mode).

The blower will begin operation momentarily after the AUTO switch is pushed. The blower speed will gradually rise to the objective speed over a time period of 3 seconds or less (actual time depends on the objective blower speed).

INFOID:000000005147700

А

D

Ε

Н

HAC

Κ

L

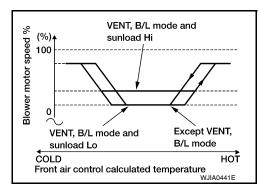

Ν

< COMPONENT DIAGNOSIS >

Blower Speed Compensation - Sunload

When the in-vehicle temperature and the set temperature are very close, the blower will be operating at low speed. The speed will vary depending on the sunload. During conditions of low or no sunload, the blower operates at low speed. During high sunload conditions, the A/C auto amp. causes the blower speed to increase.

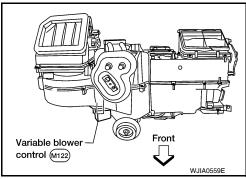

Blower Speed Control Specification

COMPONENT DESCRIPTION

Variable Blower Control

The variable blower control is located on the cooling unit. The variable blower control receives a gate voltage from the A/C auto amp. to steplessly maintain the blower motor voltage in the 0 to 5 volt range (approx.).

Front Blower Motor Component Function Check

INSPECTION FLOW

1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - FRONT BLOWER

- 1. Push blower motor (+) switch. Blower motor should operate.
- 2. Push blower motor (+) switch and continue checking blower speed and fan symbol until all speeds are checked.

Is the inspection result normal?

YES >> Inspection End.

NO >> Go to diagnosis procedure. Refer to HAC-48, "Front Blower Motor Diagnosis Procedure".

Rear Blower Motor Description

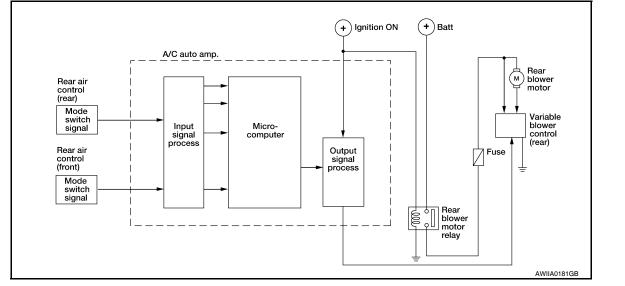

SYSTEM DESCRIPTION

Component Parts

Rear blower speed control system components are:

- · A/C auto amp.
- A/C and AV switch assembly
- Rear air control (front)
- Rear air control (rear)
- Variable blower control (rear)
- Rear blower motor
- Rear blower motor relay

System Operation

Rear Blower Control

When the rear blower control dial (front) REAR CTRL switch is pressed (indicator on), it allows the rear air control (rear) to control the rear blower motor speed. If the REAR CTRL switch is off (indicator off), the rear air control (front) controls the rear blower motor speed regardless of the rear air control (rear) position.

Rear Blower Motor Component Function Check

INSPECTION FLOW

SYMPTOM:

- Rear blower motor does not operate from the rear air control (front) and the rear air control (rear).
- Rear blower motor operates from rear air control (front) only.
- Rear blower motor operates in high at all times.

Rear Air Control System Description

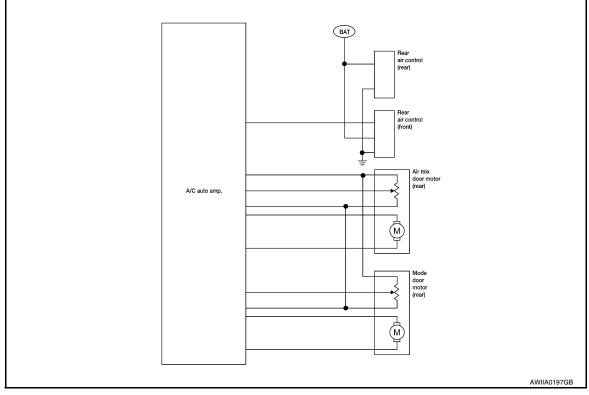

SYSTEM DESCRIPTION

Component Parts

Rear air control system components are:

- A/C auto amp.
- Rear air control (front)
- Rear air control (rear)
- Air mix door motor (rear)
- Mode door motor (rear)

System Operation

Rear Air Control

When the REAR CTRL indicator is off the rear air control (front) will control all rear blower motor speeds and the rear temperature and mode operations. When the REAR CTRL switch is pressed (indicator on), the rear air control (rear) will control all the rear blower motor speeds and the rear temperature and mode operations.

Rear Air Control Component Function Check

INFOID:000000005147710

SYMPTOM:

- Temperature cannot be adjusted from the rear air controls.
- Mode cannot be adjusted from the rear air controls.

INSPECTION FLOW

1. CHECK FOR SERVICE BULLETINS

Check for any service bulletins.

>> GO TO 2.

MAGNET CLUTCH

System Description

INFOID:000000005147713

[AUTOMATIC AIR CONDITIONER]

SYSTEM DESCRIPTION

The A/C auto amp. controls compressor operation based on ambient and intake temperature and a signal from ECM.

Low Temperature Protection Control

The A/C auto amp. will turn the compressor ON or OFF as determined by a signal detected by the intake sensor and the ambient sensor.

When intake air temperature is higher than the preset value, the compressor turns ON. The compressor turns OFF when intake air temperature is lower than the preset value. That preset value is dependent on the ambient temperature, refer to the following table.

Ambient temperature °C (°F)	Compressor ON intake temperature °C (°F)	Compressor OFF intake temperature °C (°F)
0 (32)	5.5 (42)	5.0 (41)
10 (50)	5.5 (42)	5.0 (41)
20 (68)	5.5 (42)	5.0 (41)
30 (86)	4.0 (39)	3.5 (38)
40 (104)	3.5 (38)	3.0 (37)
50 (122)	3.5 (38)	3.0 (37)

Magnet Clutch Component Function Check

WATER VALVE CIRCUIT

Description

COMPONENT DESCRIPTION

Water Valve

The water valve (1) cuts the flow of engine coolant to the front and rear heater cores to allow for maximum cooling during A/C operation. It is controlled by the A/C auto amp.

Water Valve Diagnosis Procedure

Regarding Wiring Diagram information, refer to HAC-91, "Wiring Diagram".

DIAGNOSTIC PROCEDURE FOR WATER VALVE

1.CHECK WATER VALVE POWER AND GROUND CIRCUITS

- 1. Disconnect water valve connector F68.
- 2. Turn ignition switch ON.
- 3. Rotate temperature control dial (driver) to 32°C (90°F).
- Check voltage between water valve harness connector F68 terminal 1 and terminal 2 while rotating temperature control dial (driver) to 18°C (60°F).

Connector	Те	erminals	Condition	Voltage
Connector	(+)	(-)	Condition	(Approx.)
Water valve: F68	2	1	Rotate temperature control dial	Battery voltage

AWIIA0204ZZ

 $(\mathbf{1})$

< COMPONENT DIAGNOSIS > AMBIENT SENSOR

Component Description

COMPONENT DESCRIPTION

Ambient Sensor

The ambient sensor (1) is attached on the radiator core support (left side). It detects ambient temperature and converts it into a value which is then input into the A/C auto amp.

AMBIENT TEMPERATURE INPUT PROCESS

The A/C auto amp. includes a processing circuit for the ambient sensor input. However, when the temperature detected by the ambient sensor increases quickly, the processing circuit retards the A/C auto amp. function. It only allows the A/C auto amp. to recognize an ambient temperature increase of 0.33°C (0.6°F) per 100 seconds.

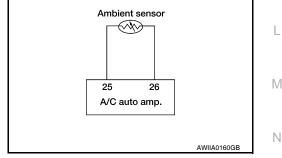

This prevents constant adjustments due to momentary conditions, such as stopping after high speed driving. Although the actual ambient temperature has not changed, the temperature detected by the ambient sensor Н will increase. This is because the heat from the engine compartment can radiate to the front grille area, location of the ambient sensor.

Ambient Sensor Diagnosis Procedure

Regarding Wiring Diagram information, refer to <u>HAC-91, "Wiring Diagram"</u>.

DIAGNOSTIC PROCEDURE FOR AMBIENT SENSOR

SYMPTOM: Ambient sensor circuit is open or shorted. (40 or 41 is indicated on A/C auto amp. as a result of conducting the A/C auto amp. self-diagnosis)

1. CHECK VOLTAGE BETWEEN AMBIENT SENSOR AND GROUND

IN-VEHICLE SENSOR

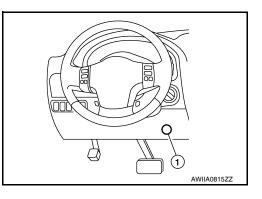

[AUTOMATIC AIR CONDITIONER]

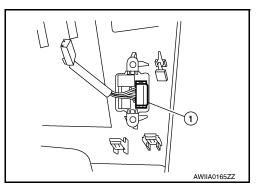

Component Description

COMPONENT DESCRIPTION

In-vehicle Sensor

The in-vehicle sensor (1) is located on the lower instrument panel LH. It converts variations in temperature of passenger compartment air (drawn in through the integrated fan) into a resistance value. It is then input into the A/C auto amp.

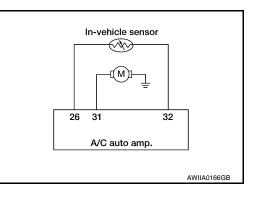

In-Vehicle Sensor Diagnosis Procedure

INFOID:000000005147722

Regarding Wiring Diagram information, refer to HAC-91, "Wiring Diagram".

DIAGNOSTIC PROCEDURE FOR IN-VEHICLE SENSOR

SYMPTOM: In-vehicle sensor circuit is open or shorted. Using the CONSULT-III, DTC B2578 or B2579 is displayed. Without a CON-SULT-III, code 30, 31, 44 or 46 is indicated on A/C auto amp. as a result of conducting self-diagnosis.

1.CHECK IN-VEHICLE SENSOR CIRCUIT

Is self-diagnosis DTC B2578 or B2579 (with CONSULT-III) or code 30, 31 44 or 46 (without CONSULT-III) present?

YES or NO?

YES >> GO TO 6. NO >> GO TO 2. INFOID:000000005147721

IN-VEHICLE SENSOR

< COMPONENT DIAGNOSIS >

- 1. Disconnect in-vehicle sensor connector.
- 2. Turn ignition switch ON.
- 3. Check voltage between in-vehicle sensor harness connector M32 terminal 4 and ground.

4 - Ground

: Approx. 5V.

Is the inspection result normal?

YES >> GO TO 3.

NO >> GO TO 5.

3.CHECK CIRCUIT CONTINUITY BETWEEN IN-VEHICLE SENSOR AND A/C AUTO AMP.

- 1. Turn ignition switch OFF.
- 2. Disconnect A/C auto amp. connector M49.
- Check continuity between in-vehicle sensor harness connector M32 (B) terminal 1 and A/C auto amp. harness connector M49 (A) terminal 26.

1 - 26

: Continuity should exist.

Is the inspection result normal?

- YES >> GO TO 4.
- NO >> Repair harness or connector.

4.CHECK IN-VEHICLE SENSOR

Check in-vehicle sensor. Refer to HAC-80, "In-Vehicle Sensor Component Inspection".

Is the inspection result normal?

- YES >> 1. Replace A/C auto amp. Refer to <u>VTL-7, "Removal and Installation"</u>.
 2. Go to <u>HAC-23, "A/C Auto Amp. Self-Diagnosis"</u> and perform self-diagnosis.
 NO >> 1. Replace in-vehicle sensor Refer to VTL-9 "Removal and Installation"
 - >> 1. Replace in-vehicle sensor. Refer to <u>VTL-9, "Removal and Installation"</u>.
 2. Go to <u>HAC-23</u>, "A/C Auto Amp. Self-Diagnosis" and perform self-diagnosis.

5. CHECK CIRCUIT CONTINUITY BETWEEN IN-VEHICLE SENSOR AND A/C AUTO AMP.

- 1. Turn ignition switch OFF.
- 2. Disconnect A/C auto amp. connector.
- Check continuity between in-vehicle sensor harness connector M32 (B) terminal 4 and A/C auto amp. harness connector M50 (A) terminal 32.

4 - 32

: Continuity should exist.

 Check continuity between in-vehicle sensor harness connector M32 (B) terminal 4 and ground.

[AUTOMATIC AIR CONDITIONER]

< COMPONENT DIAGNOSIS >

OPTICAL SENSOR

Component Description

COMPONENT DESCRIPTION

The optical sensor (1) is located in the center of the defroster grille. It detects sunload entering through windshield by means of a photo diode. The sensor converts the sunload into a current value which is then input into the A/C auto amp.

OPTICAL INPUT PROCESS

The A/C auto amp. includes a processing circuit which averages the variations in detected sunload over a period of time. This prevents adjustments in the ATC system operation due to small or quick variations in detected sunload.

For example, consider driving along a road bordered by an occasional group of large trees. The sunload detected by the optical sensor will vary whenever the trees obstruct the sunlight. The processing circuit averages the detected sunload over a period of time, so that the (insignificant) effect of the trees momentarily obstructing the sunlight does not cause any change in the ATC system operation. On the other hand, shortly after entering a long tunnel, the system will recognize the change in sunload, and the system will react accordingly. HAC

Optical Sensor Diagnosis Procedure

Regarding Wiring Diagram information, refer to HAC-91, "Wiring Diagram".

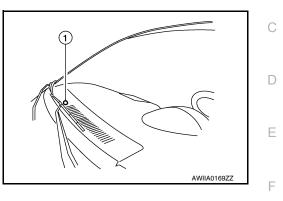

DIAGNOSTIC PROCEDURE FOR OPTICAL SENSOR

SYMPTOM: Optical sensor circuit is open or shorted. Using the CONSULT-III, DTC B257F or B2580 is displayed. Without a CON-SULT-III, code 50 or 52 is indicated on A/C auto amp. as a result of conducting self-diagnosis.

POWER SUPPLY AND GROUND CIRCUIT FOR CONTROLLER INFINIT DIAGNOSIS > [AUTOMATIC AIR CONDITIONER]

< COMPONENT DIAGNOSIS >

POWER SUPPLY AND GROUND CIRCUIT FOR CONTROLLER

Component Description

COMPONENT DESCRIPTION

A/C auto amp.

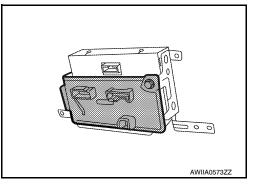

The A/C auto amp. has a built-in microcomputer which processes information sent from various sensors needed for air conditioner operation. The air mix door motors, mode door motor, intake door motor, defroster door motor, blower motor and compressor are then controlled.

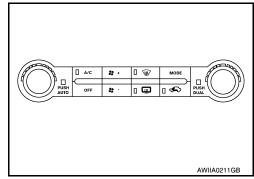

The A/C auto amp. is unitized with control mechanisms. When the various switches and temperature dials are operated, data is input to the A/C auto amp.

Self-diagnostic functions are also built into the A/C auto amp. to provide quick check of malfunctions in the auto air conditioner system.

Potentio Temperature Control (PTC)

There are two PTCs (driver and passenger) built into the A/C auto amp. They can be set at an interval of 0.5° C (1.0° F) in the 18° C (60° F) to 32° C (90° F) temperature range by rotating the temperature dial. The set temperature is displayed.

INFOID:000000005147730

A/C Auto Amp. Component Function Check

SYMPTOM: A/C system does not come on.

INSPECTION FLOW

1.CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - AUTO MODE

1. Press AUTO switch.

2. Display should indicate AUTO. Confirm that the compressor clutch engages (sound or visual inspection). (Discharge air and blower speed will depend on ambient, in-vehicle and set temperatures.)

Can a symptom be duplicated?

YES >> GO TO 3.

NO >> GO TO 2.

2. PERFORM COMPLETE OPERATIONAL CHECK

Perform a complete operational check and check for any symptoms. Refer to <u>HAC-4</u>, "<u>Operational Check</u> (<u>Front</u>)".

Can a symptom be duplicated?

YES >> Refer to <u>HAC-3, "How to Perform Trouble Diagnosis For Quick And Accurate Repair"</u>. NO >> System OK.

NO >> System OK.

3.CHECK FOR SERVICE BULLETINS

Check for any service bulletins.

INFOID:000000005147734

INSUFFICIENT COOLING

INFOID:000000005147735

Component Function Check

SYMPTOM: Insufficient cooling

INSPECTION FLOW

1. CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - TEMPERATURE DECREASE

1 Press the AUTO switch.

Turn temperature control dial (driver) counterclockwise until 18°C (60°F) is displayed. 2.

Check for cold air at discharge air outlets. 3.

Can the symptom be duplicated?

YES >> GO TO 3. NO

>> GO TO 2.

2 . CHECK FOR ANY SYMPTOMS

Perform a complete operational check for any symptoms. Refer to HAC-4. "Operational Check (Front)".

Does another symptom exist?

YES >> Refer to HAC-107, "Symptom Matrix Chart".

NO >> System OK.

3 . CHECK FOR SERVICE BULLETINS

Check for any service bulletins.

>> GO TO 4.

4.PERFORM SELF-DIAGNOSIS

Perform self-diagnosis Refer to HAC-23, "A/C Auto Amp. Self-Diagnosis".

Is the inspection result normal?

YES >> GO TO 5.

NO >> Refer to HAC-24, "A/C System Self-Diagnosis Code Chart".

5.CHECK DRIVE BELTS

Check compressor belt tension. Refer to EM-13, "Checking Drive Belts".

Is the inspection result normal?

OK >> GO TO 6.

NG >> Adjust or replace compressor belt. Refer to EM-13, "Removal and Installation".

6.CHECK AIR MIX DOOR OPERATION

Check and verify air mix door mechanism for smooth operation. Refer to HAC-31, "Air Mix Door Motor (Driver) Component Function Check".

Does air mix door operate correctly?

YES >> GO TO 7.

NO >> Check air mix door motor circuit. Refer to HAC-32, "Air Mix Door Motor (Driver) Diagnosis Procedure" or HAC-35, "Air Mix Door Motor (Passenger) Diagnosis Procedure".

7. CHECK COOLING FAN MOTOR OPERATION

Check and verify cooling fan motor for smooth operation. Refer to EC-392, "Component Inspection".

Does cooling fan motor operate correctly?

YES >> GO TO 8.

NO >> Check cooling fan motor. Refer to EC-392, "Diagnosis Procedure".

8.CHECK WATER VALVE OPERATION

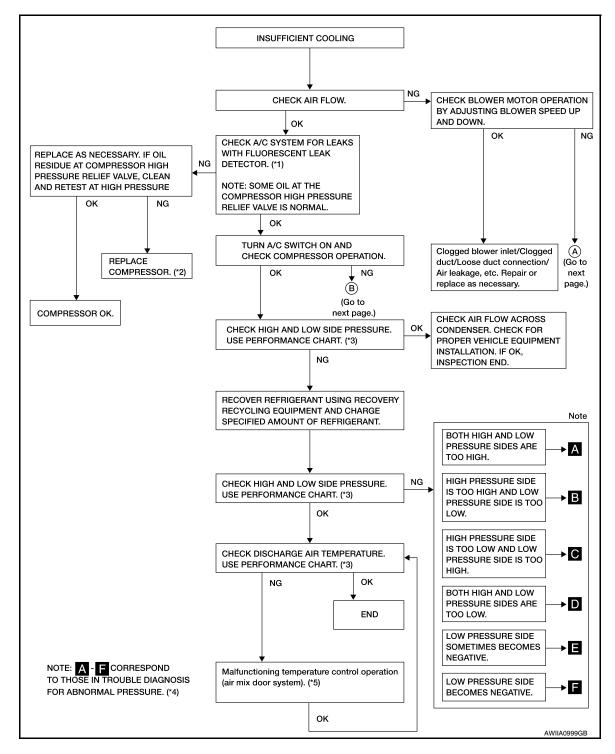

Check and verify water valve for smooth operation. Refer to HAC-73, "Description".

Does water valve operate correctly?

YES >> GO TO 9.

< SYMPTOM DIAGNOSIS > [AUTOMATIC AIR CONDITIONER]	
NO >> Check water valve circuit. Refer to <u>HAC-73</u> , "Water Valve Diagnosis Procedure".	
9. CHECK RECOVERY/RECYCLING EQUIPMENT BEFORE USAGE	А
Check recovery/recycling equipment before connecting to vehicle. Verify there is no pressure in the recovery/ recycling equipment by checking the gauges. If pressure exists, recover refrigerant from equipment lines.	В
>> GO TO 10.	
10.CHECK REFRIGERANT PURITY	С
 Connect recovery/recycling equipment to vehicle. Confirm refrigerant purity in supply tank using recovery/recycling and refrigerant identifier. <u>Is the inspection result normal?</u> YES >> GO TO 11. 	D
NO >> Check contaminated refrigerant. Refer to <u>HAC-121, "Working with HFC-134a (R-134a)"</u> . 11.CHECK FOR EVAPORATOR FREEZE UP	E
Start engine and run A/C. Check for evaporator freeze up.	
Does evaporator freeze up?YES>> Perform performance test diagnoses. Refer to <u>HAC-109, "Diagnostic Work Flow"</u> .NO>> GO TO 12.	F
12.CHECK REFRIGERANT PRESSURE	G
Check refrigerant pressure with manifold gauge connected. Refer to HAC-111. "Performance Chart". Is the inspection result normal? YES >> Perform performance test diagnoses. Refer to HAC-109. "Diagnostic Work Flow". NO >> GO TO 13.	Η
13. CHECK AIR DUCTS	HAC
Check ducts for air leaks.	
<u>Is the inspection result normal?</u> YES >> System OK. NO >> Repair air leaks.	J
Diagnostic Work Flow	K

< SYMPTOM DIAGNOSIS >

[AUTOMATIC AIR CONDITIONER]

Testing must be performed as follows:

HAC-111

< SYMPTOM DIAGNOSIS >

Vehicle location	Indoors or in the shade (in a well-ventilated place)	
Doors	Closed	
Door window	Open	
Hood	Open	
TEMP.	Max. COLD	
Mode switch	♥ (Ventilation) set	
Recirculation (REC) switch	(Recirculation) set	
St Blower speed	Max. speed set	
Engine speed	Idle speed	
Operate the air conditioning system for 10 minutes before taking measurements.		

TEST READING

Recirculating-to-discharge Air Temperature Table

Inside air (Recirculating air) at blower assembly inlet		Discharge air temperature at conter ventilator	
Relative humidity %	Air temperature °C (°F)	Discharge air temperature at center ventilator °C (°F)	
	20 (68)	9.9 - 13.9 (50 - 57)	
	25 (77)	14.6 - 18.6 (58 - 65)	
50 - 60	30 (86)	16.8 - 21.8 (62 - 71)	
	35 (95)	21.1 - 27.1 (70 - 81)	
	40 (104)	25.3 - 31.5 (78 - 89)	
	20 (68)	11.4 - 15.2 (53 - 59)	
	25 (77)	15.5 - 20.0 (60 - 68)	
60 - 70	30 (86)	19.9 - 25.0 (68 - 77)	
	35 (95)	24.5 - 29.6 (76 - 85)	
	40 (104)	28.7 - 34.9 (84 - 95)	

Ambient Air Temperature-to-operating Pressure Table

Ambient air		High-pressure (Discharge side)	Low-pressure (Suction side)	
Relative humidity %	Air temperature °C (°F)	kPa (kg/cm ² , psi)	kPa (kg/cm ² , psi)	
	20 (68)	1020 - 1250 (10.4 - 12.7, 147.9 - 181.3)	160 - 190 (1.63 - 1.94, 23.2 - 27.6)	
-	25 (77)	1236 - 1510 (12.6 - 15.4, 179.2 - 219)	206 - 245 (2.1 - 2.5, 29.9 - 35.6)	
50 - 70 30 (86)	30 (86)	1569 - 1,922 (16.0 - 19.6, 227.6 - 278.8)	265 - 324 (2.7 - 3.3, 38.4 - 46.9)	
-	35 (95)	1,697 - 2079 (17.3 - 21.2, 246.1 - 301.5)	304 - 363 (3.1 - 3.7, 44.1 - 52.6)	
-	40 (104)	1971 - 2403 (20.1 - 24.5, 285.9 - 348.5)	373 - 451 (3.8 - 4.6, 54.0 - 65.4)	

Trouble Diagnoses for Abnormal Pressure

INFOID:000000005147738

Whenever system's high and/or low side pressure is abnormal, diagnose using a manifold gauge. The marker above the gauge scale in the following tables indicates the standard (usual) pressure range. Since the stan-

< SYMPTOM DIAGNOSIS >

[AUTOMATIC AIR CONDITIONER]

А

dard (usual) pressure, however, differs from vehicle to vehicle, refer to above table (Ambient air temperatureto-operating pressure table).

Both High- and Low-pressure Sides are Too High

Gauge indication	Refrigerant cycle	Probable cause	Corrective action	В
A Both high- and low-pressure sides are too high.	Pressure is reduced soon af- ter water is splashed on con- denser.	Excessive refrigerant charge in refrigeration cycle	Reduce refrigerant until speci- fied pressure is obtained.	С
	Air suction by cooling fan is in- sufficient.	 Insufficient condenser cooling performance ↓ 1. Condenser fins are clogged. 2. Improper fan rotation of cooling fan 	 Clean condenser. Check and repair cooling fan if necessary. 	D
	 Low-pressure pipe is not cold. When compressor is stopped high-pressure value quickly drops by approximately 196 kPa (2 kg/cm², 28 psi). It then decreases gradually thereafter. 	Poor heat exchange in con- denser (After compressor operation stops, high-pressure decreas- es too slowly.) ↓ Air in refrigeration cycle	Evacuate and recharge system.	F
Ф Ф АС359А	Engine tends to overheat.	Engine cooling systems mal- function.	Check and repair engine cool- ing system.	Н
	 An area of the low-pressure pipe is colder than areas 	 Excessive liquid refrigerant on low-pressure side Excessive refrigerant dis- charge flow Expansion valve is open a lit- 		HAC
	near the evaporator outlet.Plates are sometimes covered with frost.	tle compared with the speci- fication. ↓ Improper expansion valve ad- justment	Replace expansion valve.	J

High-pressure Side is Too High and Low-pressure Side is Too Low

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
High-pressure side is too high and low-pressure side is too low.	Upper side of condenser and high-pressure side are hot, however, liquid tank is not so hot.	High-pressure tube or parts lo- cated between compressor and condenser are clogged or crushed.	 Check and repair or replace malfunctioning parts. Check oil for contamination.

High-pressure Side is Too Low and Low-pressure Side is Too High

Ρ

Κ

< SYMPTOM DIAGNOSIS >

[AUTOMATIC AIR CONDITIONER]

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
High-pressure side is too low and low-pressure side is too high.	High- and low-pressure sides become equal soon after com- pressor operation stops.	Compressor pressure opera- tion is improper. ↓ Damaged inside compressor packings.	Replace compressor.
	No temperature difference be- tween high- and low-pressure sides.	Compressor pressure opera- tion is improper. ↓ Damaged inside compressor packings.	Replace compressor.

Both High- and Low-pressure Sides are Too Low

Gauge indication	Refrigerant cycle	Probable cause	Corrective action
	 There is a big temperature difference between liquid tank outlet and inlet. Outlet temperature is extremely low. Liquid tank inlet and expansion valve are frosted. 	Liquid tank inside is slightly clogged.	Replace liquid tank.Check oil for contamination.
	 Temperature of expansion valve inlet is extremely low as compared with areas near liquid tank. Expansion valve inlet may be frosted. Temperature difference oc- curs somewhere in high- pressure side. 	High-pressure pipe located be- tween liquid tank and expan- sion valve is clogged.	 Check and repair malfunc- tioning parts. Check oil for contamination.
D Both high- and low-pressure sides are too low.	Expansion valve and liquid tank are warm or only cool when touched.	Low refrigerant charge. ↓ Leaking fittings or compo- nents.	Check refrigerant system for leaks. Refer to <u>HA-24, "Check-</u> ing of Refrigerant Leaks".
	There is a big temperature dif- ference between expansion valve inlet and outlet while the valve itself is frosted.	 Expansion valve closes a little compared with the specification. ↓ 1. Improper expansion valve adjustment. 2. Malfunctioning expansion valve. 3. Outlet and inlet may be clogged. 	 Remove foreign particles by using compressed air. Check oil for contamination.
	An area of the low-pressure pipe is colder than areas near the evaporator outlet.	Low-pressure pipe is clogged or crushed.	Check and repair malfunc- tioning parts.Check oil for contamination.
	Air flow volume is too low.	Evaporator is frozen.	 Check intake sensor circuit. Refer to <u>HAC-83</u>, "Intake <u>Sensor Diagnosis Proce-</u><u>dure"</u>. Repair evaporator fins. Replace evaporator. Refer to <u>HAC-48</u>, "Front <u>Blower Motor Component</u> <u>Function Check"</u>.

Low-pressure Side Sometimes Becomes Negative

< SYMPTOM DIAGNOSIS >

[AUTOMATIC AIR CONDITIONER]

Gauge indication	Refrigerant cycle	Probable cause	Corrective action	А
E Low-pressure side sometimes be- comes negative.	Air conditioning system does not function and does not cy- clically cool the compart-	Retriderant does not discharde	Drain water from refrigerant	В
	 ment air. The system constantly functions for a certain period of time after compressor is stopped and restarted. 	Moisture is frozen at expan- sion valve outlet and inlet. ↓ Water is mixed with refrigerant.	or replace refrigerant. • Replace liquid tank.	С
- U AC354A				D

Low-pressure Side Becomes Negative

Gauge indication	Refrigerant cycle	Probable cause	Corrective action	E
E Low-pressure side becomes nega- tive.	Liquid tank or front/rear side of expansion valve's pipe is frost- ed or dewed.	High-pressure side is closed and refrigerant does not flow. ↓ Expansion valve or liquid tank is frosted.	 Leave the system at rest until no frost is present. Start it again to check whether or not the malfunction is caused by water or foreign particles. If water is the cause, initially cooling is okay. Then the water freezes causing a blockage. Drain water from refrigerant or replace refrigerant. If due to foreign particles, remove expansion valve and remove the particles with dry and compressed air (not shop air). If either of the above methods cannot correct the malfunction, replace expansion valve. Replace liquid tank. Check oil for contamination. 	F C H H K

Ο

Ρ

INSUFFICIENT HEATING

INFOID:000000005147739

Component Function Check

SYMPTOM: Insufficient heating

INSPECTION FLOW

1. CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - TEMPERATURE INCREASE

1. Press the AUTO switch.

- 2. Turn the temperature control dial (driver) clockwise until 32°C (90°F) is displayed.
- 3. Check for hot air at discharge air outlets.

Can this symptom be duplicated?

YES >> GO TO 2.

NO >> Perform complete system operational check. Refer to HAC-4. "Operational Check (Front)".

2.CHECK FOR SERVICE BULLETINS

Check for any service bulletins.

>> GO TO 3.

3.PERFORM SELF-DIAGNOSIS

Perform self-diagnosis. Refer to HAC-23, "A/C Auto Amp. Self-Diagnosis".

Is the inspection result normal?

YES >> GO TO 4.

NO >> Refer to <u>HAC-24</u>, "A/C System Self-Diagnosis Code Chart".

4.CHECK ENGINE COOLING SYSTEM

1. Check for proper engine coolant level. Refer to <u>CO-10, "Inspection"</u>.

2. Check hoses for leaks or kinks.

3. Check radiator cap. Refer to <u>CO-10, "Inspection"</u>.

4. Check for air in cooling system.

>> GO TO 5.

5.CHECK AIR MIX DOOR OPERATION

Check the operation of the air mix door.

Is the inspection result normal?

- YES >> GO TO 6.
- NO >> Check the air mix door motor circuit. Refer to <u>HAC-31, "Air Mix Door Motor (Driver) Component</u> <u>Function Check"</u>.

6.CHECK AIR DUCTS

Check for disconnected or leaking air ducts.

Is the inspection result normal?

YES >> GO TO 7.

NO >> Repair all disconnected or leaking air ducts.

7.CHECK HEATER HOSE TEMPERATURES

- 1. Start engine and warm it up to normal operating temperature.
- 2. Touch both the inlet and outlet heater hoses. The inlet hose should be hot and the outlet hose should be warm.

Is the inspection result normal?

- YES >> Hot inlet hose and a warm outlet hose: GO TO 8.
- NO >> Inlet hose cold: GO TO 11.
 - Both hoses warm: GO TO 9.

8. CHECK ENGINE COOLANT SYSTEM

INSUFFICIENT HEATING

< SYMPTOM DIAGNOSIS >	[AUTOMATIC AIR CONDITIONER]
Check engine coolant temperature sensor. Refer to EC-123, "Component	ent Inspection".
Is the inspection result normal?	А
YES >> System OK.	
NO >> Repair or replace as necessary. Retest.	В
9.CHECK HEATER HOSES	D
Check heater hoses for proper installation.	
Is the inspection result normal?	С
YES >> System OK.	
NO >> 1. Back flush heater core.2. Drain the water from the system.	
 Refill system with new engine coolant. Refer to <u>CO-1</u> GO TO 10 to retest. 	1. "Changing Engine Coolant".
10.CHECK HEATER HOSE TEMPERATURES	E
 Start engine and warm it up to normal operating temperature. Touch both the inlet and outlet heater hoses. The inlet hose shou warm. 	ld be hot and the outlet hose should be
Is the inspection result normal?	Г
YES >> System OK.	
NO >> Replace heater core. Refer to <u>VTL-24, "Removal and Inst</u>	<u>allation"</u> . G
11.CHECK WATER VALVE	
Check the operation of the water valve. Refer to HAC-73, "Water Valve	e Diagnosis Procedure".
Is the inspection result normal?	11
YES >> System OK.	
NO >> Replace water valve.	HAC

MEMORY FUNCTION DOES NOT OPERATE

< SYMPTOM DIAGNOSIS >

[AUTOMATIC AIR CONDITIONER]

MEMORY FUNCTION DOES NOT OPERATE

Memory Function Check

INFOID:000000005147741

SYMPTOM: Memory function does not operate.

INSPECTION FLOW

1. CONFIRM SYMPTOM BY PERFORMING OPERATIONAL CHECK - MEMORY FUNCTION

- 1. Set the temperature to 32°C (90°F).
- 2. Rotate the front blower control dial (driver) to turn system OFF.
- 3. Turn ignition switch OFF.
- 4. Turn ignition switch ON.
- 5. Press the AUTO switch.
- 6. Confirm that the set temperature remains at previous temperature.
- 7. Rotate the front blower control dial (LH) to turn system OFF.

Can the symptom be duplicated?

YES >> GO TO 3.

NO >> GO TO 2.

2.PERFORM COMPLETE OPERATIONAL CHECK

Perform a complete operational check and check for any symptoms. Refer to <u>HAC-4, "Operational Check</u> (<u>Front)</u>".

Can a symptom be duplicated?

YES >> Refer to HAC-3, "How to Perform Trouble Diagnosis For Quick And Accurate Repair".

NO >> System OK.

3.CHECK FOR SERVICE BULLETINS

Check for any service bulletins.

>> GO TO 4.

4.PERFORM SELF-DIAGNOSIS

Perform self-diagnosis to check for any codes. Refer to HAC-23, "A/C Auto Amp. Self-Diagnosis".

Are any self-diagnosis codes present?

YES >> Refer to <u>HAC-24, "A/C System Self-Diagnosis Code Chart"</u>.

NO >> GO TO 5.

5.CHECK POWER AND GROUND CIRCUIT

Check main power supply and ground circuit. Refer to <u>HAC-86</u>, "A/C Auto Amp. Component Function Check". Is the inspection result normal?

YES >> GO TO 6.

NO >> Repair or replace as necessary.

6.RECHECK FOR SYMPTOMS

Perform a complete operational check for any symptoms. Refer to <u>HAC-4, "Operational Check (Front)"</u>. Does another symptom exist?

YES >> Refer to HAC-3, "How to Perform Trouble Diagnosis For Quick And Accurate Repair".

NO >> Replace A/C Auto amp. Refer to <u>VTL-7, "Removal and Installation"</u>.

PRECAUTIONS

Precaution for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

The Supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER", used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted. Information necessary to service the system safely is included in the SR and SB section of this Service Manual.

WARNING:

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the SR section.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.

PRECAUTIONS WHEN USING POWER TOOLS (AIR OR ELECTRIC) AND HAMMERS

WARNING:

- When working near the Airbag Diagnosis Sensor Unit or other Airbag System sensors with the Ignition ON or engine running, DO NOT use air or electric power tools or strike near the sensor(s) with a hammer. Heavy vibration could activate the sensor(s) and deploy the air bag(s), possibly causing serious injury.
- When using air or electric power tools or hammers, always switch the Ignition OFF, disconnect the battery, and wait at least 3 minutes before performing any service.

Working with HFC-134a (R-134a)

WARNING:

- CFC-12 (R-12) refrigerant and HFC-134a (R-134a) refrigerant are not compatible. If the refrigerants are mixed compressor failure is likely to occur. Refer to <u>HA-4</u>, <u>"Contaminated Refrigerant"</u>. To determine the purity of HFC-134a (R-134a) in the vehicle and recovery tank, use Refrigerant Recovery/ Recycling Recharging equipment and Refrigerant Identifier.
- Use only specified oil for the HFC-134a (R-134a) A/C system and HFC-134a (R-134a) components. If oil other than that specified is used, compressor failure is likely to occur.
- The specified HFC-134a (R-134a) oil rapidly absorbs moisture from the atmosphere. The following handling precautions must be observed:
- When removing refrigerant components from a vehicle, immediately cap (seal) the component to minimize the entry of moisture from the atmosphere.
- When installing refrigerant components to a vehicle, do not remove the caps (unseal) until just before connecting the components. Connect all refrigerant loop components as quickly as possible to minimize the entry of moisture into system.
- Only use the specified oil from a sealed container. Immediately reseal containers of oil. Without proper sealing, oil will become moisture saturated and should not be used.
- Avoid breathing A/C refrigerant and oil vapor or mist. Exposure may irritate eyes, nose and throat. Remove HFC-134a (R-134a) from the A/C system using certified service equipment meeting requirements of SAE J2210 [HFC-134a (R-134a) recycling equipment], or J2209 [HFC-134a (R-134a) recycling equipment], If accidental system discharge occurs, ventilate work area before resuming service. Additional health and safety information may be obtained from refrigerant and oil manufacturers.
- Do not allow A/C oil to come in contact with styrofoam parts. Damage may result.

CONTAMINATED REFRIGERANT

INFOID:000000005147743

PRECAUTIONS

< PRECAUTION >

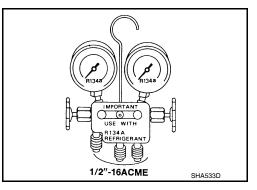

If a refrigerant other than pure HFC-134a (R-134a) is identified in a vehicle, your options are:

- Explain to the customer that environmental regulations prohibit the release of contaminated refrigerant into the atmosphere.
- Explain that recovery of the contaminated refrigerant could damage your service equipment and refrigerant supply.
- Suggest the customer return the vehicle to the location of previous service where the contamination may have occurred.
- If you choose to perform the repair, recover the refrigerant using only dedicated equipment and containers. Do not recover contaminated refrigerant into your existing service equipment. If your facility does not have dedicated recovery equipment, you may contact a local refrigerant product retailer for available service. This refrigerant must be disposed of in accordance with all federal and local regulations. In addition, replacement of all refrigerant system components on the vehicle is recommended.
- If the vehicle is within the warranty period, the air conditioner warranty is void. Please contact NISSAN Customer Affairs for further assistance.

Precaution for Service Equipment

MANIFOLD GAUGE SET

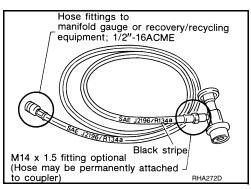

Be certain that the gauge face indicates R-134a or 134a. Make sure the gauge set has 1/2"-16 ACME threaded connections for service hoses. Confirm the set has been used only with refrigerant HFC-134a (R-134a) along with specified oil.

INFOID:000000005147744

SERVICE HOSES

Be certain that the service hoses display the markings described (colored hose with black stripe). All hoses must include positive shutoff devices (either manual or automatic) near the end of the hoses opposite the manifold gauge.

SERVICE COUPLERS

Never attempt to connect HFC-134a (R-134a) service couplers to a CFC-12 (R-12) A/C system. The HFC-134a (R-134a) couplers will not properly connect to the CFC-12 (R-12) system. However, if an improper connection is attempted, discharging and contamination may occur.

Shut-off valve rotation	A/C service valve
