BASIC INSPECTION DIAGNOSIS AND REPAIR WORKFLOW

Trouble Diagnosis Introduction

INTRODUCTION

The engine has an ECM to control major systems such as fuel control, ignition control, idle air control system, etc. The ECM accepts input signals from sensors and instantly drives actuators. It is essential that both input and output signals are proper and stable. At the same time, it is important that there are no malfunctions such as vacuum leaks, fouled spark plugs, or other malfunctions with the engine.

ment of good parts.

It is much more difficult to diagnose an incident that occurs intermittently rather than continuously. Most intermittent incidents are caused by poor electric connections or improper wiring. In this case,

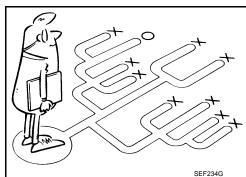

careful checking of suspected circuits may help prevent the replace-

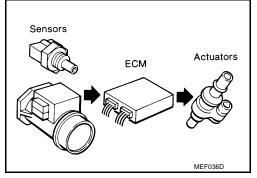

A visual check only may not find the cause of the incidents. A road test with CONSULT-III (or GST) or a circuit tester connected should be performed. Follow the Work Flow on "WORK FLOW".

Before undertaking actual checks, take a few minutes to talk with a customer who approaches with a driveability complaint. The customer can supply good information about such incidents, especially intermittent ones. Find out what symptoms are present and under what conditions they occur. A Diagnostic Worksheet like the example on "Worksheet Sample" should be used.

Start your diagnosis by looking for conventional malfunctions first. This will help troubleshoot driveability malfunctions on an electronically controlled engine vehicle.

WORK FLOW

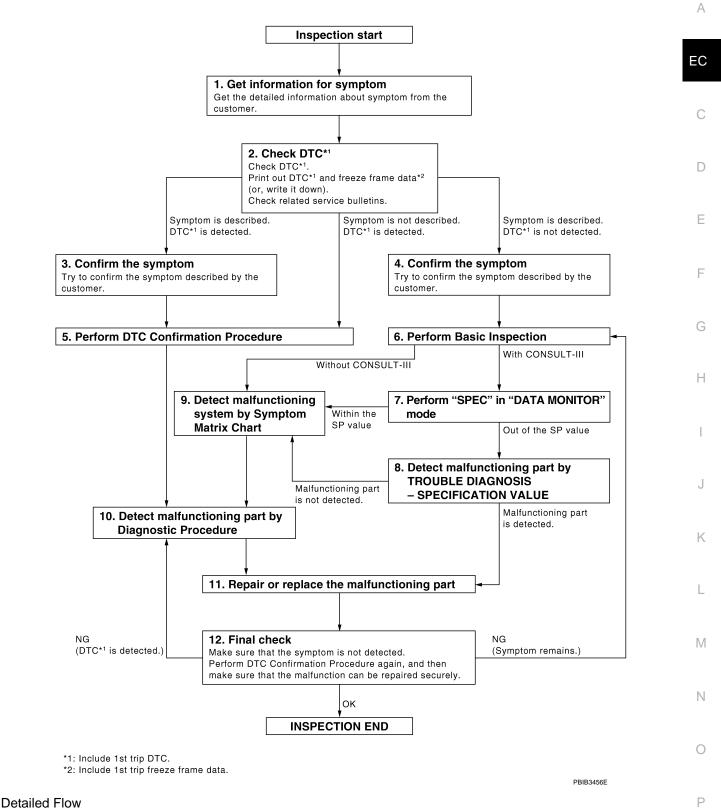

INFOID:000000005385063

< BASIC INSPECTION >

Overall Sequence

1.GET INFORMATION FOR SYMPTOM

Get the detailed information from the customer about the symptom (the condition and the environment when the incident/malfunction occurred) using the "DIAGNOSTIC WORKSHEET" .

>> GO TO 2.

< BASIC INSPECTION >

2.CHECK DTC*1

- 1. Check DTC*1.
- 2. Perform the following procedure if DTC^{*1} is displayed.
- Record DTC^{*1} and freeze frame data^{*2}. (Print them out with CONSULT-III or GST.)
- Erase DTC*¹. (Refer to <u>EC-450, "DTC Index"</u>.)
- Study the relationship between the cause detected by DTC^{*1} and the symptom described by the customer. (Symptom Matrix Chart is useful. Refer to <u>EC-469, "Symptom Matrix Chart"</u>.)
- 3. Check related service bulletins for information.

Is any symptom described and any DTC detected?

Symptom is described, DTC^{*1} is displayed>>GO TO 3. Symptom is described, DTC^{*1} is not displayed>>GO TO 4.

Symptom is not described, DTC^{*1} is displayed>>GO TO 5.

3.CONFIRM THE SYMPTOM

Try to confirm the symptom described by the customer (except MIL ON). DIAGNOSIS WORK SHEET is useful to verify the incident. Connect CONSULT-III to the vehicle and check real time diagnosis results. Verify relation between the symptom and the condition when the symptom is detected.

>> GO TO 5.

4.CONFIRM THE SYMPTOM

Try to confirm the symptom described by the customer. DIAGNOSIS WORK SHEET is useful to verify the incident. Connect CONSULT-III to the vehicle and check real time diagnosis results. Verify relation between the symptom and the condition when the symptom is detected.

>> GO TO 6.

5.PERFORM DTC CONFIRMATION PROCEDURE

Perform DTC Confirmation Procedure for the displayed DTC^{*1}, and then make sure that DTC^{*1} is detected again.

If two or more DTCs^{*1} are detected, refer to <u>EC-449, "DTC Inspection Priority Chart"</u> and determine trouble diagnosis order.

NOTE:

- Freeze frame data*² is useful if the DTC*¹ is not detected.
- Perform Overall Function Check if DTC Confirmation Procedure is not included on Service Manual. This simplified check procedure is an effective alternative though DTC^{*1} cannot be detected during this check. If the result of Overall Function Check is NG, it is the same as the detection of DTC^{*1} by DTC Confirmation Procedure.

<u>Is DTC*1 detected?</u>

Yes >> GO TO 10.

No >> Check according to GI-35. "How to Check Terminal" and GI-38. "Intermittent Incident".

6.PERFORM BASIC INSPECTION

Perform EC-13, "Basic Inspection" .

With CONSULT-III>>GO TO 7. Without CONSULT-III>>GO TO 9.

/.PERFORM SPEC IN DATA MONITOR MODE

(I) With CONSULT-III

Make sure that "MAS A/F SE-B1", "B/FUEL SCHDL", and "A/F ALPHA-B1", "A/F ALPHA-B2" are within the SP value using CONSULT-III "SPEC" in "DATA MONITOR" mode. Refer to <u>EC-77</u>.

DIAGNOSIS AND REPAIR WORKFLOW	
< BASIC INSPECTION > [VK56DE]	
Are they within the SP value?	
Yes >> GO TO 9. No >> GO TO 8.	А
8. DETECT MALFUNCTIONING PART BY TROUBLE DIAGNOSIS - SPECIFICATION VALUE	
Detect malfunctioning part according to EC-78, "Diagnosis Procedure".	EC
Is malfunctioning part detected?	
Yes >> GO TO 11. No >> GO TO 9.	С
9. DETECT MALFUNCTIONING SYSTEM BY SYMPTOM MATRIX CHART	
Detect malfunctioning system according to <u>EC-469</u> , " <u>Symptom Matrix Chart</u> " based on the confirmed symptom in step 4, and determine the trouble diagnosis order based on possible causes and symptom.	D
>> GO TO 10.	Е
10. DETECT MALFUNCTIONING PART BY DIAGNOSTIC PROCEDURE	
Inspect according to Diagnostic Procedure of the system. NOTE:	F
The Diagnostic Procedure in EC section described based on open circuit inspection. A short circuit inspection is also required for the circuit check in the Diagnostic Procedure. For details, refer to Circuit Inspection in <u>GI-34, "Work Flow"</u> .	G
Is malfunctioning part detected?	
 Yes >> GO TO 11. No >> Monitor input data from related sensors or check voltage of related ECM terminals using CON- SULT-III. Refer to <u>EC-417, "ECM Terminal and Reference Value"</u>, <u>EC-414, "CONSULT-III Refer- ence Value in Data Monitor Mode"</u>. 	Η
11.REPAIR OR REPLACE THE MALFUNCTIONING PART	
1. Repair or replace the malfunctioning part.	
2. Reconnect parts or connectors disconnected during Diagnostic Procedure again after repair and replace- ment.	J
3. Check DTC. If DTC is displayed, erase it, refer to <u>EC-450, "DTC Index"</u> .	
>> GO TO 12.	Κ
12.FINAL CHECK	
When DTC was detected in step 2, perform DTC Confirmation Procedure or Overall Function Check again, and then make sure that the malfunction have been repaired securely. When symptom was described from the customer, refer to confirmed symptom in step 3 or 4, and make sure	L
that the symptom is not detected.	M
OK or NG	
 NG (DTC*¹ is detected)>>GO TO 10. NG (Symptom remains)>>GO TO 6. OK >> 1. Before returning the vehicle to the customer, make sure to erase unnecessary DTC*¹ in ECM and TCM (Transmission Control Module). (Refer to <u>EC-450, "DTC Index"</u> and <u>TM-33, "OBD-</u> 	Ν
 <u>II Diagnostic Trouble Code (DTC)</u>.) If the completion of SRT is needed, drive vehicle under the specific driving pattern. Refer to <u>EC-450, "DTC Index"</u>. 	0
 INSPECTION END *1: Include 1st trip DTC. *2: Include 1st trip freeze frame data. 	Ρ
DIAGNOSTIC WORKSHEET	
Description	

Description

< BASIC INSPECTION >

There are many operating conditions that lead to the malfunction of engine components. A good grasp of such conditions can make troubleshooting faster and more accurate.

In general, each customer feels differently about a incident. It is important to fully understand the symptoms or conditions for a customer complaint.

Utilize a diagnostic worksheet like the one on the next page in order to organize all the information for troubleshooting.

Some conditions may cause the MIL to come on steady or blink and DTC to be detected. Examples:

- Vehicle ran out of fuel, which caused the engine to misfire.
- Fuel filler cap was left off or incorrectly screwed on, allowing fuel to evaporate into the atmosphere.

WHAT Vehicle & engine model WHEN Date, Frequencies WHERE..... Road conditions

EXCEPT FLEXIBLE FUEL VEHICLE

1.INSPECTION START

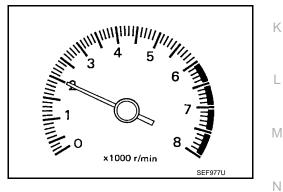

- 1. Check service records for any recent repairs that may indicate a related malfunction, or a current need for scheduled maintenance.
- 2. Open engine hood and check the following:
- Harness connectors for improper connections
- Wiring harness for improper connections, pinches and cut
- Vacuum hoses for splits, kinks and improper connections
- Hoses and ducts for leaks
- Air cleaner clogging _
- Gasket
- 3. Confirm that electrical or mechanical loads are not applied.
- Headlamp switch is OFF.
- Air conditioner switch is OFF.
- Rear window defogger switch is OFF.
- Steering wheel is in the straight-ahead position, etc.
- 4. Start engine and warm it up until engine coolant temperature indicator points the middle of gauge. Ensure engine stays below 1,000 rpm.

- Run engine at about 2,000 rpm for about 2 minutes under no 5. load.
- Make sure that no DTC is displayed with CONSULT-III or GST. 6. OK or NG

OK	>> GO TO 3.
NG	>> GO TO 2.

2. REPAIR OR REPLACE

Repair or replace components as necessary according to corresponding Diagnostic Procedure.

>> GO TO 3.

$\mathbf{3}.$ check target idle speed

(P) With CONSULT-III

VIN Registration

DESCRIPTION

VIN Registration is an operation to registering VIN in ECM. It must be performed each time ECM is replaced. **NOTE:**

Accurate VIN which is registered in ECM may be required for Inspection & Maintenance (I/M).

OPERATION PROCEDURE

(I) With CONSULT-III

- 1. Check the VIN of the vehicle and note it. Refer to GI-21, "Identification Number".
- 2. Turn ignition switch ON and engine stopped.
- 3. Select "VIN REGISTRATION" in "WORK SUPPORT" mode.
- 4. Follow the instruction of CONSULT-III display.

Accelerator Pedal Released Position Learning

DESCRIPTION

Accelerator Pedal Released Position Learning is an operation to learn the fully released position of the accelerator pedal by monitoring the accelerator pedal position sensor output signal. It must be performed each time harness connector of accelerator pedal position sensor or ECM is disconnected.

OPERATION PROCEDURE

- 1. Make sure that accelerator pedal is fully released.
- 2. Turn ignition switch ON and wait at least 2 seconds.
- 3. Turn ignition switch OFF and wait at least 10 seconds.
- 4. Turn ignition switch ON and wait at least 2 seconds.
- 5. Turn ignition switch OFF and wait at least 10 seconds.

Throttle Valve Closed Position Learning

DESCRIPTION

Throttle Valve Closed Position Learning is an operation to learn the fully closed position of the throttle valve by monitoring the throttle position sensor output signal. It must be performed each time harness connector of electric throttle control actuator or ECM is disconnected.

OPERATION PROCEDURE

- 1. Make sure that accelerator pedal is fully released.
- 2. Turn ignition switch ON.
- 3. Turn ignition switch OFF wait at least 10 seconds. Make sure that throttle valve moves during above 10 seconds by confirming the operating sound.

Ethanol Mixture Ratio Adaptation (Flexible Fuel Vehicle)

DESCRIPTION

Ethanol mixture ratio adaptation is an operation to change the ethanol mixture ratio presumed by ECM. It must be performed when engine does not start after replacing ECM. It is not necessary to be performed when engine can start.

OPERATION PROCEDURE

With CONSULT-III

- 1. Turn ignition switch ON.
- 2. Select "ETHANOL M/R ADJ" in "WORK SUPPORT" mode with CONSULT-III, then touch "START".
- 3. Select "E35" and then touch "UPDATE".
- 4. Crank engine and make sure that engine starts.

2.	Perform EC-22, "Throttle Valve Closed Position Learning".	
2. 3.	Start engine and warm it up to normal operating temperature.	Ν
4.	Check that all items listed under the topic PREPARATION (previously mentioned) are in good order.	
ч. 5.	Select "IDLE AIR VOL LEARN" in "WORK SUPPORT" mode.	
6.	Touch "START" and wait 20 seconds.	0
7.	Make sure that "CMPLT" is displayed on CONSULT-III screen. If "CMPLT" is not displayed, Idle Air Vol-	
	ume Learning will not be carried out successfully. In this case, find the cause of the incident by referring to	
	the DIAGNOSTIC PROCEDURE below.	Ρ
8.	Rev up the engine two or three times and make sure that idle speed and ignition timing are within the	
	specifications.	

ITEM SPECIFICATION

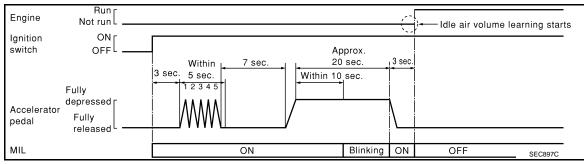

< BASIC INSPECTION >

Idle speed	650 ± 50 rpm (in P or N position)
Ignition timing	$15\pm5^\circ$ BTDC (in P or N position)

Without CONSULT-III

NOTE:

- It is better to count the time accurately with a clock.
- It is impossible to switch the diagnostic mode when an accelerator pedal position sensor circuit has a malfunction.
- 1. Perform EC-22, "Accelerator Pedal Released Position Learning".
- 2. Perform EC-22, "Throttle Valve Closed Position Learning".
- 3. Start engine and warm it up to normal operating temperature.
- 4. Check that all items listed under the topic PREPARATION (previously mentioned) are in good order.
- 5. Turn ignition switch OFF and wait at least 10 seconds.
- 6. Confirm that accelerator pedal is fully released, turn ignition switch ON and wait 3 seconds.
- 7. Repeat the following procedure quickly five times within 5 seconds.
- a. Fully depress the accelerator pedal.
- b. Fully release the accelerator pedal.
- 8. Wait 7 seconds, fully depress the accelerator pedal and keep it for approx. 20 seconds until the MIL stops blinking and turned ON.
- 9. Fully release the accelerator pedal within 3 seconds after the MIL turned ON.
- 10. Start engine and let it idle.
- 11. Wait 20 seconds.

12. Rev up the engine two or three times and make sure that idle speed and ignition timing are within the specifications.

ITEM	SPECIFICATION
Idle speed	650 ± 50 rpm (in P or N position)
Ignition timing	$15 \pm 5^{\circ}$ BTDC (in P or N position)

13. If idle speed and ignition timing are not within the specification, Idle Air Volume Learning will not be carried out successfully. In this case, find the cause of the incident by referring to the DIAGNOSTIC PROCE-DURE below.

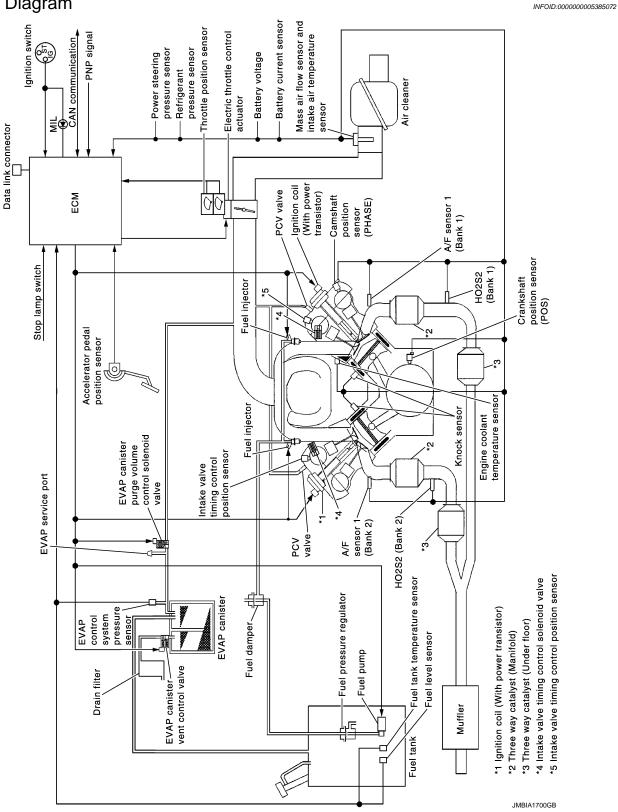

DIAGNOSTIC PROCEDURE

If idle air volume learning cannot be performed successfully, proceed as follows:

- 1. Check that throttle valve is fully closed.
- 2. Check PCV valve operation.
- 3. Check that downstream of throttle valve is free from air leakage.
- When the above three items check out OK, engine component parts and their installation condition are questionable. Check and eliminate the cause of the incident. It is useful to perform <u>EC-77</u>.
- 5. If any of the following conditions occur after the engine has started, eliminate the cause of the incident and perform Idle Air Volume Learning all over again:
 - Engine stalls.
 - Erroneous idle.

MULTIPORT FUEL INJECTION SYSTEM

< FUNCTION DIAGNOSIS >

MULTIPORT FUEL INJECTION SYSTEM

System Description

INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator		
Crankshaft position sensor (POS)	Engine speed* ³				
Camshaft position sensor (PHASE)	Piston position				
Mass air flow sensor	Amount of intake air				
Engine coolant temperature sensor	Engine coolant temperature				
Air fuel ratio (A/F) sensor 1	Density of oxygen in exhaust gas				
Throttle position sensor	Throttle position				
Accelerator pedal position sensor	Accelerator pedal position				
ТСМ	Gear position	Fuel injection & mixture ratio	Fuel injector		
Knock sensor	Engine knocking condition	control			
Battery	Battery voltage*3				
Power steering pressure sensor	Power steering operation				
Heated oxygen sensor 2*1	Density of oxygen in exhaust gas				
ABS actuator and electric unit (control unit)	VDC/TCS operation command*2				
Air conditioner switch	Air conditioner operation* ²				
Wheel sensor	Vehicle speed*2				

*2: This signal is sent to the ECM through CAN communication line.

*3: ECM determines the start signal status by the signals of engine speed and battery voltage.

SYSTEM DESCRIPTION

The amount of fuel injected from the fuel injector is determined by the ECM. The ECM controls the length of time the valve remains open (injection pulse duration). The amount of fuel injected is a program value in the ECM memory. The program value is preset by engine operating conditions. These conditions are determined by input signals (for engine speed and intake air) from both the crankshaft position sensor and the mass air flow sensor.

VARIOUS FUEL INJECTION INCREASE/DECREASE COMPENSATION

In addition, the amount of fuel injected is compensated to improve engine performance under various operating conditions as listed below.

<Fuel increase>

During warm-up

- When starting the engine
- During acceleration
- Hot-engine operation
- When selector lever is changed from N to D
- High-load, high-speed operation

<Fuel decrease>

- During deceleration
- During high engine speed operation

MULTIPORT FUEL INJECTION SYSTEM

< FUNCTION DIAGNOSIS >

MIXTURE RATIO FEEDBACK CONTROL (CLOSED LOOP CONTROL)

The mixture ratio feedback system provides the best air-fuel mixture ratio for driveability and emission control. The three way catalyst (manifold) can then better reduce CO, HC and NOx emissions. This system uses air fuel ratio (A/F) sensor 1 in the exhaust manifold to monitor whether the engine operation is rich or lean. The ECM adjusts the injection pulse width according to the sensor voltage signal. For more information about air fuel ratio (A/F) sensor 1, refer to <u>EC-140</u>. This maintains the mixture ratio within the range of stoichiometric (ideal air-fuel mixture).

This stage is referred to as the closed loop control condition.

Heated oxygen sensor 2 is located downstream of the three way catalyst (manifold). Even if the switching characteristics of air fuel ratio (A/F) sensor 1 shift, the air-fuel ratio is controlled to stoichiometric by the signal from heated oxygen sensor 2.

Open Loop Control

The open loop system condition refers to when the ECM detects any of the following conditions. Feedback control stops in order to maintain stabilized fuel combustion.

- Deceleration and acceleration
- High-load, high-speed operation
- Malfunction of A/F sensor 1 or its circuit
- Insufficient activation of A/F sensor 1 at low engine coolant temperature
- High engine coolant temperature
- During warm-up
- After shifting from N to D
- When starting the engine

MIXTURE RATIO SELF-LEARNING CONTROL

The mixture ratio feedback control system monitors the mixture ratio signal transmitted from A/F sensor 1. This feedback signal is then sent to the ECM. The ECM controls the basic mixture ratio as close to the theoretical mixture ratio as possible. However, the basic mixture ratio is not necessarily controlled as originally designed. Both manufacturing differences (i.e., mass air flow sensor hot wire) and characteristic changes during operation (i.e., injector clogging) directly affect mixture ratio.

Accordingly, the difference between the basic and theoretical mixture ratios is monitored in this system. This is then computed in terms of "injection pulse duration" to automatically compensate for the difference between the two ratios.

"Fuel trim" refers to the feedback compensation value compared against the basic injection duration. Fuel trim includes short term fuel trim and long term fuel trim.

"Short term fuel trim" is the short-term fuel compensation used to maintain the mixture ratio at its theoretical value. The signal from A/F sensor 1 indicates whether the mixture ratio is RICH or LEAN compared to the theoretical value. The signal then triggers a reduction in fuel volume if the mixture ratio is rich, and an increase in fuel volume if it is lean.

"Long term fuel trim" is overall fuel compensation carried out long-term to compensate for continual deviation of the short term fuel trim from the central value. Such deviation will occur due to individual engine differences, wear over time and changes in the usage environment.

<Flexible Fuel Vehicle>

The ECM also presumes the ethanol mixture ratio using the feedback signal from the A/F sensor 1 during the vehicle is driving. Then the ECM controls the amount of fuel injected according to the presumed ethanol mixture ratio.

MULTIPORT FUEL INJECTION SYSTEM

< FUNCTION DIAGNOSIS >

FUEL INJECTION TIMING

No. 1 Cylinder No. 1 Cylinder No. 2 Cylinder No. 2 Cylinder	
No. 3 Cylinder No. 7 Cylinder No. 4 Cylinder No. 7 Cylinder No. 5 Cylinder No. 6 Cylinder No. 7 Cylinder No. 7 Cylinder No. 8 Cylinder No. 2 Cylinder I engine cycle I	e cycle PBIB0122E

Two types of systems are used.

Sequential Multiport Fuel Injection System

Fuel is injected into each cylinder during each engine cycle according to the firing order. This system is used when the engine is running.

Simultaneous Multiport Fuel Injection System

Fuel is injected simultaneously into all eight cylinders twice each engine cycle. In other words, pulse signals of the same width are simultaneously transmitted from the ECM.

The eight fuel injectors will then receive the signals two times for each engine cycle.

This system is used when the engine is being started and/or if the fail-safe system (CPU) is operating.

FUEL SHUT-OFF

Fuel to each cylinder is cut off during deceleration, operation of the engine at excessively high speeds or operation of the vehicle at excessively high speed.

Battery	Battery voltage*2			
Wheel sensor	Vehicle speed*1			

*1: This signal is sent to the ECM through CAN communication line.

*2: ECM determines the start signal status by the signals of engine speed and battery voltage.

SYSTEM DESCRIPTION

Firing order: 1 - 8 - 7 - 3 - 6 - 5 - 4 - 2

The ignition timing is controlled by the ECM to maintain the best air-fuel ratio for every running condition of the engine. The ignition timing data is stored in the ECM.

The ECM receives information such as the injection pulse width and camshaft position sensor signal. Computing this information, ignition signals are transmitted to the power transistor.

During the following conditions, the ignition timing is revised by the ECM according to the other data stored in the ECM.

- At starting
- During warm-up
- At idle
- At low battery voltage
- During acceleration

The knock sensor retard system is designed only for emergencies. The basic ignition timing is programmed within the anti-knocking zone, if recommended fuel is used under dry conditions. The retard system does not operate under normal driving conditions. If engine knocking occurs, the knock sensor monitors the condition. The signal is transmitted to the ECM. The ECM retards the ignition timing to eliminate the knocking condition.

AIR CONDITIONING CUT CONTROL

< FUNCTION DIAGNOSIS >

AIR CONDITIONING CUT CONTROL

Input/Output Signal Chart

Sensor	Input Signal to ECM	ECM function	Actuator

ASCD steering switch	ASCD steering switch operation	ASCD vahiala apaad control	Electric throttle control actuator		
Wheel sensor	Vehicle speed*	ASCD vehicle speed control			
ТСМ	Gear position				
	Powertrain revolution*				

*: This signal is sent to the ECM through CAN communication line

BASIC ASCD SYSTEM

Refer to Owner's Manual for ASCD operating instructions.

Automatic Speed Control Device (ASCD) allows a driver to keep vehicle at predetermined constant speed without depressing accelerator pedal. Driver can set vehicle speed in advance between approximately 40 km/ h (25 MPH) and 144 km/h (89 MPH).

ECM controls throttle angle of electric throttle control actuator to regulate engine speed.

Operation status of ASCD is indicated by CRUISE indicator and SET indicator in combination meter. If any malfunction occurs in ASCD system, it automatically deactivates control.

NOTE:

Always drive vehicle in safe manner according to traffic conditions and obey all traffic laws.

SET OPERATION

Press MAIN switch. (The CRUISE indicator in combination meter illuminates.)

When vehicle speed reaches a desired speed between approximately 40 km/h (25 MPH) and 144 km/h (89 MPH), press SET/COAST switch. (Then SET indicator in combination meter illuminates.)

ACCELERATE OPERATION

If the RESUME/ACCELERATE switch is pressed during cruise control driving, increase the vehicle speed until the switch is released or vehicle speed reaches maximum speed controlled by the system. And then ASCD will keep the new set speed.

CANCEL OPERATION

When any of following conditions exist, cruise operation will be canceled.

CANCEL switch is pressed

- More than 2 switches at ASCD steering switch are pressed at the same time (Set speed will be cleared)
- Brake pedal is depressed
- Selector lever is changed to N, P, R position
- Vehicle speed decreased to 13 km/h (8 MPH) lower than the set speed

VDC system is operated

When the ECM detects any of the following conditions, the ECM will cancel the cruise operation and inform the driver by blinking indicator lamp.

• Engine coolant temperature is slightly higher than the normal operating temperature, CRUISE lamp may blink slowly.

When the engine coolant temperature decreases to the normal operating temperature, CRUISE lamp will stop blinking and the cruise operation will be able to work by pressing SET/COAST switch or RESUME/ ACCELERATE switch.

• Malfunction for some self-diagnoses regarding ASCD control: SET lamp will blink quickly.

If MAIN switch is turned to OFF during ASCD is activated, all of ASCD operations will be canceled and vehicle speed memory will be erased.

COAST OPERATION

When the SET/COAST switch is pressed during cruise control driving, decrease vehicle set speed until the switch is released. And then ASCD will keep the new set speed.

RESUME OPERATION

AUTOMATIC SPEED CONTROL DEVICE (ASCD)

CAN COMMUNICATION

System Description

CAN (Controller Area Network) is a serial communication line for real time application. It is an on-vehicle multiplex communication line with high data communication speed and excellent error detection ability. Many electronic control units are equipped onto a vehicle, and each control unit shares information and links with other control units during operation (not independent). In CAN communication, control units are connected with 2 communication lines (CAN H line, CAN L line) allowing a high rate of information transmission with less wiring. Each control unit transmits/receives data but selectively reads required data only. Refer to LAN-50, "CAN System Specification Chart", about CAN communication for detail.

INFOID:000000005385080

< FUNCTION DIAGNOSIS >

EVAPORATIVE EMISSION SYSTEM

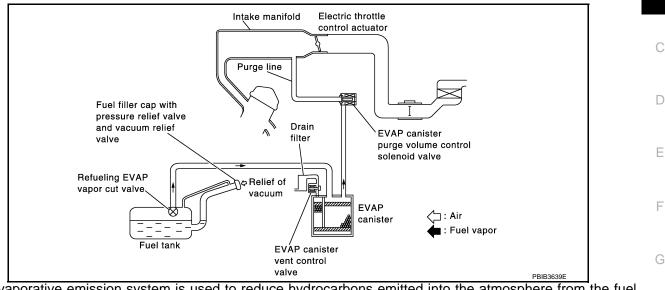

Description

А

EC

SYSTEM DESCRIPTION

The evaporative emission system is used to reduce hydrocarbons emitted into the atmosphere from the fuel system. This reduction of hydrocarbons is accomplished by activated charcoals in the EVAP canister. The fuel vapor in the sealed fuel tank is led into the EVAP canister which contains activated carbon and the vapor is stored there when the engine is not operating or when refueling to the fuel tank.

The vapor in the EVAP canister is purged by the air through the purge line to the intake manifold when the engine is operating. EVAP canister purge volume control solenoid valve is controlled by ECM. When the engine operates, the flow rate of vapor controlled by EVAP canister purge volume control solenoid valve is proportionally regulated as the air flow increases.

EVAP canister purge volume control solenoid valve also shuts off the vapor purge line during decelerating and idling.

INTAKE VALVE TIMING CONTROL

Description

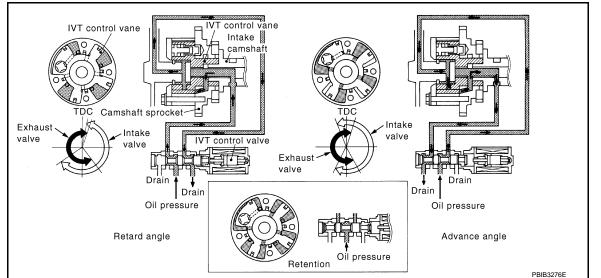

INFOID:000000005385082

[VK56DE]

SYSTEM DESCRIPTION

Sensor	Input signal to ECM function	ECM	Actuator	
Crankshaft position sensor (POS) Camshaft position sensor (PHASE)	Engine speed			
Intake valve timing control position sensor	Intake valve timing signal	Intake valve timing control	Intake valve timing control solenoid valve	
Engine coolant temperature sensor	Engine coolant temperature		Solenoid valve	
Wheel sensor	Vehicle speed*			

*: This signal is sent to the ECM through CAN communication line

This mechanism hydraulically controls cam phases continuously with the fixed operating angle of the intake valve.

The ECM receives signals such as crankshaft position, camshaft position, engine speed, and engine coolant temperature. Then, the ECM sends ON/OFF pulse duty signals to the intake valve timing (IVT) control solenoid valve depending on driving status. This makes it possible to control the shut/open timing of the intake valve to increase engine torque in low/mid speed range and output in high-speed range.

< FUNCTION DIAGNOSIS >

ON BOARD DIAGNOSTIC (OBD) SYSTEM

Introduction

The ECM has an on board diagnostic system, which detects malfunctions related to engine sensors or actuators. The ECM also records various emission-related diagnostic information including:

Emission-related diagnostic information	Diagnostic service	
Diagnostic Trouble Code (DTC)	Service \$03 of SAE J1979/ISO 15031-5	_
Freeze Frame data	Service \$02 of SAE J1979/ISO 15031-5	
System Readiness Test (SRT) code	Service \$01 of SAE J1979/ISO 15031-5	
1st Trip Diagnostic Trouble Code (1st Trip DTC)	Service \$07 of SAE J1979/ISO 15031-5	
1st Trip Freeze Frame data		
Test values and Test limits	Service \$06 of SAE J1979/ISO 15031-5	
Calibration ID	Service \$09 of SAE J1979/ISO 15031-5	
Permanent Diagnostic Trouble Code (Permanent DTC)	Service \$0A* ^{1,*2} of SAE J1979/ISO 15031-5	

*1: Service \$0A is not applied for regions where it is not mandated.

*2: Although A60 models do not support Service \$0A, it is shown on GST screen.

The above information can be checked using procedures listed in the table below.

					~		. Not applicable	
	DTC	1st trip DTC	Freeze Frame data	1st trip Freeze Frame data	SRT code	SRT status	Test value	ŀ
CONSULT-III	×	×	×	×	×	×	_	
GST	×	×	×		×	×	×	
ECM	×	×*				×	—	1

*: When DTC and 1st trip DTC simultaneously appear on the display, they cannot be clearly distinguished from each other. The malfunction indicator lamp (MIL) on the instrument panel lights up when the same malfunction is detected in two consecutive trips (Two trip detection logic), or when the ECM enters fail-safe mode. (Refer to <u>EC-447</u>, <u>"Fail-Safe Chart"</u>.)

Two Trip Detection Logic

When a malfunction is detected for the first time, 1st trip DTC and 1st trip Freeze Frame data are stored in the ECM memory. The MIL will not light up at this stage. <1st trip>

If the same malfunction is detected again during the next drive, the DTC and Freeze Frame data are stored in the ECM memory, and the MIL lights up. The MIL lights up at the same time when the DTC is stored. <2nd trip> The "trip" in the "Two Trip Detection Logic" means a driving mode in which self-diagnosis is performed during vehicle operation. Specific on board diagnostic items will cause the ECM to light up or blink the MIL, mand store DTC and Freeze Frame data, even in the 1st trip, as shown below.

×: Applicable —: Not applicable

< FUNCTION DIAGNOSIS >

When there is an open circuit on MIL circuit, the ECM cannot warn the driver by lighting up MIL when there is malfunction on engine control system.

Therefore, when electrical controlled throttle and part of ECM related diagnoses are continuously detected as NG for 5 trips, ECM warns the driver that engine control system malfunctions and MIL circuit is open by means of operating fail-safe function.

The fail-safe function also operates when above diagnoses except MIL circuit are detected and demands the driver to repair the malfunction.

Engine operating condition in fail-safe mode	Engine speed will not rise more than 2,500 rpm due to the fuel cut
Engine operating condition in fail-safe mode	Engine speed will not rise more than 2,500 rpm due to the fuel cut

Emission-related Diagnostic Information

INFOID:000000005385085

DTC AND 1ST TRIP DTC

The 1st trip DTC (whose number is the same as the DTC number) is displayed for the latest self-diagnostic result obtained. If the ECM memory was cleared previously, and the 1st trip DTC did not reoccur, the 1st trip DTC will not be displayed.

If a malfunction is detected during the 1st trip, the 1st trip DTC is stored in the ECM memory. The MIL will not light up (two trip detection logic). If the same malfunction is not detected in the 2nd trip (meeting the required driving pattern), the 1st trip DTC is cleared from the ECM memory. If the same malfunction is detected in the 2nd trip, both the 1st trip DTC and DTC are stored in the ECM memory and the MIL lights up. In other words, the DTC is stored in the ECM memory and the MIL lights up. In other words, the DTC is stored in the ECM memory and the MIL lights up when the same malfunction occurs in two consecutive trips. If a 1st trip DTC is stored and a non-diagnostic operation is performed between the 1st and 2nd trips, only the 1st trip DTC will continue to be stored. For malfunctions that blink or light up the MIL during the 1st trip, the DTC and 1st trip DTC are stored in the ECM memory.

Procedures for clearing the DTC and the 1st trip DTC from the ECM memory are described in "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION".

For malfunctions in which 1st trip DTCs are displayed, refer to "EMISSION-RELATED DIAGNOSTIC INFOR-MATION ITEMS". These items are required by legal regulations to continuously monitor the system/component. In addition, the items monitored non-continuously are also displayed on CONSULT-III.

1st trip DTC is specified in Service \$07 of SAE J1979/ISO 15031-5. 1st trip DTC detection occurs without lighting up the MIL and therefore does not warn the driver of a malfunction. However, 1st trip DTC detection will not prevent the vehicle from being tested, for example during Inspection/Maintenance (I/M) tests.

When a 1st trip DTC is detected, check, print out or write down and erase (1st trip) DTC and Freeze Frame data as specified in Work Flow procedure Step 2, refer to <u>EC-8</u>, "<u>Trouble Diagnosis Introduction</u>". Then perform DTC Confirmation Procedure or Overall Function Check to try to duplicate the malfunction. If the malfunction is duplicated, the item requires repair.

How to Read DTC and 1st Trip DTC

DTC and 1st trip DTC can be read by the following methods.

(B) With CONSULT-III

(a) With GST

CONSULT-III or GST (Generic Scan Tool) Examples: P0340, P0850, P1148, etc.

These DTCs are prescribed by SAE J2012/ISO 15031-6.

(CONSULT-III also displays the malfunctioning component or system.)

No Tools

The number of blinks of the MIL in the Diagnostic Test Mode II (Self-Diagnostic Results) indicates the DTC. Example: 0340, 0850, 1148, etc.

These DTCs are controlled by NISSAN.

• 1st trip DTC No. is the same as DTC No.

 Output of a DTC indicates a malfunction. However, GST or the Diagnostic Test Mode II do not indicate whether the malfunction is still occurring or has occurred in the past and has returned to normal. CONSULT-III can identify malfunction status as shown below. Therefore, using CONSULT-III (if available) is recommended.

DTC or 1st trip DTC of a malfunction is displayed in SELF-DIAGNOSTIC RESULTS mode of CONSULT-III. Time data indicates how many times the vehicle was driven after the last detection of a DTC.

If the DTC is being detected currently, the time data will be [0].

If a 1st trip DTC is stored in the ECM, the time data will be [1t].

FREEZE FRAME DATA AND 1ST TRIP FREEZE FRAME DATA

< FUNCTION DIAGNOSIS >

The ECM records the driving conditions such as fuel system status, calculated load value, engine coolant temperature, short term fuel trim, long term fuel trim, engine speed, vehicle speed, absolute throttle position, base fuel schedule and intake air temperature at the moment a malfunction is detected.

Data which are stored in the ECM memory, along with the 1st trip DTC, are called 1st trip freeze frame data. The data, stored together with the DTC data, are called freeze frame data and displayed on CONSULT-III or GST. The 1st trip freeze frame data can only be displayed on the CONSULT-III screen, not on the GST. For details, see EC-67, "CONSULT-III Function (ENGINE)".

Only one set of freeze frame data (either 1st trip freeze frame data or freeze frame data) can be stored in the ECM. 1st trip freeze frame data is stored in the ECM memory along with the 1st trip DTC. There is no priority С for 1st trip freeze frame data and it is updated each time a different 1st trip DTC is detected. However, once freeze frame data (2nd trip detection/MIL on) is stored in the ECM memory, 1st trip freeze frame data is no longer stored. Remember, only one set of freeze frame data can be stored in the ECM. The ECM has the following priorities to update the data.

Priority		Items	
1	Freeze frame data	Misfire — DTC: P0300 - P0308 Fuel Injection System Function — DTC: P0171, P0172, P0174, P0175	
2		Except the above items (Includes A/T related items)	
3	1st trip freeze frame d	ata	

For example, the EGR malfunction (Priority: 2) was detected and the freeze frame data was stored in the 2nd trip. After that when the misfire (Priority: 1) is detected in another trip, the freeze frame data will be updated from the EGR malfunction to the misfire. The 1st trip freeze frame data is updated each time a different malfunction is detected. There is no priority for 1st trip freeze frame data. However, once freeze frame data is stored in the ECM memory, 1st trip freeze data is no longer stored (because only one freeze frame data or 1st Н trip freeze frame data can be stored in the ECM). If freeze frame data is stored in the ECM memory and freeze frame data with the same priority occurs later, the first (original) freeze frame data remains unchanged in the ECM memory.

Both 1st trip freeze frame data and freeze frame data (along with the DTCs) are cleared when the ECM memory is erased. Procedures for clearing the ECM memory are described in "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION".

SYSTEM READINESS TEST (SRT) CODE

System Readiness Test (SRT) code is specified in Service \$01 of SAE J1979/ISO 15031-5.

As part of an enhanced emissions test for Inspection & Maintenance (I/M), certain states require the status of SRT be used to indicate whether the ECM has completed self-diagnosis of major emission systems and components. Completion must be verified in order for the emissions inspection to proceed.

If a vehicle is rejected for a State emissions inspection due to one or more SRT items indicating "INCMP", use the information in this Service Manual to set the SRT to "CMPLT".

In most cases the ECM will automatically complete its self-diagnosis cycle during normal usage, and the SRT L status will indicate "CMPLT" for each application system. Once set as "CMPLT", the SRT status remains "CMPLT" until the self-diagnosis memory is erased.

Occasionally, certain portions of the self-diagnostic test may not be completed as a result of the customer's Μ normal driving pattern; the SRT will indicate "INCMP" for these items.

NOTE:

The SRT will also indicate "INCMP" if the self-diagnosis memory is erased for any reason or if the ECM memory power supply is interrupted for several hours.

If, during the state emissions inspection, the SRT indicates "CMPLT" for all test items, the inspector will continue with the emissions test. However, if the SRT indicates "INCMP" for one or more of the SRT items the vehicle is returned to the customer untested.

NOTE:

If MIL is ON during the state emissions inspection, the vehicle is also returned to the customer untested even though the SRT indicates "CMPLT" for all test items. Therefore, it is important to check SRT ("CMPLT") and DTC (No DTCs) before the inspection.

SRT Item

The table below shows required self-diagnostic items to set the SRT to "CMPLT".

А

EC

D

J

Κ

Ν

P

< FUNCTION DIAGNOSIS >

[VK56DE]

SRT item (CONSULT-III indication)	Performance Priority*	Required self-diagnostic items to set the SRT to "CMPLT"	Corresponding DTC No.
CATALYST	2	Three way catalyst function	P0420, P0430
EVAP SYSTEM	2	EVAP control system purge flow monitoring	P0441
	1	EVAP control system	P0442
	2	EVAP control system	P0456
HO2S	2	Air fuel ratio (A/F) sensor 1	P0133, P0153
		Heated oxygen sensor 2	P0137, P0157
		Heated oxygen sensor 2	P0138, P0158
		Heated oxygen sensor 2	P0139, P0159

*: If completion of several SRTs is required, perform driving patterns (DTC confirmation procedure), one by one based on the priority for models with CONSULT-III.

SRT Set Timing

SRT is set as "CMPLT" after self-diagnosis has been performed one or more times. Completion of SRT is done regardless of whether the result is OK or NG. The set timing is different between OK and NG results and is shown in the table below.

				Example					
Self-diagno	osis result	Diagnosia	Diagnosis OFF ON OFF ON OFF						
C C		Diagnosis	$\leftarrow ON \rightarrow OF$	$F \leftarrow ON \rightarrow$	$OFF \leftarrow ON \rightarrow C$	$OFF \leftarrow ON \rightarrow$			
All OK	Case 1	P0400	OK (1)	— (1)	OK (2)	— (2)			
		P0402	OK (1)	— (1)	— (1)	OK (2)			
		P1402	OK (1)	OK (2)	— (2)	— (2)			
		SRT of EGR	"CMPLT"	"CMPLT"	"CMPLT"	"CMPLT"			
	Case 2	P0400	OK (1)	— (1)	— (1)	— (1)			
		P0402	— (0)	— (0)	OK (1)	— (1)			
		P1402	OK (1)	OK (2)	— (2)	— (2)			
		SRT of EGR	"INCMP"	"INCMP"	"CMPLT"	"CMPLT"			
NG exists	Case 3	P0400	OK	OK	—	—			
		P0402	—	—	_	—			
		P1402	NG	_	NG	NG (Consecutiv NG)			
		(1st trip) DTC	1st trip DTC	—	1st trip DTC	DTC (= MIL ON)			
		SRT of EGR	"INCMP"	"INCMP"	"INCMP"	"CMPLT"			

OK: Self-diagnosis is carried out and the result is OK.

NG: Self-diagnosis is carried out and the result is NG.

-: Self-diagnosis is not carried out.

When all SRT related self-diagnoses showed OK results in a single cycle (Ignition OFF-ON-OFF), the SRT will indicate "CMPLT". \rightarrow Case 1 above

When all SRT related self-diagnoses showed OK results through several different cycles, the SRT will indicate "CMPLT" at the time the respective self-diagnoses have at least one OK result. \rightarrow Case 2 above

If one or more SRT related self-diagnoses showed NG results in 2 consecutive cycles, the SRT will also indicate "CMPLT". \rightarrow Case 3 above

The table above shows that the minimum number of cycles for setting SRT as "INCMP" is one (1) for each self-diagnosis (Case 1 & 2) or two (2) for one of self-diagnoses (Case 3). However, in preparation for the state emissions inspection, it is unnecessary for each self-diagnosis to be executed twice (Case 3) for the following reasons:

• The SRT will indicate "CMPLT" at the time the respective self-diagnoses have one (1) OK result.

• The emissions inspection requires "CMPLT" of the SRT only with OK self-diagnosis results.

< FUNCTION DIAGNOSIS >

[VK56DE]

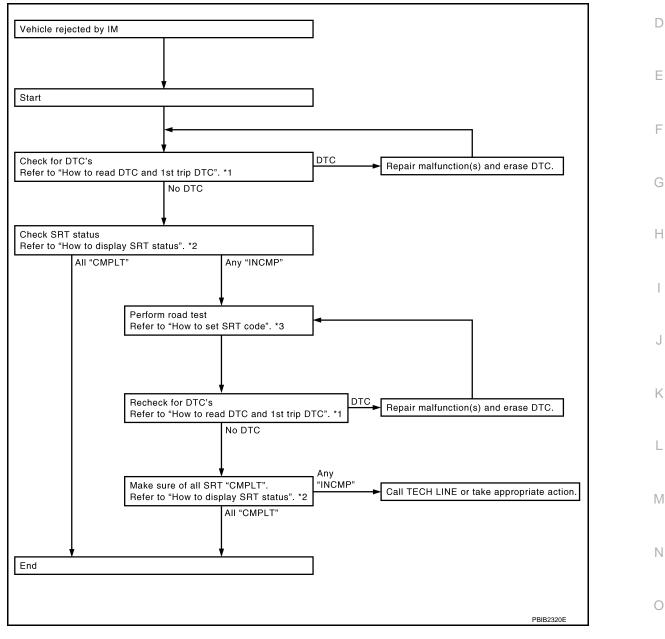

А

- When, during SRT driving pattern, 1st trip DTC (NG) is detected prior to "CMPLT" of SRT, the self-diagnosis memory must be erased from ECM after repair.
- If the 1st trip DTC is erased, all the SRT will indicate "INCMP". NOTE:

SRT can be set as "CMPLT" together with the DTC(s). Therefore, DTC check must always be carried out prior to the state emission inspection even though the SRT indicates "CMPLT".

SRT Service Procedure

If a vehicle has failed the state emissions inspection due to one or more SRT items indicating "INCMP", review the flowchart diagnostic sequence on the next page.

*1 "How to Read DTC and 1st Trip DTC" *2 "How to Display SRT Status"

*3 "How to Set SRT Code"

How to Display SRT Status

B WITH CONSULT-III

Selecting "SRT STATUS" in "DTC CONFIRMATION" mode with CONSULT-III.

For items whose SRT codes are set, a "CMPLT" is displayed on the CONSULT-III screen; for items whose SRT codes are not set, "INCMP" is displayed.

NOTE:

Though displayed on the CONSULT-III screen, "HO2S HTR" is not SRT item.

EC-49

Ρ

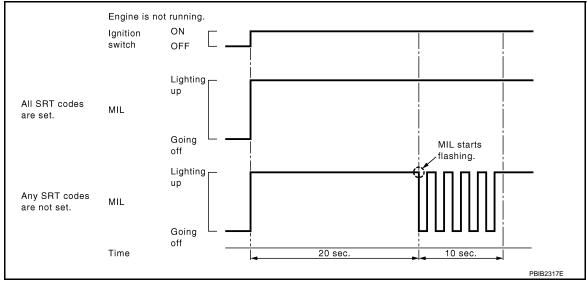

WITH GST

Selecting Service \$01 with GST (Generic Scan Tool)

NO TOOLS

A SRT code itself can not be displayed while only SRT status can be.

- 1. Turn ignition switch ON and wait 20 seconds.
- 2. SRT status is indicated as shown below.
 - When all SRT codes are set, MIL lights up continuously.
 - When any SRT codes are not set, MIL will flash periodically for 10 seconds.

How to Set SRT Code

To set all SRT codes, self-diagnosis for the items indicated above must be performed one or more times. Each diagnosis may require a long period of actual driving under various conditions.

(I) WITH CONSULT-III

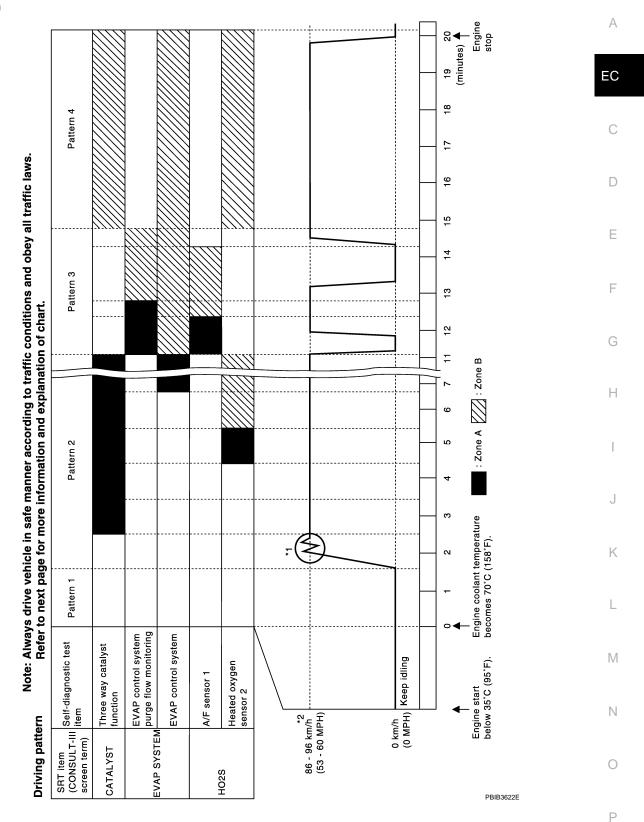

Perform corresponding DTC Confirmation Procedure one by one based on Performance Priority in the table on "SRT Item".

WITHOUT CONSULT-III

The most efficient driving pattern in which SRT codes can be properly set is explained on the next page. The driving pattern should be performed one or more times to set all SRT codes.

< FUNCTION DIAGNOSIS >

Driving Pattern

• The time required for each diagnosis varies with road surface conditions, weather, altitude, individual driving habits, etc.

Zone A refers to the range where the time, required for the diagnosis under normal conditions*, is the shortest.

Zone B refers to the range where the diagnosis can still be performed if the diagnosis is not completed within zone A.

*: Normal conditions refer to the following:

< FUNCTION DIAGNOSIS >

- Sea level
- Flat road
- Ambient air temperature: 20 30°C (68 86°F)
- Diagnosis is performed as quickly as possible under normal conditions. Under different conditions [For example: ambient air temperature other than 20 - 30°C (68 - 86°F)], diagnosis may also be performed.

Pattern 1:

- The engine is started at the engine coolant temperature of -10 to 35°C (14 to 95°F) (where the voltage between the ECM terminal 73 and ground is 3.0 - 4.3V).
- The engine must be operated at idle speed until the engine coolant temperature is greater than 70°C (158°F) (where the voltage between the ECM terminal 73 and ground is lower than 1.4V).
- The engine is started at the fuel tank temperature of warmer than 0°C (32°F) (where the voltage between the ECM terminal 107 and ground is less than 4.1V).

Pattern 2:

• When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Pattern 3:

- Operate vehicle following the driving pattern shown in the figure.
- Release the accelerator pedal during decelerating vehicle speed from 90 km/h (56 MPH) to 0 km/h (0 MPH).

Pattern 4:

- The accelerator pedal must be held very steady during steadystate driving.
- If the accelerator pedal is moved, the test must be conducted all over again.

*1: Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

*2: Checking the vehicle speed with GST is advised.

Suggested Transmission Gear Position

Set the selector lever in the D position with the overdrive switch turned ON.

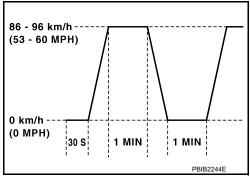

TEST VALUE AND TEST LIMIT

The following is the information specified in Service \$06 of SAE J1979/ISO 15031-5.

The test value is a parameter used to determine whether a system/circuit diagnostic test is OK or NG while being monitored by the ECM during self-diagnosis. The test limit is a reference value which is specified as the maximum or minimum value and is compared with the test value being monitored.

These data (test value and test limit) are specified by On Boad Monitor ID(OBDMID), Test ID (TID), Unit and Scaling ID and can be displayed on the GST screen.

The items of the test value and test limit will be displayed with GST screen which items are provided by the ECM. (eg., if the bank 2 is not applied on this vehicle, only the items of the bank 1 is displayed)

HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION

How to Erase DTC

(B) WITH CONSULT-III

The emission related diagnostic information in the ECM can be erased by selecting "All Erase" in the "Description" of "FINAL CHECK" mode with CONSULT-III.

WITH GST

The emission related diagnostic information in the ECM can be erased by selecting Service \$04 with GST.

1. Select Service \$04 with GST (Generic Scan Tool).

No Tools

1. If the ignition switch stays ON after repair work, be sure to turn ignition switch OFF once.

< FUNCTION DIAGNOSIS >

Wait at least 10 seconds and then turn it ON (engine stopped) again.

- 2. Erase DTC in ECM. Refer to How to Erase Diagnostic Test Mode II.
- If the battery is disconnected, the emission-related diagnostic information will be lost within 24 hours.
- The following data are cleared when the ECM memory is erased.
- Diagnostic trouble codes
- 1st trip diagnostic trouble codes
- Freeze frame data
- 1st trip freeze frame data
- System readiness test (SRT) codes
- Test values
- <Flexible Fuel Vehicle>
- Presumed ethanol mixture ratio

Actual work procedures are explained using a DTC as an example. Be careful so that not only the DTC, but all of the data listed above, are cleared from the ECM memory during work procedures.

Malfunction Indicator Lamp (MIL)

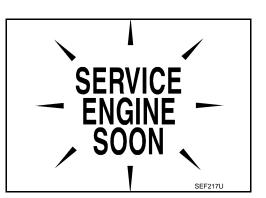

DESCRIPTION

The MIL is located on the instrument panel.

- The MIL will light up when the ignition switch is turned ON without the engine running. This is a bulb check. If the MIL does not light up, refer to <u>MWI-27</u>, "<u>Diagnosis Descrip-</u> <u>tion</u>".
- When the engine is started, the MIL should go off. If the MIL remains on, the on board diagnostic system has detected an engine system malfunction.

ON BOARD DIAGNOSTIC SYSTEM FUNCTION

The on board diagnostic system has the following three functions.

INFOID:000000005385086

D

Ε

F

Н

Κ

L

Μ

Ν

Ρ

А

< FUNCTION DIAGNOSIS >

Diagnostic Test Mode	KEY and ENG. Status	Function	Explanation of Function
Mode I	Ignition switch in ON position CON Engine stopped	BULB CHECK	This function checks the MIL bulb for damage (blown, open circuit, etc.). If the MIL does not come on, check MIL circuit.
	Engine running	MALFUNCTION WARNING	 This is a usual driving condition. When a malfunction is detected twice in two consecutive driving cycles (two trip detection logic), the MIL will light up to inform the driver that a malfunction has been detected. The following malfunctions will light up or blink the MIL in the 1st trip. Misfire (Possible three way catalyst damage) One trip detection diagnoses
Mode II	Ignition switch in ON position	SELF-DIAGNOSTIC RESULTS	This function allows DTCs and 1st trip DTCs to be read.

When there is an open circuit on MIL circuit, the ECM cannot warn the driver by lighting up MIL when there is malfunction on engine control system.

Therefore, when electrical controlled throttle and part of ECM related diagnoses are continuously detected as NG for 5 trips, ECM warns the driver that engine control system malfunctions and MIL circuit is open by means of operating fail-safe function.

The fail-safe function also operates when above diagnoses except MIL circuit are detected and demands the driver to repair the malfunction.

	Engine operating condition in fail-safe mode	Engine speed will not rise more than 2,500 rpm due to the fuel cut
--	----------------------------------------------	--------------------------------------------------------------------

MIL Flashing Without DTC

When any SRT codes are not set, MIL may flash without DTC. For the details, refer to EC-450, "DTC Index".

HOW TO SWITCH DIAGNOSTIC TEST MODE **NOTE**:

- It is better to count the time accurately with a clock.
- It is impossible to switch the diagnostic mode when an accelerator pedal position sensor circuit has a malfunction.
- Always ECM returns to Diagnostic Test Mode I after ignition switch is turned OFF.

How to Set Diagnostic Test Mode II (Self-diagnostic Results)

- 1. Confirm that accelerator pedal is fully released, turn ignition switch ON and wait 3 seconds.
- 2. Repeat the following procedure quickly five times within 5 seconds.
- a. Fully depress the accelerator pedal.
- b. Fully release the accelerator pedal.
- 3. Wait 7 seconds, fully depress the accelerator pedal and keep it for approx. 10 seconds until the MIL starts blinking.

Do not release the accelerator pedal for 10 seconds if MIL may start blinking on the halfway of this 10 seconds. This blinking is displaying SRT status and is continued for another 10 seconds. For the details, refer to <u>EC-450, "DTC Index"</u>.

How to Erase Diagnostic Test Mode II (Self-diagnostic Results)

- 1 Set ECM in Diagnostic Test Mode II (Self-diagnostic results). Refer to "How to Set Diagnostic Test Mode II (Self-diagnostic Results)".
- Fully depress the accelerator pedal and keep it for more than 10 seconds. 2. The emission-related diagnostic information has been erased from the backup memory in the ECM.
- Fully release the accelerator pedal, and confirm the DTC 0000 is displayed. 3.

DIAGNOSTIC TEST MODE I — BULB CHECK

In this mode, the MIL on the instrument panel should stay ON. If it remains OFF, check the bulb. Refer to MWI-27, "Diagnosis Description".

DIAGNOSTIC TEST MODE I — MALFUNCTION WARNING

MIL	Condition	I
ON	When the malfunction is detected.	
OFF	No malfunction.	

This DTC number is clarified in Diagnostic Test Mode II (SELF-DIAGNOSTIC RESULTS)

DIAGNOSTIC TEST MODE II — SELF-DIAGNOSTIC RESULTS

In this mode, the DTC and 1st trip DTC are indicated by the number of blinks of the MIL as shown below. Κ The DTC and 1st trip DTC are displayed at the same time. If the MIL does not illuminate in diagnostic test mode I (Malfunction warning), all displayed items are 1st trip DTCs. If only one code is displayed when the MIL illuminates in diagnostic test mode II (SELF-DIAGNOSTIC RESULTS), it is a DTC; if two or more codes are displayed, they may be either DTCs or 1st trip DTCs. DTC No. is same as that of 1st trip DTC. These uniden-L

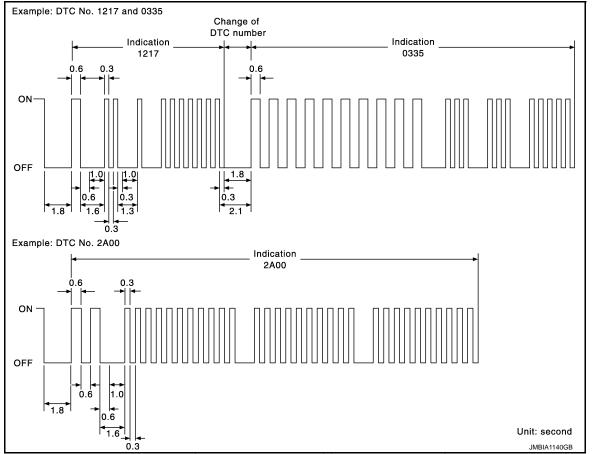

Μ

Ν

Ρ

< FUNCTION DIAGNOSIS >

tified codes can be identified by using the CONSULT-III or GST. A DTC will be used as an example for how to read a code.

A particular trouble code can be identified by the number of four-digit numeral flashes. The "zero" is indicated by the number of ten flashes. The "A" is indicated by the number of eleven flash. The length of time the 1,000th-digit numeral flashes on and off is 1.2 seconds consisting of an ON (0.6-second) - OFF (0.6-second) cycle.

The 100th-digit numeral and lower digit numerals consist of a 0.3-second ON and 0.3-second OFF cycle. A change from one digit numeral to another occurs at an interval of 1.0-second OFF. In other words, the later numeral appears on the display 1.3 seconds after the former numeral has disappeared.

A change from one trouble code to another occurs at an interval of 1.8-second OFF.

In this way, all the detected malfunctions are classified by their DTC numbers. The DTC 0000 refers to no malfunction. (See <u>EC-450, "DTC Index"</u>)

How to Erase Diagnostic Test Mode II (Self-diagnostic Results)

The DTC can be erased from the back up memory in the ECM by depressing accelerator pedal. Refer to "How to Erase Diagnostic Test Mode II (Self-diagnostic Results)".

- If the battery is disconnected, the DTC will be lost from the backup memory within 24 hours.
- Be careful not to erase the stored memory before starting trouble diagnoses.

OBD System Operation Chart

INFOID:000000005385087

RELATIONSHIP BETWEEN MIL, 1ST TRIP DTC, DTC, AND DETECTABLE ITEMS

- When a malfunction is detected for the first time, the 1st trip DTC and the 1st trip freeze frame data are stored in the ECM memory.
- When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data are stored in the ECM memory, and the MIL will come on. For details, refer to <u>EC-45. "Two Trip Detection Logic"</u>
- The MIL will go off after the vehicle is driven 3 times (driving pattern B) with no malfunction. The drive is counted only when the recorded driving pattern is met (as stored in the ECM). If another malfunction occurs while counting, the counter will reset.
- The DTC and the freeze frame data will be stored until the vehicle is driven 40 times (driving pattern A) without the same malfunction recurring (except for Misfire and Fuel Injection System). For Misfire and Fuel Injection System, the DTC and freeze frame data will be stored until the vehicle is driven 80 times (driving pattern

< FUNCTION DIAGNOSIS >

C) without the same malfunction recurring. The "TIME" in "SELF-DIAGNOSTIC RESULTS" mode of CON-SULT-III will count the number of times the vehicle is driven.

• The 1st trip DTC is not displayed when the self-diagnosis results in OK for the 2nd trip.

SUMMARY CHART

Fuel Injection System	Misfire	Other	
3 (pattern B)	3 (pattern B)	3 (pattern B)	
80 (pattern C)	80 (pattern C)	40 (pattern A)	— C
1 (pattern C), * ¹	1 (pattern C), *1	1 (pattern B)	D

< FUNCTION DIAGNOSIS >

- *1: When the same malfunction is detected in two consecutive trips, MIL will light up.
- *4: The DTC and the freeze frame data will not be displayed any longer after vehicle is driven 80 times (pattern C) without the same malfunction. (The DTC and the freeze frame data still remain in ECM.)
- *7: When the same malfunction is detected in the 2nd trip, the 1st trip freeze frame data will be cleared.

- *2: MIL will go off after vehicle is driven 3 times (pattern B) without any malfunctions.
- *5: When a malfunction is detected for the first time, the 1st trip DTC and the 1st trip freeze frame data will be stored in ECM.
- *8: 1st trip DTC will be cleared when vehicle is driven once (pattern C) without the same malfunction after DTC is stored in ECM.
- *3: When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data will be stored in ECM.
- *6: The 1st trip DTC and the 1st trip freeze frame data will be cleared at the moment OK is detected.

EXPLANATION FOR DRIVING PATTERNS FOR "MISFIRE <EXHAUST QUALITY DETERIORA-TION>", "FUEL INJECTION SYSTEM"

<Driving Pattern B> Driving pattern B means the vehicle operation as follows:

EC-64

< FUNCTION DIAGNOSIS >

All components and systems should be monitored at least once by the OBD system.

- The B counter will be cleared when the malfunction is detected once regardless of the driving pattern.
- The B counter will be counted up when driving pattern B is satisfied without any malfunction.
- The MIL will go off when the B counter reaches 3. (*2 in "OBD SYSTEM OPERATION CHART")

<Driving Pattern C>

Driving pattern C means the vehicle operation as follows:

The following conditions should be satisfied at the same time:

Engine speed: (Engine speed in the freeze frame data) ±375 rpm

Calculated load value: (Calculated load value in the freeze frame data) x (1 \pm 0.1) [%]

Engine coolant temperature (T) condition:

- When the freeze frame data shows lower than 70°C (158°F), T should be lower than 70°C (158°F).
- When the freeze frame data shows higher than or equal to 70°C (158°F), T should be higher than or equal to 70°C (158°F).

Example:

If the stored freeze frame data is as follows:

Engine speed: 850 rpm, Calculated load value: 30%, Engine coolant temperature: 80°C (176°F) To be satisfied with driving pattern C, the vehicle should run under the following conditions:

Engine speed: 475 - 1,225 rpm, Calculated load value: 27 - 33%, Engine coolant temperature: more than 70°C (158°F)

- The C counter will be cleared when the malfunction is detected regardless of vehicle conditions above.
- The C counter will be counted up when vehicle conditions above is satisfied without the same malfunction.
- The DTC will not be displayed after C counter reaches 80.
- The 1st trip DTC will be cleared when C counter is counted once without the same malfunction after DTC is stored in ECM.

 $\ensuremath{^*\!\!:}$ The item is the same as that of 1st trip freeze frame data.

DATA MONITOR MODE

Monitored Item

Monitored item [Unit]	ECM IN- PUT SIG- NALS	MAIN SIGNALS	Description	Remarks	J
ENG SPEED [rpm]	×	×	• Indicates the engine speed computed from the signal of the crankshaft position sensor (POS) and camshaft position sensor (PHASE).	 Accuracy becomes poor if engine speed drops below the idle rpm. If the signal is interrupted while the en- gine is running, an abnormal value may be indicated. 	K
MAS A/F SE-B1 [V]	×	×	 The signal voltage of the mass air flow sensor is displayed. 	 When the engine is stopped, a certain value is indicated. When engine is running specification range is indicated in "SPEC". 	M
B/FUEL SCHDL [ms]	×	×	• Base fuel schedule indicates the fuel in- jection pulse width programmed into ECM, prior to any learned on board cor- rection.	 When engine is running specification range is indicated in "SPEC". 	Ν
A/F ALPHA-B1 [%]				• When the engine is stopped, a certain	
A/F ALPHA-B2 [%]			• The mean value of the air-fuel ratio feed- back correction factor per cycle is indi- cated.	 value is indicated. When engine is running specification range is indicated in "SPEC". This data also includes the data for the air-fuel ratio learning control. 	O P
COOLAN TEMP/S [°C] or [°F]	×	×	• The engine coolant temperature (deter- mined by the signal voltage of the engine coolant temperature sensor) is dis- played.	• When the engine coolant temperature sensor is open or short-circuited, ECM enters fail-safe mode. The engine coolant temperature determined by the ECM is displayed.	
A/F SEN1 (B1) [V]	×	×	• The A/F signal computed from the input		
A/F SEN1 (B2) [V]	×	×	signal of the A/F sensor 1 is displayed.		

< FUNCTION DIAGNOSIS >

Monitored item [Unit]	ECM IN- PUT SIG- NALS	MAIN SIGNALS	Description	Remarks
HO2S2 (B1) [V] HO2S2 (B2) [V]	×	×	• The signal voltage of the heated oxygen sensor 2 is displayed.	
HO2S2 MNTR (B1) [RICH/LEAN]		×	Display of heated oxygen sensor 2 sig- nal:	
HO2S2 MNTR (B2) [RICH/LEAN]		×	RICH: means the amount of oxygen after three way catalyst is relatively small. LEAN: means the amount of oxygen af- ter three way catalyst is relatively large.	 When the engine is stopped, a certain value is indicated.
VHCL SPEED SE [km/h] or [mph]	×	×	• The vehicle speed computed from the vehicle speed signal sent from combination meter is displayed.	
BATTERY VOLT [V]			• The power supply voltage of ECM is displayed.	
ACCEL SEN 1 [V]			The accelerator pedal position sensor	ACCEL SEN 2 signal is converted by
ACCEL SEN 2 [V]			signal voltage is displayed.	ECM internally. Thus, it differs from ECM terminal voltage signal.
TP SEN 1-B1	×	×	The throttle position sensor signal volt-	• TP SEN 2-B1 signal is converted by
TP SEN 2-B1	×	×	age is displayed.	ECM internally. Thus, it differs from ECM terminal voltage signal.
FUEL T/TMP SE [°C] or [°F]			• The fuel temperature (determined by the signal voltage of the fuel tank temperature sensor) is displayed.	
INT/A TEMP SE [°C] or [°F]	×	×	• The intake air temperature (determined by the signal voltage of the intake air temperature sensor) is indicated.	
EVAP SYS PRES [V]			• The signal voltage of EVAP control system pressure sensor is displayed.	
FPCM DR VOLT [V]* ¹			 The voltage between fuel pump and FPCM is displayed. 	
FUEL LEVEL SE [V]	×		• The signal voltage of the fuel level sensor is displayed.	
START SIGNAL [ON/OFF]			 Indicates start signal status [ON/OFF] computed by the ECM according to the signals of engine speed and battery volt- age. 	 After starting the engine, [OFF] is displayed regardless of the starter signal.
CLSD THL POS [ON/OFF]	×	×	 Indicates idle position [ON/OFF] comput- ed by ECM according to the accelerator pedal position sensor signal. 	
AIR COND SIG [ON/OFF]	×	×	 Indicates [ON/OFF] condition of the air conditioner switch as determined by the air conditioner signal. 	
P/N POSI SW [ON/OFF]	×	×	 Indicates [ON/OFF] condition from the park/neutral position (PNP) signal. 	
PW/ST SIGNAL [ON/OFF]	×	×	• [ON/OFF] condition of the power steering system (determined by the signal voltage of the power steering pressure sensor signal) is indicated.	
LOAD SIGNAL [ON/OFF]	×	×	 Indicates [ON/OFF] condition from the electrical load signal. ON: Lighting switch is in 2nd position. OFF: Lighting switch is OFF. 	
IGNITION SW [ON/OFF]	×	×	 Indicates [ON/OFF] condition from igni- tion switch signal. 	

< FUNCTION DIAGNOSIS >

Monitored item [Unit]	ECM IN- PUT SIG- NALS	MAIN SIGNALS	Description	Remarks	A
HEATER FAN SW [ON/OFF]	×		 Indicates [ON/OFF] condition from heat- er fan switch signal. 		EC
BRAKE SW [ON/OFF]			 Indicates [ON/OFF] condition from the stop lamp switch signal. 		
INJ PULSE-B1 [msec] INJ PULSE-B2 [msec]			 Indicates the actual fuel injection pulse width compensated by ECM according to the input signals. 	 When the engine is stopped, a certain computed value is indicated. 	C
IGN TIMING [BT- DC]			 Indicates the ignition timing computed by ECM according to the input signals. 	• When the engine is stopped, a certain value is indicated.	
CAL/LD VALUE [%]			• "Calculated load value" indicates the val- ue of the current air flow divided by peak air flow.		E
MASS AIRFLOW [g·m/s]			 Indicates the mass air flow computed by ECM according to the signal voltage of the mass air flow sensor. 		F
PURG VOL C/V [%]			 Indicates the EVAP canister purge volume control solenoid valve control value computed by the ECM according to the input signals. The opening becomes larger as the value increases. 		G
INT/V TIM (B1) [°CA]			 Indicates [°CA] of intake camshaft ad- 		-
INT/V TIM (B2) [°CA]			vanced angle.		I
INT/V SOL (B1) [%]			 The control value of the intake valve timing control solenoid valve (determined by ECM according to the input signals) is indicated. The advance angle becomes larger as the value increases. 		J
AIR COND RLY [ON/OFF]			• The air conditioner relay control condi- tion (determined by ECM according to the input signals) is indicated.		L
FUEL PUMP RLY [ON/OFF]			 Indicates the fuel pump relay control con- dition determined by ECM according to the input signals. 		M
FPCM [HI/LOW]*			• The control condition of the fuel pump control module (FPCM) (determined by the ECM according to the input signals) is indicated.		N
VENT CONT/V [ON/OFF]			 The control condition of the EVAP canister vent control valve (determined by ECM according to the input signals) is indicated. ON: Closed OFF: Open 		0 P
THRTL RELAY [ON/OFF]			 Indicates the throttle control motor relay control condition determined by the ECM according to the input signals. 		- r
HO2S2 HTR (B1) [ON/OFF] HO2S2 HTR (B2) [ON/OFF]			 Indicates [ON/OFF] condition of heated oxygen sensor 2 heater determined by ECM according to the input signals. 		-

< FUNCTION DIAGNOSIS >

Monitored item [Unit]	ECM IN- PUT SIG- NALS	MAIN SIGNALS	Description	Remarks
I/P PULLY SPD [rpm]			 Indicates the engine speed computed from the input speed sensor signal. 	
VEHICLE SPEED [km/h] or [mph]			• Indicates the vehicle speed computed from the output speed sensor signal.	
IDL A/V LEARN [YET/CMPLT]			 Display the condition of Idle Air Volume Learning YET: Idle Air Volume Learning has not been performed yet. CMPLT: Idle Air Volume Learning has al- ready been performed successfully. 	
TRVL AFTER MIL [km] or [mile]			Distance traveled while MIL is activated.

A/F S1 HTR (B2) [%]			nals.The current flow to the heater becomes larger as the value increases.	
AC PRESS SEN [V]			• The signal voltage from the refrigerant pressure sensor is displayed.	
VHCL SPEED SE [km/h] or [mph]			• The vehicle speed computed from the vehicle speed signal sent from combination meter is displayed.	
SET VHCL SPD [km/h] or [mph]			The preset vehicle speed is displayed.	
MAIN SW [ON/OFF]			 Indicates [ON/OFF] condition from MAIN switch signal. 	
CANCEL SW [ON/OFF]			 Indicates [ON/OFF] condition from CAN- CEL switch signal. 	
RESUME/ACC SW [ON/OFF]			 Indicates [ON/OFF] condition from RE- SUME/ACCELERATE switch signal. 	
SET SW [ON/OFF]			 Indicates [ON/OFF] condition from SET/ COAST switch signal. 	
BRAKE SW1 [ON/OFF]			 Indicates [ON/OFF] condition from ASCD brake switch signal. 	
BRAKE SW2 [ON/OFF]			 Indicates [ON/OFF] condition of stop lamp switch signal. 	
VHCL SPD CUT [NON/CUT]			 Indicates the vehicle cruise condition. NON: Vehicle speed is maintained at the ASCD set speed. CUT: Vehicle speed increased to exces- sively high compared with the ASCD set speed, and ASCD operation is cut off. 	
LO SPEED CUT [NON/CUT]			 Indicates the vehicle cruise condition. NON: Vehicle speed is maintained at the ASCD set speed. CUT: Vehicle speed decreased to exces- sively low compared with the ASCD set speed, and ASCD operation is cut off. 	
AT OD MONITOR [ON/OFF]			 Indicates [ON/OFF] condition of A/T O/D according to the input signal from the TCM. 	
AT OD CANCEL [ON/OFF]			 Indicates [ON/OFF] condition of A/T O/D cancel signal sent from the TCM. 	

< FUNCTION DIAGNOSIS >

Monitored item [Unit]	ECM IN- PUT SIG- NALS	MAIN SIGNALS	Description	Remarks	А
CRUISE LAMP [ON/OFF]			 Indicates [ON/OFF] condition of CRUISE lamp determined by the ECM according to the input signals. 		EC
SET LAMP [ON/OFF]			 Indicates [ON/OFF] condition of SET lamp determined by the ECM according to the input signals. 		С
ETHANOL M/R [%]*			• Ethanol mixture ratio presumed by the ECM according to the input signals is displayed.		D
ALT DUTY [%]			 Indicates the duty ratio of the power gen- eration command value. The ratio is cal- culated by ECM based on the battery current sensor signal. 		E
BAT CUR SEN [mV]			The signal voltage of battery current sen- sor is displayed.		F
ALT DUTY SIG [ON/OFF]			 The control condition of the power gener- ation voltage variable control (deter- mined by ECM according to the input signals) is indicated. ON: Power generation voltage variable control is active. OFF: Power generation voltage variable control is inactive. 		G
A/F ADJ-B1			Indicates the correction factor stored in		-
A/F ADJ-B2			ECM. The factor is calculated from the difference between the target air/fuel ra- tio stored in ECM and the air-fuel ratio calculated from air fuel ratio (A/F) sensor 1 signal.		
HO2 S2 DIAG2 (B1) ^{*2} [INCMP/CMPLT]			 Indicates DTC P0139 self-diagnosis (slow responce) INCMP: Self-diagnosis is incomplete. CMPLT: Self-diagnosis is complete. 		– J K
HO2 S2 DIAG2 (B2)* ² [INCMP/CMPLT]			 Indicates DTC P0159 self-diagnosis (slow responce)condition. INCMP: Self-diagnosis is incomplete. CMPLT: Self-diagnosis is complete. 		L

*1: For Flexible Fuel Vehicle

*2: The item is indicated, but not used.

NOTE:

Any monitored item that does not match the vehicle being diagnosed is deleted from the display automatically.

ACTIVE TEST MODE

Test Item

TEST ITEM	CONDITION	JUDGEMENT	CHECK ITEM (REMEDY)
FUEL INJEC- TION	 Engine: Return to the original trouble condition Change the amount of fuel injec- tion using CONSULT-III. 	If trouble symptom disappears, see CHECK ITEM.	 Harness and connectors Fuel injector Air fuel ratio (A/F) sensor 1
IGNITION TIM- ING	 Engine: Return to the original trouble condition Timing light: Set Retard the ignition timing using CONSULT-III. 	If trouble symptom disappears, see CHECK ITEM.	Perform Idle Air Volume Learning.

Generic Scan Tool (GST) Function

INFOID:000000005385089

Ε

F

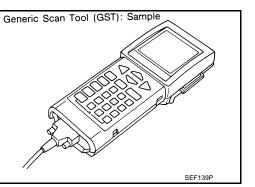

Н

DESCRIPTION

Generic Scan Tool (OBDII scan tool) complying with SAE J1978 has different functions explained below.

ISO15765-4 is used as the protocol.

The name GST or Generic Scan Tool is used in this service manual.

FUNCTION

C	Diagnostic test mode	Function
Service \$01	READINESS TESTS	This diagnostic service gains access to current emission-related data values, including analog inputs and outputs, digital inputs and outputs, and system status information.
Service \$02	(FREEZE DATA)	This diagnostic service gains access to emission-related data value which were stored by ECM during the freeze frame. For details, refer to EC-450, "DTC In- dex".
Service \$03	DTCs	This diagnostic service gains access to emission-related power train trouble codes which were stored by ECM.
Service \$04	CLEAR DIAG INFO	 This diagnostic service can clear all emission-related diagnostic information. This includes: Clear number of diagnostic trouble codes (Service \$01) Clear diagnostic trouble codes (Service \$03) Clear trouble code for freeze frame data (Service \$01) Clear freeze frame data (Service \$02) Reset status of system monitoring test (Service \$01) Clear on board monitoring test results (Service \$06 and \$07)
Service \$06	(ON BOARD TESTS)	This diagnostic service accesses the results of on board diagnostic monitoring tests of specific components/systems that are not continuously monitored.
Service \$07	(ON BOARD TESTS)	This diagnostic service enables the off board test drive to obtain test results for emission-related powertrain components/systems that are continuously monitored during normal driving conditions.
Service \$08		 This diagnostic service can close EVAP system in ignition switch ON position (Engine stopped). When this diagnostic service is performed, the EVAP canister vent control valve can be closed. In the following conditions, this diagnostic service cannot function. Low ambient temperature Low battery voltage Engine running Ignition switch OFF Low fuel temperature Too much pressure is applied to EVAP system

< FUNCTION DIAGNOSIS >

[VK56DE]

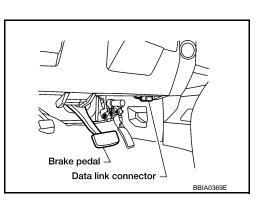

Diagnostic test mode		Function
Service \$09	(CALIBRATION ID)	This diagnostic service enables the off-board test device to request specific vehicle information such as Vehicle Identification Number (VIN) and Calibration IDs.
Service \$0A* ^{1,*2}	PERMANENT DTCs	This diagnostic service gains access to permanent DTCs which were stored by ECM.

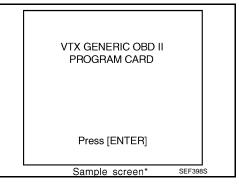

*1: Service \$0A is not applied for regions where it is not mandated.

*2: Although A60 models do not support Service \$0A, it is shown on GST screen.

INSPECTION PROCEDURE

- 1. Turn ignition switch OFF.
- 2. Connect GST to data link connector, which is located under LH dash panel near the hood opener handle.

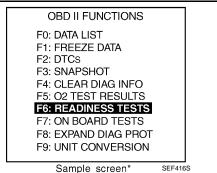

- 3. Turn ignition switch ON.
- 4. Enter the program according to instruction on the screen or in the operation manual.

(*: Regarding GST screens in this section, sample screens are shown.)

5. Perform each diagnostic service according to each service procedure.

For further information, see the GST Operation Manual of the tool maker.

Revision: August 2009

TROUBLE DIAGNOSIS - SPECIFICATION VALUE

< COMPONENT DIAGNOSIS >

COMPONENT DIAGNOSIS

TROUBLE DIAGNOSIS - SPECIFICATION VALUE

Description

The specification (SP) value indicates the tolerance of the value that is displayed in "SPEC" of "DATA MONI-TOR" mode with CONSULT-III during normal operation of the Engine Control System. When the value in "SPEC" of "DATA MONITOR" mode is within the SP value, the Engine Control System is confirmed OK. When the value in "SPEC" of "DATA MONITOR" mode is NOT within the SP value, the Engine Control System may have one or more malfunctions. The SP value is used to detect malfunctions that may affect the Engine Control System, but will not light the MIL.

The SP value will be displayed for the following three items:

- B/FUEL SCHDL (The fuel injection pulse width programmed into ECM prior to any learned on board correction)
- A/F ALPHA-B1/B2 (The mean value of air-fuel ratio feedback correction factor per cycle)
- MAS A/F SE-B1 (The signal voltage of the mass air flow sensor)

Testing Condition

 Vehicle driven distance: More than 5,000 km (3,107 miles) 	
• Barometric pressure: 98.3 - 104.3 kPa (1.003 - 1.064 kg/cm ² , 14.25 - 15.12 psi))

- Atmospheric temperature: 20 30°C (68 86°F)
- Engine coolant temperature: 75 95°C (167 203°F)
- Engine speed: Idle
- Transmission: Warmed-up
- After the engine is warmed up to normal operating temperature, drive vehicle until "ATF TEMP SE 1" (A/T fluid temperature sensor signal) indicates more than 60°C (140°F).
- Electrical load: Not applied
- Rear window defogger switch, air conditioner switch, lighting switch are OFF. Steering wheel is straight ahead.

Inspection Procedure

NOTE: Perform "SPEC" in "DATA MONITOR" mode in maximum scale display. 1. Perform <u>EC-13. "Basic Inspection"</u>. 2. Confirm that the testing conditions indicated above are met. 3. Select "B/FUEL SCHDL", "A/F ALPHA-B1", "A/F ALPHA-B2" and "MAS A/F SE-B1" in "SPEC" of "DATA MONITOR" mode with CONSULT-III.

EC-77

- 4. Make sure that monitor items are within the SP value.
- 5. If NG, go to EC-78, "Diagnosis Procedure".

< COMPONENT DIAGNOSIS >

Diagnosis Procedure

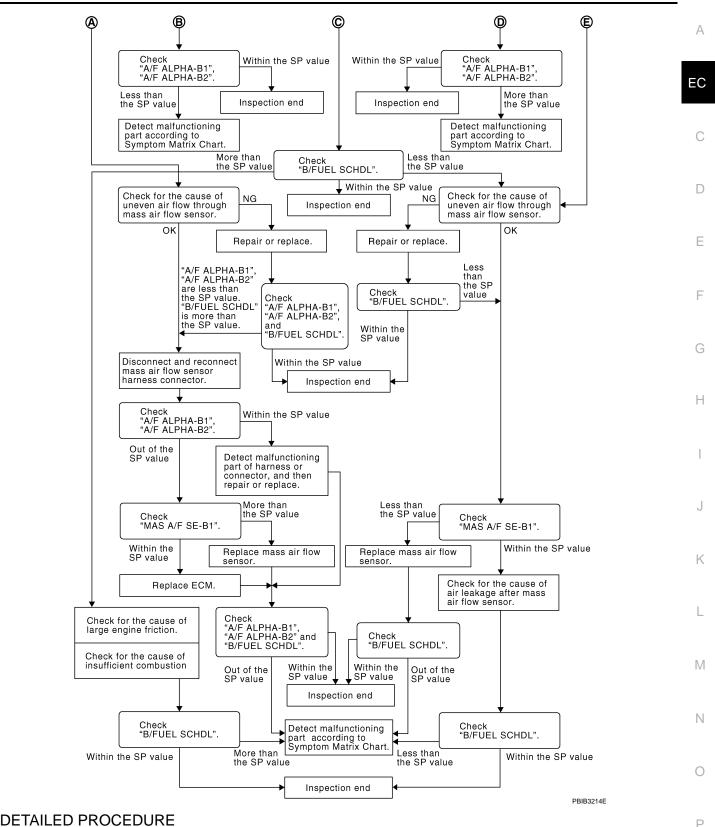

[VK56DE]

OVERALL SEQUENCE

< COMPONENT DIAGNOSIS >

[VK56DE]

1.CHECK "A/F ALPHA-B1", "A/F ALPHA-B2"

- 1. Start engine.
- 2. Confirm that the testing conditions are met. Refer to EC-77. "Testing Condition".
- Select "A/F ALPHA-B1", "A/F ALPHA-B2" in "SPEC" of "DATA MONITOR" mode, and make sure that the each indication is within the SP value.
 NOTE:

< COMPONENT DIAGNOSIS >

[VK56DE]

Check "A/F ALPHA-B1", "A/F ALPHA-B2" for approximately 1 minute because they may fluctuate. It is NG if the indication is out of the SP value even a little.

<u>OK or NG</u>

OK >> GO TO 17. NG (Less than the SP value)>>GO TO 2. NG (More than the SP value)>>GO TO 3.

2.CHECK "B/FUEL SCHDL"

Select "B/FUEL SCHDL" in "SPEC" of "DATA MONITOR" mode, and make sure that the indication is within the SP value.

OK or NG

OK >> GO TO 4.

NG (More than the SP value)>>GO TO 19.

 ${f 3.}$ CHECK "B/FUEL SCHDL"

Select "B/FUEL SCHDL" in "SPEC" of "DATA MONITOR" mode, and make sure that the indication is within the SP value.

OK or NG

OK >> GO TO 6. NG (More than the SP value)>>GO TO 6. NG (Less than the SP value)>>GO TO 25.

4.CHECK "A/F ALPHA-B1", "A/F ALPHA-B2"

- 1. Stop the engine.
- 2. Disconnect PCV hose, and then plug it.
- 3. Start engine.
- 4. Select "A/F ALPHA-B1", "A/F ALPHA-B2" in "SPEC" of "DATA MONITOR" mode, and make sure that the each indication is within the SP value.

<u>OK or NG</u>

OK >> GO TO 5. NG >> GO TO 6.

5.CHANGE ENGINE OIL

- 1. Stop the engine.
- 2. Change engine oil.

NOTE:

This symptom may occur when a large amount of gasoline is mixed with engine oil because of driving conditions (such as when engine oil temperature does not rise enough since a journey distance is too short during winter). The symptom will not be detected after changing engine oil or changing driving condition.

>> INSPECTION END

6.CHECK FUEL PRESSURE

Check fuel pressure. (Refer to <u>EC-481, "Fuel Pressure Check"</u>.)

OK or NG

- OK >> GO TO 9.
- NG (Fuel pressure is too high)>>Replace fuel pressure regulator, refer to <u>EC-481, "Fuel Pressure Check"</u>. GO TO 8.

NG (Fuel pressure is too low)>>GO TO 7.

7. DETECT MALFUNCTIONING PART

1. Check the following.

- Clogged and bent fuel hose and fuel tube
- Clogged fuel filter
- Fuel pump and its circuit (Refer to EC-392.)
- If NG, repair or replace the malfunctioning part. (Refer to <u>EC-481, "Fuel Pressure Check"</u>.) If OK, replace fuel pressure regulator.

< COMPONENT DIAGNOSIS >

[VK56DE]

>> GO TO 8.	А
8.CHECK "A/F ALPHA-B1", "A/F ALPHA-B2"	
 Start engine. Select "A/F ALPHA-B1", "A/F ALPHA-B2" in "SPEC" of "DATA MONITOR" mode, and make sure that the each indication is within the SP value. 	EC
OK or NG	С
OK >> INSPECTION END NG >> GO TO 9.	
9. PERFORM POWER BALANCE TEST	D
 Perform "POWER BALANCE" in "ACTIVE TEST" mode. Make sure that the each cylinder produces a momentary engine speed drop. 	
OK or NG	Е
OK >> GO TO 12. NG >> GO TO 10.	
10. DETECT MALFUNCTIONING PART	F
 Check the following. Ignition coil and its circuit (Refer to <u>EC-399</u>.) Fuel injector and its circuit (Refer to <u>EC-389</u>.) Intake air leakage 	G
 Low compression pressure (Refer to <u>EM-23. "Checking Compression Pressure"</u>.) If NG, repair or replace the malfunctioning part. If OK, replace fuel injector. (It may be caused by leakage from fuel injector or clogging.) 	Н
>> GO TO 11. 11. CHECK "A/F ALPHA-B1", "A/F ALPHA-B2"	
 Start engine. Select "A/F ALPHA-B1", "A/F ALPHA-B2" in "SPEC" of "DATA MONITOR" mode, and make sure that the each indication is within the SP value. 	J
OK >> INSPECTION END	Κ
NG >> GO TO 12. 12.CHECK A/F SENSOR 1 FUNCTION	
Perform all DTC Confirmation Procedure related with A/F sensor 1.	L
 For DTC P0130, P0150, refer to <u>EC-140, "DTC Confirmation Procedure"</u>. For DTC P0131, P0151, refer to <u>EC-144, "DTC Confirmation Procedure"</u>. For DTC P0132, P0152, refer to <u>EC-147, "DTC Confirmation Procedure"</u>. For DTC P0133, P0153, refer to <u>EC-150, "DTC Confirmation Procedure"</u>. For DTC P2A00, P2A03, refer to <u>EC-374, "DTC Confirmation Procedure"</u>. 	Μ
OK or NG	Ν
OK >> GO TO 15. NG >> GO TO 13.	
13. CHECK A/F SENSOR 1 CIRCUIT	0
Perform Diagnostic Procedure according to corresponding DTC.	
>> GO TO 14. 14. CHECK "A/F ALPHA-B1", "A/F ALPHA-B2"	Ρ

- 1. Start engine.
- 2. Select "Ă/F ALPHA-B1", "A/F ALPHA-B2" in "SPEC" of "DATA MONITOR" mode, and make sure that the each indication is within the SP value.
- <u>OK or NG</u>

< COMPONENT DIAGNOSIS >

OK >> INSPECTION END NG >> GO TO 15.

15. DISCONNECT AND RECONNECT ECM HARNESS CONNECTOR

1. Stop the engine.

2. Disconnect ECM harness connector. Check pin terminal and connector for damage, and then reconnect it.

>> GO TO 16.

16.CHECK "A/F ALPHA-B1", "A/F ALPHA-B2"

- 1. Start engine.
- Select "Ă/F ALPHA-B1", "A/F ALPHA-B2" in "SPEC" of "DATA MONITOR" mode, and make sure that the each indication is within the SP value.

<u>OK or NG</u>

OK >> INSPECTION END

NG >> Detect malfunctioning part according to <u>EC-469, "Symptom Matrix Chart"</u>.

17.CHECK "B/FUEL SCHDL"

Select "B/FUEL SCHDL" in "SPEC" of "DATA MONITOR" mode, and make sure that the indication is within the SP value.

OK or NG

OK >> INSPECTION END

NG (More than the SP value)>>GO TO 18.

NG (Less than the SP value)>>GO TO 25.

18. DETECT MALFUNCTIONING PART

- 1. Check for the cause of large engine friction. Refer to the following.
- Engine oil level is too high
- Engine oil viscosity
- Belt tension of power steering, alternator, A/C compressor, etc. is excessive
- Noise from engine
- Noise from transmission, etc.
- 2. Check for the cause of insufficient combustion. Refer to the following.
- Valve clearance malfunction
- Intake valve timing control function malfunction
- Camshaft sprocket installation malfunction, etc.

>> Repair or replace malfunctioning part, and then GO TO 30.

19.CHECK INTAKE SYSTEM

Check for the cause of uneven air flow through mass air flow sensor. Refer to the following.

Crushed air ducts

- · Malfunctioning seal of air cleaner element
- Uneven dirt of air cleaner element
- Improper specification of intake air system

OK or NG

OK >> GO TO 21.

NG >> Repair or replace malfunctioning part, and then GO TO 20.

20. CHECK "A/F ALPHA-B1", "A/F ALPHA-B2", AND "B/FUEL SCHDL"

Select "A/F ALPHA-B1", "A/F ALPHA-B2", and "B/FUEL SCHDL" in "SPEC" of "DATA MONITOR" mode, and make sure that the each indication is within the SP value.

OK or NG

OK >> INSPECTION END

NG ("B/FUEL SCHDL" is more, "A/F ALPHA-B1", "A/F ALPHA-B2" are less than the SP value)>>GO TO 21.

21. DISCONNECT AND RECONNECT MASS AIR FLOW SENSOR HARNESS CONNECTOR

1. Stop the engine.

< COMPONENT DIAGNOSIS > [VK56DE]	
2. Disconnect mass air flow sensor harness connector. Check pin terminal and connector for damage and then reconnect it again.	A
>> GO TO 22.	
22.CHECK "A/F ALPHA-B1", "A/F ALPHA-B2"	EC
 Start engine. Select "A/F ALPHA-B1", "A/F ALPHA-B2" in "SPEC" of "DATA MONITOR" mode, and make sure that the each indication is within the SP value. 	(
<u>OK or NG</u>	
 OK >> 1. Detect malfunctioning part of mass air flow sensor circuit and repair it. Refer to <u>EC-113</u>. 2. GO TO 29. NG >> GO TO 23. 	C
23. CHECK "MAS A/F SE-B1"	
	E
Select "MAS A/F SE-B1" in "SPEC" of "DATA MONITOR" mode, and make sure that the indication is within the SP value.	
<u>OK or NG</u>	F
OK >> GO TO 24.	
NG (More than the SP value)>>Replace mass air flow sensor, and then GO TO 29.	
24.replace ecm	0
1. Replace ECM.	
 Perform initialization of NVIS(NATS) system and registration of all NVIS(NATS) ignition key IDs. Refer to SEC-7, "ECM RE-COMMUNICATING FUNCTION : Description". 	F
3. Perform <u>EC-22, "VIN Registration"</u> .	
4. Perform <u>EC-22, "Accelerator Pedal Released Position Learning"</u> .	
 Perform EC-22, "Throttle Valve Closed Position Learning". Flexible Fuel Vehicles 	
Perform EC-22, "Ethanol Mixture Ratio Adaptation (Flexible Fuel Vehicle)".	
7. Perform <u>EC-23, "Idle Air Volume Learning"</u> .	
>> GO TO 29.	
25. CHECK INTAKE SYSTEM	k
Check for the cause of uneven air flow through mass air flow sensor. Refer to the following.	1
Crushed air ducts	
Malfunctioning seal of air cleaner element	l
 Uneven dirt of air cleaner element Improper specification of intake air system 	
<u>OK or NG</u>	Ν
OK >> GO TO 27.	1
NG >> Repair or replace malfunctioning part, and then GO TO 26.	
26.check "B/Fuel Schdl"	ľ
Select "B/FUEL SCHDL" in "SPEC" of "DATA MONITOR" mode, and make sure that the indication is within the SP value.	
OK or NG	(
OK >> INSPECTION END NG (Less than the SP value)>>GO TO 27.	_
27.CHECK "MAS A/F SE-B1"	F
Select "MAS A/F SE-B1" in "SPEC" of "DATA MONITOR" mode, and make sure that the indication is within the SP value.	
OK or NG	

OK or NG

OK >> GO TO 28. NG (Less than the SP value)>>Replace mass air flow sensor, and then GO TO 30.

< COMPONENT DIAGNOSIS >

28. CHECK INTAKE SYSTEM

- Check for the cause of air leak after the mass air flow sensor. Refer to the following.
- Disconnection, looseness, and cracks in air duct
- Looseness of oil filler cap
- Disconnection of oil level gauge
- Open stuck, breakage, hose disconnection, or cracks of PCV valve
- Disconnection or cracks of EVAP purge hose, open stuck of EVAP canister purge volume control solenoid valve
- Malfunctioning seal of rocker cover gasket
- Disconnection, looseness, or cracks of hoses, such as vacuum hose, connecting to intake air system parts
- Malfunctioning seal of intake air system, etc.

>> GO TO 30.

29.CHECK "A/F ALPHA-B1", "A/F ALPHA-B2", AND "B/FUEL SCHDL"

Select "A/F ALPHA-B1", "A/F ALPHA-B2", and "B/FUEL SCHDL" in "SPEC" of "DATA MONITOR" mode, and make sure that the each indication is within the SP value.

<u>OK or NG</u>

OK >> INSPECTION END

NG >> Detect malfunctioning part according to EC-469, "Symptom Matrix Chart".

30.CHECK "B/FUEL SCHDL"

Select "B/FUEL SCHDL" in "SPEC" of "DATA MONITOR" mode, and then make sure that the indication is within the SP value.

OK or NG

OK >> INSPECTION END

NG >> Detect malfunctioning part according to <u>EC-469</u>, "Symptom Matrix Chart".

Ground Inspection

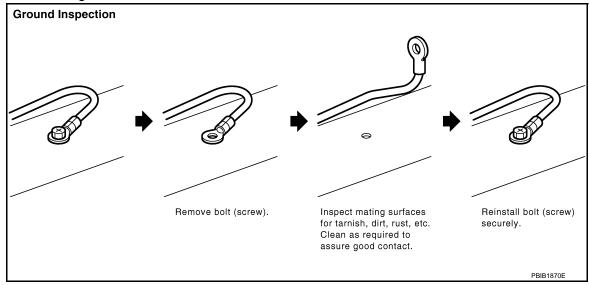

INFOID:000000005385095

Ground connections are very important to the proper operation of electrical and electronic circuits. Ground connections are often exposed to moisture, dirt and other corrosive elements. The corrosion (rust) can become an unwanted resistance. This unwanted resistance can change the way a circuit works.

Electronically controlled circuits are very sensitive to proper grounding. A loose or corroded ground can drastically affect an electronically controlled circuit. A poor or corroded ground can easily affect the circuit. Even when the ground connection looks clean, there can be a thin film of rust on the surface.

When inspecting a ground connection follow these rules:

- Remove the ground bolt or screw.
- Inspect all mating surfaces for tarnish, dirt, rust, etc.
- Clean as required to assure good contact.
- Reinstall bolt or screw securely.
- Inspect for "add-on" accessories which may be interfering with the ground circuit.
- If several wires are crimped into one ground eyelet terminal, check for proper crimps. Make sure all of the wires are clean, securely fastened and providing a good ground path. If multiple wires are cased in one eyelet make sure no ground wires have excess wire insulation.

U0101 CAN COMM CIRCUIT

Description

CAN (Controller Area Network) is a serial communication line for real time application. It is an on-vehicle mul-EC tiplex communication line with high data communication speed and excellent error detection ability. Many electronic control units are equipped onto a vehicle, and each control unit shares information and links with other control units during operation (not independent). In CAN communication, control units are connected with 2 communication lines (CAN H line, CAN L line) allowing a high rate of information transmission with less wiring. Each control unit transmits/receives data but selectively reads required data only.

DTC Confirmation Procedure

CAUTION:

Always	drive	at a	safe	speed.
NOTÉ:				

- If DTC P0011 or P0021 is displayed with DTC P0075, P0081, P1140 or P1145, first perform the trouble K diagnosis for <u>EC-104</u> or <u>EC-297</u>.
- If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.
- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is between 10V and 16V at idle.

PROCEDURE FOR MALFUNCTION A

- 1. Turn ignition switch ON.
- 2. Select "DATA MONITOR" mode with CONSULT-III.
- 3. Maintain the following conditions for at least 10 consecutive seconds.

ENG SPEED	More than 2,000 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving con- ditions required for this test.)

< COMPONENT DIAGNOSIS >

4. Maintain the following conditions for at least 20 consecutive seconds.

ENG SPEED	Idle
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	P or N position

5. Check 1st trip DTC.

6. If 1st trip DTC is detected, go to EC-92, "Diagnosis Procedure".

PROCEDURE FOR MALFUNCTION B

- 1. Turn ignition switch ON.
- 2. Select "DATA MONITOR" mode with CONSULT-III.
- 3. Maintain the following conditions for at least 10 consecutive seconds.

ENG SPEED	1,700 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	70 - 105°C (158 - 221°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving con- ditions required for this test.)

4. Check 1st trip DTC.

5. If 1st trip DTC is detected, go to EC-92, "Diagnosis Procedure".

Diagnosis Procedure

1.CHECK OIL PRESSURE WARNING LAMP

- 1. Start engine.
- 2. Check oil pressure warning lamp and confirm it is not illuminated.

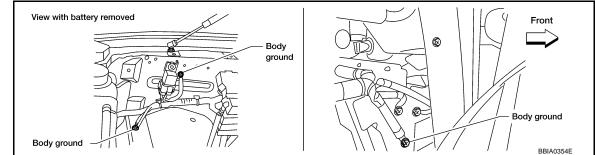

OK or NG

- OK >> GO TO 2.
- NG >> Go to <u>LU-8, "Inspection"</u>.

2. CHECK GROUND CONNECTIONS

- 1. Turn ignition switch OFF.
- 2. Loosen and retighten three ground screws on the body. Refer to <u>EC-88, "Ground Inspection"</u>.

OK or NG

OK >> GO TO 3.

NG >> Repair or replace ground connections.

Voltage: Battery voltage

OK or NG

OK	>> GO TO 11.
NG	>> GO TO 10.

10. DETECT MALFUNCTIONING PART

Check the following.

Harness connectors E2, F32

• Harness for open or short between intake valve timing control solenoid valve and IPDM E/R.

< COMPONENT DIAGNOSIS >	[VK56DE]
>> Repair open circuit or short to ground or short to power in harness or connectors.	
11.CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE OUTPUT SIGNAL CIRCUIT AND SHORT	FOR OPEN
1. Turn ignition switch OFF.	
 Disconnect ECM harness connector. Check harness continuity between the following; 	
ECM terminal 10 and intake valve timing control solenoid valve (Bank 1) terminal 1 or	
ECM terminal 11 and intake valve timing control solenoid valve (Bank 2) terminal 1.	
Refer to Wiring Diagram.	
Continuity should exist.	
4. Also check harness for short to ground and short to power.	
OK or NG	
OK >> GO TO 12. NG >> Repair open circuit or short to ground or short to power in harness or connectors.	
12. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE	
Refer to <u>EC-96, "Component Inspection"</u> .	
<u>OK or NG</u>	
OK >> GO TO 13.	
NG >> Replace malfunctioning intake valve timing control solenoid valve. Refer to <u>EC-486</u> .	
13. CHECK CRANKSHAFT POSITION SENSOR (POS)	
Refer to EC-205, "Component Inspection".	
<u>OK or NG</u>	
OK >> GO TO 14. NG >> Replace crankshaft position sensor (POS).	
14. CHECK CAMSHAFT POSITION SENSOR (PHASE)	
Refer to <u>EC-209</u> , "Component Inspection".	
<u>OK or NG</u>	
OK >> GO TO 15.	
NG >> Replace malfunctioning camshaft position sensor (PHASE). Refer to <u>EC-487</u> .	
15. CHECK CAMSHAFT SPROCKET	
Check accumulation of debris to the signal pick-up portion of the camshaft sprocket. Refe	r to <u>EM-53,</u>
"Removal and Installation".	
<u>OK or NG</u> OK >> GO TO 16.	
NG >> Remove debris and clean the signal pick-up cutout of camshaft sprocket.	
16. CHECK TIMING CHAIN INSTALLATION	
Check service records for any recent repairs that may cause timing chain misaligned.	
Are there any service records that may cause timing chain misaligned?	
Yes or No	
Yes >> Check timing chain installation. Refer to <u>EM-45, "Removal and Installation"</u> . No >> GO TO 17.	
17. CHECK LUBRICATION CIRCUIT	
Refer to EM-62, "Inspection after Installation".	
<u>OK or NG</u>	
OK >> GO TO 18.	
NG >> Clean lubrication line.	
18. CHECK INTERMITTENT INCIDENT	
Refer to GI-35, "How to Check Terminal" and GI-38, "Intermittent Incident".	

< COMPONENT DIAGNOSIS >

[VK56DE]

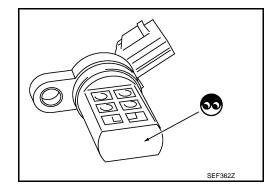

INFOID:000000005385103

>> INSPECTION END

Component Inspection

INTAKE VALVE TIMING CONTROL POSITION SENSOR

- 1. Disconnect intake valve timing control position sensor harness connector.
- 2. Loosen the fixing bolt of the sensor.
- 3. Remove the sensor.
- 4. Visually check the sensor for chipping.

5. Check resistance as shown below.

Terminal No. (Polarity)	Resistance Ω [at 25°C (77°F)]
3 (+) - 1 (-)	
2 (+) - 1 (-)	Except 0 or ∞
3 (+) - 2 (-)	

 If NG, replace intake valve timing control position sensor. Refer to <u>EC-487</u>.

INTAKE VALVE TIMING CONTROL SOLENOID VALVE

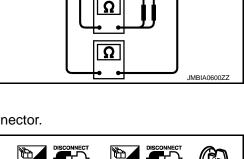

- 1. Disconnect intake valve timing control solenoid valve harness connector.
- 2. Check resistance between intake valve timing control solenoid valve terminals as follows.

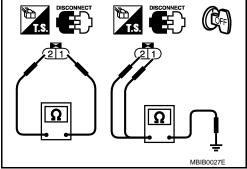

Terminals	Resistance
1 and 2	7.1 - 7.7Ω [at 20°C (68°F)]
1 or 2 and ground	${}^{\infty\Omega}$ (Continuity should not exist)

If NG, replace intake valve timing control solenoid valve. Refer to $\underline{\text{EC-486}}$.

If OK, go to next step.

3. Remove intake valve timing control solenoid valve.

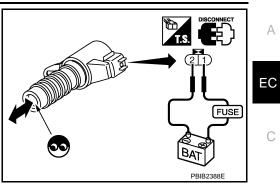

< COMPONENT DIAGNOSIS >

4. Provide 12V DC between intake valve timing control solenoid valve terminals and then interrupt it. Make sure that the plunger moves as shown in the figure. **CAUTION:**

Do not apply 12V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in intake valve timing control solenoid valve.

If NG, replace intake valve timing control solenoid valve. NOTE:

Always replace O-ring when intake valve timing control solenoid valve is removed.

P0075, P0081 IVT CONTROL SOLENOID VALVE

< COMPONENT DIAGNOSIS >

P0075, P0081 IVT CONTROL SOLENOID VALVE

Component Description

Intake valve timing control solenoid valve is activated by ON/OFF pulse duty (ratio) signals from the ECM.

The intake valve timing control solenoid valve changes the oil amount and direction of flow through intake valve timing control unit or stops oil flow.

The longer pulse width advances valve angle.

The shorter pulse width retards valve angle.

Trouble diagnosis name

Intake valve timing control

solenoid valve circuit

DTC Confirmation Procedure

When ON and OFF pulse widths become equal, the solenoid valve stops oil pressure flow to fix the intake valve angle at the control position.

valve.

P0075, P0081 IVT CONTROL SOLENOID VALVE

< COMPONENT DIAGNOSIS >

2. Check resistance between intake valve timing control solenoid valve terminals as follows.

Terminals	Resistance
1 and 2	7.1 - 7.7Ω [at 20°C (68°F)]
1 or 2 and ground	$\infty \Omega$ (Continuity should not exist)

If NG, replace intake valve timing control solenoid valve. Refer to $\underline{\text{EC-486}}$.

If OK, go to next step.

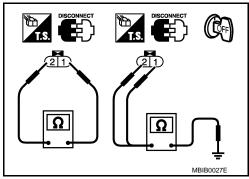

- 3. Remove intake valve timing control solenoid valve.
- 4. Provide 12V DC between intake valve timing control solenoid valve terminals and then interrupt it. Make sure that the plunger moves as shown in the figure.

CAUTION:

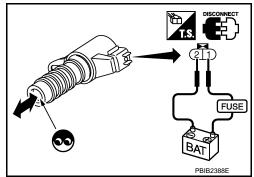

Do not apply 12V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in intake valve timing control solenoid valve.

If NG, replace intake valve timing control solenoid valve. **NOTE:**

Always replace O-ring when intake valve timing control solenoid valve is removed.

[VK56DE]

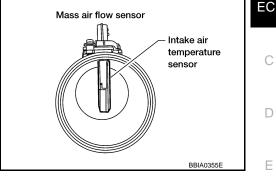

< COMPONENT DIAGNOSIS >

P0101 MAF SENSOR

Component Description

The mass air flow sensor is placed in the stream of intake air. It measures the intake flow rate by measuring a part of the entire intake flow. The mass air flow sensor controls the temperature of the hot wire to a certain amount. The heat generated by the hot wire is reduced as the intake air flows around it. The more air, the greater the heat loss.

Therefore, the electric current supplied to the hot wire is changed to maintain the temperature of the hot wire as air flow increases. The ECM detects the air flow by means of this current change.

On Board Diagnosis Logic

DTC No.	Trouble diagnosis name		DTC detecting condition	Possible cause

EC-128

P0122, P0123 TP SENSOR

< COMPONENT DIAGNOSIS >

P0122, P0123 TP SENSOR

Component Description

Electric throttle control actuator consists of throttle control motor, throttle position sensor, etc. The throttle position sensor responds to the throttle valve movement.

The throttle position sensor has the two sensors. These sensors are a kind of potentiometers which transform the throttle valve position into output voltage, and emit the voltage signal to the ECM. In addition, these sensors detect the opening and closing speed of the throttle valve and feed the voltage signals to the ECM. The ECM judges the current opening angle of the throttle valve from these signals and the ECM controls the throttle control motor to make the throttle valve opening angle properly in response to driving condition.

On Board Diagnosis Logic

These self-diagnoses have the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0122 0122	Throttle position sensor 2 circuit low input	An excessively low voltage from the TP sensor 2 is sent to ECM.	Harness or connectors (TP sensor 2 circuit is open or shorted.)
P0123 0123	Throttle position sensor 2 circuit high input	An excessively high voltage from the TP sensor 2 is sent to ECM.	 (APP sensor 2 circuit is shorted.) Electric throttle control actuator (TP sensor 2) Accelerator pedal position sensor (APP sensor 2)

FAIL-SAFE MODE

When the malfunction is detected, ECM enters fail-safe mode and the MIL lights up.

Engine operation condition in fail-safe mode

The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees.

The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. So, the acceleration will be poor.

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 8V at idle.

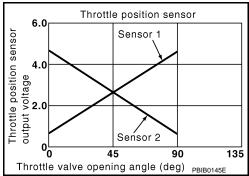

- 1. Start engine and let it idle for 1 second.
- 2. Check DTC.
- 3. If DTC is detected, go to EC-128, "Diagnosis Procedure".

Diagnosis Procedure

1.CHECK GROUND CONNECTIONS

- 1. Turn ignition switch OFF.

P0130, P0150 A/F SENSOR 1

Component Description

The air fuel ratio (A/F) sensor 1 is a planar one-cell limit current sensor. The sensor element of the A/F sensor 1 is composed an electrode layer, which transports ions. It has a heater in the element.

The sensor is capable of precise measurement $\lambda = 1$, but also in the lean and rich range. Together with its control electronics, the sensor outputs a clear, continuous signal throughout a wide λ range.

The exhaust gas components diffuse through the diffusion layer at the sensor cell. An electrode layer is applied voltage, and this current relative oxygen density in lean. Also this current relative hydrocarbon density in rich.

Therefore, the A/F sensor 1 is able to indicate air fuel ratio by this electrode layer of current. In addition, a heater is integrated in the

sensor to ensure the required operating temperature of about 800°C (1,472°F).

On Board Diagnosis Logic

To judge the malfunction, the diagnosis checks that the A/F signal computed by ECM from the A/F sensor 1 signal fluctuates according to fuel feedback control.

DTC No.	Trouble diagnosis name		DTC detecting condition	Possible Cause
P0130 0130 (Bank 1)	Air fuel ratio (A/F) sensor 1	A)	The A/F signal computed by ECM from the A/F sensor 1 signal is constantly in the range other than approx. 2.2V.	Harness or connectors (The A/F sensor 1 circuit is open
P0150 0150 (Bank 2)	circuit	B)	The A/F signal computed by ECM from the A/F sensor 1 signal is constantly approx. 2.2V.	or shorted.) • Air fuel ratio (A/F) sensor 1

DTC Confirmation Procedure

Perform PROCEDURE FOR MALFUNCTION A first. If the DTC cannot be confirmed, perform PROCEDURE FOR MALFUNCTION B. NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 11V at idle.

PROCEDURE FOR MALFUNCTION A

- 1. Start engine and warm it up to normal operating temperature.
- 2. Let engine idle for 2 minutes.
- 3. Check 1st trip DTC.
- 4. If 1st trip DTC is detected, go to EC-141. "Diagnosis Procedure".

The sensor is capable of precise measurement $\lambda = 1$, but also in the lean and rich range. Together with its control electronics, the sensor outputs a clear, continuous signal throughout a wide λ range.

The exhaust gas components diffuse through the diffusion layer at the sensor cell. An electrode layer is applied voltage, and this current relative oxygen density in lean. Also this current relative hydrocarbon density in rich.

Therefore, the A/F sensor 1 is able to indicate air fuel ratio by this electrode layer of current. In addition, a heater is integrated in the

sensor to ensure the required operating temperature of about 800°C (1,472°F).

Holder

On Board Diagnosis Logic

To judge the malfunction of A/F sensor 1, this diagnosis measures response time of the A/F signal computed by ECM from the A/F sensor 1 signal. The time is compensated by engine operating (speed and load), fuel feedback control constant, and the A/F sensor 1 temperature index. Judgment is based on whether the compensated time (the A/F signal cycling time index) is inordinately long or not.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible Cause

	1.	Turn ignition switch OFF.	Ρ

< COMPONENT DIAGNOSIS >

Refer to EC-88, "Ground Inspection".

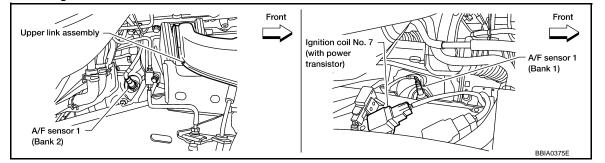

OK or NG

OK >> GO TO 2.

NG >> Repair or replace ground connections.

2.RETIGHTEN A/F SENSOR 1

Loosen and retighten the A/F sensor 1.

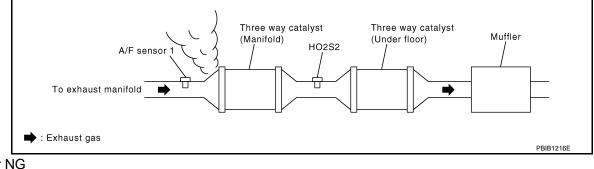

Tightening torque: 50 N-m (5.1 kg-m, 37 ft-lb)

>> GO TO 3.

3. CHECK EXHAUST GAS LEAK

- 1. Start engine and run it at idle.
- 2. Listen for an exhaust gas leak before three way catalyst (manifold).

OK or NG OK >> G

OK >> GO TO 4. NG >> Repair or replace.

4.CHECK FOR INTAKE AIR LEAK

Listen for an intake air leak after the mass air flow sensor.

OK or NG

- OK >> GO TO 5.
- NG >> Repair or replace.

5.CLEAR THE SELF-LEARNING DATA

With CONSULT-III

1. Start engine and warm it up to normal operating temperature.

< COMPONENT DIAGNOSIS >

- 2. Select "SELF-LEARNING CONT" in "WORK SUPPORT" mode with CONSULT-III.
- 3. Clear the self-learning control coefficient by touching "CLEAR" or "START".

Run engine for at least 10 minutes at idle speed.
 Is the 1st trip DTC P0171, P172, P0174 or P0175 detected? Is it difficult to start engine?

B Without CONSULT-III

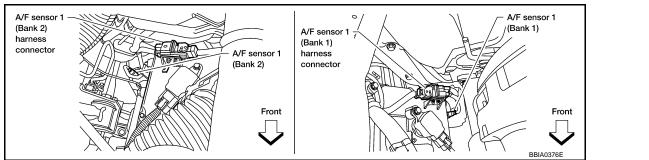

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF.
- 3. Disconnect mass air flow sensor harness connector.
- 4. Restart engine and let it idle for at least 5 seconds.
- 5. Stop engine and reconnect mass air flow sensor harness connector.
- 6. Make sure DTC P0102 is displayed.
- 7. Erase the DTC memory. Refer to <u>EC-59, "Malfunction Indicator</u> <u>Lamp (MIL)"</u>.
- 8. Make sure DTC P0000 is displayed.
- Run engine for at least 10 minutes at idle speed.
 Is the 1st trip DTC P0171, P0172, P0174 or P0175 detected?
 Is it difficult to start engine?

Yes or No

Yes \rightarrow Perform trouble diagnosis for DTC P0171, P0174 or P0172, P0175. Refer to <u>EC-173</u> or <u>EC-178</u>. No \rightarrow GO TO 6.

6.CHECK A/F SENSOR 1 POWER SUPPLY CIRCUIT

- 1. Turn ignition switch OFF.
- 2. Disconnect A/F sensor 1 harness connector.

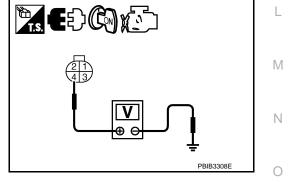

- 3. Turn ignition switch ON.
- 4. Check voltage between A/F sensor 1 terminal 4 and ground with CONSULT-III or tester.

Voltage: Battery voltage

OK or NG

OK >> GO TO 8. NG >> GO TO 7.

7. DETECT MALFUNCTIONING PART

Check the following.

- Harness connectors E5, F14
- IPDM E/R harness connector E119
- 15A fuse
- Harness for open or short between A/F sensor 1 and fuse

>> Repair or replace harness or connectors.

P0137, P0157 HO2S2

Component Description

The heated oxygen sensor 2, after three way catalyst (manifold), monitors the oxygen level in the exhaust gas on each bank.

Even if switching characteristics of the air fuel ratio (A/F) sensor 1 are shifted, the air-fuel ratio is controlled to stoichiometric, by the signal from the heated oxygen sensor 2.

This sensor is made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions.

Under normal conditions the heated oxygen sensor 2 is not used for engine control operation.

On Board Diagnosis Logic

The heated oxygen sensor 2 has a much longer switching time between rich and lean than the air fuel ratio (A/F) sensor 1. The oxygen storage capacity of the three way catalyst (manifold) causes the longer switching time. To judge the malfunctions of heated oxygen sensor 2, ECM monitors whether the maximum voltage of the sensor is sufficiently high during the various driving condition such as fuelcut.

P0139, P0159 HO2S2

	FUI39, FUI39 HOZ32	
< C	COMPONENT DIAGNOSIS > [VK56DE]	
	If not, warm up engine and go to next step when "COOLAN TEMP/S" indication reaches to 70°C (158°F).	
7.	Open engine hood.	А
8.	Select "HO2S2 (B1) P0139" or "HO2S2 (B2) P0159" of "HO2S2" in "DTC WORK SUPPORT" mode with CONSULT-III.	
9.	Start engine and following the instruction of CONSULT-III. NOTE:	EC
	It will take at most 10 minutes until "COMPLETED is displayed.	
10.	Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to <u>EC-169, "Diagnosis Procedure"</u> .	С
	If "CAN NOT BE DIAGNOSED" is displayed, perform the following.	
a.	Turn ignition switch OFF and leave the vehicle in a cool place (soak the vehicle).	D
b.	Return to step 1.	
Ov	verall Function Check	Е
	e this procedure to check the overall function of the heated oxygen sensor 2 circuit. During this check, a 1st DTC might not be confirmed.	
(ST)	WITH GST	F
1. 2.	Start engine and warm it up to the normal operating temperature. Turn ignition switch OFF and wait at least 10 seconds.	G
3.	Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.	0
4.	Let engine idle for 1 minute.	
5.	Set voltmeter probes between ECM terminal 55 [HO2S2 (B1) signal] or 74 [HO2S2 (B2) signal] and ground.	Н
6.	Check the voltage when revving up to 4,000 rpm under no load at least 10 times. (Depress and release accelerator pedal as soon as possible.)	l
	A change of voltage should be more than 0.12V for 1 sec- ond during this procedure. If the voltage can be confirmed in step 6, step 7 is not nec- essary.	J
7.	Keep vehicle at idling for 10 minutes, then check the voltage. Or check the voltage when coasting from 80 km/h (50 MPH) in D position.	Κ
	A change of voltage should be more than 0.12V for 1 sec-	L
8.	If NG, go to <u>EC-169, "Diagnosis Procedure"</u> .	

Diagnosis Procedure

Diagnosis i rocedure

1. CHECK GROUND CONNECTIONS

- 1. Turn ignition switch OFF.
- 2. Loosen and retighten three ground screws on the body. Refer to <u>EC-88, "Ground Inspection"</u>.

OK or NG

OK >> GO TO 2.

INFOID:000000005385197

Μ

Ν

Ο

Ρ

NG >> Repair or replace ground connections.

2.CLEAR THE SELF-LEARNING DATA

With CONSULT-III

- 1. Start engine and warm it up to normal operating temperature.
- 2. Select "SELF-LEARNING CONT" in "WORK SUPPORT" mode with CONSULT-III.
- 3. Clear the self-learning control coefficient by touching "CLEAR".
- Run engine for at least 10 minutes at idle speed. Is the 1st trip DTC P0171, P0172, P0174 or P0175 detected? Is it difficult to start engine?

Without CONSULT-III

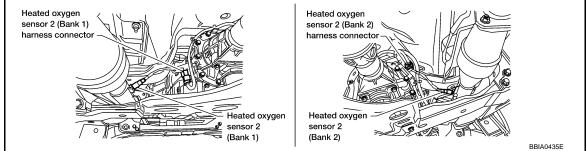

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF.
- 3. Disconnect mass air flow sensor harness connector, and restart and run engine for at least 5 seconds at idle speed.
- 4. Stop engine and reconnect mass air flow sensor harness connector.
- 5. Make sure DTC P0102 is displayed.
- 6. Erase the DTC memory. Refer to <u>EC-59, "Malfunction Indicator</u> <u>Lamp (MIL)"</u>.
- 7. Make sure DTC P0000 is displayed.
- 8. Run engine for at least 10 minutes at idle speed. Is the 1st trip DTC P0171, P0172, P0174 or P0175 detected? Is it difficult to start engine?

Yes or No

Yes >> Perform trouble diagnosis for DTC P0171, P0174 or P0172, P0175. Refer to <u>EC-173</u> or <u>EC-178</u>. No >> GO TO 3.

 $\mathbf{3.}$ CHECK HO2S2 GROUND CIRCUIT FOR OPEN AND SHORT

- 1. Turn ignition switch OFF.
- 2. Disconnect heated oxygen sensor 2 harness connector.

3. Disconnect ECM harness connector.

4. Check harness continuity between ECM terminal 78 and HO2S2 terminal 4. Refer to Wiring Diagram.

Continuity should exist.

5. Also check harness for short to ground and short to power.

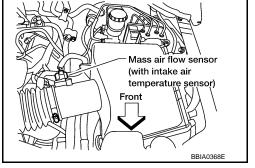

<u>OK or NG</u>

OK >> GO TO 4.

NG >> Repair open circuit or short to ground or short to power in harness or connectors.

4.CHECK HO2S2 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check harness continuity between ECM terminal and HO2S2 terminal as follows. Refer to Wiring Diagram.

P0139, P0159 HO2S2

P0139, P0159 HO2S2

< COMPONENT DIAGNOSIS >

"HO2S2 (B1)/(B2)" should be above 0.58V at least once when the "FUEL INJECTION" is +25%. "HO2S2 (B1)/(B2)" should be below 0.18V at least once when the "FUEL INJECTION" is -25%.

CAUTION:

- Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.
- Before installing new oxygen sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner tool J-43897-18 or J-43897-12 and approved anti-seize lubricant.

Without CONSULT-III

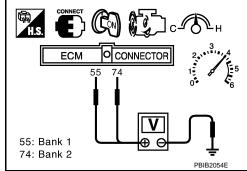

- 1. Start engine and warm it up to the normal operating temperature.
- 2. Turn ignition switch "OFF" and wait at least 10 seconds.
- 3. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
- 4. Let engine idle for 1 minute.
- 5. Set voltmeter probes between ECM terminal 55 [HO2S2 (B1) signal] or 74 [HO2S2 (B2) signal] and ground.
- 6. Check the voltage when revving up to 4,000 rpm under no load at least 10 times.

(Depress and release accelerator pedal as soon as possible.) The voltage should be above 0.58V at least once during this procedure.

If the voltage is above 0.58V at step 6, step 7 is not necessary.

 Keep vehicle at idling for 10 minutes, then check voltage. Or check the voltage when coasting from 80 km/h (50 MPH) in D position.

The voltage should be below 0.18V at least once during this procedure.

8. If NG, replace heated oxygen sensor 2.

CAUTION:

- Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.
- Before installing new oxygen sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner tool J-43897-18 or J-43897-12 and approved anti-seize lubricant.

< COMPONENT DIAGNOSIS >

P0171, P0174 FUEL INJECTION SYSTEM FUNCTION

On Board Diagnosis Logic

With the Air/Fuel Mixture Ratio Self-Learning Control, the actual mixture ratio can be brought closely to the theoretical mixture ratio based on the mixture ratio feedback signal from the A/F sensors 1. The ECM calculates the necessary compensation to correct the offset between the actual and the theoretical ratios. In case the amount of the compensation value is extremely large (The actual mixture ratio is too lean.), the ECM judges the condition as the fuel injection system malfunction and lights up the MIL (2 trip detection logic).

Sensor	Input signal to ECM	ECM function	Actuator	
A/F sensor 1	Density of oxygen in exhaust gas (Mixture ratio feedback signal)	Fuel injection control	Fuel injector	

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P0171 0171 (Bank 1) P0174 0174 (Bank 2)	Fuel injection system too lean	 Fuel injection system does not operate properly. The amount of mixture ratio compensation is too large. (The mixture ratio is too lean.) 	 Intake air leaks A/F sensor 1 Fuel injector Exhaust gas leaks Incorrect fuel pressure Lack of fuel Mass air flow sensor Incorrect PCV hose connection 	F

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

WITH CONSULT-III

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Turn ignition switch ON and select "SELF-LEARNING CONT" in "WORK SUPPORT" mode with CON-SULT-III.
- 4. Clear the self-learning control coefficient by touching "CLEAR".
- 5. Start engine again and let it idle for at least 10 minutes.
- 6. Check 1st trip DTC.

The 1st trip DTC P0171 or P0174 should be detected at this stage, if a malfunction exists. If so, go to <u>EC-</u> <u>174, "Diagnosis Procedure"</u>. **NOTE:**

If 1st trip DTC is not detected during above procedure, performing the following procedure is advised.

- a. Turn ignition switch OFF and wait at least 10 seconds.
- b. Start engine and drive the vehicle under the similar conditions to (1st trip) Freeze Frame Data for 10 minutes. Refer to the table below.

Hold the accelerator pedal as steady as possible.

The similar conditions to (1st trip) Freeze Frame Data means the vehicle operation that the following conditions should be satisfied at the same time.

Engine speed	Engine speed in the freeze frame data \pm 400 rpm
Vehicle speed	Vehicle speed in the freeze frame data \pm 10 km/h (6 MPH)

Engine coolant temperature (T) condition	When the freeze frame data shows lower than 70 °C (158 °F), T should be lower than 70 °C (158 °F).
	When the freeze frame data shows higher than or equal to 70 °C (158 °F), T should be higher than or equal to 70 °C (158 °F).

- 7. If it is difficult to start engine at step 6, the fuel injection system has a malfunction, too.
- 8. Crank engine while depressing accelerator pedal. If engine starts, go to <u>EC-174</u>, "Diagnosis Procedure". If engine does not start, check exhaust and intake air leak visually.

WITH GST

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Disconnect mass air flow sensor harness connector.
- 4. Restart engine and let it idle for at least 5 seconds.
- 5. Stop engine and reconnect mass air flow sensor harness connector.
- 6. Select Service \$03 with GST. Make sure DTC P0102 is detected.
- 7. Select Service \$04 with GST and erase the DTC P0102.
- 8. Start engine again and let it idle for at least 10 minutes.
- Select Service \$07 with GST. The 1st trip DTC P0171 or P0174 should be detected at this stage, if a malfunction exists. If so, go to <u>EC-174, "Diagnosis Procedure"</u>. NOTE:

If 1st trip DTC is not detected during above procedure, performing the following procedure is advised.

- a. Turn ignition switch OFF and wait at least 10 seconds.
- b. Start engine and drive the vehicle under the similar conditions to (1st trip) Freeze Frame Data for 10 minutes. Refer to the table below.

Hold the accelerator pedal as steady as possible.

The similar conditions to (1st trip) Freeze Frame Data means the vehicle operation that the following conditions should be satisfied at the same time.

Engine speed	Engine speed in the freeze frame data \pm 400 rpm
Vehicle speedVehicle speed in the freeze frame data \pm 10 km/h (6 MPH)	
Engine coolant temperature (T) condition	When the freeze frame data shows lower than 70 °C (158 °F), T should be lower than 70 °C (158 °F).
	When the freeze frame data shows higher than or equal to 70 °C (158 °F), T should be higher than or equal to 70 °C (158 °F).

10. If it is difficult to start engine at step 8, the fuel injection system has a malfunction.

11. Crank engine while depressing accelerator pedal. If engine starts, go to <u>EC-174, "Diagnosis Procedure"</u>. If engine does not start, check exhaust and intake air leak visually.

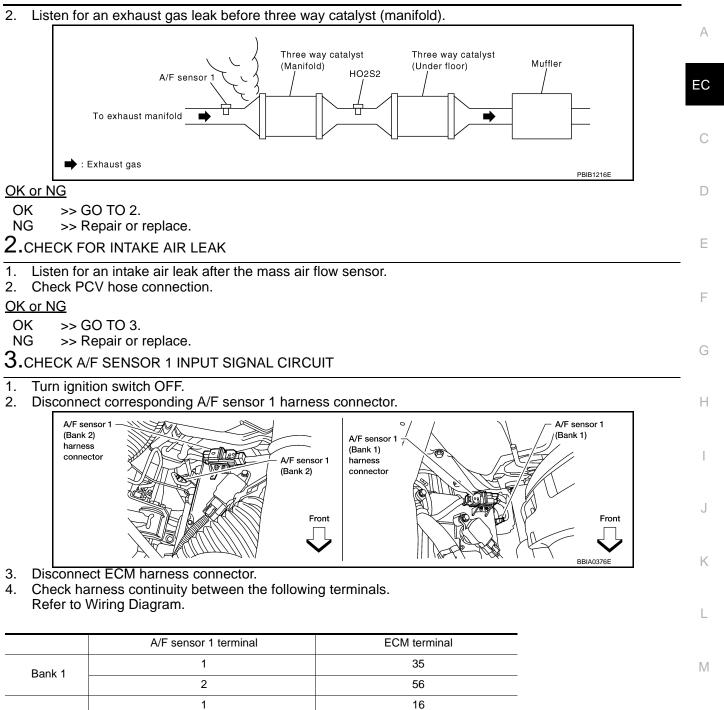

Diagnosis Procedure

INFOID:000000005385201

1.CHECK EXHAUST GAS LEAK

1. Start engine and run it at idle.

< COMPONENT DIAGNOSIS >

Continuity should exist.

5. Check harness continuity between the following terminals and ground. Refer to Wiring Diagram.

2

Bank 1		Bai	nk 2
A/F sensor 1 terminal	ECM terminal	A/F sensor 1 terminal	ECM terminal
1	35	1	16

[VK56DE]

6. Also check harness for short to power.

OK or NG

OK >> GO TO 4.

NG >> Repair open circuit or short to ground or short to power in harness or connectors.

4.CHECK FUEL PRESSURE

- 1. Release fuel pressure to zero. Refer to EC-481, "Fuel Pressure Check".
- Install fuel pressure gauge kit [SST (J-44321)] and check fuel pressure. Refer to <u>EC-481, "Fuel Pressure</u> <u>Check"</u>.

At idling: Approximately 350 kPa (3.57 kg/cm², 51 psi)

OK or NG

OK >> GO TO 6. NG >> GO TO 5.

5. DETECT MALFUNCTIONING PART

Check the following.

- Fuel pump and circuit (Refer to EC-392.)
- <Flexible Fuel Vehicle> FPCM and circuit (Refer to EC-307.)
- Fuel pressure regulator (Refer to EC-481, "Fuel Pressure Check".)
- Fuel lines
- Fuel filter for clogging

>> Repair or replace.

6.CHECK MASS AIR FLOW SENSOR

(B) With CONSULT-III

- 1. Install all removed parts.
- 2. Check "MASS AIR FLOW" in "DATA MONITOR" mode with CONSULT-III.

3.0 - 9.0 g·m/sec: at idling 9.0 - 28.0 g·m/sec: at 2,500 rpm

With GST

- 1. Install all removed parts.
- 2. Check mass air flow sensor signal in Service \$01 with GST.

3.0 - 9.0 g-m/sec: at idling

97.0 - 28.0 g·m/sec: at 2,500 rpm

OK or NG

- OK >> GO TO 7.
- NG >> Check connectors for rusted terminals or loose connections in the mass air flow sensor circuit or grounds. Refer to <u>EC-107</u>.

7.CHECK FUNCTION OF FUEL INJECTOR

With CONSULT-III

- 1. Start engine.
- 2. Perform "POWER BALANCE" in "ACTIVE TEST" mode with CONSULT-III.
- 3. Make sure that each circuit produces a momentary engine speed drop.

Without CONSULT-III

1. Start engine.

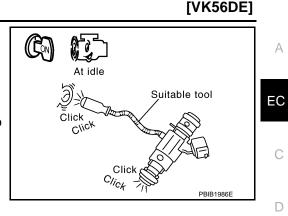

< COMPONENT DIAGNOSIS >

2. Listen to each fuel injector operating sound.

Clicking noise should be heard.

<u>OK or NG</u>

- OK >> GO TO 8.
- NG >> Perform trouble diagnosis for FUEL INJECTOR, refer to <u>EC-389</u>.

Е

F

Κ

L

Μ

Ν

Ρ

8. CHECK FUEL INJECTOR

- 1. Confirm that the engine is cooled down and there are no fire hazards near the vehicle.
- 2. Turn ignition switch OFF.
- 3. Disconnect all fuel injector harness connectors.
- Remove fuel injector gallery assembly. Refer to <u>EM-40, "Removal and Installation"</u>. Keep fuel hose and all fuel injectors connected to fuel injector gallery.
- 5. For DTC P0171, reconnect fuel injector harness connectors on bank 1. For DTC P0174, reconnect fuel injector harness connectors on bank 2.
- 6. Disconnect all ignition coil harness connectors.
- 7. Prepare pans or saucers under each fuel injector.
- Crank engine for about 3 seconds.
 For DTC P0171 make sure that fuel sprays (

For DTC P0171, make sure that fuel sprays out from fuel injectors on bank 1.

For DTC P0174, make sure that fuel sprays out from fuel injectors on bank 2.

Fuel should be sprayed evenly for each fuel injector.

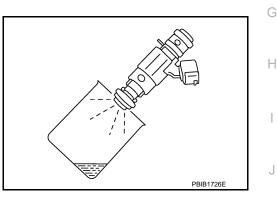

<u>OK or NG</u>

- OK >> GO TO 9.
- NG >> Replace fuel injectors from which fuel does not spray out. Always replace O-ring with new ones.

9.CHECK INTERMITTENT INCIDENT

Refer to GI-35, "How to Check Terminal" and GI-38, "Intermittent Incident".

>> INSPECTION END

< COMPONENT DIAGNOSIS >

P0172, P0175 FUEL INJECTION SYSTEM FUNCTION

On Board Diagnosis Logic

With the Air/Fuel Mixture Ratio Self-Learning Control, the actual mixture ratio can be brought closely to the theoretical mixture ratio based on the mixture ratio feedback signal from the A/F sensors 1. The ECM calculates the necessary compensation to correct the offset between the actual and the theoretical ratios. In case the amount of the compensation value is extremely large (The actual mixture ratio is too rich.), the ECM judges the condition as the fuel injection system malfunction and lights up the MIL (2 trip detection logic).

Sensor	Input signal to ECM	ECM function	Actuator
A/F sensor 1	Density of oxygen in exhaust gas (Mixture ratio feedback signal)	Fuel injection control	Fuel injector

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0172 0172 (Bank 1) P0175 0175 (Bank 2)	Fuel injection system too rich	 Fuel injection system does not operate properly. The amount of mixture ratio compensation is too large. (The mixture ratio is too rich.) 	 A/F sensor 1 Fuel injector Exhaust gas leaks Incorrect fuel pressure Mass air flow sensor

DTC Confirmation Procedure

INFOID:000000005385203

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

WITH CONSULT-III

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Turn ignition switch ON and select "SELF-LEARNING CONT" in "WORK SUPPORT" mode with CON-SULT-III.
- 4. Clear the self-learning control coefficient by touching "CLEAR".
- 5. Start engine again and let it idle for at least 10 minutes.
- 6. Check 1st trip DTC.

The 1st trip DTC P0172, P0175 should be detected at this stage, if a malfunction exists. If so, go to <u>EC-179</u>, "Diagnosis Procedure".

NOTE:

If 1st trip DTC is not detected during above procedure, performing the following procedure is advised.

- a. Turn ignition switch OFF and wait at least 10 seconds.
- b. Start engine and drive the vehicle under the similar conditions to (1st trip) Freeze Frame Data for 10 minutes. Refer to the table below.

Hold the accelerator pedal as steady as possible.

The similar conditions to (1st trip) Freeze Frame Data means the vehicle operation that the following conditions should be satisfied at the same time.

Engine speed in the freeze frame data ± 400 rpm	
Vehicle speed	Vehicle speed in the freeze frame data \pm 10 km/h (6 MPH)

INFOID:000000005385202

< COMPONENT DIAGNOSIS >

Engine coolant temperature (T)	When the freeze frame data shows lower than 70 °C (158 °F), T should be lower than 70 °C (158 °F).	А
condition	When the freeze frame data shows higher than or equal to 70 °C (158 °F), T should be higher than or equal to 70 °C (158 °F).	

- 7. If it is difficult to start engine at step 6, the fuel injection system has a malfunction, too.
- 8. Crank engine while depressing accelerator pedal. If engine starts, go to EC-179, "Diagnosis Procedure". If engine does not start, remove spark plugs and check for fouling, etc.

WITH GST

- 1. Start engine and warm it up to normal operating temperature.
- Turn ignition switch OFF and wait at least 10 seconds. 2.
- 3. Disconnect mass air flow sensor harness connector. Then restart and run engine for at least 5 seconds at idle speed.
- 4. Stop engine and reconnect mass air flow sensor harness connector.
- Select Service \$03 with GST. Make sure DTC P0102 is 5. detected.
- Select Service \$04 with GST and erase the DTC P0102. 6.
- 7. Start engine again and let it idle for at least 10 minutes.
- Select Service \$07 with GST. The 1st trip DTC P0172 or P0175 8. should be detected at this stage, if a malfunction exists. If so, go to EC-179, "Diagnosis Procedure". NOTE:

If 1st trip DTC is not detected during above procedure, performing the following procedure is advised.

- Turn ignition switch OFF and wait at least 10 seconds. a.
- Start engine and drive the vehicle under the similar conditions to (1st trip) Freeze Frame Data for 10 minb. utes. Refer to the table below.

Hold the accelerator pedal as steady as possible.

The similar conditions to (1st trip) Freeze Frame Data means the vehicle operation that the following conditions should be satisfied at the same time.

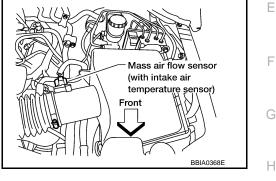

Engine speed	Engine speed in the freeze frame data \pm 400 rpm	-
Vehicle speed	Vehicle speed in the freeze frame data \pm 10 km/h (6 MPH)	-
Engine coolant temperature (T)	When the freeze frame data shows lower than 70 °C (158 °F), T should be lower than 70 °C (158 °F).	_
condition	When the freeze frame data shows higher than or equal to 70 °C (158 °F), T should be higher than or equal to 70 °C (158 °F).	- N

9. If it is difficult to start engine at step 7, the fuel injection system has a malfunction.

P0181 FTT SENSOR

Component Description

The fuel tank temperature sensor is used to detect the fuel temperature inside the fuel tank. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the fuel temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

<Reference data>

Fluid temperature °C (°F)]	Voltage* (V)	Resistance (kΩ)

DTC Confirmation Procedure INFOID:000000005385207 NOTE:

DTC detecting condition

Rationally incorrect voltage from the sensor is

sent to ECM, compared with the voltage signals

from engine coolant temperature sensor and in-

take air temperature sensor.

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- Turn ignition swich OFF and wait at least 10 seconds. 1.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

WITH CONSULT-III

- Turn ignition switch ON and wait at least 10 seconds.
- Check 1st trip DTC. 2 If 1st trip DTC is detected, go to EC-184, "Diagnosis Procedure". If 1st trip DTC is not detected, go to following step.
- Select "DATA MONITOR" mode with CONSULT-III. 3.
- Check "COOLAN TEMP/S" value. 4 If the "COOLAN TEMP/S" is less than 60°C (140°F), the result will be OK. If the "COOLAN TEMP/S" is above 60°C (140°F), go to the following step.
- Cool engine down until "COOLAN TEMP/S" is less than 60°C (140°F). 5.

Component Description

The fuel tank temperature sensor is used to detect the fuel temperature inside the fuel tank. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the fuel temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

2010 Titan

P0222, P0223 APP SENSOR

Component Description

Electric throttle control actuator consists of throttle control motor, throttle position sensor, etc. The throttle position sensor responds to the throttle valve movement.

The throttle position sensor has the two sensors. These sensors are a kind of potentiometers which transform the throttle valve position into output voltage, and emit the voltage signal to the ECM. In addition, these sensors detect the opening and closing speed of the throttle valve and feed the voltage signals to the ECM. The ECM judges the current opening angle of the throttle valve from these signals and the ECM controls the throttle control motor to make the throttle valve opening angle properly in response to driving condition.

On Board Diagnosis Logic

These self-diagnoses have the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	(
P0222 0222	Throttle position sensor 1 circuit low input	An excessively low voltage from the TP sensor 1 is sent to ECM.	Harness or connectors (TP sensor 1 circuit is open or shorted.)	
P0223 0223	Throttle position sensor 1 circuit high input	An excessively high voltage from the TP sensor 1 is sent to ECM.	 (APP sensor 2 circuit is shorted.) Electric throttle control actuator (TP sensor 1) Accelerator pedal position sensor (APP sensor 2) 	ŀ

FAIL-SAFE MODE

When the malfunction is detected, ECM enters fail-safe mode and the MIL lights up.

Engine operation condition in fail-safe mode The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 Κ degrees. The ECM regulates the opening speed of the throttle valve to be slower than the normal condition.

So, the acceleration will be poor.

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conduct-M ing the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 8V at idle.

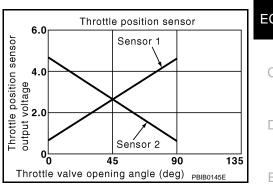

- 1. Start engine and let it idle for 1 second.
- 2. Check DTC.
- If DTC is detected, go to EC-189, "Diagnosis Procedure". 3.

Diagnosis Procedure

1.CHECK GROUND CONNECTIONS

- 1. Turn ignition switch OFF.
- Loosen and retighten three ground screws on the body. 2.

- 8. Perform EC-23, "Idle Air Volume Learning".

P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308 MISFIRE < COMPONENT DIAGNOSIS > [VK56DE]

P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308 MIS-FIRE

On Board Diagnosis Logic

When a misfire occurs, engine speed will fluctuate. If the engine speed fluctuates enough to cause the crankshaft position (CKP) sensor (POS) signal to vary, ECM can determine that a misfire is occurring.

Sensor	Input signal to ECM	ECM function	0
Crankshaft position sensor (POS)	Engine speed	On board diagnosis of misfire	

The misfire detection logic consists of the following two conditions.

1. One Trip Detection Logic (Three Way Catalyst Damage)

On the 1st trip that a misfire condition occurs that can damage the three way catalyst (TWC) due to overheating, the MIL will blink.

When a misfire condition occurs, the ECM monitors the CKP sensor signal every 200 engine revolutions for a change.

When the misfire condition decreases to a level that will not damage the TWC, the MIL will turn off. If another misfire condition occurs that can damage the TWC on a second trip, the MIL will blink. When the misfire condition decreases to a level that will not damage the TWC, the MIL will remain on. If another misfire condition occurs that can damage the TWC, the MIL will begin to blink again.

 Two Trip Detection Logic (Exhaust quality deterioration) For misfire conditions that will not damage the TWC (but will affect vehicle emissions), the MIL will only light when the misfire is detected on a second trip. During this condition, the ECM monitors the CKP sensor signal every 1,000 engine revolutions.

A misfire malfunction can be detected on any one cylinder or on multiple cylinders.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P0300 0300	Multiple cylinder misfire detected	Multiple cylinder misfire.		
P0301 0301	No.1 cylinder misfire de- tected	No. 1 cylinder misfires.		,

EC

D

Ε

F

Н

INFOID:000000005385220

CAUTION:

Always drive vehicle in safe manner according to traffic conditions and obey all traffic laws when driving.

- 1. If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.
- a. Turn ignition switch OFF and wait at least 10 seconds.
- b. Turn ignition switch ON.

< COMPONENT DIAGNOSIS >

- c. Turn ignition switch OFF and wait at least 10 seconds.
- 2. Start engine and warm it up to normal operating temperature.
- 3. Turn ignition switch OFF and wait at least 10 seconds.
- 4. Restart engine and let it idle for about 15 minutes.
- 5. Check 1st trip DTC.
- 6. If 1st trip DTC is detected, go to <u>EC-194. "Diagnosis Procedure"</u>. **NOTE:**

If 1st trip DTC is not detected during above procedure, performing the following procedure is advised.

- a. Turn ignition switch OFF and wait at least 10 seconds.
- b. Start engine and drive the vehicle under the similar conditions to (1st trip) Freeze Frame Data for a certain time. Refer to the table below.

Hold the accelerator pedal as steady as possible.

The similar conditions to (1st trip) Freeze Frame Data means the vehicle operation that the following conditions should be satisfied at the same time.

Engine speed	Engine speed in the freeze frame data \pm 400 rpm	
Vehicle speed	Vehicle speed in the freeze frame data \pm 10 km/h (6 MPH)	
Engine coolant temperature (T)	When the freeze frame data shows lower than 70 °C (158 °F), T should be lower than 70 °C (158 °F).	
condition	When the freeze frame data shows higher than or equal to 70 °C (158 °F), T should be higher than or equal to 70 °C (158 °F).	

The time to driving varies according to the engine speed in the freeze frame data.

Engine speed	Time
Around 1,000 rpm	Approximately 10 minutes
Around 2,000 rpm	Approximately 5 minutes
More than 3,000 rpm	Approximately 3.5 minutes

Diagnosis Procedure

1.CHECK FOR INTAKE AIR LEAK AND PCV HOSE

1. Start engine and run it at idle speed.

- 2. Listen for the sound of the intake air leak.
- 3. Check PCV hose connection.

OK or NG

OK >> GO TO 2.

NG >> Discover air leak location and repair.

2. CHECK FOR EXHAUST SYSTEM CLOGGING

Stop engine and visually check exhaust tube, three way catalyst and muffler for dents.

OK or NG

OK >> GO TO 3.

NG >> Repair or replace it.

 $\mathbf{3.}$ PERFORM POWER BALANCE TEST

With CONSULT-III

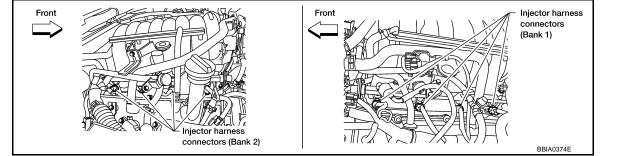

- 1. Perform "POWER BALANCE" in "ACTIVE TEST" mode.
- 2. Is there any cylinder which does not produce a momentary engine speed drop?

Without CONSULT-III

[VK56DE]

< COMPONENT DIAGNOSIS >

When disconnecting each fuel injector harness connector one at a time, is there any cylinder which does not produce a momentary engine speed drop?

Yes or No

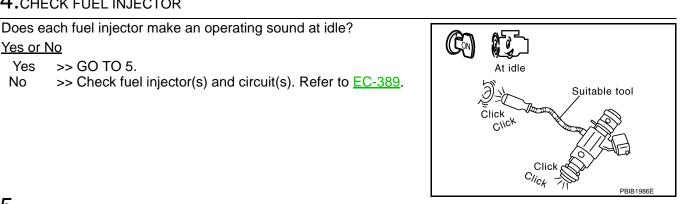

Yes or No Yes

No

Yes >> GO TO 4. No >> GO TO 7.

4.CHECK FUEL INJECTOR

>> GO TO 5.

5. CHECK FUNCTION OF IGNITION COIL-I

CAUTION:

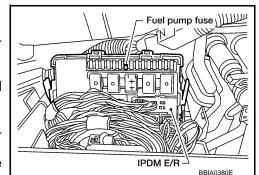

Do the following procedure in the place where ventilation is good without the combustible.

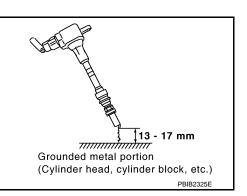

- Turn ignition switch OFF. 1.
- Remove fuel pump fuse in IPDM E/R to release fuel pressure. 2. NOTE: Do not use CONSULT-III to release fuel pressure, or fuel pres-

sure applies again during the following procedure.

- Start engine.
- 4. After engine stalls, crank it two or three times to release all fuel pressure.
- Turn ignition switch OFF. 5.
- 6. Remove all ignition coil harness connectors to avoid the electrical discharge from the ignition coils.
- 7. Remove ignition coil and spark plug of the cylinder to be checked.
- Crank engine for 5 seconds or more to remove combustion gas in the cylinder.
- 9. Connect spark plug and harness connector to ignition coil.
- 10. Fix ignition coil using a rope etc. with gap of 13 17 mm between the edge of the spark plug and grounded metal portion as shown in the figure.
- 11. Crank engine for about 3 seconds, and check whether spark is generated between the spark plug and the grounded metal portion.

Spark should be generated. CAUTION:

[VK56DE]

Е

F

А

EC

Н

Μ

Ρ

< COMPONENT DIAGNOSIS >

- Do not approach to the spark plug and the ignition coil within 50cm. Be careful not to get an electrical shock while checking, because the electrical discharge voltage becomes 20kV or more.
- It might cause to damage the ignition coil if the gap of more than 17 mm is taken. NOTE:

When the gap is less than 13 mm, the spark might be generated even if the coil is malfunctioning.

OK or NG

OK >> GO TO 9. NG >> GO TO 6.

6. CHECK FUNCTION OF IGNITION COIL-II

- 1. Turn ignition switch OFF.
- Disconnect spark plug and connect a known-good spark plug. 2.
- Crank engine for about 3 seconds, and recheck whether spark is generated between the spark plug and 3. the grounded metal portion.

Spark should be generated.

OK or NG

>> GO TO 7. OK

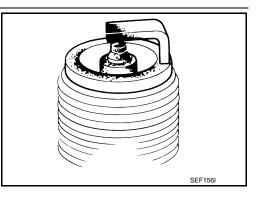

NG >> Check ignition coil, power transistor and their circuits. Refer to EC-399.

7.CHECK SPARK PLUG

Check the initial spark plug for fouling, etc.

OK or NG

- OK >> Replace malfunctioning spark plug(s) with standard type one(s). For spark plug type, refer to EM-16, "Removal and Installation". NG
 - >> 1. Repair or clean spark plug.
 - 2. GO TO 8.

[VK56DE]

8.CHECK FUNCTION OF IGNITION COIL-III

- 1. Reconnect the initial spark plugs.
- 2. Crank engine for about 3 seconds, and recheck whether spark is generated between the spark plug and the grounded portion.

Spark should be generated.

OK or NG

OK >> INSPECTION END

>> Replace malfunctioning spark plug(s) with standard type one(s). For spark plug type, refer to EM-NG 16. "Removal and Installation".

9.CHECK COMPRESSION PRESSURE

Check compression pressure. Refer to EM-23, "Checking Compression Pressure".

OK or NG

OK >> GO TO 10.

NG >> Check pistons, piston rings, valves, valve seats and cylinder head gaskets.

10.CHECK FUEL PRESSURE

1. Install all removed parts.

- Release fuel pressure to zero. Refer to EC-481, "Fuel Pressure Check". 2.
- Install fuel pressure gauge and check fuel pressure. Refer to EC-481, "Fuel Pressure Check". 3.

At idling: Approximately 350 kPa (3.57 kg/cm², 51 psi)

P0327, P0328, P0332, P0333 KS

Component Description

The knock sensor is attached to the cylinder block. It senses engine knocking using a piezoelectric element. A knocking vibration from the cylinder block is sensed as vibrational pressure. This pressure is converted into a voltage signal and sent to the ECM.

On Board Diagnosis Logic

The MIL will not light up for these self-diagnoses.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0327 0327 (bank 1)	Knock sensor circuit low in-	An excessively low voltage from the sensor is sent to ECM.	 Harness or connectors (The sensor circuit is open or shorted.)
P0332 0332 (bank 2)	- put		
P0328 0328 (bank 1)	Knock sensor circuit high in-	An excessively high voltage from the sensor is sent to ECM.	Knock sensor
P0333 0333 (bank 2)	put		

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 10V at idle.

- 1. Start engine and run it for at least 5 seconds at idle speed.
- 2. Check 1st trip DTC.
- 3. If 1st trip DTC is detected, go to EC-200, "Diagnosis Procedure".

Diagnosis Procedure

1. CHECK KNOCK SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT-I

- 1. Turn ignition switch OFF.
- 2. Disconnect ECM harness connector.
- 3. Check resistance between ECM terminals 15, 36 and ground. Refer to Wiring Diagram. **NOTE:**

It is necessary to use an ohmmeter which can measure more than 10 $\text{M}\Omega.$

Resistance: Approximately 532 - 588 kΩ [at 20°C (68°F)]

Component Inspection

KNOCK SENSOR

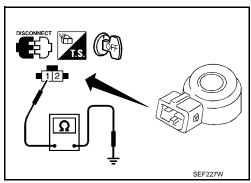

Check resistance between knock sensor terminal 1 and ground. **NOTE:**

It is necessary to use an ohmmeter which can measure more than 10 $\text{M}\Omega.$

Resistance: Approximately 532 - 588 kΩ [at 20°C (68°F)]

CAUTION:

Do not use any knock sensors that have been dropped or physically damaged. Use only new ones.

P0335 CKP SENSOR (POS)

Component Description

The crankshaft position sensor (POS) is located on the A/T assembly facing the gear teeth (cogs) of the signal plate. It detects the fluctuation of the engine revolution.

The sensor consists of a permanent magnet and Hall IC.

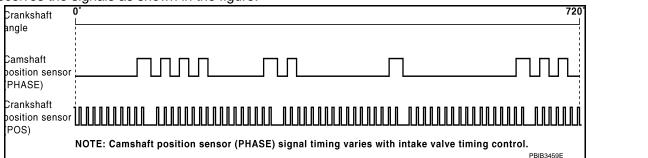

When the engine is running, the high and low parts of the teeth cause the gap with the sensor to change.

The changing gap causes the magnetic field near the sensor to change.

Due to the changing magnetic field, the voltage from the sensor changes.

The ECM receives the voltage signal and detects the fluctuation of the engine revolution.

ECM receives the signals as shown in the figure.

P0340 CMP SENSOR (PHASE)

Component Description

The camshaft position sensor (PHASE) senses the protrusion of exhaust valve cam sprocket to identify a particular cylinder. The camshaft position sensor (PHASE) senses the piston position.

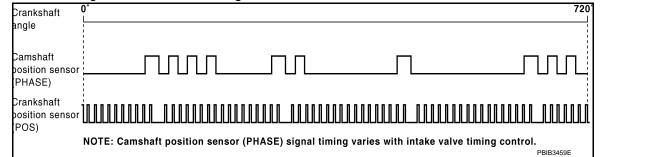

When the crankshaft position sensor (POS) system becomes inoperative, the camshaft position sensor (PHASE) provides various controls of engine parts instead, utilizing timing of cylinder identification signals.

The sensor consists of a permanent magnet and Hall IC.

When engine is running, the high and low parts of the teeth cause the gap with the sensor to change.

The changing gap causes the magnetic field near the sensor to change.

Due to the changing magnetic field, the voltage from the sensor changes. ECM receives the signals as shown in the figure.

P0420, P0430 THREE WAY CATALYST FUNCTION

On Board Diagnosis Logic

The ECM monitors the switching frequency ratio of air fuel sensor (A/F) sensor 1 and heated oxygen sensor 2.

A three way catalyst (manifold) with high oxygen storage capacity will indicate a low switching frequency of heated oxygen sensor 2. As oxygen storage capacity decreases, the heated oxygen sensor 2 switching frequency will increase.

When the frequency ratio of air fuel ratio (A/F) sensor 1 and heated oxygen sensor 2 approaches a specified limit value, the three way catalyst (manifold) malfunction is diagnosed.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	F
P0420 0420 (Bank 1) P0430 0430 (Bank 2)	Catalyst system efficien- cy below threshold	 Three way catalyst (manifold) does not oper- ate properly. Three way catalyst (manifold) does not have enough oxygen storage capacity. 	 Three way catalyst (manifold) Exhaust tube Intake air leaks Fuel injector Fuel injector leaks Spark plug Improper ignition timing 	G

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

WITH CONSULT-III

TESTING CONDITION:

Do not hold engine speed for more than the specified minutes below.

- 1. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-III.
- 2. Start engine and warm it up to the normal operating temperature.
- 3. Turn ignition switch OFF and wait at least 10 seconds.
- 4. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
- 5. Let engine idle for 1 minute.
- Make sure that "COOLAN TEMP/S" indicates more than 70°C (158°F). If not, warm up engine and go to next step when "COOLAN TEMP/S" indication reaches to 70°C (158°F).
- 7. Open engine hood.
- 8. Select "DTC & SRT CONFIRMATION" then "SRT WORK SUPPORT" mode with CONSULT-III.
- 9. Rev engine up to 2,000 to 3,000 rpm and hold it for 3 consecutive minutes then release the accelerator pedal completely.

If "INCMP" of "CATALYST" changed to "CMPLT", go to step 12.

- 10. Wait 5 seconds at idle.
- 11. Rev engine up to 2,000 to 3,000 rpm and maintain it until "INCMP" of "CATALYST" changes to "CMPLT" (It will take approximately 5 minutes).

If not "CMPLT", stop engine and cool it down to less than 70°C (158°F) and then retest from step 1.

- 12. Select "SELF-DIAG RESULTS" mode with CONSULT-III.
- 13. Confirm that the 1st trip DTC is not detected.

< COMPONENT DIAGNOSIS >

If the 1st trip DTC is detected, go to EC-212. "Diagnosis Procedure".

Overall Function Check

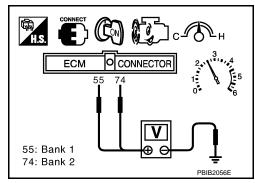

Use this procedure to check the overall function of the three way catalyst (manifold). During this check, a 1st trip DTC might not be confirmed.

WITH GST

- 1. Start engine and warm it up to the normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
- 4. Let engine idle for 1 minute.
- 5. Open engine hood.
- Set voltmeter probes between ECM terminals ECM terminals 55 [HO2S2 (bank 1) signal], 74 [HO2S2 (bank 2) signal] and ground.
- 7. Keep engine speed at 2,500 rpm constant under no load.
- 8. Make sure that the voltage does not vary for more than 5 seconds.

If the voltage fluctuation cycle takes less than 5 seconds, go to <u>EC-212, "Diagnosis Procedure"</u>.

• 1 cycle: 0.6 - 1.0 \rightarrow 0 - 0.3 \rightarrow 0.6 - 1.0

Diagnosis Procedure

1.CHECK EXHAUST SYSTEM

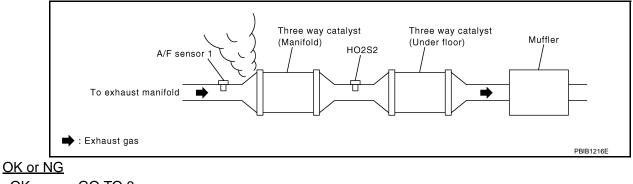

Visually check exhaust tubes and muffler for dent.

OK or NG

OK >> GO TO 2.

NG >> Repair or replace.

- 2.CHECK EXHAUST GAS LEAK
- 1. Start engine and run it at idle.
- 2. Listen for an exhaust gas leak before the three way catalyst (manifold).

OK >> GO TO 3. NG >> Repair or replac

NG >> Repair or replace.

3.CHECK INTAKE AIR LEAK

Listen for an intake air leak after the mass air flow sensor.

<u>OK or NG</u>

OK >> GO TO 4. NG >> Repair or replace. 4.CHECK IGNITION TIMING

Check the following items. Refer to EC-13, "Basic Inspection".

INEOID:000000005385240

< COMPONENT DIAGNOSIS >

[VK56DE]

Items	Specifications
Target idle speed	650 ± 50 rpm (in P or N position)
Ignition timing	$15\pm5^\circ$ BTDC (in P or N position)

<u>OK or NG</u>

OK >> GO TO 5.

NG >> Follow the <u>EC-13</u>, "Basic Inspection".

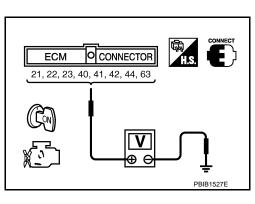

5.CHECK FUEL INJECTOR

- 1. Stop engine and then turn ignition switch ON.
- Check voltage between ECM terminals 21, 22, 23, 40, 41, 42, 44, 63 and ground with CONSULT-III or tester. Refer to Wiring Diagram for fuel injectors, <u>EC-427</u>, "Wiring Diagram - <u>ENGINE CONTROL SYSTEM -</u>".

Battery voltage should exist.

OK or NG

- OK >> GO TO 6.
- NG >> Perform EC-389, "Diagnosis Procedure".

6. CHECK FUNCTION OF IGNITION COIL-I

CAUTION:

Do the following procedure in the place where ventilation is good without the combustible.

- 1. Turn ignition switch OFF.
- Remove fuel pump fuse in IPDM E/R to release fuel pressure.
 NOTE:

Do not use CONSULT-III to release fuel pressure, or fuel pressure applies again during the following procedure.

- 3. Start engine.
- 4. After engine stalls, crank it two or three times to release all fuel pressure.
- 5. Turn ignition switch OFF.
- 6. Remove all ignition coil harness connectors to avoid the electrical discharge from the ignition coils.
- 7. Remove ignition coil and spark plug of the cylinder to be checked.
- 8. Crank engine for 5 seconds or more to remove combustion gas in the cylinder.
- 9. Connect spark plug and harness connector to ignition coil.
- 10. Fix ignition coil using a rope etc. with gap of 13 17 mm between the edge of the spark plug and grounded metal portion as shown in the figure.
- 11. Crank engine for about 3 seconds, and check whether spark is generated between the spark plug and the grounded metal portion.

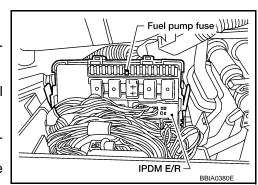

Spark should be generated.

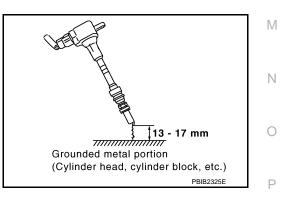

CAUTION:

- Do not approach to the spark plug and the ignition coil within 50cm. Be careful not to get an electrical shock while checking, because the electrical discharge voltage becomes 20kV or more.
- It might cause to damage the ignition coil if the gap of more than 17 mm is taken. NOTE:
- When the gap is less than 13 mm, the spark might be generated even if the coil is malfunctioning. OK or NG

OK >> GO TO 10.

7. CHECK FUNCTION OF IGNITION COIL-II

- 1. Turn ignition switch OFF.
- 2. Disconnect spark plug and connect a known-good spark plug.
- 3. Crank engine for about 3 seconds, and recheck whether spark is generated between the spark plug and the grounded metal portion.

Spark should be generated.

OK or NG

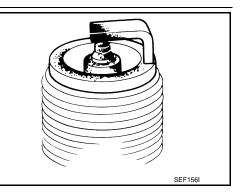

- OK >> GO TO 8.
- NG >> Check ignition coil, power transistor and their circuits. Refer to <u>EC-427</u>, "Wiring Diagram <u>ENGINE CONTROL SYSTEM -</u>".

8. CHECK SPARK PLUG

Check the initial spark plug for fouling, etc.

OK or NG

- OK >> Replace malfunctioning spark plug(s) with standard type one(s). For spark plug type, refer to <u>EM-16. "Removal and Installation"</u>.
- NG >> 1. Repair or clean spark plug. 2. GO TO 9.

9. CHECK FUNCTION OF IGNITION COIL-III

- 1. Reconnect the initial spark plugs.
- 2. Crank engine for about 3 seconds, and recheck whether spark is generated between the spark plug and the grounded portion.

Spark should be generated.

OK or NG

- OK >> INSPECTION END
- NG >> Replace malfunctioning spark plug(s) with standard type one(s). For spark plug type, refer to EM-16, "Removal and Installation".

10. CHECK FUEL INJECTOR

- 1. Turn ignition switch OFF.
- Remove fuel injector assembly. Refer to <u>EM-40, "Removal and Installation"</u>. Keep fuel hose and all fuel injectors connected to fuel injector gallery.
- 3. Disconnect all ignition coil harness connectors.
- 4. Reconnect all fuel injector harness connector disconnected.
- Turn ignition switch ON. Make sure fuel does not drip from fuel injector.

OK or NG

OK (Does not drip.)>>GO TO 11.

NG (Drips.)>>Replace the fuel injector(s) from which fuel is dripping.

11.CHECK INTERMITTENT INCIDENT

Refer to GI-35, "How to Check Terminal" and GI-38, "Intermittent Incident".

Trouble is fixed.>>INSPECTION END

Trouble is not fixed.>>Replace three way catalyst assembly.

P0441 EVAP CONTROL SYSTEM

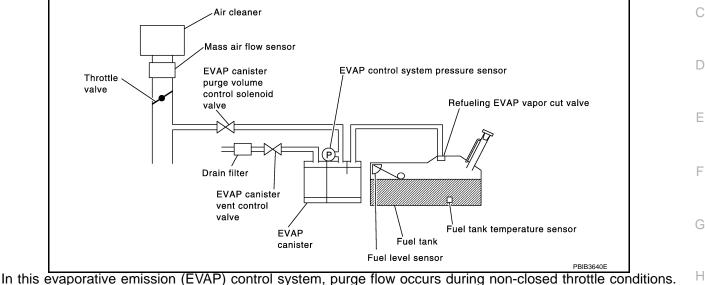

< COMPONENT DIAGNOSIS >

P0441 EVAP CONTROL SYSTEM

System Description

NOTE:

If DTC P0441 is displayed with other DTC such as P2122, P2123, P2127, P2128 or P2138, first perform trouble diagnosis for other DTC.

In this evaporative emission (EVAP) control system, purge flow occurs during non-closed throttle conditions. Purge volume is related to air intake volume. Under normal purge conditions (non-closed throttle), the EVAP canister purge volume control solenoid valve is open to admit purge flow. Purge flow exposes the EVAP control system pressure sensor to intake manifold vacuum.

On Board Diagnosis Logic

Under normal conditions (non-closed throttle), sensor output voltage indicates if pressure drop and purge flow are adequate. If not, a malfunction is determined.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0441 0441	EVAP control system in- correct purge flow	EVAP control system does not operate proper- ly, EVAP control system has a leak between in- take manifold and EVAP control system pressure sensor.	 EVAP canister purge volume control solenoid valve stuck closed EVAP control system pressure sensor and the circuit Loose, disconnected or improper connection of rubber tube Blocked rubber tube Cracked EVAP canister EVAP canister purge volume control solenoid valve circuit Accelerator pedal position sensor Blocked purge port EVAP canister vent control valve Drain filter

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed. NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

VHCL SPEED SE	32 - 120 km/h (20 - 75 MPH)
ENG SPEED	500 - 3,000 rpm
B/FUEL SCHDL	1.0 - 12.0 msec
COOLAN TEMP/S	0 - 119°C (32 - 246°F)

If "TESTING" is not changed for a long time, retry from step 2.

7. Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to <u>EC-216, "Diagnosis Procedure"</u>.

Overall Function Check

INFOID:000000005385245

Use this procedure to check the overall monitoring function of the EVAP control system purge flow monitoring. During this check, a 1st trip DTC might not be confirmed.

@ WITH GST

- 1. Lift up drive wheels.
- 2. Start engine (VDC switch OFF) and warm it up to normal operating temperature.
- 3. Turn ignition switch OFF, wait at least 10 seconds.
- 4. Start engine and wait at least 70 seconds.
- 5. Set voltmeter probes to ECM terminals 32 (EVAP control system pressure sensor signal) and ground.
- 6. Check EVAP control system pressure sensor value at idle speed and note it.
- 7. Establish and maintain the following conditions for at least 1 minute.

Air conditioner switch	ON
Headlamp switch	ON
Engine speed	Approx. 3,000 rpm
Gear position	Any position other than P, N or R

8. Verify that EVAP control system pressure sensor value stays 0.1V less than the value at idle speed (measured at step 6) for at least 1 second.

If NG, go to <u>EC-216, "Diagnosis Procedure"</u>.

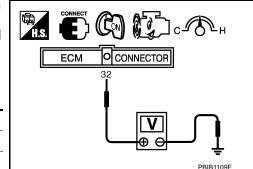

Diagnosis Procedure

1.CHECK EVAP CANISTER

- 1. Turn ignition switch OFF.
- 2. Check EVAP canister for cracks.

<u>OK or NG</u>

OK (With CONSULT-III)>>GO TO 2. OK (Without CONSULT-III)>>GO TO 3. NG >> Replace EVAP canister.

< COMPONENT DIAGNOSIS >

P0442 EVAP CONTROL SYSTEM

On Board Diagnosis Logic

This diagnosis detects leaks in the EVAP purge line using engine intake manifold vacuum.

If pressure does not increase, the ECM will check for leaks in the line between the fuel tank and EVAP canister purge volume control solenoid valve, under the following "Vacuum test" conditions.

The EVAP canister vent control valve is closed to shut the EVAP purge line off. The EVAP canister purge volume control solenoid valve will then be opened to depressurize the EVAP purge line using intake manifold vacuum. After this occurs, the EVAP canister purge volume control solenoid valve will be closed.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0442 0442	EVAP control system small leak detected (negative pressure)	EVAP control system has a leak, EVAP control system does not operate properly.	 Incorrect fuel tank vacuum relief valve Incorrect fuel filler cap used Fuel filler cap remains open or fails to close. Foreign matter caught in fuel filler cap. Leak is in line between intake manifold and EVAP canister purge volume control solenoid valve. Foreign matter caught in EVAP canister vent control valve. EVAP canister or fuel tank leaks EVAP purge line (pipe and rubber tube) leaks EVAP purge line rubber tube bent Loose or disconnected rubber tube EVAP canister purge volume control solenoid valve and the circuit EVAP canister purge volume control solenoid valve and the circuit EVAP canister purge volume control solenoid valve and the circuit EVAP canister purge volume control valve is missing or damaged EVAP control system pressure sensor Fuel level sensor and the circuit Refueling EVAP vapor cut valve ORVR system leaks

CAUTION:

- Use only a genuine NISSAN fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.
- If the fuel filler cap is not tightened properly, the MIL may come on.
- Use only a genuine NISSAN rubber tube as a replacement.

< COMPONENT DIAGNOSIS > [VK56DE]
DTC Confirmation Procedure	
NOTE:	A
• If DTC Confirmation Procedure has been previously conducted, always perform the following before cor)-
ducting the next step. Turn ignition swich OFF and wait at least 10 seconds. 	EC
2. Turn ignition swich ON.	
3. Turn ignition swich OFF and wait at least 10 seconds.	С
TESTING CONDITION:	
 Perform "DTC WORK SUPPORT" when the fuel level is between 1/4 and 3/4 full, and vehicle is place on flat level surface. 	
 Always perform test at a temperature of 0 to 30°C (32 to 86°F). 	D
WITH CONSULT-III	
1. Turn ignition switch ON.	E
 Turn ignition switch OFF and wait at least 10 seconds. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-III. 	
4. Make sure that the following conditions are met.	_
COOLAN TEMP/S: 0 - 70°C (32 - 158°F)	F
 INT/A TEMP SE: 0 - 30°C (32 - 86°F) 5. Select "EVP SML LEAK P0442/P1442" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mod 	e
with CONSULT-III.	G
Follow the instruction displayed. NOTE:	
If the engine speed cannot be maintained within the range displayed on the CONSULT-III screen, go t	o H
EC-13, "Basic Inspection".	
 Make sure that "OK" is displayed. If "NG" is displayed, refer to <u>EC-221, "Diagnosis Procedure"</u>. NOTE: Make sure that EVAP hoses are connected to EVAP canister purge volume control solenoid valv properly. 	e J
	-
WITH GST NOTE:	
Be sure to read the explanation of EC-450, "DTC Index" before driving vehicle.	K
 Start engine. Drive vehicle according to <u>EC-450, "DTC Index"</u>. 	
3. Stop vehicle.	L
 Turn ignition switch OFF, wait at least 10 seconds and then turn ON. Select Service \$07 with GST. 	
 If P0442 is displayed on the screen, go to <u>EC-221, "Diagnosis Procedure"</u>. 	M

2.CHECK FUEL FILLER CAP INSTALLATION

Check that the cap is tightened properly by rotating the cap clockwise.

OK or NG

OK >> GO TO 3.

NG >> 1. Open fuel filler cap, then clean cap and fuel filler neck threads using air blower.
 2. Retighten until ratcheting sound is heard.

3.CHECK FUEL FILLER CAP FUNCTION

Check for air releasing sound while opening the fuel filler cap.

<u>OK or NG</u>

OK >> GO TO 5. NG >> GO TO 4.

NG >> GO TO 4. 1

4.CHECK FUEL TANK VACUUM RELIEF VALVE

Refer to EC-226, "Component Inspection".

OK or NG

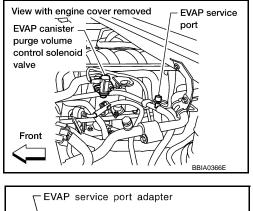

OK >> GO TO 5.

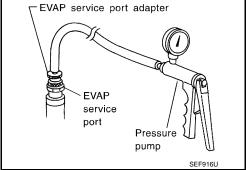

NG >> Replace fuel filler cap with a genuine one.

5.INSTALL THE PRESSURE PUMP

To locate the EVAP leak, install EVAP service port adapter (commercial service tool) and pressure pump to EVAP service port securely. **NOTE:**

Improper installation of the EVAP service port adapter to the EVAP service port may cause leaking.

With CONSULT-III>>GO TO 6. Without CONSULT-III>>GO TO 7.

6.CHECK FOR EVAP LEAK

With CONSULT-III

- 1. Turn ignition switch ON.
- 2. Select "EVAP SYSTEM CLOSE" of "WORK SUPPORT" mode with CONSULT-III.
- Touch "START" and apply pressure into the EVAP line until the pressure indicator reaches the middle of the bar graph.

CAUTION:

- Never use compressed air or a high pressure pump.
- Do not exceed 4.12 kPa (0.042 kg/cm², 0.6 psi) of pressure in the system.

EC-222

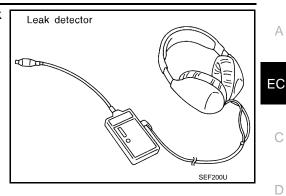

< COMPONENT DIAGNOSIS >

[VK56DE]

Using EVAP leak detector, locate the EVAP leak. For the leak 4 detector, refer to the instruction manual for more details. Refer to EC-41, "Description".

OK or NG

- OK >> GO TO 8.
- NG >> Repair or replace.

Ρ

А

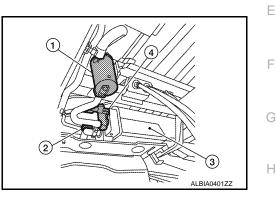

7. CHECK FOR EVAP LEAK

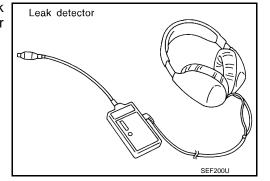

Without CONSULT-III

- Turn ignition switch OFF. 1.
- Apply 12 volts DC to EVAP canister vent control valve (4). The 2. valve will close. (Continue to apply 12 volts until the end of test.)
 - 1 : Drain filter
 - 2 : EVAP control system pressure sensor
 - 3 : EVAP canister
- 3. Pressurize the EVAP line using pressure pump with 1.3 to 2.7 kPa (10 to 20 mmHg, 0.39 to 0.79 inHg), then remove pump and EVAP service port adapter. **CAUTION:**
 - Never use compressed air or a high pressure pump.
 - Do not exceed 4.12 kPa (0.042 kg/cm², 0.6 psi) of pressure in the system.
- 4. Using EVAP leak detector, locate the EVAP leak. For the leak detector, refer to the instruction manual for more details. Refer to EC-41, "Description".

OK or NG

- OK >> GO TO 8.
- NG >> Repair or replace.

8. CHECK DRAIN FILTER

Refer to	EC-226,	"Component	Inspection".

OK or NG

- OK >> GO TO 9.
- NG >> Replace drain filter.

9.CHECK EVAP CANISTER VENT CONTROL VALVE

Check the following.

- EVAP canister vent control valve is installed properly. Refer to EC-485, "Removal and Installation".
- EVAP canister vent control valve. Refer to EC-237, "Component Inspection".

OK or NG

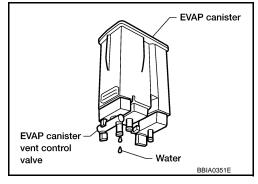

- OK >> GO TO 10.
- NG >> Repair or replace EVAP canister vent control valve and O-ring.
- 10.check if evap canister saturated with water

< COMPONENT DIAGNOSIS >

- 1. Remove EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.
- 2. Does water drain from the EVAP canister?

Yes or No

Yes >> GO TO 11. No (With CONSULT-III)>>GO TO 13. No (Without CONSULT-III)>>GO TO 14.

11.CHECK EVAP CANISTER

Weigh the EVAP canister with the EVAP canister vent control valve and EVAP control system pressure sensor attached.

Short wheel base:The weight should be less than 2.5 kg (5.5 lb).Long wheel base:The weight should be less than 3.2 kg (7.1 lb).

OK or NG

OK (With CONSULT-III)>>GO TO 13. OK (Without CONSULT-III)>>GO TO 14. NG >> GO TO 12.

12. DETECT MALFUNCTIONING PART

Check the following.

- EVAP canister for damage
- EVAP hose between EVAP canister and drain filter for clogging or poor connection

>> Repair hose or replace EVAP canister.

$13. {\sf check evap canister purge volume control solenoid valve operation}$

With CONSULT-III

- 1. Disconnect vacuum hose to EVAP canister purge volume control solenoid valve at EVAP service port.
- 2. Start engine.
- 3. Perform "PURG VOL CONT/V" in "ACTIVE TEST" mode.
- 4. Touch "Qu" on CONSULT-III screen to increase "PURG VOL CONT/V" opening to 100%.
- 5. Check vacuum hose for vacuum when revving engine up to 2,000 rpm.

Vacuum should exist.

OK or NG

OK >> GO TO 16. NG >> GO TO 15.

14. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE OPERATION

Without CONSULT-III

- 1. Start engine and warm it up to normal operating temperature.
- 2. Stop engine.
- 3. Disconnect vacuum hose to EVAP canister purge volume control solenoid valve at EVAP service port.
- 4. Start engine and let it idle for at least 80 seconds.
- 5. Check vacuum hose for vacuum when revving engine up to 2,000 rpm.

Vacuum should exist.

P0443 EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

Description

INFOID:000000005385252

SYSTEM DESCRIPTION

Sensor	Input signal to ECM	ECM function	Actuator
Crankshaft position sensor (POS) Camshaft position sensor (PHASE)	Engine speed ^{*1}		
Mass air flow sensor	Amount of intake air		
Engine coolant temperature sensor	Engine coolant temperature	-	
Battery	Battery voltage*1	_	
Throttle position sensor	Throttle position	EVAP canister purge flow control	EVAP canister purge vol- ume control solenoid valve
Accelerator pedal position sensor	Accelerator pedal position		
Air fuel ratio (A/F) sensor 1	Density of oxygen in exhaust gas (Mixture ratio feedback signal)	_	
Fuel tank temperature sensor	Fuel temperature in fuel tank		
Wheel sensor	Vehicle speed*2		

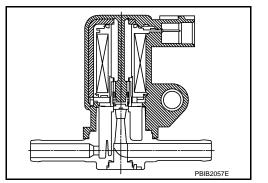

*1: ECM determines the start signal status by the signals of engine speed and battery voltage.

*2: This signal is sent to the ECM through CAN communication line.

This system controls flow rate of fuel vapor from the EVAP canister. The opening of the vapor by-pass pas-Н sage in the EVAP canister purge volume control solenoid valve changes to control the flow rate. The EVAP canister purge volume control solenoid valve repeats ON/OFF operation according to the signal sent from the ECM. The opening of the valve varies for optimum engine control. The optimum value stored in the ECM is determined by considering various engine conditions. When the engine is operating, the flow rate of fuel vapor from the EVAP canister is regulated as the air flow changes.

COMPONENT DESCRIPTION

The EVAP canister purge volume control solenoid valve uses a ON/ OFF duty to control the flow rate of fuel vapor from the EVAP canister. The EVAP canister purge volume control solenoid valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of fuel vapor that will flow through the valve.

P0444, P0445 EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

Description

INFOID:000000005385257

SYSTEM DESCRIPTION

Sensor	Input signal to ECM	ECM function	Actuator
Crankshaft position sensor (POS) Camshaft position sensor (PHASE)	Engine speed*1		
Mass air flow sensor	Amount of intake air		
Engine coolant temperature sensor	Engine coolant temperature		
Battery	Battery voltage*1		
Throttle position sensor	Throttle position		EVAP canister purge vol- ume control solenoid valve
Accelerator pedal position sensor	Accelerator pedal position		
Air fuel ratio (A/F) sensor 1	Density of oxygen in exhaust gas (Mixture ratio feedback signal)		
Fuel tank temperature sensor	Fuel temperature in fuel tank		
Wheel sensor	Vehicle speed* ²		

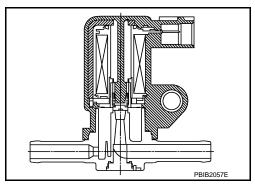

*1: ECM determines the start signal status by the signals of engine speed and battery voltage.

*2: This signal is sent to the ECM through CAN communication line.

This system controls flow rate of fuel vapor from the EVAP canister. The opening of the vapor by-pass passage in the EVAP canister purge volume control solenoid valve changes to control the flow rate. The EVAP canister purge volume control solenoid valve repeats ON/OFF operation according to the signal sent from the ECM. The opening of the valve varies for optimum engine control. The optimum value stored in the ECM is determined by considering various engine conditions. When the engine is operating, the flow rate of fuel vapor from the EVAP canister is regulated as the air flow changes.

COMPONENT DESCRIPTION

The EVAP canister purge volume control solenoid valve uses a ON/ OFF duty to control the flow rate of fuel vapor from the EVAP canister. The EVAP canister purge volume control solenoid valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of fuel vapor that will flow through the valve.

P0447 EVAP CANISTER VENT CONTROL VALVE

Component Description

The EVAP canister vent control valve (4) is located on the EVAP canister (3) and is used to seal the canister vent.

This solenoid valve responds to signals from the ECM. When the ECM sends an ON signal, the coil in the solenoid valve is energized. A plunger will then move to seal the canister vent. The ability to seal the vent is necessary for the on board diagnosis of other evaporative emission control system components.

This solenoid valve is used only for diagnosis, and usually remains opened.

When the vent is closed, under normal purge conditions, the evaporative emission control system is depressurized and allows "EVAP Control System" diagnosis.

- 1 : Drain filter
- 2 : EVAP control system pressure sensor

EVAP CONTROL SYSTEM PRESSURE SENSOR

- 1. Remove EVAP control system pressure sensor with its harness connector connected from EVAP canister. Always replace O-ring with a new one.
- 2. Install a vacuum pump to EVAP control system pressure sensor.
- 3. Turn ignition switch ON and check output voltage between ECM terminal 32 and ground under the following conditions.

Applied vacuum [kPa (mmHg, inHg)]	Voltage (V)
Not applied	1.8 - 4.8
-26.7 (-200, -7.87)	2.1 to 2.5 lower than above value

CAUTION:

• Always calibrate the vacuum pump gauge when using it.

- Do not apply below -93.3 kPa (-700 mmHg, -27.56 inHg) or
- pressure over 101.3 kPa (760 mmHg, 29.92 inHg).
 4. If NG, replace EVAP control system pressure sensor.

< COMPONENT DIAGNOSIS >

P0453 EVAP CONTROL SYSTEM PRESSURE SENSOR

Component Description

The EVAP control system pressure sensor (2) detects pressure in the purge line. The sensor output voltage to EC the ECM increases as pressure increases.

- : Drain filter 1
- 3 : EVAP canister
- 4 : EVAP canister vent control value

(1 D Ε 3 ALBIA0401ZZ 4 > Output voltage 3 2 Н 0. 60.0 106.7 (450, 17.72) (800.7, 31.52)

> Pressure kPa (mmHg, inHg) (Absolute pressure)

NOTE:

If DTC P0451 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643. Refer to EC-291.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P0453 0453	EVAP control system pressure sensor high input	An excessively high voltage from the sensor is sent to ECM.	 Harness or connectors (The sensor circuit is open or shorted.) EVAP control system pressure sensor EVAP canister vent control valve EVAP canister Drain filter Rubber hose from EVAP canister vent control valve to drain filter 	ſ

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- Turn ignition swich OFF and wait at least 10 seconds. 1.
- 2. Turn ignition swich ON.
- Turn ignition swich OFF and wait at least 10 seconds. 3.

TESTING CONDITION: Always perform test at a temperature of 5°C (41°F) or more.

With CONSULT-III

FUEL TANK VACUUM RELIEF VALVE (BUILT INTO FUEL FILLER CAP)

INFOID:000000005385290

< COMPONENT DIAGNOSIS >

1. Wipe clean valve housing.

2. Check valve opening pressure and vacuum.

Pressure: 15.3 - 20.0 kPa (0.156 - 0.204 kg/cm², 2.22 - 2.90 psi)

Vacuum: -6.0 to -3.3 kPa (-0.061 to -0.034 kg/cm², -0.87 to -0.48 psi)

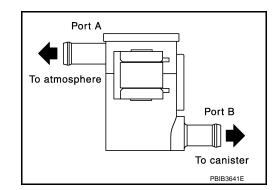

3. If out of specification, replace fuel filler cap as an assembly.

CAUTION:

Use only a genuine fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.

DRAIN FILTER

- 1. Check visually for insect nests in the drain filter air inlet.
- 2. Check visually for cracks or flaws in the appearance.
- 3. Check visually for cracks or flaws in the hose.
- 4. Blow air into port A and check that it flows freely out of port B.
- 5. Block port B.
- 6. Blow air into port A and check that there is no leakage.
- 7. If NG, replace drain filter.

< COMPONENT DIAGNOSIS >

P0456 EVAP CONTROL SYSTEM

On Board Diagnosis Logic

This diagnosis detects very small leaks in the EVAP line between fuel tank and EVAP canister purge volume control solenoid valve, using the intake manifold vacuum in the same way as conventional EVAP small leak diagnosis.

If ECM judges a leak which corresponds to a very small leak, the very small leak P0456 will be detected. If ECM judges a leak equivalent to a small leak, EVAP small leak P0442 will be detected.

If ECM judges there are no leaks, the diagnosis will be OK.

Air cleaner Mass air flow sensor EVAP canister EVAP control system pressure sensor Throttle purge volume valve control solenoid Refueling EVAP vapor cut valve valve (P Drain filter EVAP canister vent control valve Fuel tank temperature sensor EVAP Fuel tank canister Fuel level sensor PBIB3640E

DTC Confirmation Procedure

INFOID:000000005385292

NOTE:

- If DTC P0456 is displayed with P0442, first perform trouble diagnosis for DTC P0456.
- After repair, make sure that the hoses and clips are installed properly.
- If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.
- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

TESTING CONDITION:

- Open engine hood before conducting following procedure.
- If any of following conditions are met just before the DTC confirmation procedure, leave the vehicle for more than 1 hour.
- Fuel filler cap is removed.
- Fuel is refilled or drained.
- EVAP component parts is/are removed.
- Before performing the following procedure, confirm that battery voltage is more than 11V at idle.

(I) WITH CONSULT-III

- 1. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT-III.
- 2. Make sure the following conditions are met.

FUEL LEVEL SE: 0.25 - 1.4V COOLAN TEMP/S: 0 - 32°C (32 - 90°F) FUEL T/TMP SE: 0 - 35°C (32 - 95°F) INT/A TEMP SE: More than 0°C (32°F)

INT/A TEMP SE: More than 0°C (32°F)

If NG, turn ignition switch OFF and leave the vehicle in a cool place (soak the vehicle) or refilling/draining fuel until the output voltage condition of the "FUEL LEVEL SE" meets within the range above and leave the vehicle for more than 1 hour. Then start from step 1).

- 3. Turn ignition switch OFF, wait at least 10 seconds and then turn ON.
- 4. Select "EVP V/S LEAK P0456/P1456" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT-III.

Follow the instruction displayed.

 Make sure that "OK" is displayed. If "NG" is displayed, refer to <u>EC-265, "Diagnosis Procedure"</u>. NOTE:

- If the engine speed cannot be maintained within the range displayed on CONSULT-III screen, go to <u>EC-13, "Basic Inspection"</u>.
- Make sure that EVAP hoses are connected to EVAP canister purge volume control solenoid valve properly.

Overall Function Check

INFOID:000000005385293

WITH GST

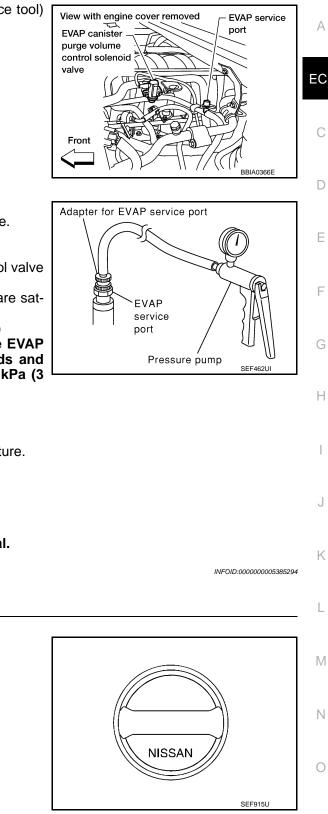

Use this procedure to check the overall function of the EVAP very small leak function. During this check, a 1st trip DTC might not be confirmed.

CAUTION:

- Do not use compressed air, doing so may damage the EVAP system.
- Do not start engine.
- Do not exceeded 4.12 kPa (0.042 kg/cm², 0.6 psi).

< COMPONENT DIAGNOSIS >

1. Attach the EVAP service port adapter (commercial service tool) securely to the EVAP service port.

Set the pressure pump and a hose. 3. Also set a vacuum gauge via 3-way connector and a hose.

- 4. Turn ignition switch ON.
- 5. Connect GST and select Service \$08.
- Using Service \$08, control the EVAP canister vent control valve 6. (close).
- 7. Apply pressure and make sure the following conditions are satisfied.

Pressure to be applied: 2.7 kPa (20 mmHg, 0.79 inHg) Time to be waited after the pressure drawn in to the EVAP system and the pressure to be dropped: 60 seconds and the pressure should not be dropped more than 0.4 kPa (3 mmHg, 0.12 inHg).

If NG, go to EC-265, "Diagnosis Procedure". If OK, go to next step.

- Disconnect GST.
- 9. Start engine and warm it up to normal operating temperature.
- 10. Turn ignition switch OFF and wait at least 10 seconds.
- 11. Restart engine and let it idle for 90 seconds.
- 12. Keep engine speed at 2,000 rpm for 30 seconds.
- Turn ignition switch OFF. NOTE:

For more information, refer to GST Instruction Manual.

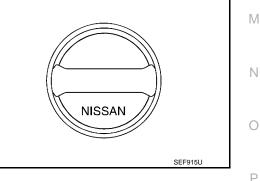

Diagnosis Procedure

1.CHECK FUEL FILLER CAP DESIGN

- 1. Turn ignition switch OFF.
- Check for genuine NISSAN fuel filler cap design. 2.

OK or NG

- OK >> GO TO 2.
- NG >> Replace with genuine NISSAN fuel filler cap.

2.CHECK FUEL FILLER CAP INSTALLATION

Check that the cap is tightened properly by rotating the cap clockwise.

OK or NG

- OK >> GO TO 3.
- NG >> 1. Open fuel filler cap, then clean cap and fuel filler neck threads using air blower.
 - 2. Retighten until ratcheting sound is heard.

[VK56DE]

3.CHECK FUEL FILLER CAP FUNCTION

Check for air releasing sound while opening the fuel filler cap.

OK or NG

OK >> GO TO 5. NG >> GO TO 4.

 $\frac{1}{4}$

4.CHECK FUEL TANK VACUUM RELIEF VALVE

Refer to EC-226, "Component Inspection".

<u>OK or NG</u>

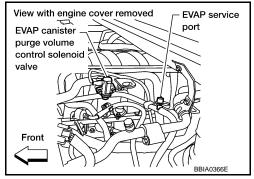

OK >> GO TO 5.

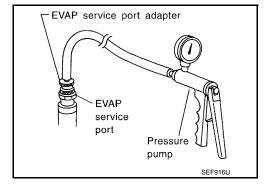

NG >> Replace fuel filler cap with a genuine one.

5.INSTALL THE PRESSURE PUMP

To locate the EVAP leak, install EVAP service port adapter and pressure pump to EVAP service port securely. **NOTE:**

Improper installation of the EVAP service port adapter to the EVAP service port may cause leaking.

With CONSULT-III>>GO TO 6. Without CONSULT-III>>GO TO 7.

6.CHECK FOR EVAP LEAK

(I) With CONSULT-III

- 1. Turn ignition switch ON.
- 2. Select "EVAP SYSTEM CLOSE" of "WORK SUPPORT" mode with CONSULT-III.
- 3. Touch "START" and apply pressure into the EVAP line until the pressure indicator reaches the middle of the bar graph.

CAUTION:

- Do not use compressed air or a high pressure pump.
- Do not exceed 4.12 kPa (0.042 kg/cm², 0.6 psi) of pressure in the system.

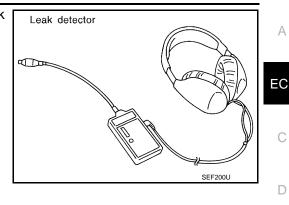

< COMPONENT DIAGNOSIS >

[VK56DE]

4. Using EVAP leak detector, locate the EVAP leak. For the leak detector, refer to the instruction manual for more details. Refer to EC-41, "Description".

OK or NG

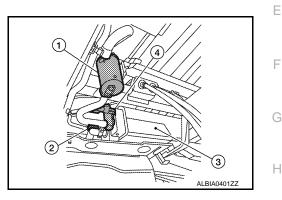

- OK >> GO TO 8.
- NG >> Repair or replace.

7.CHECK FOR EVAP LEAK

Without CONSULT-III

- Turn ignition switch OFF. 1.
- Apply 12 volts DC to EVAP canister vent control valve (4). The 2. valve will close. (Continue to apply 12 volts until the end of test.)
 - 1 : Drain filter
 - 2 : EVAP control system pressure sensor
 - 3 : EVAP canister

 Pressurize the EVAP line using pressure pump with 1.3 to 2.7 kPa (10 to 20 mmHg, 0.39 to 0.79 inHg), then remove pump and EVAP service port adapter.

CAUTION:

- Do not use compressed air or a high pressure pump.
- Do not exceed 4.12 kPa (0.042 kg/cm², 0.6 psi) of pressure in the system.
- 4. Using EVAP leak detector, locate the EVAP leak. For the leak detector, refer to the instruction manual for more details. Refer to EC-41, "Description".

OK or NG

- OK >> GO TO 8.

P0460 FUEL LEVEL SENSOR

Component Description

The fuel level sensor is mounted in the fuel level sensor unit. The sensor detects a fuel level in the fuel tank and transmits a signal to the combination meter. The combination meter sends the fuel level sensor signal to the ECM through CAN communication line. It consists of two parts, one is mechanical float and the other is vari-

able resistor. Fuel level sensor output voltage changes depending on the movement of the fuel mechanical float.

- If DTC P0461 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607. Refer to <u>EC-290</u>.

Driving long distances naturally affect fuel gauge level.

This diagnosis detects the fuel gauge malfunction of the gauge not moving even after a long distance has been driven.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0461 0461	Fuel level sensor circuit range/performance	The output signal of the fuel level sensor does not change within the specified range even though the vehicle has been driven a long dis- tance.	 Harness or connectors (The CAN communication line is open or shorted) Harness or connectors (The sensor circuit is open or shorted) Combination meter Fuel level sensor

Overall Function Check

Use this procedure to check the overall function of the fuel level sensor function. During this check, a 1st trip DTC might not be confirmed.

WARNING:

When performing following procedure, be sure to observe the handling of the fuel. Refer to <u>FL-6</u>, <u>"Removal and Installation"</u>.

TESTING CONDITION:

Before starting overall function check, preparation of draining fuel and refilling fuel is required.

WITH CONSULT-III

NOTE:

Start from step 10, if it is possible to confirm that the fuel cannot be drained by 30 ℓ (7-7/8 US gal, 6-5/8 Imp gal) in advance.

- 1. Prepare a fuel container and a spare hose.
- 2. Release fuel pressure from fuel line, refer to EC-481, "Fuel Pressure Check".
- 3. Remove the fuel feed hose on the fuel level sensor unit.
- 4. Connect a spare fuel hose where the fuel feed hose was removed.
- 5. Turn ignition switch OFF and wait at least 10 seconds then turn ON.
- 6. Select "FUEL LEVEL SE" in "DATA MONITOR" mode with CONSULT-III.
- 7. Check "FUEL LEVEL SE" output voltage and note it.
- 8. Select "FUEL PUMP" in "ACTIVE TEST" mode with CONSULT-III.
- 9. Touch "ON" and drain fuel approximately 30 ℓ (7-7/8 US gal, 6-5/8 Imp gal) and stop it.
- 10. Check "FUEL LEVEL SE" output voltage and note it.
- 11. Fill fuel into the fuel tank for 30 ℓ (7-7/8 US gal, 6-5/8 Imp gal).

The vehicle speed signal is sent to the combination meter from the "ABS actuator and electric unit (control unit)" by CAN communication line. The c combination meter then sends a signal to the ECM by CAN communication line.

On Board Diagnosis Logic

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0500 0500	Vehicle speed sensor	The vehicle speed signal sent to ECM is almost 0 km/h (0 MPH) even when vehicle is being driven.	 Harness or connectors (The CAN communication line is open or short- ed) Harness or connectors (The vehicle speed signal circuit is open or shorted) Wheel sensor Combination meter ABS actuator and electric unit (control unit)

FAIL-SAFE MODE

When the malfunction is detected, the ECM enters fail-safe mode.

Detected items	Engine operating condition in fail-safe mode	
Vehicle speed sensor	When the fail-safe system for vehicle speed sensor is activated, the cooling fan operates (High) while engine is running.	J

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed.

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

TESTING CONDITION:

Steps 1 and 2 may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a normal test is expected to be easier, it is unnecessary to lift the vehicle.

WITH CONSULT-III

- 1. Start engine (VDC switch OFF).
- Read "VHCL SPEED SE" in "DATA MONITOR" mode with CONSULT-III. The vehicle speed on CON-SULT-III should exceed 10 km/h (6 MPH) when rotating wheels with suitable gear position. If NG, go to <u>EC-278, "Diagnosis Procedure"</u>.
 P If OK, go to following step.
- 3. Select "DATA MONITOR" mode with CONSULT-III.
- 4. Warm engine up to normal operating temperature.
- 5. Maintain the following conditions for at least 60 consecutive seconds.

ENG SPEED	1,600 - 6,000 rpm
COOLAN TEMP/S	More than 70°C (158°F)

P0506 ISC SYSTEM

Description

NOTE:

DTC No.

P0506

0506

1. 2.

3.

1.

2.

If DTC P0506 is displayed with other DTC, first perform the trouble diagnosis for the other DTC. The ECM controls the engine idle speed to a specified level through the fine adjustment of the air, which is let

into the intake manifold, by operating the electric throttle control actuator. The operating of the throttle valve is varied to allow for optimum control of the engine idling speed. The crankshaft position sensor (POS) detects the actual engine speed and sends a signal to the ECM.

The ECM controls the electric throttle control actuator so that the engine speed coincides with the target value memorized in the ECM. The target engine speed is the lowest speed at which the engine can operate steadily. D The optimum value stored in the ECM is determined by taking into consideration various engine conditions, such as during warming up, deceleration, and engine load (air conditioner, power steering and cooling fan operation, etc.). Ε

>> INSPECTION END

P0550 PSP SENSOR

Component Description

Power steering pressure (PSP) sensor (1) is installed to the power steering high-pressure tube and detects a power steering load. This sensor is a potentiometer which transforms the power steering load into output voltage, and emits the voltage signal to the ECM. The ECM controls the electric throttle control actuator and adjusts the throttle valve opening angle to increase the engine speed and adjusts the idle speed for the increased load.

On Board Diagnosis Logic

The MIL will not light up for this self-diagnosis. NOTE:

If DTC P0550 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643. Refer to EC-291.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0550 0550	Power steering pressure sensor circuit	An excessively low or high voltage from the sensor is sent to ECM.	 Harness or connectors (The sensor circuit is open or shorted) Power steering pressure sensor

OK or NG

OK >> GO TO 2.

NG >> Repair or replace ground connections.

DTC Confirmation Procedure

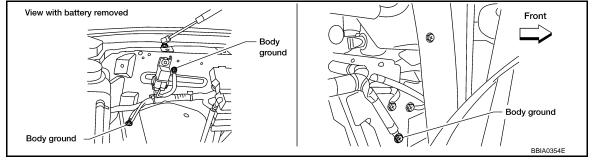

- 1. If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.
- Turn ignition switch OFF and wait at least 10 seconds. a.
- Turn ignition switch ON. b.
- Turn ignition switch OFF and wait at least 10 seconds. c.
- Start engine and let it idle for at least 5 seconds.
- 3. Check 1st trip DTC.

4. If 1st trip DTC is detected, go to EC-283, "Diagnosis Procedure".

Diagnosis Procedure

1.CHECK GROUND CONNECTIONS

- 1. Turn ignition switch OFF.
- 2. Loosen and retighten three ground screws on the body. Refer to EC-88, "Ground Inspection".

P0605 ECM

The ECM consists of a microcomputer and connectors for signal input and output and for power supply. The ECM controls the engine.

On Board Diagnosis Logic

This self-diagnosis has one or two trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition		Possible cause
P0605 0605 Engine control module	A)	ECM calculation function is malfunctioning.		
	B)	ECM EEP-ROM system is malfunctioning.	• ECM	
	C)	ECM self shut-off function is malfunctioning.		

FAIL-SAFE MODE

ECM enters fail-safe mode when the malfunction A is detected.

Detected items	Engine operation condition in fail-safe mode
Malfunction A	 ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring. ECM deactivates ASCD operation.

DTC Confirmation Procedure

Perform PROCEDURE FOR MALFUNCTION A first. If the 1st trip DTC cannot be confirmed, perform PROCEDURE FOR MALFUNCTION B. If there is no malfunction on PROCEDURE FOR MALFUNCTION B, perform PROCEDURE FOR MALFUNCTION C.

NOTE:

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

PROCEDURE FOR MALFUNCTION A

- 1. Turn ignition switch ON.
- 2. Check 1st trip DTC.
- 3. If 1st trip DTC is detected, go to EC-289. "Diagnosis Procedure".

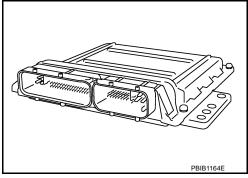

PROCEDURE FOR MALFUNCTION B

- 1. Turn ignition switch ON and wait at least 1 second.
- 2. Turn ignition switch OFF, wait at least 10 seconds and then turn ON.
- 3. Check 1st trip DTC.
- 4. If 1st trip DTC is detected, go to EC-289, "Diagnosis Procedure".

PROCEDURE FOR MALFUNCTION C

- 1. Turn ignition switch ON and wait at least 1 second.
- 2. Turn ignition switch OFF, wait at least 10 seconds and then turn ON.
- 3. Repeat step 2 for 32 times.
- 4. Check 1st trip DTC.
- If 1st trip DTC is detected, go to <u>EC-289, "Diagnosis Procedure"</u>.

P0607 ECM

Description

CAN (Controller Area Network) is a serial communication line for real time application. It is an on-vehicle multiplex communication line with high data communication speed and excellent error detection ability. Many electronic control units are equipped onto a vehicle, and each control unit shares information and links with other control units during operation (not independent). In CAN communication, control units are connected with 2 communication lines (CAN H line, CAN L line) allowing a high rate of information transmission with less wiring. Each control unit transmits/receives data but selectively reads required data only.

On Board Diagnosis Logic

This self-diagnosis has the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0607 0607	CAN communication bus	When detecting error during the initial diagno- sis of CAN controller of ECM.	• ECM

DTC Confirmation Procedure

- Turn ignition switch ON.
- Check DTC. 2.
- 3. If DTC is detected, go to EC-290, "Diagnosis Procedure".

Diagnosis Procedure

1.INSPECTION START

(P) With CONSULT-III

- Turn ignition switch ON. 1.
- Select "SELF-DIAG RESULTS" mode with CONSULT-III. 2.
- 3. Touch "ERASE".
- Perform DTC Confirmation Procedure. 4. See EC-290, "DTC Confirmation Procedure".
- 5. Is the DTC P0607 displayed again?

With GST

- Turn ignition switch ON. 1.
- Select Service \$04 with GST.
- Perform DTC Confirmation Procedure. 3. See EC-290, "DTC Confirmation Procedure".
- 4. Is the DTC P0607 displayed again?

Yes or No

Yes >> GO TO 2.

No >> INSPECTION END

2.REPLACE ECM

- 1. Replace ECM.
- 2. Perform initialization of NVIS (NATS) system and registration of all NVIS (NATS) ignition key IDs. Refer to SEC-7, "ECM RE-COMMUNICATING FUNCTION : Description".
- Perform EC-22, "VIN Registration". 3.
- Perform <u>EC-22</u>, "Accelerator Pedal Released Position Learning".
 Perform <u>EC-22</u>, "Throttle Valve Closed Position Learning".
- <Flexible Fuel Vehicle> 6. Perform EC-22, "Ethanol Mixture Ratio Adaptation (Flexible Fuel Vehicle)".
- Perform EC-23, "Idle Air Volume Learning". 7.

P0850 PNP SWITCH

< COMPONENT DIAGNOSIS >

P0850 PNP SWITCH

Component Description

When the gear position is P or N, transmission range switch is ON. TCM detects the position because the continuity of the line (the ON signal) exists. Then the TCM sends the PNP signal to the ECM via combination meter.

On Board Diagnosis Logic

INFOID:000000005385342

INFOID:000000005385343

INFOID:000000005385341

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P0850 0850	Park/neutral position switch	The park/neutral position (PNP) signal is not changed in the process of engine starting and driving.	 Harness or connectors [The park/neutral position (PNP) signal circuit is open or shorted.] Combination meter TCM

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed. NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

B WITH CONSULT-III

- 1. Turn ignition switch ON.
- Select "P/N POSI SW" in "DATA MONITOR" mode with CONSULT-III. Then check the "P/N POSI SW" signal under the following conditions.

Position (Selector lever)	Known-good signal
N or P position	ON
Except the above position	OFF

If NG, go to EC-295, "Diagnosis Procedure".

If OK, go to following step.

- 3. Select "DATA MONITOR" mode with CONSULT-III.
- 4. Start engine and warm it up to normal operating temperature.
- 5. Maintain the following conditions for at least 60 consecutive seconds.

ENG SPEED	1,000 - 6,375 rpm
COOLAN TEMP/S	More than 70°C (158°F)
B/FUEL SCHDL	2.0 - 31.8 msec
VHCL SPEED SE	More than 64 km/h (40 MPH)
Selector lever	Suitable position

6. Check 1st trip DTC.

7. If 1st trip DTC is detected, go to EC-295. "Diagnosis Procedure".

Overall Function Check

INFOID:000000005385344

Use this procedure to check the overall function of the park/neutral position (PNP) signal circuit. During this check, a 1st trip DTC might not be confirmed.

WITH GST

< COMPONENT DIAGNOSIS >

P1140, P1145 IVT CONTROL POSITION SENSOR

Component Description

Intake valve timing control position sensors are located in the front of cylinder heads in both bank 1 and bank 2.

This sensor uses a Hall IC.

The cam position is determined by the intake camshaft sprocket concave (in four places). The ECM provides feedback to the intake valve timing control for appropriate target valve open-close timing according to drive conditions based on detected cam position.

P1211 TCS CONTROL UNIT

< COMPONENT DIAGNOSIS >

P1211 TCS CONTROL UNIT

Description

The malfunction information related to TCS is transferred through the CAN communication line from "ABS actuator and electric unit (control unit)" to ECM.

Be sure to erase the malfunction information such as DTC not only for "ABS actuator and electric unit (control unit)" but also for ECM after TCS related repair.

On Board Diagnosis Logic

Freeze frame data is not stored in the ECM for this self-diagnosis. The MIL will not light up for this self-diagnosis.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P1211 1211	TCS control unit	ECM receives a malfunction information from "ABS actuator electric unit (control unit)"	 ABS actuator and electric unit (control unit) TCS related parts

DTC Confirmation Procedure

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 10.5V at idle.

- 1. Start engine and let it idle for at least 60 seconds.
- 2. Check 1st trip DTC.
- 3. If 1st trip DTC is detected, go to EC-302, "Diagnosis Procedure".

Diagnosis Procedure

Go to BRC-23, "CONSULT-III Function (ABS)".

INFOID:000000005385355

INFOID:000000005385354

INFOID:000000005385352

P1212 TCS COMMUNICATION LINE

< COMPONENT DIAGNOSIS >

P1212 TCS COMMUNICATION LINE

Description

NOTE:

- If DTC P1212 is displayed with DTC U0101 or U1001, first perform the trouble diagnosis for DTC U0101, U1001. Refer to <u>EC-89</u>.
- If DTC P1212 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607. Refer to <u>EC-290</u>.

This CAN communication line is used to control the smooth engine operation during the TCS operation. Pulse signals are exchanged between ECM and "ABS actuator and electric unit (control unit)".

Be sure to erase the malfunction information such as DTC not only for "ABS actuator and electric unit (control unit)" but also for ECM after TCS related repair.

On Board Diagnosis Logic

Freeze frame data is not stored in the ECM for this self-diagnosis. The MIL will not light up for this self-diagnosis.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P1212 1212	TCS communication line	ECM can not receive the information from "ABS actuator and electric unit (control unit)" continuously.	 Harness or connectors (The CAN communication line is open or short- ed.) ABS actuator and electric unit (control unit) Dead (Weak) battery 	G

DTC Confirmation Procedure

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 10.5V at idle.

- 1. Start engine and let it idle for at least 10 seconds.
- 2. Check 1st trip DTC.
- 3. If 1st trip DTC is detected, go to EC-303, "Diagnosis Procedure".

Diagnosis Procedure

Go to BRC-23, "CONSULT-III Function (ABS)".

P1217 ENGINE OVER TEMPERATURE

< COMPONENT DIAGNOSIS >

P1217 ENGINE OVER TEMPERATURE

On Board Diagnosis Logic

If the cooling fan or another component in the cooling system malfunctions, engine coolant temperature will rise.

When the engine coolant temperature reaches an abnormally high temperature condition, a malfunction is indicated.

This self-diagnosis has the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P1217	Engine over tempera-	 Cooling fan does not operate properly (Overheat). Cooling fan system does not operate properly (Overheat). Engine coolant was not added to the system using the proper filling method. Engine coolant is not within the specified range. 	 Cooling fan (crankshaft driven) Radiator hose Radiator Radiator cap Reservoir tank Reservoir tank cap Water pump Thermostat For more information, refer to EC-306,
1217	ture (Overheat)		"Main 13 Causes of Overheating".

CAUTION:

When a malfunction is indicated, be sure to replace the coolant. Refer to <u>CO-11, "Changing Engine</u> <u>Coolant"</u>. Also, replace the engine oil. Refer to <u>LU-9, "Changing Engine Oil"</u>.

- 1. Fill radiator with coolant up to specified level with a filling speed of 2 liters per minute. Be sure to use coolant with the proper mixture ratio. Refer to <u>MA-11</u>, "Engine Oil Recommendation".
- 2. After refilling coolant, run engine to ensure that no water-flow noise is emitted.

Overall Function Check

INFOID:000000005385361

Use this procedure to check the overall function of the cooling fan. During this check, a DTC might not be confirmed.

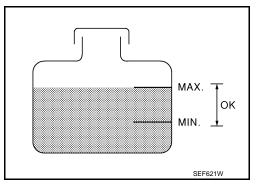

WARNING:

Never remove the radiator cap and/or reservoir tank cap when the engine is hot. Serious burns could be caused by high pressure fluid escaping from the radiator and/or reservoir tank. Wrap a thick cloth around cap. Carefully remove the cap by turning it a quarter turn to allow built-up pressure to escape. Then turn the cap all the way off.

(I) WITH CONSULT-III

- Check the coolant level in the reservoir tank and radiator. Allow engine to cool before checking coolant level. If the coolant level in the reservoir tank and/or radiator is below the proper range, skip the following steps and go to <u>EC-385</u>. <u>"Diagnosis Procedure"</u>.
- Confirm whether customer filled the coolant or not. If customer filled the coolant, skip the following steps and go to <u>EC-385</u>. <u>"Diagnosis Procedure"</u>.
- 3. Start engine.
- 4. Make sure that cooling fan (crankshaft driven) operates.
- 5. If are NG, go to EC-385, "Diagnosis Procedure".

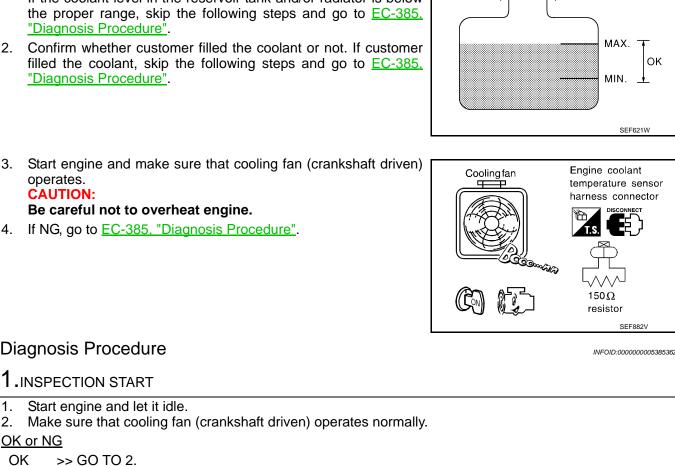

WITH GST

P1217 ENGINE OVER TEMPERATURE

< COMPONENT DIAGNOSIS >

- Check the coolant level in the reservoir tank and radiator. 1. Allow engine to cool before checking coolant level. If the coolant level in the reservoir tank and/or radiator is below the proper range, skip the following steps and go to EC-385. "Diagnosis Procedure".
- 2. Confirm whether customer filled the coolant or not. If customer filled the coolant, skip the following steps and go to EC-385. "Diagnosis Procedure".

Diagnosis Procedure

operates.

4

CAUTION:

1.INSPECTION START

- 1. Start engine and let it idle.
- 2. Make sure that cooling fan (crankshaft driven) operates normally.

OK or NG

- OK >> GO TO 2.

*1: Turn the ignition switch ON.

*2: Engine running at 3,000 rpm for 10 minutes.

*3: Drive at 90 km/h (55 MPH) for 30 minutes and then let idle for 10 minutes.

*4: After 60 minutes of cool down time.

For more information, refer to CO-8, "Troubleshooting Chart".

P1220 FUEL PUMP CONTROL MODULE (FPCM)

< COMPONENT DIAGNOSIS >

P1220 FUEL PUMP CONTROL MODULE (FPCM)

Description

SYSTEM DESCRIPTION

Sensor	Input Signal to ECM	ECM function	Actuator	
Crankshaft position sensor (POS) Camshaft position sensor (PHASE)	Engine speed*			С
Mass air flow sensor	Amount of intake air	Fuel pump control	Fuel pump control module (FPCM)	
Engine coolant temperature sensor	Engine coolant temperature			D
Battery	Battery voltage*			

*: ECM determines the start signal status by the signals of engine speed and battery voltage.

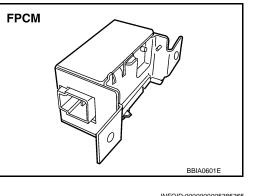

This system controls the fuel pump operation. The amount of fuel flow delivered from the fuel pump is altered between two flow rates by the FPCM operation. The FPCM determines the voltage supplied to the fuel pump (and therefore fuel flow) according to the following conditions.

Conditions	Amount of fuel flow	Supplied voltage	
 Engine cranking Engine coolant temperature is below 10°C (50°F). Engine is running under heavy load and high speed conditions 	high	Battery voltage (11 - 14V)	G
Except the above	low	Approximately 8V	

COMPONENT DESCRIPTION

On Board Diagnosis Logic

The FPCM adjusts the voltage supplied to the fuel pump to control the amount of fuel flow. When the FPCM increases the voltage supplied to the fuel pump, the fuel flow is increased. When the FPCM decreases the voltage, the fuel flow is decreased.

INFOID:000000005385365

INFOID:000000005385366

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	M
P1220 1220	Fuel pump control module (FPCM)	An improper voltage signal from the FPCM, which is supplied to a point between the fuel pump and the dropping resistor, is detected by ECM.	 Harness or connectors (FPCM circuit is shorted.) Dropping resistor FPCM 	Ν

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed.

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.

P1225 TP SENSOR

Component Description

Electric throttle control actuator consists of throttle control motor, throttle position sensor, etc. The throttle position sensor responds to the throttle valve movement.

The throttle position sensor has the two sensors. These sensors are a kind of potentiometers which transform the throttle valve position into output voltage, and emit the voltage signal to the ECM. In addition, these sensors detect the opening and closing speed of the throttle valve and feed the voltage signals to the ECM. The ECM judges the current opening angle of the throttle valve from these signals and the ECM controls the throttle control motor to make the throttle valve opening angle properly in response to driving condition.

On Board Diagnosis Logic

The MIL will not light up for this self-diagnosis.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P1225 1225	Closed throttle position learning performance	Closed throttle position learning value is excessively low.	• Electric throttle control actuator (TP sensor 1 and 2)

P1550 BATTERY CURRENT SENSOR

Component Description

The power generation voltage variable control enables fuel consumption to be decreased by reducing the engine load which is caused by the power generation of the generator. The battery current sensor (1) is installed to the battery cable at the negative terminal. The sensor measures the charging/discharging current of the battery. Based on the sensor signal, ECM judges whether or not the power generation voltage variable control is performed. When performing the power generation voltage variable control, ECM calculates the target power generation voltage based on the sensor signal. And ECM sends the calculated value as the power generation command value to IPDM E/R. For the details of the power generation voltage variable control, refer to <u>CHG-6</u>, "System Description".

✓⊐: Vehicle front

CAUTION:

Do not connect the electrical component or the ground wire directly to the battery terminal. The connection causes the malfunction of the power generation voltage variable control, and then the battery discharge may occur.

On Board Diagnosis Logic

INFOID:000000005385382

The MIL will not light up for this self-diagnosis. NOTE:

If DTC P1550 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643. Refer to <u>EC-291</u>.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P1550 1550	Battery current sensor circuit range/performance	The output voltage of the battery current sensor remains within the specified range while engine is running.	Harness or connectors (The sensor circuit is open or shorted.)Battery current sensor

DTC Confirmation Procedure

INFOID:000000005385383

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 8V at idle.

- 1. Start engine and wait at least 10 seconds.
- 2. Check 1st trip DTC.
- If 1st trip DTC is detected, go to <u>EC-318</u>, "Diagnosis Procedure".

Diagnosis Procedure

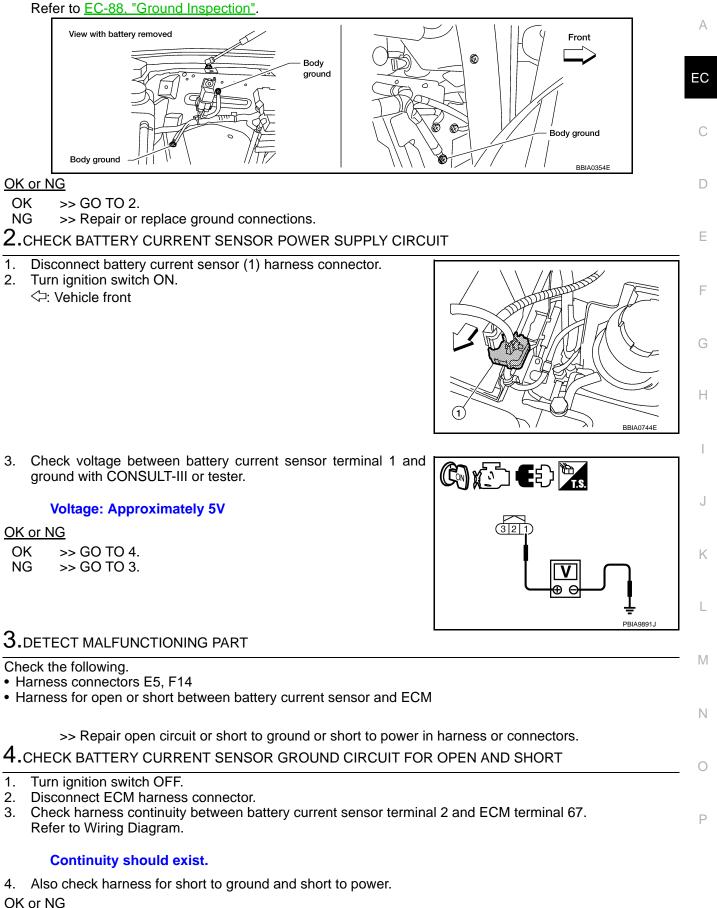

INFOID:000000005385384

1.CHECK GROUND CONNECTIONS

- 1. Turn ignition switch OFF.
- 2. Loosen and retighten ground screws on the body.

P1572 ASCD BRAKE SWITCH

Component Description

When the brake pedal is depressed, ASCD brake switch is turned OFF and stop lamp switch is turned ON. ECM detects the state of the brake pedal by this input of two kinds (ON/OFF signal). Refer to <u>EC-38</u> for the ASCD function.

On Board Diagnosis Logic

- This self-diagnosis has the one trip detection logic.
- The MIL will not light up for this self-diagnosis.
- NOTE:
- If DTC P 1572 is displayed with DTC P0605, first perform the trouble diagnosis for DTC P0605. Refer to <u>EC-288</u>.
- This self-diagnosis has the one trip detection logic. When malfunction A is detected, DTC is not stored in ECM memory. And in that case, 1st trip DTC and 1st trip freeze frame data are displayed. 1st trip DTC is erased when ignition switch OFF. And even when malfunction A is detected in two consecutive trips, DTC is not stored in ECM memory.

DTC No.	Trouble Diagnosis Name	DTC Detecting Condition		Possible Cause
P1572		A)	When the vehicle speed is above 30km/h (19 MPH), ON signals from the stop lamp switch and the ASCD brake switch are sent to ECM at the same time.	 Harness or connectors (The stop lamp switch circuit is shorted.) Harness or connectors (The ASCD brake switch circuit is shorted.)
1572	ASCD brake switch	B)	ASCD brake switch signal is not sent to ECM for extremely long time while the vehicle is driving	 Stop lamp switch ASCD brake switch Incorrect stop lamp switch installation Incorrect ASCD brake switch installation ECM

DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed.

NOTE:

- If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.
- Procedure for malfunction B is not described here. It takes extremely long time to complete procedure for malfunction B. By performing procedure for malfunction A, the incident that causes malfunction B can be detected.

TESTING CONDITION:

Steps 4 and 7 may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.

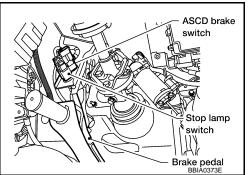

- 1. Start engine (VDC switch OFF).
- 2. Select "DATA MONITOR" mode with CONSULT-III.
- 3. Press MAIN switch and make sure that CRUISE indicator lights up.
- 4. Drive the vehicle for at least 5 consecutive seconds under the following condition.

Condition	Continuity
Brake pedal: Fully released	Should not exist.
Brake pedal: Slightly depressed	Should exist.

If NG, adjust stop lamp switch installation, refer to <u>BR-13,</u> <u>"Inspection and Adjustment - Standard Pedal"</u>, and perform step 3 again.

P1574 ASCD VEHICLE SPEED SENSOR

< COMPONENT DIAGNOSIS >

P1574 ASCD VEHICLE SPEED SENSOR

Component Description

The ECM receives two vehicle speed signals via CAN communication line. One is sent from combination meter and the other is from TCM (Transmission control module). The ECM uses these signals for ASCD control. Refer to EC-38 for ASCD functions.

On Board Diagnosis Logic

- This self-diagnosis has the one trip detection logic.
- The MIL will not light up for this self-diagnosis.

NOTE:

- If DTC P1574 is displayed with DTC U0101, U1001, first perform the trouble diagnosis for DTC U0101, U1001. Refer to EC-89.
- If DTC P1574 is displayed with DTC P0500, first perform the trouble diagnosis for DTC P0500. Refer Е to EC-277.
- If DTC P1574 is displayed with DTC P0605, first perform the trouble diagnosis for DTC P0605. Refer to <u>EC-288</u>
- F If DTC P1574 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607. Refer to EC-290.

DTC No.	Trouble Diagnosis Name	DTC Detecting Condition	Possible Cause	G

P2100, P2103 THROTTLE CONTROL MOTOR RELAY

< COMPONENT DIAGNOSIS >

P2100, P2103 THROTTLE CONTROL MOTOR RELAY

Component Description

Power supply for the throttle control motor is provided to the ECM via throttle control motor relay. The throttle control motor relay is ON/OFF controlled by the ECM. When the ignition switch is turned ON, the ECM sends an ON signal to throttle control motor relay and battery voltage is provided to the ECM. When the ignition switch is turned OFF, the ECM sends an OFF signal to throttle control motor relay and battery voltage is not provided to the ECM.

On Board Diagnosis Logic

INFOID:000000005385421

These self-diagnoses have the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause
P2100 2100	Throttle control motor relay circuit open	ECM detects a voltage of power source for throttle control motor is excessively low.	 Harness or connectors (Throttle control motor relay circuit is open) Throttle control motor relay
P2103 2103	Throttle control motor relay circuit short	ECM detect the throttle control motor re- lay is stuck ON.	 Harness or connectors (Throttle control motor relay circuit is shorted) Throttle control motor relay

FAIL-SAFE MODE

When the malfunction is detected, ECM enters fail-safe mode and the MIL lights up.

Engine operating condition in fail-safe mode

ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring.

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

PROCEDURE FOR DTC P2100

- 1. Turn ignition switch ON and wait at least 2 seconds.
- 2. Start engine and let it idle for 5 seconds.
- 3. Check DTC.
- 4. If DTC is detected, go to EC-348, "Diagnosis Procedure".

PROCEDURE FOR DTC P2103

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 8V.

- 1. Turn ignition switch ON and wait at least 1 second.
- 2. Check DTC.
- 3. If DTC is detected, go to EC-348. "Diagnosis Procedure".

Diagnosis Procedure

P2101 ELECTRIC THROTTLE CONTROL FUNCTION

< COMPONENT DIAGNOSIS >

P2101 ELECTRIC THROTTLE CONTROL FUNCTION

Description

NOTE: If DTC P2101 is displayed with DTC P2100 or 2119, first perform the trouble diagnosis for DTC P2100 or P2119. Refer to <u>EC-348</u> or <u>EC-357</u>.

Electric throttle control actuator consists of throttle control motor, throttle position sensor, etc. The throttle control motor is operated by the ECM and it opens and closes the throttle valve. The current opening angle of the throttle valve is detected by the throttle position sensor and it provides feedback to the ECM to control the throttle control motor to make the throttle valve opening angle properly in response to driving condition.

On Board Diagnosis Logic

This self-diagnosis has the one trip detection logic.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P2101 2101	Electric throttle control performance	Electric throttle control function does not oper- ate properly.	 Harness or connectors (Throttle control motor circuit is open or shorted) Electric throttle control actuator 	F

FAIL-SAFE MODE

When the malfunction is detected, ECM enters fail-safe mode and the MIL lights up.

Engine operating condition in fail-safe mode ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring. **DTC Confirmation Procedure** INFOID:000000005385426 NOTE: If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step. Κ 1. Turn ignition swich OFF and wait at least 10 seconds. 2. Turn ignition swich ON. 3. Turn ignition swich OFF and wait at least 10 seconds. L TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 11V when engine is running.

- 1. Turn ignition switch ON and wait at least 2 seconds.
- 2. Start engine and let it idle for 5 seconds.
- 3. Check DTC.
- If DTC is detected, go to <u>EC-351</u>, "Diagnosis Procedure".

Diagnosis Procedure

1.CHECK GROUND CONNECTIONS

- 1. Turn ignition switch OFF.
- 2. Loosen and retighten three ground screws on the body.

P2119 ELECTRIC THROTTLE CONTROL ACTUATOR

< COMPONENT DIAGNOSIS >

P2119 ELECTRIC THROTTLE CONTROL ACTUATOR

Component Description

Electric throttle control actuator consists of throttle control motor, throttle position sensor, etc. The throttle control motor is operated by the ECM and it opens and closes the throttle valve. The throttle position sensor detects the throttle valve position, and the opening and closing speed of the throttle valve and feeds the voltage signals to the ECM. The ECM judges the current opening angle of the throttle valve from these signals and the ECM controls the throttle control motor to make the throttle valve opening angle properly in response to driving condition.

On Board Diagnosis Logic

This self-diagnosis has one trip detection logic.

DTC No.	Trouble diagnosis name		DTC detecting condition	Possible cause	E
P2119 Electric throttle control 2119 actuator	Electric throttle control	A)	Electric throttle control actuator does not func- tion properly due to the return spring malfunc- tion.		F
	B)	Throttle valve opening angle in fail-safe mode is not in specified range.	Electric throttle control actuator		
	C)	ECM detect the throttle valve is stuck open.		G	

FAIL-SAFE MODE

When the malfunction is detected, ECM enters fail-safe mode and the MIL lights up.

Detected items	Engine operating condition in fail-safe mode	
Malfunction A	The ECM controls the electric throttle actuator by regulating the throttle opening around the idle position. The engine speed will not rise more than 2,000 rpm.	l
Malfunction B	ECM controls the electric throttle control actuator by regulating the throttle opening to 20 degrees or less.	
Malfunction C	While the vehicle is driving, it slows down gradually by fuel cut. After the vehicle stops, the engine stalls. The engine can restart in N or P position, and engine speed will not exceed 1,000 rpm or more.	J

DTC Confirmation Procedure

NOTE:

- Perform PROCEDURE FOR MALFUNCTION A AND B first. If the DTC cannot be confirmed, perform PROCEDURE FOR MALFUNCTION C.
- If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.
- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

PROCEDURE FOR MALFUNCTION A AND B

- 1. Turn ignition switch ON and wait at least 1 second.
- 2. Shift selector lever to D position and wait at least 3 seconds.
- 3. Shift selector lever to P or N position.
- 4. Turn ignition switch OFF and wait at least 10 seconds.
- 5. Turn ignition switch ON and wait at least 1 second.
- 6. Shift selector lever to D position and wait at least 3 seconds.
- 7. Shift selector lever to P or N position.
- 8. Turn ignition switch OFF, wait at least 10 seconds and then turn ON.
- 9. Check DTC.
- 10. If DTC is detected, go to EC-358. "Diagnosis Procedure".

PROCEDURE FOR MALFUNCTION C

- 1. Turn ignition switch ON and wait at least 1 second.
- 2. Shift selector lever to D position and wait at least 3 seconds.

EC-357

< COMPONENT DIAGNOSIS >

P2122, P2123 APP SENSOR

Component Description

The accelerator pedal position sensor is installed on the upper end of the accelerator pedal assembly. The sensor detects the accelerator position and sends a signal to the ECM.

Accelerator pedal position sensor has two sensors. These sensors are a kind of potentiometers which transform the accelerator pedal position into output voltage, and emit the voltage signal to the ECM. In addition, these sensors detect the opening and closing speed of the accelerator pedal and feed the voltage signals to the ECM. The ECM judges the current opening angle of the accelerator pedal from these signals and controls the throttle control motor based on these signals.

Accelerator pedal position sensor

receiving the signal from the accelerator pedal position sensor. The ECM uses this signal for the engine operation such as fuel cut.

On Board Diagnosis Logic

These self-diagnoses have the one trip detection logic. NOTE:

If DTC P2122 or P2123 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643. Refer to EC-291.

DTC No.	Trouble diagnosis name	DTC detecting condition	Possible cause	
P2122 2122	Accelerator pedal position sensor 1 circuit low input	An excessively low voltage from the APP sensor 1 is sent to ECM.	Harness or connectors (The APP sensor 1 circuit is open or	
P2123 2123	Accelerator pedal position sensor 1 circuit high input	An excessively high voltage from the APP sensor 1 is sent to ECM.	 shorted.) Accelerator pedal position sensor (Accelerator pedal position sensor 1) 	

FAIL-SAFE MODE

When the malfunction is detected, ECM enters fail-safe mode and the MIL lights up.

Engine operating condition in fail-safe mode

The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees.

The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. So, the acceleration will be poor.

DTC Confirmation Procedure

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conduct-Ν ing the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- Turn ignition swich OFF and wait at least 10 seconds. 3.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 8V at idle.

- Start engine and let it idle for 1 second. 1.
- 2. Check DTC.
- If DTC is detected, go to EC-359, "Diagnosis Procedure". 3.

P2A00, P2A03 A/F SENSOR 1

Component Description

The air fuel ratio (A/F) sensor 1 is a planar one-cell limit current sensor. The sensor element of the A/F sensor 1 is composed an electrode layer, which transports ions. It has a heater in the element.

The sensor is capable of precise measurement $\lambda = 1$, but also in the lean and rich range. Together with its control electronics, the sensor outputs a clear, continuous signal throughout a wide λ range.

The exhaust gas components diffuse through the diffusion layer at the sensor cell. An electrode layer is applied voltage, and this current relative oxygen density in lean. Also this current relative hydrocarbon density in rich.

Therefore, the A/F sensor 1 is able to indicate air fuel ratio by this electrode layer of current. In addition, a heater is integrated in the

sensor to ensure the required operating temperature of about 800°C (1,472°F).

PBIB3354E

INFOID:000000005385460

To judge the malfunction, the A/F signal computed by ECM from the A/F sensor 1 signal is monitored not to be shifted to LEAN side or RICH side.

DTC Confirmation Procedure

On Board Diagnosis Logic

NOTE:

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next step.

- 1. Turn ignition swich OFF and wait at least 10 seconds.
- 2. Turn ignition swich ON.
- 3. Turn ignition swich OFF and wait at least 10 seconds.

TESTING CONDITION:

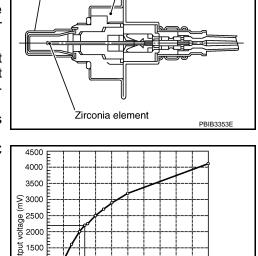

Before performing the following procedure, confirm that battery voltage is more than 11V at idle.

WITH CONSULT-III

- 1. Start engine and warm it up to normal operating temperature.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- Turn ignition switch ON and select "SELF-LEARNING CONT" in "WORK SUPPORT" mode with CON-SULT-III.
- 4. Clear the self-learning coefficient by touching "CLEAR".

< COMPONENT DIAGNOSIS >

- 5. Turn ignition switch OFF and wait at least 10 seconds.
- 6. Start engine and keep the engine speed between 3,500 and 4,000 rpm for 1 minute under no load.
- Let engine idle for 1 minute.
- 8. Keep engine speed between 2,500 and 3,000 rpm for 20 minutes.
- Check 1st trip DTC.
- 10. If 1st trip DTC is detected, go to EC-375, "Diagnosis Procedure".

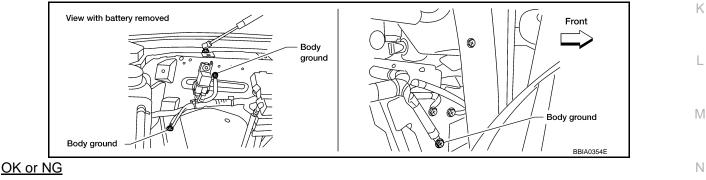

WITH GST

- Start engine and warm it up to normal operating temperature. 1.
- 2. Turn ignition switch OFF and wait at least 10 seconds.
- 3. Disconnect mass air flow sensor harness connector.
- 4. Start engine and let it idle for at least 5 seconds.
- 5. Stop engine and reconnect mass air flow sensor harness connector.
- Select Service \$03 with GST and make sure that DTC P0102 is 6. detected.
- Select Service \$04 with GST and erase the DTC P0102. 7.
- 8. Start engine and keep the engine speed between 3,500 and 4,000 rpm for 1 minute under no load.
- 9. Let engine idle for 1 minute.
- 10. Keep engine speed between 2,500 and 3,000 rpm for 20 minutes.
- Select Service \$07 with GST. If 1st trip DTC is detected, go to EC-375, "Diagnosis Procedure".

Diagnosis Procedure

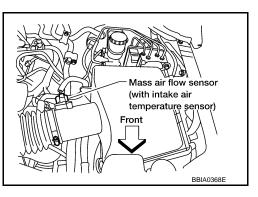

1. CHECK GROUND CONNECTIONS

- 1. Turn ignition switch OFF.
- 2. Loosen and retighten two ground screws on the body. Refer to EC-88, "Ground Inspection".

- OK >> GO TO 2.
- NG >> Repair or replace ground connections.

2.RETIGHTEN A/F SENSOR 1

Component Description

When the brake pedal is depressed, ASCD brake switch is turned OFF and stop lamp switch is turned ON. ECM detects the state of the brake pedal by this input of two kinds (ON/OFF signal). Refer to <u>EC-38</u> for the ASCD function.

Diagnosis Procedure

1.CHECK OVERALL FUNCTION-I

(I) With CONSULT-III

- 1. Turn ignition switch ON.
- 2. Select "BRAKE SW 1" in "DATA MONITOR" mode with CONSULT-III.
- 3. Check "BRAKE SW 1" indication under the following conditions.

CONDITION	INDICATION
Brake pedal: Slightly depressed	OFF
Brake pedal: Fully released	ON

Without CONSULT-III

- 1. Turn ignition switch ON.
- 2. Check voltage between ECM terminal 108 and ground under the following conditions.

CONDITION	VOLTAGE
Brake pedal: Slightly depressed	Approximately 0V
Brake pedal: Fully released	Battery voltage

<u>OK or NG</u>

ASCD INDICATOR

< COMPONENT DIAGNOSIS >

ASCD INDICATOR

Component Description

ASCD indicator lamp illuminates to indicate ASCD operation status. Lamp has two indicators, CRUISE and SET, and is integrated in combination meter.

CRUISE indicator illuminates when MAIN switch on ASCD steering switch is turned ON to indicate that ASCD system is ready for operation.

SET indicator illuminates when following conditions are met.

- CRUISE indicator is illuminated.
- SET/COAST switch on ASCD steering switch is turned ON while vehicle speed is within the range of ASCD setting.

SET indicator remains lit during ASCD control.

Refer to EC-38 for the ASCD function.

Diagnosis Procedure

INFOID:000000005385466

1.CHECK OVERALL FUNCTION

Check ASCD indicator under the following conditions.

ASCD INDICATOR	CONDITION		SPECIFICATION
CRUISE LAMP	Ignition switch: ON	 MAIN switch: Pressed at the 1st time → at the 2nd time 	$ON\toOFF$
	MAIN switch: ON	ASCD: Operating	ON

FUEL INJECTOR

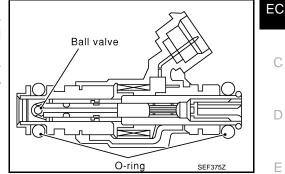

< COMPONENT DIAGNOSIS >

FUEL INJECTOR

Diagnosis Procedure

Component Description

The fuel injector is a small, precise solenoid valve. When the ECM supplies a ground to the fuel injector circuit, the coil in the fuel injector is energized. The energized coil pulls the ball valve back and allows fuel to flow through the fuel injector into the intake manifold. The amount of fuel injected depends upon the injection pulse duration. Pulse duration is the length of time the fuel injector remains open. The ECM controls the injection pulse duration based on engine fuel needs.

FUEL PUMP

Description

INFOID:000000005385474

SYSTEM DESCRIPTION

Sensor	Input signal to ECM	ECM Function	Actuator
Crankshaft position sensor (POS) Camshaft position sensor (PHASE)	Engine speed*	Fuel pump control	Fuel pump relay
Battery	Battery voltage*	†	

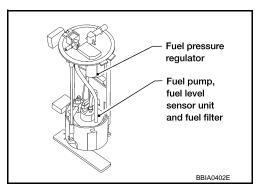

*: ECM determines the start signal status by the signals of engine speed and battery voltage.

The ECM activates the fuel pump for several seconds after the ignition switch is turned ON to improve engine startability. If the ECM receives a engine speed signal from the camshaft position sensor (PHASE), it knows that the engine is rotating, and causes the pump to operate. If the engine speed signal is not received when the ignition switch is ON, the engine stalls. The ECM stops pump operation and prevents battery discharging, thereby improving safety. The ECM does not directly drive the fuel pump. It controls the ON/OFF fuel pump relay, which in turn controls the fuel pump.

Condition	Fuel pump operation
Ignition switch is turned to ON	Operates for 1 second.
Engine running and cranking	Operates.
When engine is stopped	Stops in 1.5 seconds.
Except as shown above	Stops.

COMPONENT DESCRIPTION

A turbine type design fuel pump is used in the fuel tank.

INFOID:000000005385475

Diagnosis Procedure

EXCEPT FLEXIBLE FUEL VEHICLE

1.CHECK OVERALL FUNCTION

IGNITION SIGNAL

Component Description

IGNITION COIL & POWER TRANSISTOR

The ignition signal from the ECM is sent to and amplified by the power transistor. The power transistor turns ON and OFF the ignition coil primary circuit. This ON/OFF operation induces the proper high voltage in the coil secondary circuit.

Component Inspection

INFOID:000000005385479

IGNITION COIL WITH POWER TRANSISTOR CAUTION:

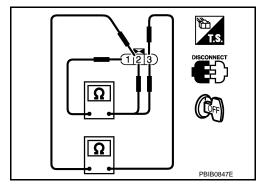

Do the following procedure in the place where ventilation is good without the combustible.

- 1. Turn ignition switch OFF.
- 2. Disconnect ignition coil harness connector.
- 3. Check resistance between ignition coil terminals as follows.

Terminal No. (Polarity)	Resistance Ω [at 25°C (77°F)]
1 and 2	Except 0 or ∞
1 and 3	Event 0
2 and 3	Except 0

4. If NG, replace ignition coil with power transistor. If OK, go to next step.

- 5. Turn ignition switch OFF.
- 6. Reconnect all harness connectors disconnected.

IGNITION SIGNAL

< COMPONENT DIAGNOSIS >

Remove fuel pump fuse in IPDM E/R to release fuel pressure.
 NOTE:
 Do not use CONSULT-III to release fuel pressure, or fuel pressure.

Do not use CONSULT-III to release fuel pressure, or fuel pressure applies again during the following procedure.

- 8. Start engine.
- 9. After engine stalls, crank it two or three times to release all fuel pressure.
- 10. Turn ignition switch OFF.
- 11. Remove all ignition coil harness connectors to avoid the electrical discharge from the ignition coils.
- 12. Remove ignition coil and spark plug of the cylinder to be checked.
- 13. Crank engine for 5 seconds or more to remove combustion gas in the cylinder.
- 14. Connect spark plug and harness connector to ignition coil.
- 15. Fix ignition coil using a rope etc. with gap of 13 17 mm (0.52 0.66 in) between the edge of the spark plug and grounded metal portion as shown in the figure.
- 16. Crank engine for about 3 seconds, and check whether spark is generated between the spark plug and the grounded metal portion.

Spark should be generated.

CAUTION:

• Do not approach to the spark plug and the ignition coil within 50cm. Be careful not to get an electrical shock while checking, because the electrical discharge voltage becomes 20kV or more.

• It might cause to damage the ignition coil if the gap of more than 17 mm (0.66 in) is taken. NOTE:

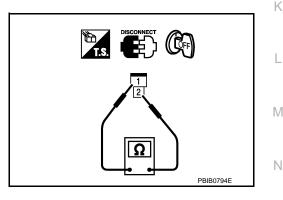

When the gap is less than 13 mm (0.52 in), the spark might be generated even if the coil is malfunctioning.

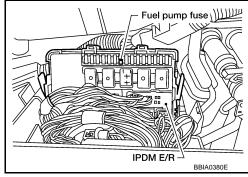

17. If NG, replace ignition coil with power transistor.

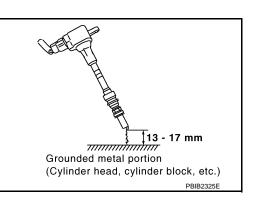

CONDENSER-1

- 1. Turn ignition switch OFF.
- 2. Disconnect condenser-1 harness connector.
- 3. Check resistance between condenser-1 terminals 1 and 2.

< COMPONENT DIAGNOSIS >

ON BOARD REFUELING VAPOR RECOVERY (ORVR)

System Description

From the beginning of refueling, the air and vapor inside the fuel tank go through refueling EVAP vapor cut valve and EVAP/ORVR line to the EVAP canister. The vapor is absorbed by the EVAP canister and the air is released to the atmosphere.

When the refueling has reached the full level of the fuel tank, the refueling EVAP vapor cut valve is closed and refueling is stopped because of auto shut-off. The vapor which was absorbed by the EVAP canister is purged during driving.

WARNING:

When conducting inspections below, be sure to observe the following:

- Put a "CAUTION: FLAMMABLE" sign in workshop.
- Do not smoke while servicing fuel system. Keep open flames and sparks away from work area.
- Be sure to furnish the workshop with a CO₂ fire extinguisher.

CAUTION:

- Before removing fuel line parts, carry out the following procedures:
- Put drained fuel in an explosion-proof container and put lid on securely.
- Release fuel pressure from fuel line. Refer to EC-481, "Fuel Pressure Check".
- Disconnect battery ground cable.
- Always replace O-ring when the fuel gauge retainer is removed.
- Do not kink or twist hose and tube when they are installed.
- Do not tighten hose and clamps excessively to avoid damaging hoses.
- After installation, run engine and check for fuel leaks at connection.
- Do not attempt to top off the fuel tank after the fuel pump nozzle shuts off automatically. Continued refueling may cause fuel overflow, resulting in fuel spray and possibly a fire.

Diagnosis Procedure

INFOID:000000005385481

SYMPTOM: FUEL ODOR FROM EVAP CANISTER IS STRONG.

1.CHECK EVAP CANISTER

- 1. Remove EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.
- Weigh the EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.

Short wheel base:	The weight should be less than 2.5 kg (5.5 lb).
Long wheel base:	The weight should be less than 3.2 kg (7.1 lb).

- 1. Make sure that fuel is drained from the tank.
- 2. Remove fuel filler tube and hose.
- Check one-way fuel valve for operation as follows. When a stick is inserted, the valve should open, when removing stick it should close.

Do not drop any material into the tank.

<u>OK or NG</u>

OK >> INSPECTION END

NG >> Replace fuel filler tube or replace one-way fuel valve with fuel tank.

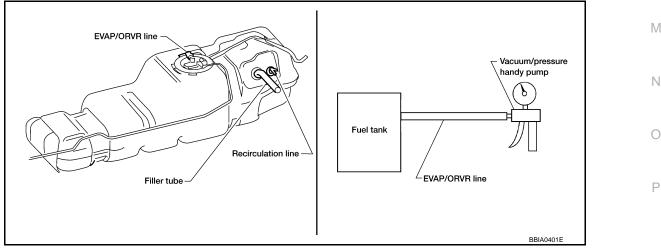

Component Inspection

REFUELING EVAP VAPOR CUT VALVE

With CONSULT-III

- 1. Remove fuel tank. Refer to FL-6. "Removal and Installation".
- 2. Drain fuel from the tank as follows:
- a. Remove fuel feed hose located on the fuel gauge retainer.
- b. Connect a spare fuel hose, one side to fuel gauge retainer where the hose was removed and the other side to a fuel container.
- c. Drain fuel using "FUEL PUMP RELAY" in "ACTIVE TEST" mode with CONSULT-III.
- Check refueling EVAP vapor cut valve for being stuck to close as follows. Blow air into the refueling EVAP vapor cut valve (from the end of EVAP/ORVR line hose), and check that the air flows freely into the tank.
- 4. Check refueling EVAP vapor cut valve for being stuck to open as follows.
- a. Connect vacuum pump to hose end.
- Remove fuel gauge retainer with fuel gauge unit.
 Always replace O-ring with new one.
- c. Put fuel tank upside down.
- d. Apply vacuum pressure to hose end [–13.3 kPa (–100 mmHg, –3.94 inHg)] with fuel gauge retainer remaining open and check that the pressure is applicable.

Without CONSULT-III

- 1. Remove fuel tank. Refer to FL-6, "Removal and Installation".
- 2. Drain fuel from the tank as follows:

[VK56DE]

INFOID:000000005385482

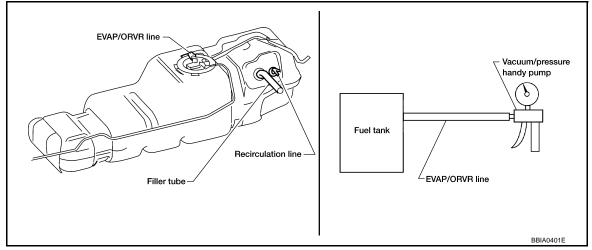

А

Н

Κ

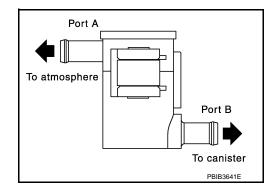

< COMPONENT DIAGNOSIS >

- a. Remove fuel gauge retainer.
- b. Drain fuel from the tank using a handy pump into a fuel container.
- Check refueling EVAP vapor cut valve for being stuck to close as follows. Blow air into the refueling EVAP vapor cut valve (from the end of EVAP/ORVR line hose), and check that the air flows freely into the tank.
- 4. Check refueling EVAP vapor cut valve for being stuck to open as follows.
- a. Connect vacuum pump to hose end.
- b. Remove fuel gauge retainer with fuel gauge unit. Always replace O-ring with new one.
- c. Put fuel tank upside down.
- d. Apply vacuum pressure to hose end [-13.3 kPa (-100 mmHg, -3.94 inHg)] with fuel gauge retainer remaining open and check that the pressure is applicable.

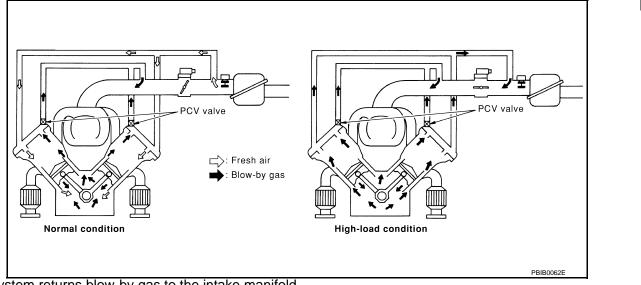

DRAIN FILTER

- 1. Check visually for insect nests in the drain filter air inlet.
- 2. Check visually for cracks or flaws in the appearance.
- 3. Check visually for cracks or flaws in the hose.
- 4. Blow air into port A and check that it flows freely out of port B.
- 5. Block port B.
- 6. Blow air into port A and check that there is no leakage.
- 7. If NG, replace drain filter.

POSITIVE CRANKCASE VENTILATION

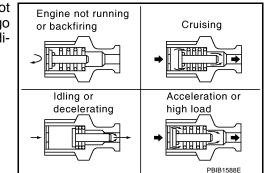

Description

This system returns blow-by gas to the intake manifold.

The positive crankcase ventilation (PCV) valve is provided to conduct crankcase blow-by gas to the intake manifold. During partial throttle operation of the engine, the intake manifold sucks the blow-by gas through the PCV valve. Normally, the capacity of the valve is sufficient to handle any blow-by and a small amount of ventilating air. The ventilating air is drawn from the air inlet tubes into the crankcase. In this process the air passes through the hose connecting air inlet tubes to rocker cover. Under full-throttle condition, the manifold vacuum is insufficient to draw the blow-by flow through the valve. The flow goes through the hose connection in the reverse direction.

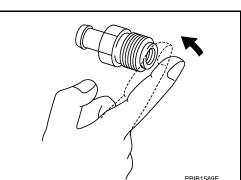

On vehicles with an excessively high blow-by, the valve does not meet the requirement. This is because some of the flow will go through the hose connection to the air inlet tubes under all conditions.

Component Inspection

PCV (POSITIVE CRANKCASE VENTILATION) VALVE

With engine running at idle, remove PCV valve from rocker cover. A properly working valve makes a hissing noise as air passes through it. A strong vacuum should be felt immediately when a finger is placed over valve inlet.

[VK56DE]

- 1. Check hoses and hose connections for leaks.
- 2. Disconnect all hoses and clean with compressed air. If any hose cannot be freed of obstructions, replace.

REFRIGERANT PRESSURE SENSOR

Component Description

The refrigerant pressure sensor is installed at the condenser of the air conditioner system. The sensor uses an electrostatic volume pressure transducer to convert refrigerant pressure to voltage. The voltage signal is sent to ECM, and ECM controls cooling fan system.

Diagnosis Procedure

INFOID:000000005385486

1.CHECK REFRIGERANT PRESSURE SENSOR OVERALL FUNCTION

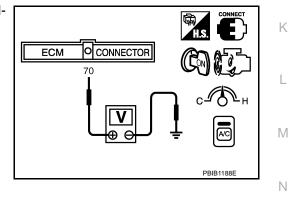

- 1. Start engine and warm it up to normal operating temperature.
- Turn A/C switch and blower fan switch ON. 2. 3.
 - Check voltage between ECM terminal 70 and ground with CON-SULT-III or tester.

Voltage: 1.0 - 4.0V

OK or NG

OK >> INSPECTION END

NG >> GO TO 2.

2. CHECK GROUND CONNECTIONS

- Turn A/C switch and blower fan switch OFF. 1.
- 2. Turn ignition switch OFF.
- 3. Loosen and retighten three ground screws on the body.

ECU DIAGNOSIS ECM

CONSULT-III Reference Value in Data Monitor Mode

INFOID:000000005385487

[VK56DE]

Remarks:

• Specification data are reference values.

• Specification data are output/input values which are detected or supplied by the ECM at the connector. * Specification data may not be directly related to their components signals/values/operations.

i.e. Adjust ignition timing with a timing light before monitoring IGN TIMING, because the monitor may show the specification data in spite of the ignition timing not being adjusted to the specification data. This IGN TIMING monitors the data calculated by the ECM according to the signals input from the camshaft position sensor and other ignition timing related sensors.

HO2 S2 DIAG2 (B2)	NOTE: The item is indicated, but not used.	_	EC

*1: Accelerator pedal position sensor 2 signal and throttle position sensor 2 signal are converted by ECM internally. Thus, they differ from ECM terminals voltage signal.

*2: For Flexible Fuel Vehicle

*3: Before measuring the terminal voltage, confirm the battery is fully charged.

ECM Harness Connector Terminal Layout

ECM Terminal and Reference Value

PREPARATION

ECM is located in the engine room passenger side behind battery.

Specification data are reference values and are measured between each terminal and ground. Pulse signal is measured by CONSULT-III.

CAUTION:

Do not use ECM ground terminals when measuring input/output voltage. Doing so may result in damage to the ECMs transistor. Use a ground other than ECM terminals, such as the ground.

Fail-Safe Chart

When the DTC listed below is detected, the ECM enters fail-safe mode and the MIL lights up.

EC-447

INFOID:000000005385491

< ECU DIAGNOSIS >

DTC No.	Detected items	Engine opera	ating condition in fail-safe mode						
P0102 P0103	Mass air flow sensor circuit	Engine speed will not rise more that	n 2,400 rpm due to the fuel cut.						
P0117 P0118	Engine coolant tempera- ture sensor circuit		determined by ECM based on the following condition. polant temperature decided by ECM.						
		Condition	Engine coolant temperature decided (CONSULT-III display)						
		Just as ignition switch is turned ON or START	40°C (104°F)						
		Approx. 4 minutes or more after engine starting.	80°C (176°F)						
		Except as shown above	40 - 80°C (104 - 176°F) (Depends on the time)						
		When the fail-safe system for engine coolant temperature sensor is activated, the cooling fan operates while engine is running.							
P0122 P0123 P0222 P0223 P2135	Throttle position sensor	The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees. The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. So, the acceleration will be poor.							
P0643	Sensor power supply	ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring.							
P2100 P2103	Throttle control motor relay		ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring.						
P2101	Electric throttle control function	ECM stops the electric throttle cont fixed opening (approx. 5 degrees) b	rol actuator control, throttle valve is maintained at a by the return spring.						
P2118	Throttle control motor	ECM stops the electric throttle cont fixed opening (approx. 5 degrees) b	rol actuator control, throttle valve is maintained at a by the return spring.						
P2119	Electric throttle control ac- tuator	 (When electric throttle control actuator does not function properly due to the return spring malfunction:) ECM controls the electric throttle actuator by regulating the throttle opening around the idle position. The engine speed will not rise more than 2,000 rpm. 							
		(When throttle valve opening angle in fail-safe mode is not in specified range:) ECM controls the electric throttle control actuator by regulating the throttle opening to 20 degrees or less.							
		 (When ECM detects the throttle valve is stuck open:) While the vehicle is driving, it slows down gradually by fuel cut. After the vehicle stops, the engine stalls. The engine can restart in N or P position, and engine speed will not exceed 1,000 rpm or more. 							
P2122 P2123 P2127 P2128 P2128 P2138	Accelerator pedal position sensor	The ECM controls the electric throttle control actuator in regulating the throttle openi order for the idle position to be within +10 degrees. The ECM regulates the opening speed of the throttle valve to be slower than the no condition. So, the acceleration will be poor.							

• When there is an open circuit on MIL circuit, the ECM cannot warn the driver by lighting up MIL when there is malfunction on engine control system.

Therefore, when electrical controlled throttle and part of ECM related diagnoses are continuously detected as NG for 5 trips, ECM warns the driver that engine control system malfunctions and MIL circuit is open by means of operating fail-safe function.

The fail-safe function also operates when above diagnoses except MIL circuit are detected and demands the driver to repair the malfunction.

DTC Inspection Priority Chart

If some DTCs are displayed at the same time, perform inspections one by one based on the following priority chart.

ECM

NOTE:

- If DTC U0101 and/or U1001 is displayed with other DTC, first perform the trouble diagnosis for DTC U0101, U1001. Refer to <u>EC-89</u>.
- If DTC P0607 is displayed with other DTC, first perform the trouble diagnosis for DTC P0607. Refer to <u>EC-290</u>.

*1: 1st trip DTC No. is the same as DTC No.

*2: This number is prescribed by SAE J2012.

*3: In Diagnostic Test Mode II (Self-diagnostic results), this number is controlled by NISSAN.

*4: SRT code will not be set if the self-diagnostic result is NG.

*5: The troubleshooting for this DTC needs CONSULT-III.

*6: When the fail-safe operations for both self-diagnoses occur, the MIL illuminates.

*7: When the ECM is in the mode of displaying SRT status, MIL may flash. For the details, refer to How to "Display SRT Status".

*8: 2WD models

*9: Flexible fuel vehicle (FFV)

Emission-related Diagnostic Information

DTC AND 1ST TRIP DTC

The 1st trip DTC (whose number is the same as the DTC number) is displayed for the latest self-diagnostic result obtained. If the ECM memory was cleared previously, and the 1st trip DTC did not reoccur, the 1st trip DTC will not be displayed.

If a malfunction is detected during the 1st trip, the 1st trip DTC is stored in the ECM memory. The MIL will not light up (two trip detection logic). If the same malfunction is not detected in the 2nd trip (meeting the required driving pattern), the 1st trip DTC is cleared from the ECM memory. If the same malfunction is detected in the 2nd trip, both the 1st trip DTC and DTC are stored in the ECM memory and the MIL lights up. In other words, the DTC is stored in the ECM memory and the MIL lights up. In other words, the DTC is stored in the ECM memory and the MIL lights up when the same malfunction occurs in two consecutive trips. If a 1st trip DTC is stored and a non-diagnostic operation is performed between the 1st and 2nd trips, only the 1st trip DTC will continue to be stored. For malfunctions that blink or light up the MIL during the 1st trip, the DTC and 1st trip DTC are stored in the ECM memory.

Procedures for clearing the DTC and the 1st trip DTC from the ECM memory are described in "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION".

For malfunctions in which 1st trip DTCs are displayed, refer to "EMISSION-RELATED DIAGNOSTIC INFOR-MATION ITEMS". These items are required by legal regulations to continuously monitor the system/component. In addition, the items monitored non-continuously are also displayed on CONSULT-III.

1st trip DTC is specified in Service \$07 of SAE J1979. 1st trip DTC detection occurs without lighting up the MIL and therefore does not warn the driver of a malfunction. However, 1st trip DTC detection will not prevent the vehicle from being tested, for example during Inspection/Maintenance (I/M) tests.

When a 1st trip DTC is detected, check, print out or write down and erase (1st trip) DTC and Freeze Frame data as specified in Work Flow procedure Step 2, refer to <u>EC-8</u>, "<u>Trouble Diagnosis Introduction</u>". Then perform DTC Confirmation Procedure or Overall Function Check to try to duplicate the malfunction. If the malfunction is duplicated, the item requires repair.

How to Read DTC and 1st Trip DTC

DTC and 1st trip DTC can be read by the following methods.

With CONSULT-III

INFOID:000000005385494

 With GST CONSULT-III or GST (Generic Scan Tool) Examples: P0340, P0850, P1148, etc. A These DTCs are prescribed by SAE J2012.

Ν				

lf the information in this Service Manual to set the SRT to "CMPLT".

In most cases the ECM will automatically complete its self-diagnosis cycle during normal usage, and the SRT status will indicate "CMPLT" for each application system. Once set as "CMPLT", the SRT status remains "CMPLT" until the self-diagnosis memory is erased.

< ECU DIAGNOSIS >

< ECU DIAGNOSIS >

[VK56DE]

Occasionally, certain portions of the self-diagnostic test may not be completed as a result of the customer's normal driving pattern; the SRT will indicate "INCMP" for these items.

NOTE:

The SRT will also indicate "INCMP" if the self-diagnosis memory is erased for any reason or if the ECM memory power supply is interrupted for several hours.

If, during the state emissions inspection, the SRT indicates "CMPLT" for all test items, the inspector will continue with the emissions test. However, if the SRT indicates "INCMP" for one or more of the SRT items the vehicle is returned to the customer untested.

NOTE:

If MIL is ON during the state emissions inspection, the vehicle is also returned to the customer untested even though the SRT indicates "CMPLT" for all test items. Therefore, it is important to check SRT ("CMPLT") and DTC (No DTCs) before the inspection.

SRT Item

The table below shows required self-diagnostic items to set the SRT to "CMPLT".

SRT item (CONSULT-III indication)	Performance Priority*	Required self-diagnostic items to set the SRT to "CMPLT"	Corresponding DTC No.
CATALYST	2	Three way catalyst function	P0420, P0430
EVAP SYSTEM	2	EVAP control system purge flow monitoring	P0441
	1	EVAP control system	P0442
	2	EVAP control system	P0456
HO2S	2	Air fuel ratio (A/F) sensor 1	P0133, P0153
		Heated oxygen sensor 2	P0137, P0157
		Heated oxygen sensor 2	P0138, P0158
		Heated oxygen sensor 2	P0139, P0159

*: If completion of several SRTs is required, perform driving patterns (DTC confirmation procedure), one by one based on the priority for models with CONSULT-III.

SRT Set Timing

SRT is set as "CMPLT" after self-diagnosis has been performed one or more times. Completion of SRT is done regardless of whether the result is OK or NG. The set timing is different between OK and NG results and is shown in the table below.

		Example							
Self-diagnosis result		Diagnosis	$\leftarrow ON \rightarrow OF$	•	ition cycle OFF \leftarrow ON \rightarrow C	$OFF \leftarrow ON \rightarrow$			
All OK	Case 1	P0400	OK (1)	— (1)	OK (2)	— (2)			
		P0402	OK (1)	— (1)	— (1)	OK (2)			
		P1402	OK (1)	OK (2)	— (2)	— (2)			
		SRT of EGR	"CMPLT"	"CMPLT"	"CMPLT"	"CMPLT"			
	Case 2	P0400	OK (1)	— (1)	— (1)	— (1)			
		P0402	— (0)	— (0)	OK (1)	— (1)			
		P1402	OK (1)	OK (2)	— (2)	— (2)			
		SRT of EGR	"INCMP"	"INCMP"	"CMPLT"	"CMPLT"			
NG exists	Case 3	P0400	ОК	OK	_	_			
		P0402	—	—	_	_			
		P1402	NG	_	NG	NG (Consecutiv NG)			
		(1st trip) DTC	1st trip DTC	—	1st trip DTC	DTC (= MIL ON)			
		SRT of EGR	"INCMP"	"INCMP"	"INCMP"	"CMPLT"			

OK: Self-diagnosis is carried out and the result is OK.

< ECU DIAGNOSIS >
NG: Self-diagnosis is carried out and the result is NG.
-: Self-diagnosis is not carried out.
When all SRT related self-diagnoses showed OK results in a si
indicate "CMPLT". \rightarrow Case 1 above
When all SRT related self-diagnoses showed OK results through

ingle cycle (Ignition OFF-ON-OFF), the SRT will IK results through several different cycles, the SRT will indicate

ECM

EC "CMPLT" at the time the respective self-diagnoses have at least one OK result. \rightarrow Case 2 above If one or more SRT related self-diagnoses showed NG results in 2 consecutive cycles, the SRT will also indi-

cate "CMPLT". \rightarrow Case 3 above

The table above shows that the minimum number of cycles for setting SRT as "INCMP" is one (1) for each С self-diagnosis (Case 1 & 2) or two (2) for one of self-diagnoses (Case 3). However, in preparation for the state emissions inspection, it is unnecessary for each self-diagnosis to be executed twice (Case 3) for the following reasons: D

- The SRT will indicate "CMPLT" at the time the respective self-diagnoses have one (1) OK result.
- The emissions inspection requires "CMPLT" of the SRT only with OK self-diagnosis results.
- When, during SRT driving pattern, 1st trip DTC (NG) is detected prior to "CMPLT" of SRT, the self-diagnosis memory must be erased from ECM after repair.

 If the 1st trip DTC is erased, all the SRT will indicate "INCMP". NOTE:

SRT can be set as "CMPLT" together with the DTC(s). Therefore, DTC check must always be carried out F prior to the state emission inspection even though the SRT indicates "CMPLT".

SRT Service Procedure

If a vehicle has failed the state emissions inspection due to one or more SRT items indicating "INCMP", review the flowchart diagnostic sequence on the next page.

Revision: August 2009

*1 "How to Read DTC and 1st Trip DTC" *2 "How to Display SRT Status" *3 "How to Set SRT Code"

How to Display SRT Status

(P) WITH CONSULT-III

Selecting "SRT STATUS" in "DTC CONFIRMATION" mode with CONSULT-III.

For items whose SRT codes are set, a "CMPLT" is displayed on the CONSULT-III screen; for items whose SRT codes are not set, "INCMP" is displayed.

NOTE:

Though displayed on the CONSULT-III screen, "HO2S HTR" is not SRT item.

WITH GST

Selecting Service \$01 with GST (Generic Scan Tool)

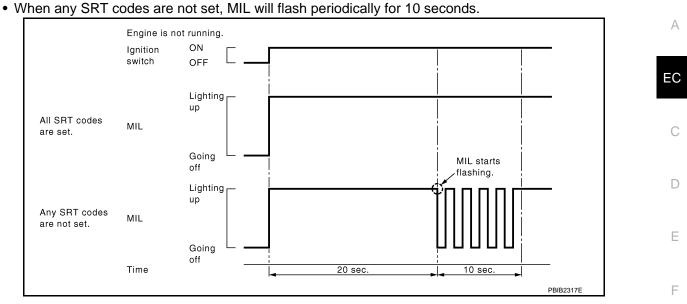

NO TOOLS

A SRT code itself can not be displayed while only SRT status can be.

- 1. Turn ignition switch ON and wait 20 seconds.
- 2. SRT status is indicated as shown below.
 - When all SRT codes are set, MIL lights up continuously.

< ECU DIAGNOSIS >

[VK56DE]

How to Set SRT Code

To set all SRT codes, self-diagnosis for the items indicated above must be performed one or more times. Each diagnosis may require a long period of actual driving under various conditions.

(I) WITH CONSULT-III

Perform corresponding DTC Confirmation Procedure one by one based on Performance Priority in the table on "SRT Item".

WITHOUT CONSULT-III

The most efficient driving pattern in which SRT codes can be properly set is explained on the next page. The driving pattern should be performed one or more times to set all SRT codes.

< ECU DIAGNOSIS >

Driving Pattern

• The time required for each diagnosis varies with road surface conditions, weather, altitude, individual driving habits, etc.

Zone A refers to the range where the time, required for the diagnosis under normal conditions*, is the shortest.

Zone B refers to the range where the diagnosis can still be performed if the diagnosis is not completed within zone A.

*: Normal conditions refer to the following:

[VK56DE]

< ECU DIAGNOSIS >

- Sea level
- Flat road
- Ambient air temperature: 20 30°C (68 86°F)
- Diagnosis is performed as quickly as possible under normal conditions. Under different conditions [For example: ambient air temperature other than 20 - 30°C (68 - 86°F)], diagnosis may also be performed.

Pattern 1:

- The engine is started at the engine coolant temperature of -10 to 35°C (14 to 95°F) (where the voltage between the ECM terminal 73 and ground is 3.0 4.3V).
- The engine must be operated at idle speed until the engine coolant temperature is greater than 70°C (158°F) (where the voltage between the ECM terminal 73 and ground is lower than 1.4V).
- The engine is started at the fuel tank temperature of warmer than 0°C (32°F) (where the voltage between the ECM terminal 107 and ground is less than 4.1V).
- Pattern 2:
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Pattern 3:

- Operate vehicle following the driving pattern shown in the figure.
- Release the accelerator pedal during decelerating vehicle speed from 90 km/h (56 MPH) to 0 km/h (0 MPH).

Pattern 4:

- The accelerator pedal must be held very steady during steadystate driving.
- If the accelerator pedal is moved, the test must be conducted all over again.

*1: Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

*2: Checking the vehicle speed with GST is advised.

Suggested Transmission Gear Position

Set the selector lever in the D position with the overdrive switch turned ON.

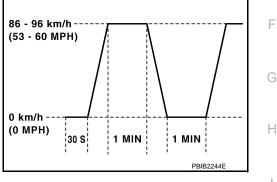

TEST VALUE AND TEST LIMIT

The following is the information specified in Service \$06 of SAE J1979.

The test value is a parameter used to determine whether a system/circuit diagnostic test is OK or NG while being monitored by the ECM during self-diagnosis. The test limit is a reference value which is specified as the maximum or minimum value and is compared with the test value being monitored.

These data (test value and test limit) are specified by On Boad Monitor ID(OBDMID), Test ID (TID), Unit and Scaling ID and can be displayed on the GST screen.

The items of the test value and test limit will be displayed with GST screen which items are provided by the ECM. (eg., if the bank 2 is not applied on this vehicle, only the items of the bank 1 is displayed)

HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION

How to Erase DTC

WITH CONSULT-III

The emission related diagnostic information in the ECM can be erased by selecting "All Erase" in the "Description" of "FINAL CHECK" mode with CONSULT-III.

(I) WITH GST

The emission related diagnostic information in the ECM can be erased by selecting Service \$04 with GST.

1. Select Service \$04 with GST (Generic Scan Tool).

📖 No Tools

1. If the ignition switch stays ON after repair work, be sure to turn ignition switch OFF once.

Ρ

< ECU DIAGNOSIS >

Wait at least 10 seconds and then turn it ON (engine stopped) again.

- 2. Erase DTC in ECM. Refer to How to Erase Diagnostic Test Mode II.
- If the battery is disconnected, the emission-related diagnostic information will be lost within 24 hours.
- The following data are cleared when the ECM memory is erased.
- Diagnostic trouble codes
- 1st trip diagnostic trouble codes
- Freeze frame data
- 1st trip freeze frame data
- System readiness test (SRT) codes
- Test values
- <Flexible Fuel Vehicle>
- Presumed ethanol mixture ratio

Actual work procedures are explained using a DTC as an example. Be careful so that not only the DTC, but all of the data listed above, are cleared from the ECM memory during work procedures.

NORMAL OPERATING CONDITION

< SYMPTOM DIAGNOSIS >

NORMAL OPERATING CONDITION

Fuel Cut Control (at No Load and High Engine Speed)

INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator	
ТСМ	Neutral position			C
Accelerator pedal position sensor	Accelerator pedal position			
Engine coolant temperature sensor	Engine coolant temperature	Fuel cut control	Fuel injector	Г
Crankshaft position sensor (POS) Camshaft position sensor (PHASE)	Engine speed			L
Wheel sensor	Vehicle speed*			F

*: This signal is sent to the ECM through CAN communication line.

SYSTEM DESCRIPTION

If the engine speed is above 1,800 rpm under no load (for example, the shift position is neutral and engine speed over is 1,800 rpm) fuel will be cut off after some time. The exact time when the fuel is cut off varies based on engine speed.

Fuel cut will be operated until the engine speed reaches 1,500 rpm, then fuel cut will be cancelled. **NOTE:**

EC-473

This function is different from deceleration control listed under EC-33, "System Description".

< PRECAUTION > PRECAUTION PRECAUTIONS

Precaution for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

The Supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER", used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted. Information necessary to service the system safely is included in the SRS and SB section of this Service Manual.

WARNING:

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the SRS section.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.

On Board Diagnosis (OBD) System of Engine and A/T

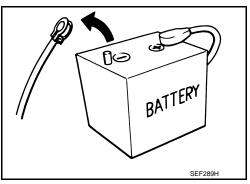

INFOID:000000005385498

The ECM has an on board diagnostic system. It will light up the malfunction indicator lamp (MIL) to warn the driver of a malfunction causing emission deterioration.

- CAUTION: • Be sure to turn the ignition sw
- Be sure to turn the ignition switch OFF and disconnect the negative battery cable before any repair or inspection work. The open/short circuit of related switches, sensors, solenoid valves, etc. will cause the MIL to light up.
- Be sure to connect and lock the connectors securely after work. A loose (unlocked) connector will cause the MIL to light up due to the open circuit. (Be sure the connector is free from water, grease, dirt, bent terminals, etc.)
- Certain systems and components, especially those related to OBD, may use a new style slide-locking type harness connector. For description and how to disconnect, refer to <u>PG-68</u>, "<u>Description</u>".
- Be sure to route and secure the harnesses properly after work. The interference of the harness with a bracket, etc. may cause the MIL to light up due to the short circuit.
- Be sure to connect rubber tubes properly after work. A misconnected or disconnected rubber tube may cause the MIL to light up due to the malfunction of the EVAP system or fuel injection system, etc.
- Be sure to erase the unnecessary malfunction information (repairs completed) from the ECM and TCM (Transmission control module) before returning the vehicle to the customer.

Precaution

- Always use a 12 volt battery as power source.
- Do not attempt to disconnect battery cables while engine is running.
- Before connecting or disconnecting the ECM harness connector, turn ignition switch OFF and disconnect negative battery cable. Failure to do so may damage the ECM because battery voltage is applied to ECM even if ignition switch is turned OFF.
- Before removing parts, turn ignition switch OFF and then disconnect negative battery cable.

PRECAUTIONS

< PRECAUTION >

- Do not disassemble ECM.
- If a battery cable is disconnected, the memory will return to the ECM value.

The ECM will now start to self-control at its initial value. Engine operation can vary slightly when the terminal is disconnected. However, this is not an indication of a malfunction. Do not replace parts because of a slight variation.

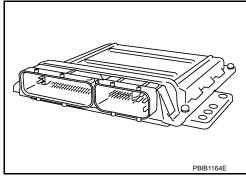

- If the battery is disconnected, the following emission-related diagnostic information will be lost within 24 hours.
- Diagnostic trouble codes
- 1st trip diagnostic trouble codes
- Freeze frame data
- 1st trip freeze frame data
- System readiness test (SRT) codes
- Test values
- <Flexible Fuel Vehicle>
 Presumed ethanol mixture ratio
- When connecting ECM harness connector, fasten it securely with a lever as far as it will go as shown in the figure.

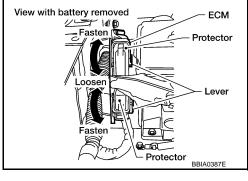

• When connecting or disconnecting pin connectors into or from ECM, take care not to damage pin terminals (bend or break).

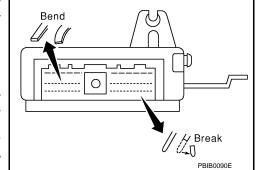

Make sure that there are not any bends or breaks on ECM pin terminal, when connecting pin connectors.

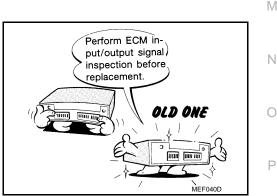

Securely connect ECM harness connectors.
 A poor connection can cause an extremely high (surge) voltage to develop in coil and condenser, thus resulting in damage to ICs.

- Keep engine control system harness at least 10 cm (4 in) away from adjacent harness, to prevent engine control system malfunctions due to receiving external noise, degraded operation of ICs, etc.
- Keep engine control system parts and harness dry.
- Before replacing ECM, perform ECM Terminals and Reference Value inspection and make sure ECM functions properly. Refer to <u>EC-417, "ECM Terminal and Reference Value"</u>.
- Handle mass air flow sensor carefully to avoid damage.
- Do not disassemble mass air flow sensor.
- Do not clean mass air flow sensor with any type of detergent.
- Do not disassemble electric throttle control actuator.
- Even a slight leak in the air intake system can cause serious incidents.
- Do not shock or jar the camshaft position sensor (PHASE), crankshaft position sensor (POS).

D

Н

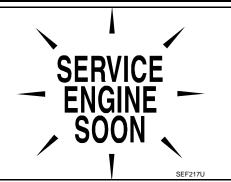

Κ

L

PRECAUTIONS

< PRECAUTION >

• After performing each TROUBLE DIAGNOSIS, perform DTC Confirmation Procedure or Overall Function Check. The DTC should not be displayed in the DTC Confirmation Procedure if the repair is completed. The Overall Function Check should be a good result if the repair is completed.

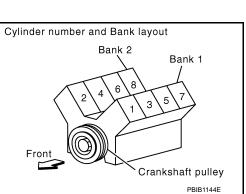

[VK56DE]

· When measuring ECM signals with a circuit tester, never allow the two tester probes to contact.

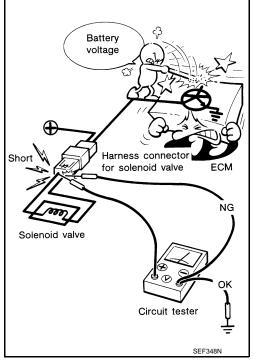

Accidental contact of probes will cause a short circuit and damage the ECM power transistor.

Do not use ECM ground terminals when measuring input/out-٠ put voltage. Doing so may result in damage to the ECM's transistor. Use a ground other than ECM terminals, such as the ground.

PRECAUTIONS

- Do not operate fuel pump when there is no fuel in lines.
- Tighten fuel hose clamps to the specified torque.

Do not depress accelerator pedal when starting.

• Do not rev up engine just prior to shutdown.

< PRECAUTION >

ily.

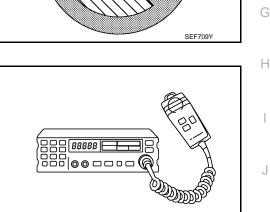

• When installing C.B. ham radio or a mobile phone, be sure to observe the following as it may adversely affect electronic control systems depending on installation location.

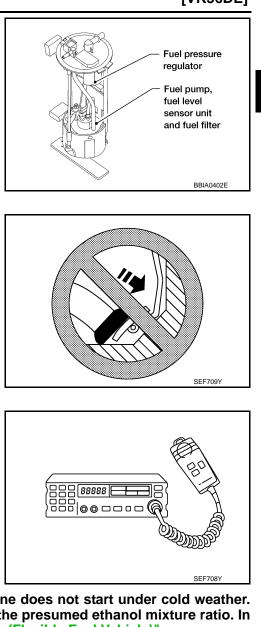

Immediately after starting, do not rev up engine unnecessar-

- Keep the antenna as far as possible from the electronic control units.
- Keep the antenna feeder line more than 20 cm (8 in) away from the harness of electronic controls.
 - Do not let them run parallel for a long distance.
- Adjust the antenna and feeder line so that the standing-wave radio can be kept smaller.
- Be sure to ground the radio to vehicle body.
- <Flexible Fuel Vehicle>

When replacing the ECM, there is a small possibility that engine does not start under cold weather. This is caused by the large difference between the actual and the presumed ethanol mixture ratio. In such a case, perform EC-22, "Ethanol Mixture Ratio Adaptation (Flexible Fuel Vehicle)".

Anti-seize lubricant i.e.: (Permatex TM 133AR or equivalent meeting MIL specifica- tion MIL-A-907)	S-NT779	Lubricating oxygen sensor thread cleaning tool when reconditioning exhaust system threads.

FUEL PRESSURE

<u>ON-VEHICLE MAINTENANCE</u> ON-VEHICLE MAINTENANCE FUEL PRESSURE

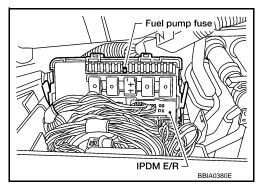

FUEL PRESSURE RELEASE

With CONSULT-III

- 1. Turn ignition switch ON.
- 2. Perform "FUEL PRESSURE RELEASE" in "WORK SUPPORT" mode with CONSULT-III.
- 3. Start engine.
- 4. After engine stalls, crank it two or three times to release all fuel pressure.
- 5. Turn ignition switch OFF.

Without CONSULT-III

- 1. Remove fuel pump fuse located in IPDM E/R.
- 2. Start engine.
- 3. After engine stalls, crank it two or three times to release all fuel pressure.
- 4. Turn ignition switch OFF.
- 5. Reinstall fuel pump fuse after servicing fuel system.

FUEL PRESSURE CHECK

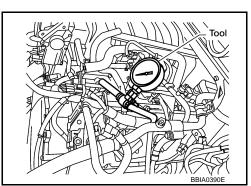

CAUTION:

- Before disconnecting fuel line, release fuel pressure from fuel line to eliminate danger.
- Be careful not to scratch or get the fuel hose connection area dirty when servicing, so that the quick connector o-ring maintains sealability.
- Use Fuel Pressure Gauge Kit J-44321 and Fuel Pressure Adapter J-44321-6 to check fuel pressure.
- Do not perform fuel pressure check with electrical system operating (i.e. lights, rear defog, A/C, etc.). Fuel pressure gauge may indicate false readings due to varying engine loads and changes in manifold vacuum.

NOTE:

Prepare pans or saucers under the disconnected fuel line because the fuel may spill out. The fuel pressure cannot be completely released because A60 models do not have fuel return system.

- 1. Release fuel pressure to zero. Refer to "FUEL PRESSURE RELEASE".
- 2. Remove engine cover.
- Remove fuel hose using Quick Connector Release J-45488. Refer to <u>EM-26, "Removal and Installation"</u>.
 Do not twist or kink fuel hose because it is plastic hose.
 - Do not remove fuel hose from quick connector.
 - Keep fuel hose connections clean.
- 4. Install Fuel Pressure Adapter J-44321-6 and Fuel Pressure Gauge (from kit J-44321) as shown in figure.
 - Do not distort or bend fuel rail tube when installing fuel pressure gauge adapter.
 - When reconnecting fuel hose, check the original fuel hose for damage and abnormality.
- 5. Turn ignition switch ON (reactivate fuel pump), and check for fuel leakage.
- 6. Start engine and check for fuel leakage.
- 7. Read the indication of fuel pressure gauge.
 - During fuel pressure check, check for fuel leakage from fuel connection every 3 minutes.

- 2. Remove air duct and resonator assembly. Refer to EM-25, "Removal and Installation".
- 3. Remove drive belt. Refer to EM-13, "Removal and Installation".
- 4. Disconnect Intake valve timing controlintake valve timing control solenoid valve connector (LH).
- 5. Remove Intake valve timing control solenoid valve (LH) (2) from Intake valve timing control solenoid valve cover (LH) (1).

AWBIA0145ZZ

INSTALLATION

Installation is in the reverse order of removal.

CAUTION:

Replace the O-ring (3) of the Intake valve timing control solenoid valve with a new one, then lubricate O-ring with engine oil before installing.

Intake valve timing control sole-: 9.6 N·m (0.98 kg-m, 85 in-lb) noid valve bolt

Intake Valve Timing Control Solenoid Valve (RH)

REMOVAL

- 1. Remove drive belt. Refer to EM-13, "Removal and Installation".
- 2. Disconnect Intake valve timing control solenoid valve connector (RH).
- Remove Intake valve timing control solenoid valve (RH) (3) from 3. Intake valve timing control solenoid valve cover (RH) (1).

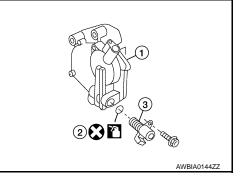

Installation is in the reverse order of removal.

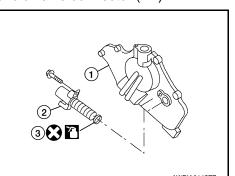

CAUTION:

Replace the O-ring (2) of the Intake valve timing control solenoid valve with a new one, then lubricate O-ring with engine oil before installing.

Intake valve timing control sole- : 9.6 N·m (0.98 kg-m, 85 in-lb) noid valve bolt

INFOID:000000005385507

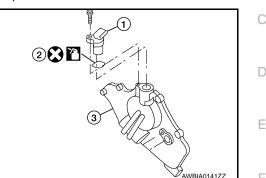

INTAKE VALVE TIMING CONTROL

< ON-VEHICLE REPAIR >

Intake Valve Timing Control Position Sensor (LH)

REMOVAL

- 1. Remove engine room cover using power tool. Refer to EM-24, "Removal and Installation".
- 2. Remove air duct and resonator assembly. Refer to <u>EM-25, "Removal and Installation"</u>.
- 3. Disconnect intake valve timing control position sensor connector (LH).
- Remove intake valve timing control position sensor (LH) (1) from Intake valve timing control solenoid valve cover (LH) (3).

INSTALLATION

Installation is in the reverse order of removal.

CAUTION:

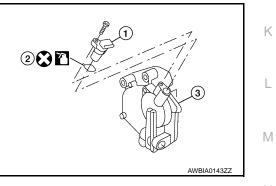

Replace the O-ring (2) of the intake valve timing control position sensor with a new one, then lubricate O-ring with engine oil before installing.

Intake valve timing control position sensor bolt : 9.6 N·m (0.98 kg-m, 85 in-lb)

Intake Valve Timing Control Position Sensor (RH)

REMOVAL

- 1. Remove engine room cover using power tool. Refer to EM-24, "Removal and Installation".
- 2. Disconnect intake valve timing control position sensor connector (RH).
- 3. Remove intake valve timing control position sensor (RH) (1) from Intake valve timing control solenoid valve cover (RH) (3).

Ν

INSTALLATION

Installation is in the reverse order of removal.

CAUTION:

Replace the O-ring (2) of the intake valve timing control position sensor with a new one, then lubricate O-ring with engine oil before installing.

Intake valve timing control position sensor bolt

: 9.6 N·m (0.98 kg-m, 85 in-lb)

Camshaft Position Sensor (PHASE)

REMOVAL

- 1. Remove engine room cover using power tool. Refer to EM-24. "Removal and Installation".
- Remove air duct and resonator assembly. Refer to <u>EM-25, "Removal and Installation"</u>.
- 3. Disconnect camshaft position sensor connector.
