PRECAUTION

PRECAUTIONS

Precaution for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

INFOID:0000000012543363

The Supplemental Restraint System such as “AIR BAG” and “SEAT BELT PRE-TENSIONER”, used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. Information necessary to service the system safely is included in the SR and SB section of this Service Manual.

WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, it is recommended that all maintenance and repair be performed by an authorized NISSAN/INFINITI dealer.**
- **Improper repair, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the SR section.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.**

PRECAUTIONS WHEN USING POWER TOOLS (AIR OR ELECTRIC) AND HAMMERS

WARNING:

- **When working near the Airbag Diagnosis Sensor Unit or other Airbag System sensors with the Ignition ON or engine running, DO NOT use air or electric power tools or strike near the sensor(s) with a hammer. Heavy vibration could activate the sensor(s) and deploy the air bag(s), possibly causing serious injury.**
- **When using air or electric power tools or hammers, always switch the Ignition OFF, disconnect the battery or batteries, and wait at least three minutes before performing any service.**

On Board Diagnosis (OBD) System of Engine and A/T

INFOID:0000000012543364

The ECM has an on board diagnostic system. It will light up the malfunction indicator lamp (MIL) to warn the driver of a malfunction causing emission deterioration.

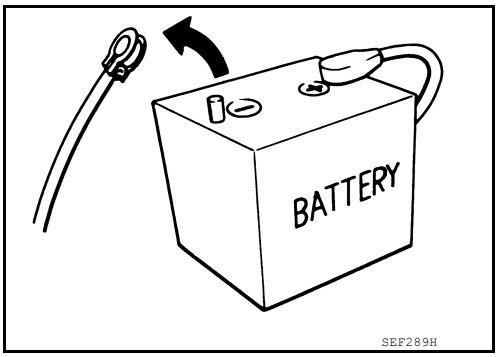
CAUTION:

- **Be sure to turn the ignition switch OFF and disconnect the negative battery cable before any repair or inspection work. The open/short circuit of related switches, sensors, solenoid valves, etc. will cause the MIL to light up.**
- **Be sure to connect and lock the connectors securely after work. A loose (unlocked) connector will cause the MIL to light up due to the open circuit. (Be sure the connector is free from water, grease, dirt, bent terminals, etc.)**
- **Certain systems and components, especially those related to OBD, may use a new style slide-locking type harness connector. For description and how to disconnect, refer to PG-7, "Harness Connector".**
- **Be sure to route and secure the harnesses properly after work. The interference of the harness with a bracket, etc. may cause the MIL to light up due to the short circuit.**
- **Be sure to connect rubber tubes properly after work. A misconnected or disconnected rubber tube may cause the MIL to light up due to the malfunction of the EVAP system or fuel injection system, etc.**
- **Be sure to erase the unnecessary malfunction information (repairs completed) from the ECM and TCM (Transmission control module) before returning the vehicle to the customer.**

Precaution

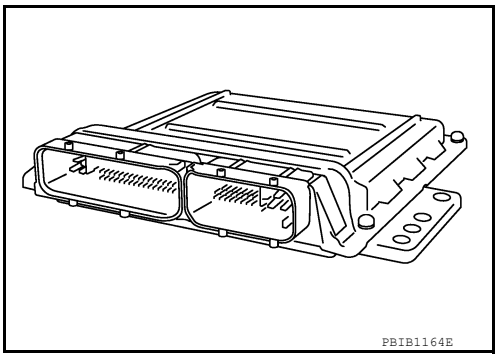
INFOID:0000000012543365

- **Always use a 12 volt battery as power source.**
- **Do not attempt to disconnect battery cables while engine is running.**
- **Before connecting or disconnecting the ECM harness connector, turn ignition switch OFF and disconnect negative battery cable. Failure to do so may damage the ECM because battery voltage is applied to ECM even if ignition switch is turned OFF.**
- **Before removing parts, turn ignition switch OFF and then disconnect negative battery cable.**

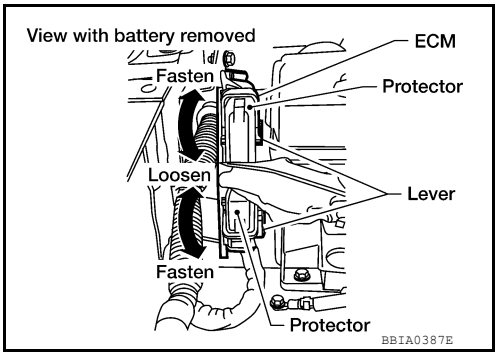


- **Do not disassemble ECM.**
- **If a battery cable is disconnected, the memory will return to the ECM value.**
  The ECM will now start to self-control at its initial value. Engine operation can vary slightly when the terminal is disconnected. However, this is not an indication of a malfunction. Do not replace parts because of a slight variation.
- **If the battery is disconnected, the following emission-related diagnostic information will be lost within 24 hours.**

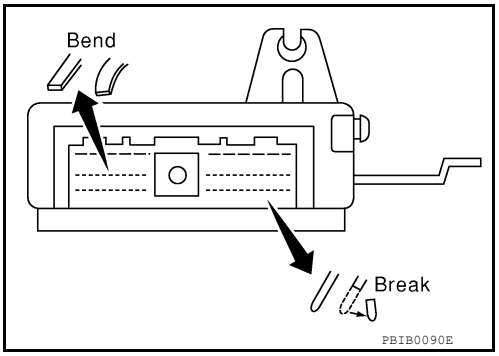
- **Diagnostic trouble codes**
- **1st trip diagnostic trouble codes**
- **Freeze frame data**
- **1st trip freeze frame data**
- **System readiness test (SRT) codes**
- **Test values**
- **<Flexible Fuel Vehicle>**
  Presumed ethanol mixture ratio



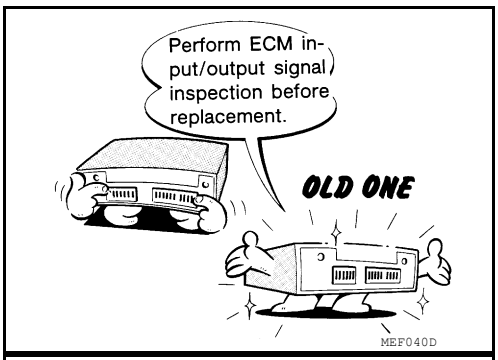
- **When connecting ECM harness connector, fasten it securely with a lever as far as it will go as shown in the figure.**

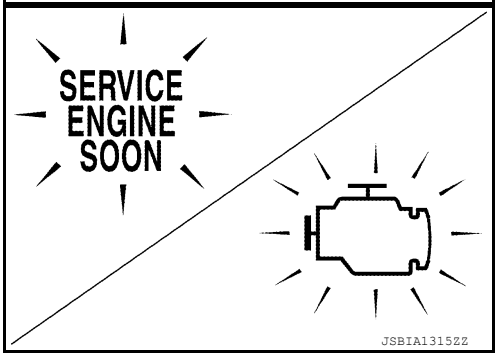


- **When connecting or disconnecting pin connectors into or from ECM, take care not to damage pin terminals (bend or break).**
  Make sure that there are not any bends or breaks on ECM pin terminal, when connecting pin connectors.
- **Securely connect ECM harness connectors.**
  A poor connection can cause an extremely high (surge) voltage to develop in coil and condenser, thus resulting in damage to ICs.
- **Keep engine control system harness at least 10 cm (4 in) away from adjacent harness, to prevent engine control system malfunctions due to receiving external noise, degraded operation of ICs, etc.**
- **Keep engine control system parts and harness dry.**

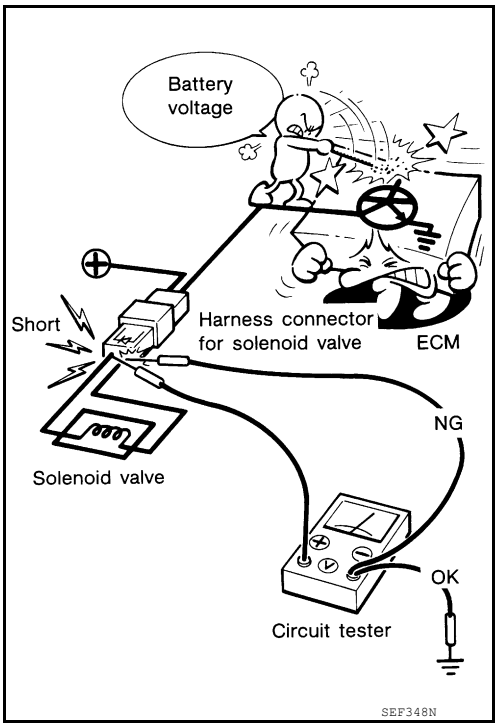


- **Before replacing ECM, perform ECM Terminals and Reference Value inspection and make sure ECM functions properly. Refer to EC-114, "Reference Value".**
- **Handle mass air flow sensor carefully to avoid damage.**
- **Do not disassemble mass air flow sensor.**
- **Do not clean mass air flow sensor with any type of detergent.**
- **Do not disassemble electric throttle control actuator.**
- **Even a slight leak in the air intake system can cause serious incidents.**
- **Do not shock or jar the camshaft position sensor (PHASE), crankshaft position sensor (POS).**
- **After performing each TROUBLE DIAGNOSIS, perform DTC Confirmation Procedure or Overall Function Check.**
  The DTC should not be displayed in the DTC Confirmation Procedure if the repair is completed. The Overall Function Check should be a good result if the repair is completed.

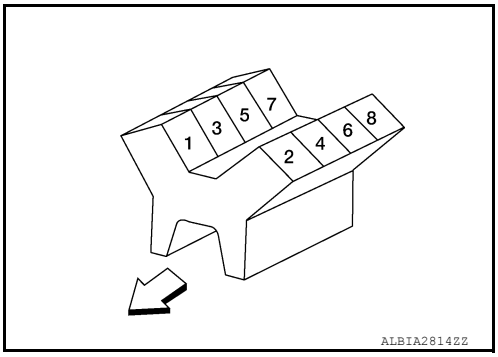




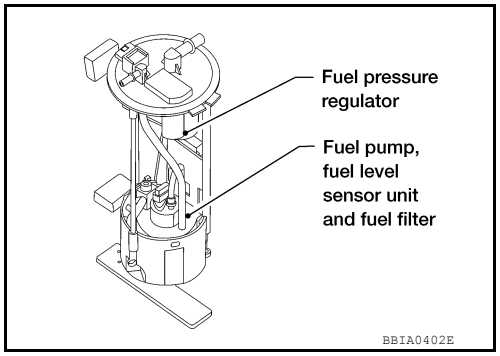
- **When measuring ECM signals with a circuit tester, never allow the two tester probes to contact.**
  Accidental contact of probes will cause a short circuit and damage the ECM power transistor.
- **Do not use ECM ground terminals when measuring input/output voltage. Doing so may result in damage to the ECM's transistor. Use a ground other than ECM terminals, such as the ground.**



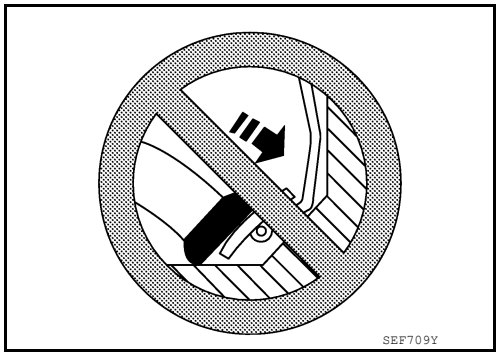
- Cylinder number and bank layout:
- Bank 1: 1, 3, 5, 7
- Bank 2: 2, 4, 6, 8
- ⇦: Front



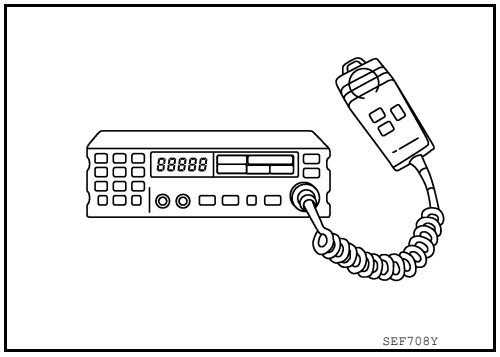
- **Do not operate fuel pump when there is no fuel in lines.**
- **Tighten fuel hose clamps to the specified torque.**



- **Do not depress accelerator pedal when starting.**
- **Immediately after starting, do not rev up engine unnecessarily.**
- **Do not rev up engine just prior to shutdown.**



- **When installing C.B. ham radio or a mobile phone, be sure to observe the following as it may adversely affect electronic control systems depending on installation location.**
  - **Keep the antenna as far as possible from the electronic control units.**
  - **Keep the antenna feeder line more than 20 cm (8 in) away from the harness of electronic controls. Do not let them run parallel for a long distance.**
  - **Adjust the antenna and feeder line so that the standing-wave radio can be kept smaller.**
  - **Be sure to ground the radio to vehicle body.**



PREPARATION

PREPARATION

Special Service Tool

INFOID:0000000012543366

The actual shapes of TechMate tools may differ from those of special service tools illustrated here.

Tool number (TechMate No.) Tool name	Description	
EG17650301 (J-33984-A) Radiator cap tester adapter	 S-NT564	Adapting radiator cap tester to radiator cap and radiator filler neck **a: 28 (1.10) dia.** **b: 31.4 (1.236) dia.** **c: 41.3 (1.626) dia.** Unit: mm (in)
— (J-45722) 130 mm lock ring tool	 LBIA0398E	Removing and installing DEF pump
(J-44321) Fuel pressure gauge kit	 LEC642	Checking fuel pressure
(J-44321-6) Fuel pressure adapter	 LBIA0376E	Connecting fuel pressure gauge to quick connector type fuel lines.
(J-23688) Engine coolant refractometer	 WBIA0539E	Checking concentration of ethylene glycol in engine coolant
— (J-54466) 5025 DEF Refractometer	 WBIA0539E	Checking concentration of urea in DEF

Commercial Service Tool

INFOID:0000000012543367

Tool name (TechMate No.)	Description	
Leak detector i.e.: (J-41416)	 S-NT703	Locating the EVAP leak
EVAP service port adapter i.e.: (J-41413-OBD)	 S-NT704	Applying positive pressure through EVAP service port
Fuel filler cap adapter i.e.: (MLR-8382)	 S-NT815	Checking fuel tank vacuum relief valve opening pressure
Socket wrench	 S-NT705	Removing and installing engine coolant temperature sensor
Anti-seize lubricant i.e.: (Permatex™ 133AR or equivalent meeting MIL specification MIL-A-907)	 S-NT779	Lubricating sensor threads and bolts for exhaust system.

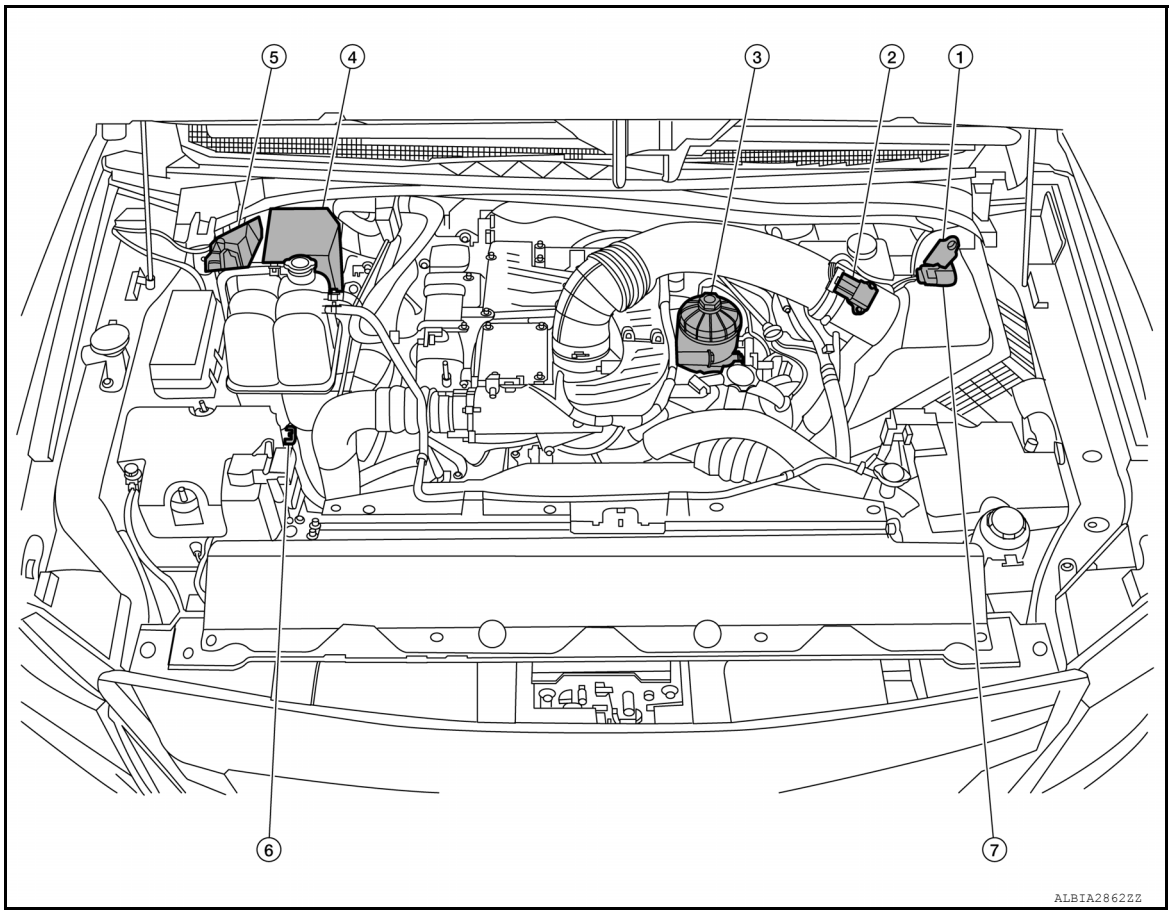
SYSTEM DESCRIPTION

COMPONENT PARTS

Component Parts Location

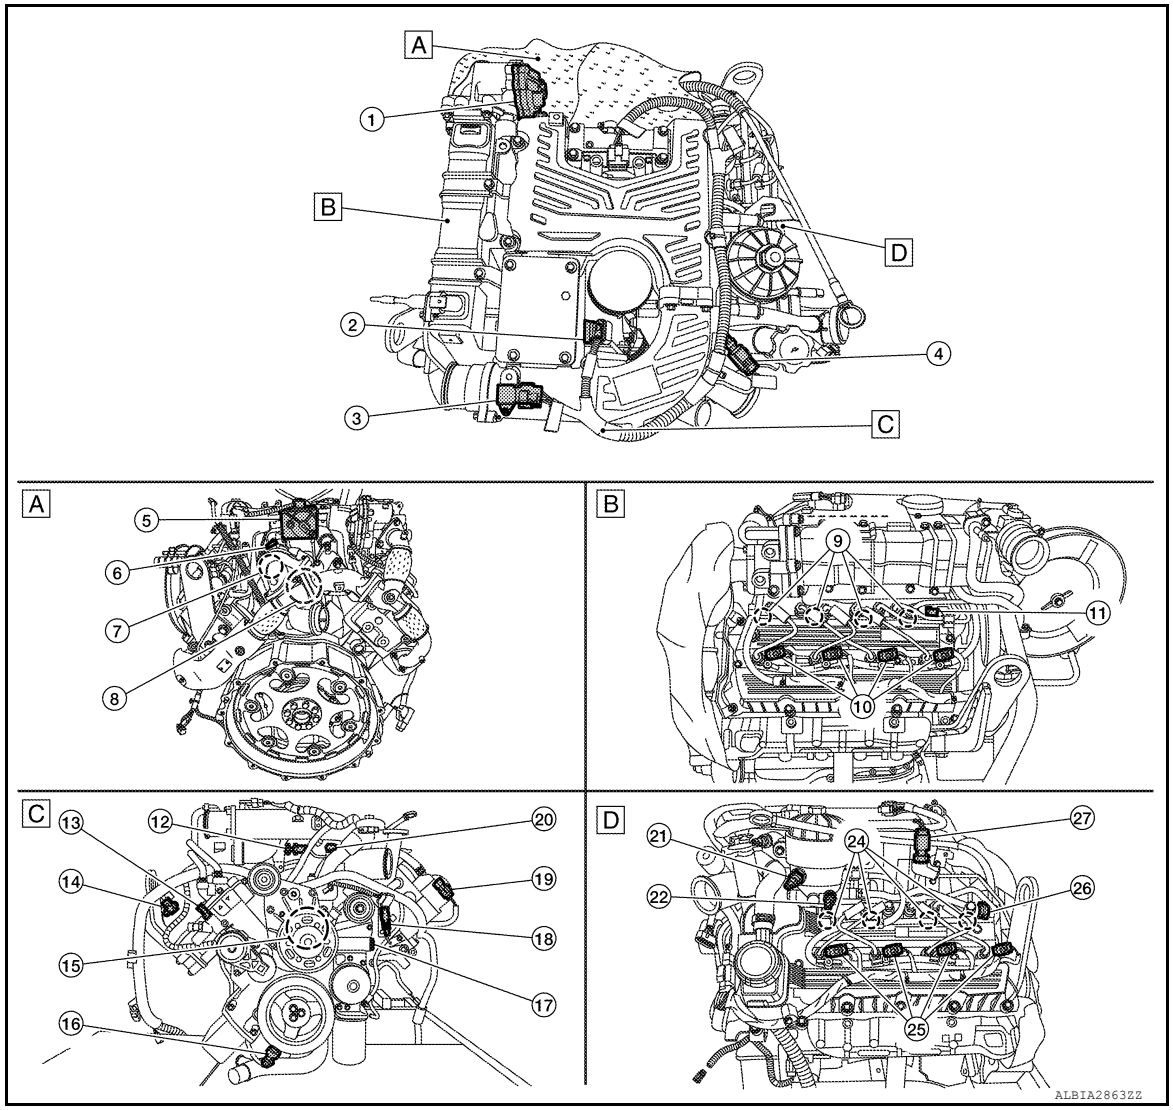
INFOID:0000000013416111

ENGINE ROOM COMPARTMENT



No.	Component parts	Function
①	Glow plug control module	EC-46, "Glow Plug Control Module"
②	Mass air flow (MAF) sensor	EC-48, "Mass Air Flow Sensor"
③	Fuel filter (stage 2)	• EC-42, "DEF Line Heater" • EC-50, "Water In Fuel Sensor"
④	IPDM E/R	IPDM E/R activates the internal control circuit to perform the relay ON/OFF control according to the input signals from various sensors and the request signals received from control units via CAN communication. Refer to PCS-43, "Removal and Installation of IPDM E/R" for detailed installation location.
⑤	ECM	EC-43, "ECM"
⑥	Coolant level sensor	EC-40, "Coolant Level Sensor"
⑦	Turbocharger compressor intake pressure/temperature sensor (with intake air temperature sensor)	EC-50, "Turbocharger Compressor Intake Pressure/Temperature Sensor"

ENGINE COMPARTMENT

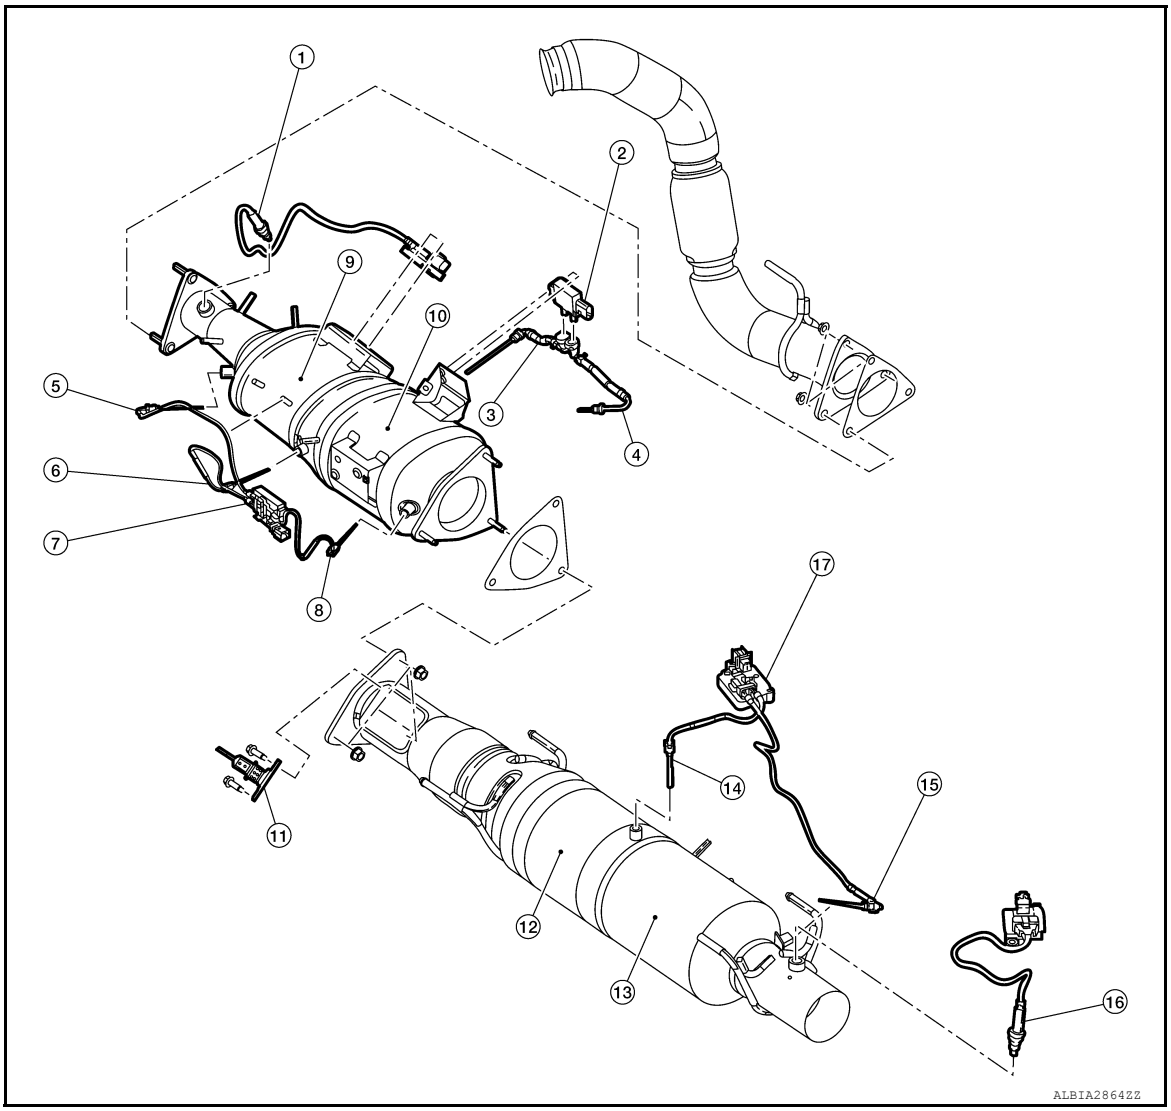


A Back side of engine
B Right side of engine
C Front side of engine
D Left side of engine

No.	Component parts	Function
①	EGR valve	EC-44, "EGR Valve"
②	EGR bypass valve	EC-43, "EGR Bypass Valve"
③	Engine charge air cooler outlet pressure/temperature sensor	EC-44, "Engine Charge Air Cooler Outlet Pressure/Temperature Sensor"
④	Intake manifold temperature sensor	EC-47, "Intake Manifold Temperature Sensor"
⑤	Rotary turbine control valve actuator	EC-49, "Rotary Turbine Control Valve Actuator"
⑥	Turbocharger speed sensor	EC-50, "Turbocharger Speed Sensor"
⑦	High pressure turbo compressor	EM-390, "Exploded View"
⑧	Low pressure turbo compressor	
⑨	Glow plugs RH	EC-46, "Glow Plug"
⑩	Fuel injectors RH	EC-45, "Fuel Injector"
⑪	Fuel rail pressure sensor	EC-46, "Fuel Rail Pressure Sensor"

No.	Component parts	Function
⑫	EGR temperature sensor	EC-43, "EGR Temperature Sensor"
⑬	Camshaft position sensor	EC-40, "Camshaft Position Sensor"
⑭	Coolant temperature sensor	EC-44, "Engine Coolant Temperature Sensor"
⑮	Fuel pump actuator	EC-45, "Fuel Pump Actuator"
⑯	Crankshaft position sensor	EC-41, "Crankshaft Position Sensor"
⑰	Compressor bypass valve solenoid	EC-40, "Compressor Bypass Valve Solenoid"
⑱	Coolant heater (if equipped)	CO-32, "System Description"
⑲	Crankcase pressure sensor	EC-41, "Crankcase Pressure Sensor"
⑳	Low pressure turbocharger boost pressure sensor	EC-47, "Low Pressure Turbocharger Boost Pressure Sensor"
㉑	Fuel temperature sensor	EC-46, "Fuel Temperature Sensor"
㉒	Fuel pressure sensor	EC-45, "Fuel Pressure Sensor"
㉓	Oil pressure switch	EC-48, "Oil Pressure Switch"
㉔	Glow plugs LH	EC-46, "Glow Plug"
㉕	Fuel injectors LH	EC-45, "Fuel Injector"
㉖	Fuel pressure relief valve	EC-45, "Fuel Pressure Relief Valve"
㉗	Exhaust gas pressure sensor	EC-43, "Exhaust Gas Pressure Sensor"

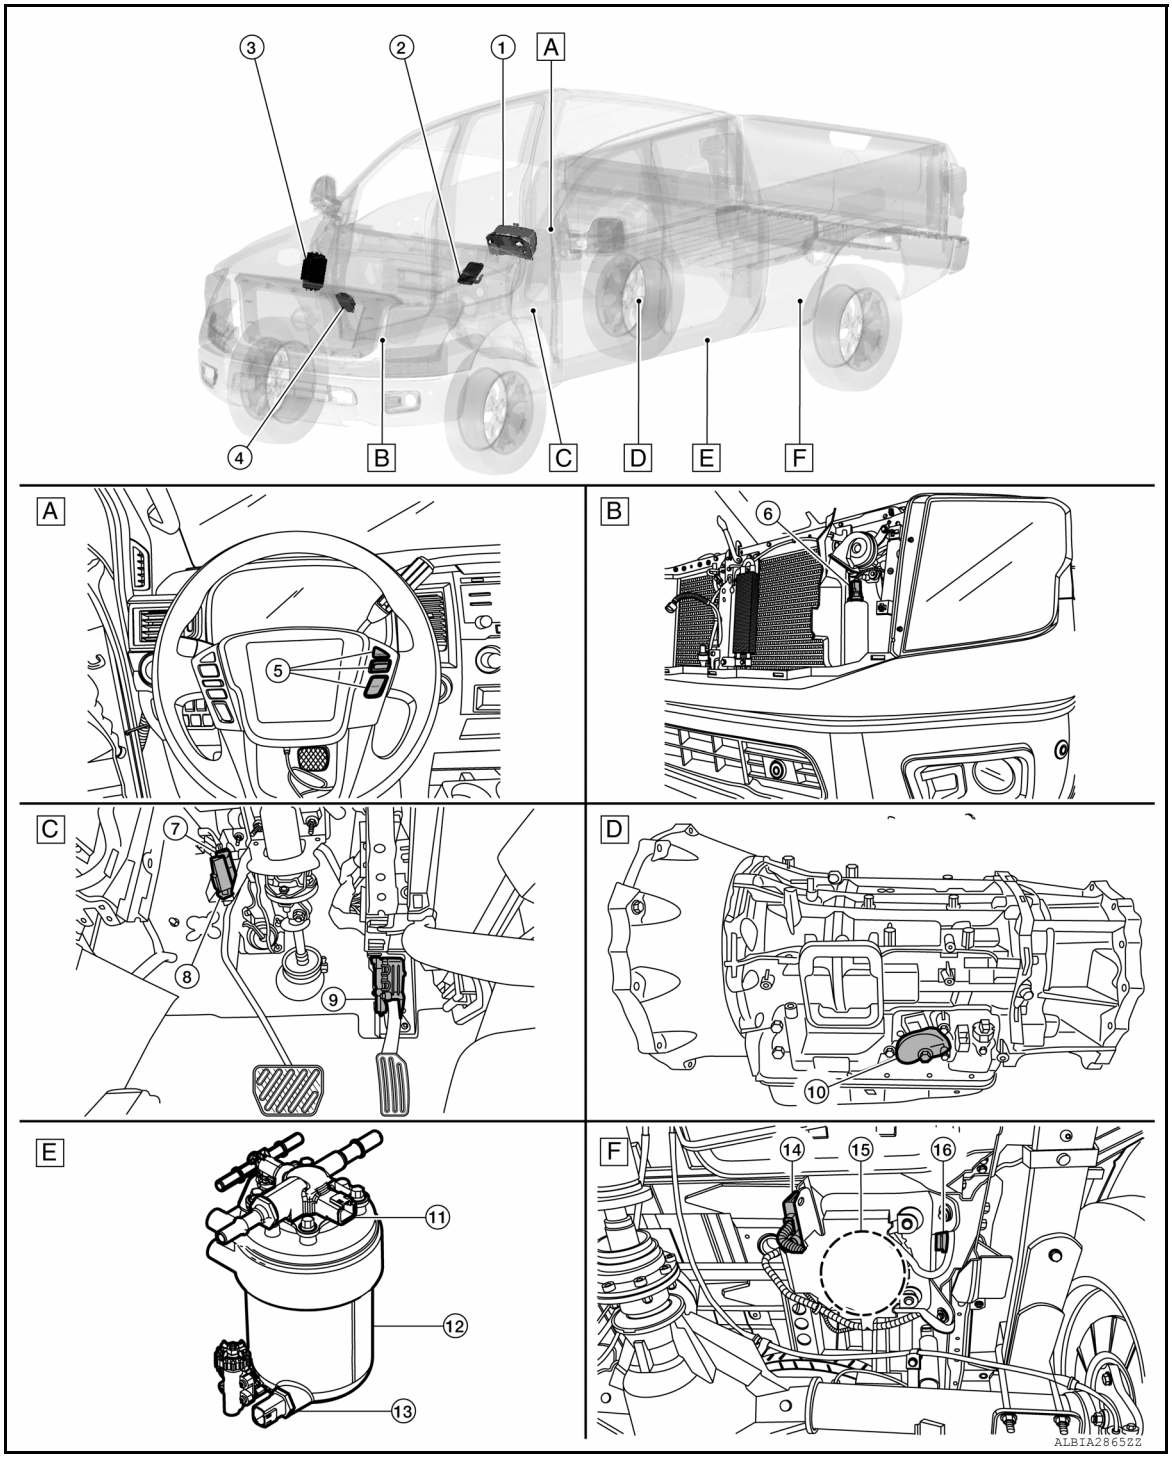
EXHAUST COMPARTMENT



No.	Component parts	Function
①	Intake NOx sensor	EC-47, "Intake NOx Sensor"
②	DPF (diesel particulate filter) differential pressure sensor	EC-42, "DPF (Diesel Particulate Filter) Differential Pressure Sensor"
③	DPF (diesel particulate filter) differential pressure sensor up-stream tube	
④	DPF (diesel particulate filter) differential pressure sensor downstream tube	
⑤	DOC (diesel oxidation catalyst) inlet temperature sensor	EC-42, "DPF Temperature Sensor"
⑥	DPF (diesel particulate filter) inlet temperature sensor	
⑦	DPF (diesel particulate filter) temperature sensor module	
⑧	DPF (diesel particulate filter) outlet temperature sensor	
⑨	DOC (diesel oxidation catalyst) assembly	EX-41, "Exploded View"
⑩	DPF (diesel particulate filter) assembly	
⑪	DEF (diesel exhaust fluid) dosing valve	EC-41, "DEF Dosing Valve"
⑫	SCR (selective catalyst reduction) assembly	EX-35, "Exploded View"
⑬	AOC (ammonia oxidation catalyst) assembly	

No.	Component parts	Function
⑭	SCR (selective catalyst reduction) temperature sensor	EC-49, "SCR Temperature Sensor Module"
⑮	AOC (ammonia oxidation catalyst) temperature sensor	
⑯	Outlet NOx sensor	EC-48, "Outlet NOx Sensor"
⑰	SCR (selective catalyst reduction) temperature sensor module	EC-49, "SCR Temperature Sensor Module"

BODY COMPARTMENT



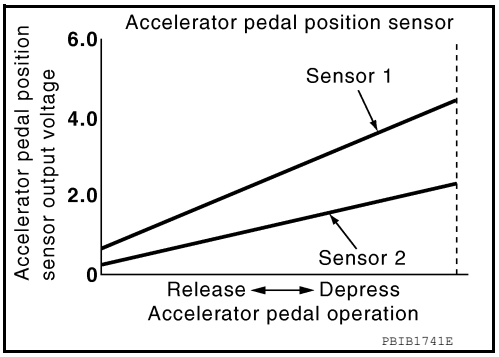
A Steering wheel
B Behind front grille
C Pedal periphery
D Transmission
E Behind fuel tank
F Left rear side under carriage

No.	Component	Function
①	Combination meter	Mainly transmits the following signals to ECM via CAN communication. • Vehicle speed • A/C ON signal • Blower fan ON signal Refer to MWI-12, "METER SYSTEM : Combination Meter" for detailed installation location.
②	BCM	Mainly transmits the following signals to ECM via CAN communication. • A/C ON signal • Blower fan ON signal Refer to BCS-79, "Removal and Installation".
③	ECM	EC-43, "ECM"
④	TCM	Mainly transmits the following signal to ECM via electrical signal. • Park/neutral signal Mainly transmits the following signal to ECM via CAN communication: • Powertrain revolution Refer to TM-17, "A/T CONTROL SYSTEM : TCM" for detailed installation location.
⑤	ASCD steering switch	EC-40, "ASCD Steering Switch"
⑥	Refrigerant pressure sensor	EC-48, "Refrigerant Pressure Sensor"
⑦	Stop lamp switch	EC-49, "Stop Lamp Switch/ASCD Cancel Switch"
⑧	Brake pedal position switch	
⑨	Accelerator pedal position switch	EC-39, "Accelerator Pedal Position Sensor"
⑩	Transmission range switch	TM-17, "A/T CONTROL SYSTEM : Transmission Range Switch"
⑪	Fuel pump	EC-45, "Fuel Pump Actuator"
⑫	Stage 1 filter assembly	FL-39, "Removal and Installation"
⑬	Water in fuel sensor	EC-50, "Water In Fuel Sensor"
⑭	DEF (diesel exhaust fluid) control module	EC-41, "DEF Control Module"
⑮	DEF (diesel exhaust fluid) dosing control module	EC-42, "DEF Supply Pump Assembly"
⑯	DEF (diesel exhaust fluid) quality sensor	EC-42, "DEF Quality Sensor"

Accelerator Pedal Position Sensor

INFOID:0000000013416112

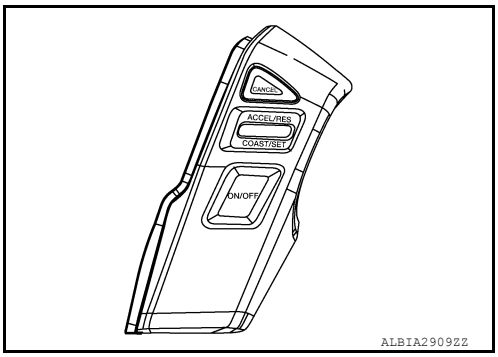
The accelerator pedal position (APP) sensor is installed on the upper end of the accelerator pedal assembly. The sensors detect the accelerator pedal position and send a signal to the ECM. The ECM uses the signal to determine the amount of fuel to be injected.



ASCD Steering Switch

INFOID:0000000013416114

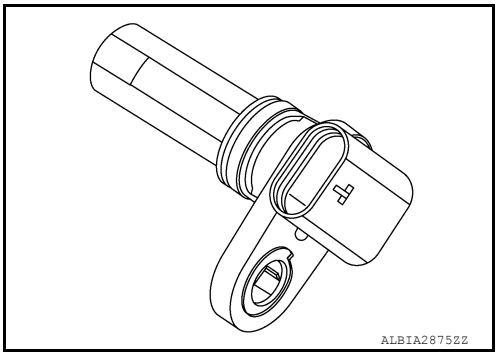
ASCD steering switch has variant values of electrical resistance for each button. ECM reads voltage variation of switch and determines which button is operated.



Camshaft Position Sensor

INFOID:0000000013416115

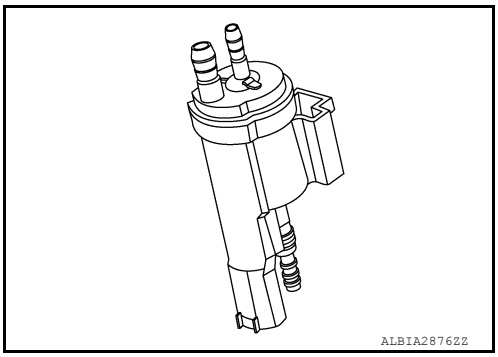
After the ECM determines top dead center of cylinder number 1 on the compression stroke at startup (using the camshaft position sensor), the ECM then relies on the crankshaft position sensor to control the timing of the injections.



Compressor Bypass Valve Solenoid

INFOID:0000000013416141

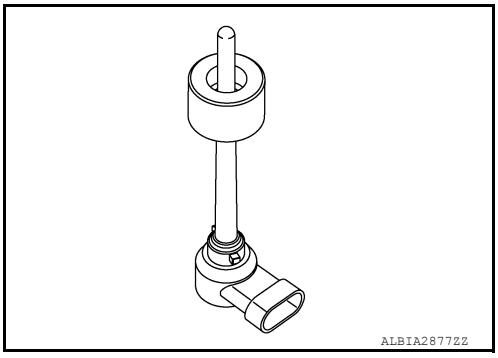
Located on the front left side of the engine. It is an ON/OFF solenoid that is controlled by the ECM. When energized by the ECM, the compressor bypass solenoid directs vacuum to the compressor bypass actuator to open the compressor bypass valve.



Coolant Level Sensor

INFOID:0000000013461032

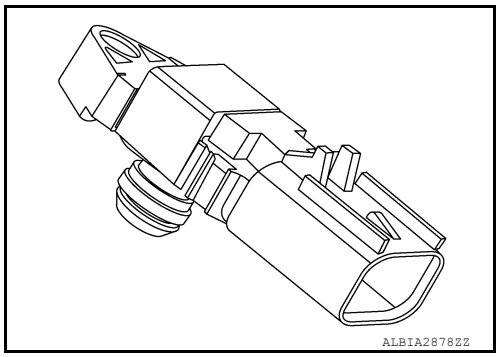
Detects that coolant level is low and transmits coolant level signal to ECM.



Crankcase Pressure Sensor

INFOID:0000000013461030

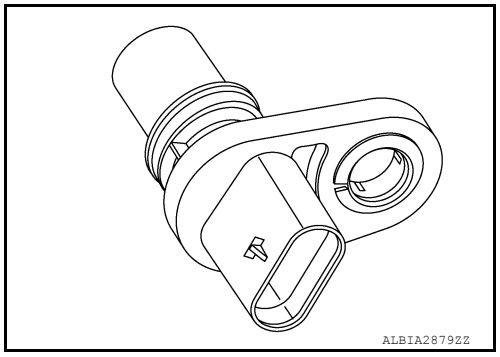
- Crankcase pressure sensor measures pressure in the crankcase, converts it to voltage signal and transmits it to ECM.



Crankshaft Position Sensor

INFOID:0000000013416117

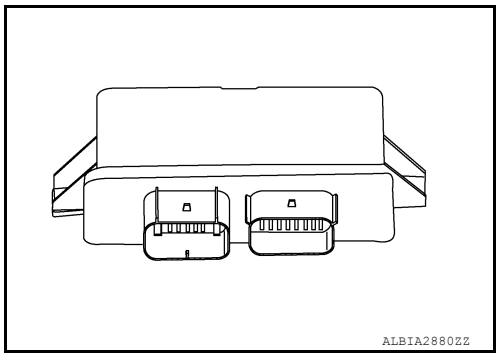
Crankshaft Position Sensor (CKP) detects engine speed and crankshaft position. The size difference of gear tooth placed on signal plate changes the gap between signal plate and sensor, and magnetic field change around the sensor induces sensor output voltage change. ECM detects engine speed and crankshaft position based on this voltage change.



DEF Control Module

INFOID:0000000013461020

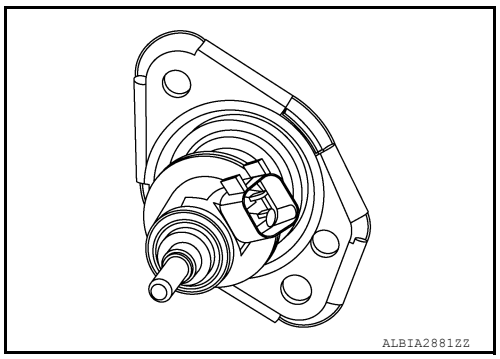
The DEF control module communicates and shares information with the ECM. Using input from the ECM and other sensors, the control module controls the operation of the DEF pump assembly, including the DEF heating systems.



DEF Dosing Valve

INFOID:0000000013461028

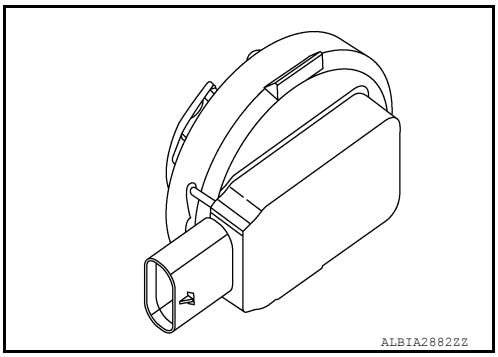
- The DEF dosing valve is located on the decomposition tube. It is a PWM valve that sprays a fine mist of DEF into the exhaust stream when commanded by the ECM. This spray of DEF is sometimes called SCR dosing because the SCR catalyst uses DEF to chemically convert NOx to nitrogen and water.



DEF Quality Sensor

INFOID:0000000013461022

- A DEF quality sensor is mounted on the side of the DEF tank. This sensor detects the urea concentration in the DEF to confirm it is acceptable for effective dosing (approximately 32.5% urea). If the DEF quality sensor detects an incorrect DEF concentration, the DEF warning lamp in the combination meter will illuminate. In some cases, the MIL may also illuminate.
- If the DEF tank is filled with anything other than DEF or has diluted DEF, the aftertreatment system will not operate correctly. A DTC will be set and engine power reductions will follow.



DEF Line Heater

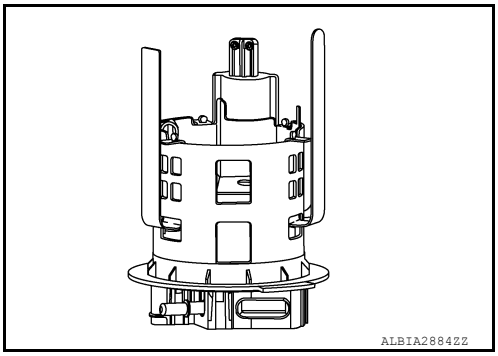
INFOID:0000000013416133

A DEF line heater is located at the end of the DEF dosing line where it meets the DEF pump. This heater is used to heat the dosing line between the DEF pump and the DEF dosing valve to prevent freezing during vehicle operation.

DEF Supply Pump Assembly

INFOID:0000000013461019

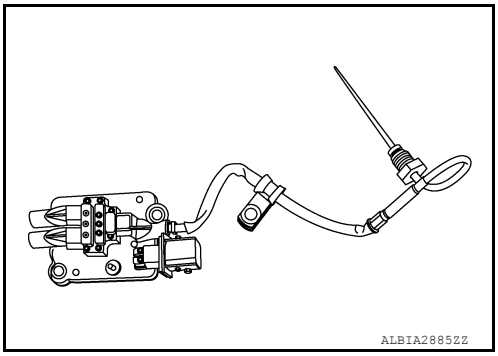
- The DEF pump assembly is mounted to the bottom of the DEF tank with most of the assembly inside the tank submerged in DEF.
- The pump assembly includes:
- DEF pump
- DEF tank heater
- DEF temperature sensor
- DEF level sensor
- DEF pressure sensor
- DEF dosing line heater



DPF Temperature Sensor

INFOID:0000000013461021

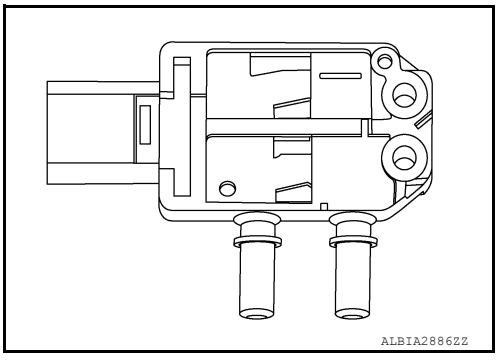
The DPF temperature sensor is located between the DOC and the DPF. This sensor measures exhaust gas temperature after it has passed through the DOC and also helps determine the amount of fuel dosing for aftertreatment thermal management.



DPF (Diesel Particulate Filter) Differential Pressure Sensor

INFOID:0000000013416119

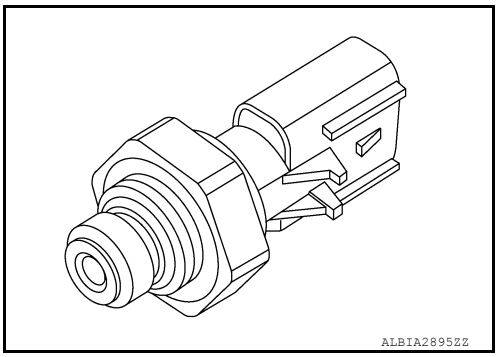
The Diesel Particulate Filter (DPF) differential pressure sensor is connected to the DPF with tubes (upstream and downstream). The DPF pressure sensor measures the difference between the exhaust pressure before and after the DPF. The DPF differential pressure sensor converts the pressure difference into a voltage signal. The ECM receives the signal and estimates the amount of particulate matter in the DPF.



Exhaust Gas Pressure Sensor

INFOID:0000000013416131

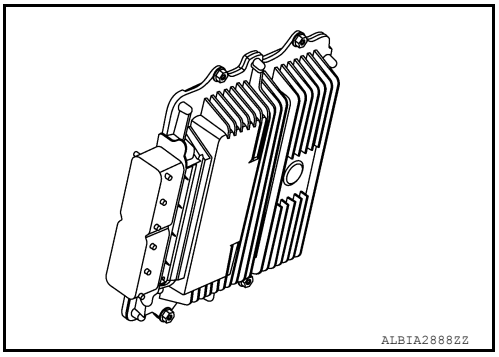
The exhaust gas pressure sensor is remotely located at the back left corner of the air intake manifold. The sensor is mounted in a tube that reads exhaust gas pressure from the left exhaust manifold. The exhaust gas pressure sensor is used as an input for rotary turbine control valve positioning during cold start and is also used to assist in thermal management for the aftertreatment system. In addition, the exhaust gas pressure sensor is used by the ECM as one of the inputs to determine the quantity of EGR flow.



ECM

INFOID:0000000013416121

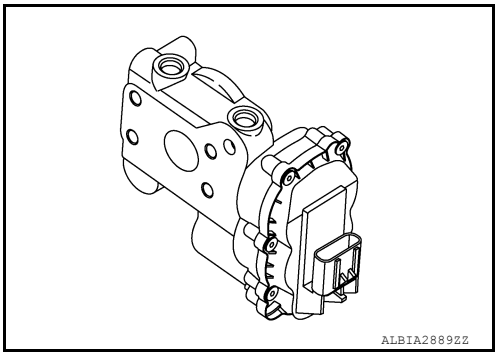
The ECM controls all aspects of engine performance, including the operation of fuel, EGR, and aftertreatment components for reducing emissions.



EGR Bypass Valve

INFOID:0000000013416122

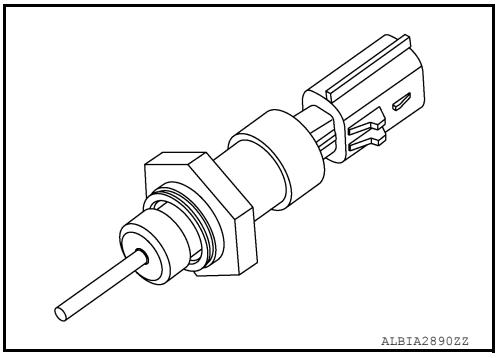
The ECM uses this valve to allow exhaust gas into the engine without going through the EGR cooler (EGR cooler bypass). Some operating conditions require EGR that does not go through the EGR cooler, such as at start up (aids in warming a cold engine) or during regeneration of the Diesel Particulate Filter (DPF),



EGR Temperature Sensor

INFOID:0000000013416124

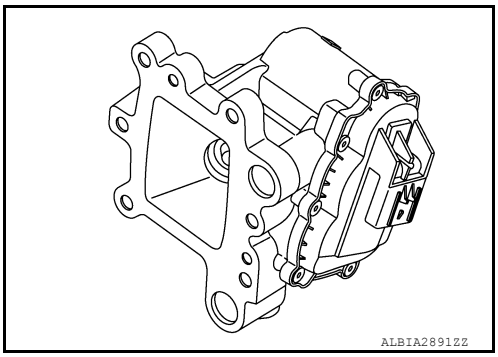
The ECM uses the EGR temperature sensor, as well as other sensors, to precisely calculate the appropriate flow and density of exhaust gas passing through either valve.



EGR Valve

INFOID:0000000013416125

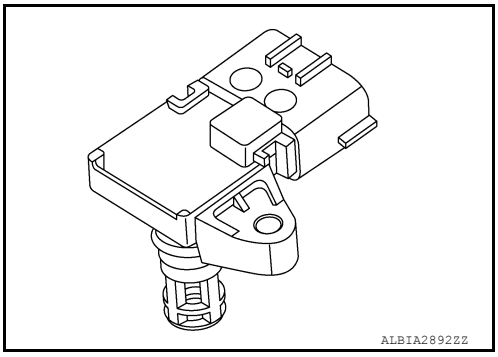
The EGR valve is used by the ECM to control the amount of exhaust gas that flows through the EGR cooler before it enters the intake. Since the engine does not always need EGR, the EGR flow may be disabled during cold ambient conditions, low speed/load, or if certain DTCs related to the EGR components are current.



Engine Charge Air Cooler Outlet Pressure/Temperature Sensor

INFOID:0000000013416145

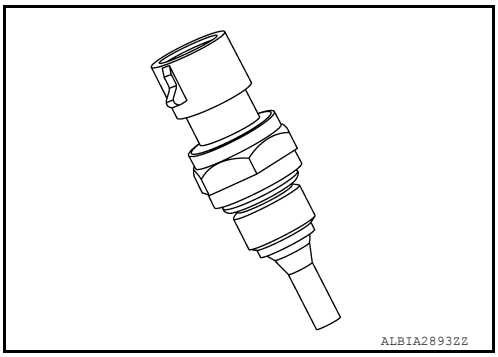
The engine charge air cooler outlet pressure/temperature sensor monitors the temperature and pressure of air in the intake air duct. The sensor information is used by the ECM to determine air filter restriction, changes in altitude, help determine air volume entering the engine and manage engine operation.



Engine Coolant Temperature Sensor

INFOID:0000000013416128

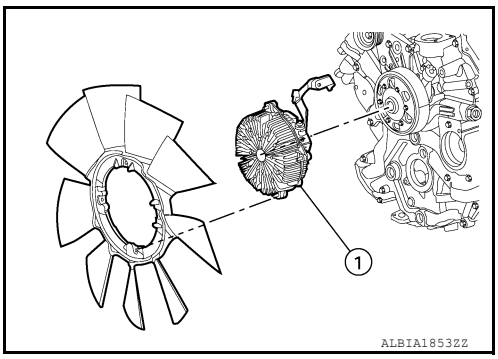
The Engine Coolant Temperature (ECT) sensor is used to detect the engine coolant temperature.



Fan Clutch Assembly

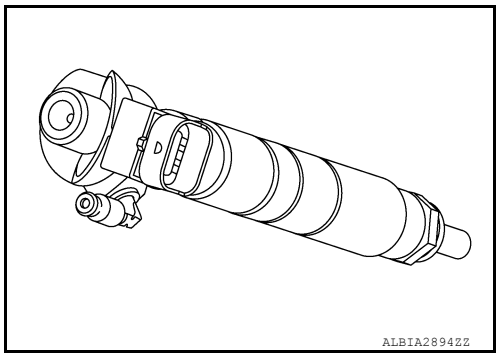
INFOID:0000000013461031

- A cooling fan clutch (1) is utilized to control cooling fan operation. This fan clutch is controlled by the ECM. The ECM monitors coolant temperature and intake manifold temperature to determine when to engage the cooling fan. There are also additional sensors monitored by the ECM for fan control (for example, air conditioner pressure and transmission temperature). The fan clutch is an electro-viscous fan clutch.



Fuel Injector

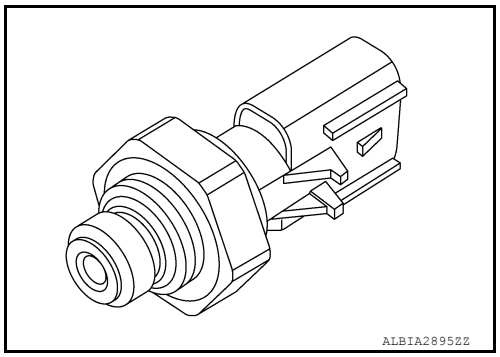
INFOID:0000000013416134



Piezoelectric injectors require electrical current, high pressure fuel, low pressure fuel, and reversed electrical current to inject fuel and close the injector after injection. Piezoelectric injectors use high and low fuel pressure within the injector and piezo crystals within a stack of ceramic discs. High pressure fuel near the top of the high pressure control chamber holds the injector needle in place until it is time to inject. When the ECM sends current through the piezo stack, the piezo crystals expand. This expansion is amplified by the hydraulic pressure of the fuel in the low pressure chamber to move the control valve. High pressure fuel in the control chamber exits to the low pressure chamber when the control valve opens. This action unseats the injector needle and fuel is injected. To close the injector, current must flow in the opposite direction (reverse polarity) to retract the piezo crystals and allow fuel pressure in the injector to seat the injector needle.

Fuel Pressure Sensor

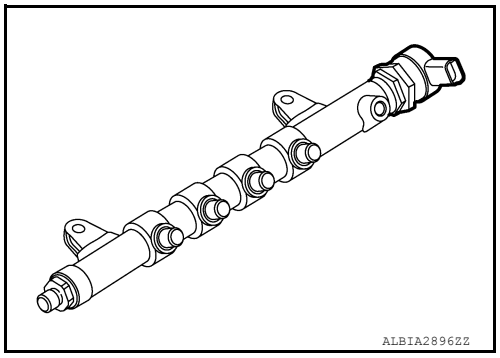
INFOID:0000000013416132



The right bank fuel rail contains a fuel rail pressure sensor that monitors the pressure provided to the fuel rails from the high-pressure fuel pump.

Fuel Pressure Relief Valve

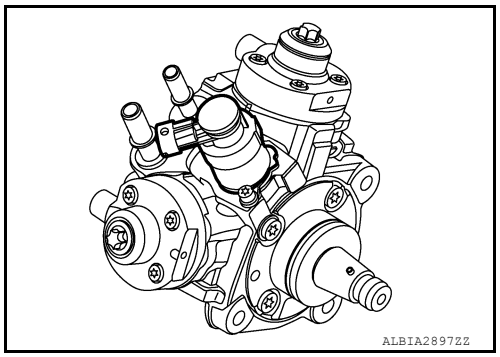
INFOID:0000000013461026



- The left bank fuel rail contains a fuel rail pressure relief valve. The fuel rail pressure relief valve is controlled by a Pulse Width Modulation (PWM) signal from the ECM. Using the fuel rail pressure relief valve to regulate the fuel pressure in the high pressure system is one of the controls the ECM uses to regulate fuel delivered (injected) into the engine. Bled off fuel from the fuel rail pressure relief valve is routed to the return manifold in the bottom of the stage 2 fuel filter. When the engine shuts down and the ignition switch is turned OFF, the fuel pressure relief valve will open, allowing the fuel pressure inside the rails to depressurize. Before opening any high pressure components, make sure to wait a minimum of 10 minutes for fuel pressure and temperature to decrease.

Fuel Pump Actuator

INFOID:0000000013416135

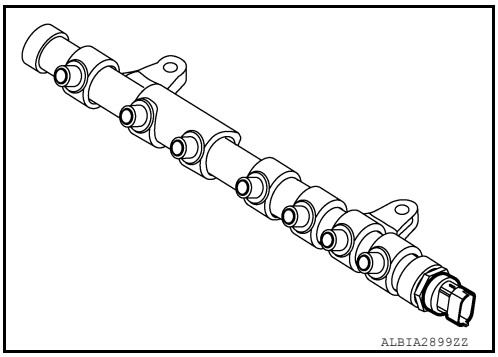


The fuel pump actuator is a normally open, Pulse-Width Modulated (PWM) valve used to control fuel volume into the high pressure fuel pump. The ECM controls operation of the fuel pump actuator and fuel pressure relief valve to regulate fuel rail volume and pressure. The fuel pump actuator and O-rings are the only serviceable components on the high pressure fuel pump.

Fuel Rail Pressure Sensor

INFOID:0000000013416136

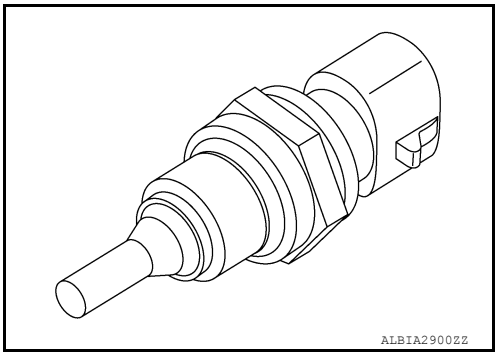
The fuel rail pressure sensor monitors the fuel pressure within the fuel rails and communicates this data to the ECM. The ECM uses fuel pressure data to adjust the PWM signal to the fuel pump actuator and fuel pressure relief valve to achieve the desired fuel pressure for optimum fuel injection.



Fuel Temperature Sensor

INFOID:0000000013416137

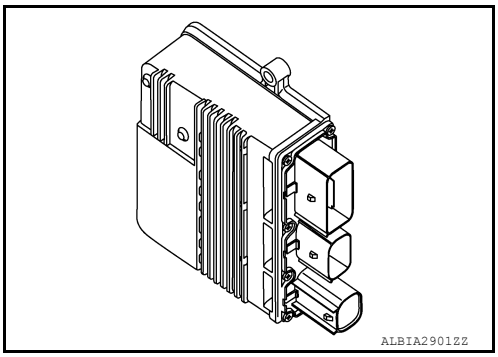
The fuel temperature sensor measures fuel temperature before it passes through the stage 2 fuel filter housing. This sensor is critical for determining if fuel temperature is within specifications. If fuel temperature is above specifications, a DTC could be set and engine power may be reduced to protect the engine.



Glow Plug Control Module

INFOID:0000000013416139

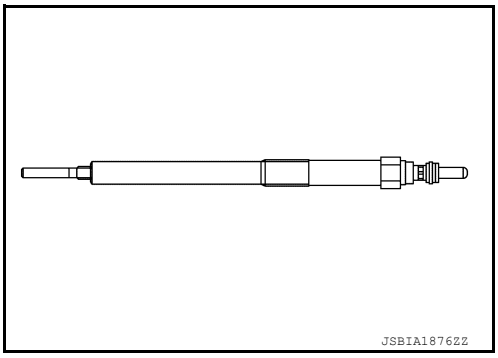
The glow plug control module receives fused power directly from the batteries. The ECM communicates with the glow plug control module over the CAN. The glow plugs are grounded through the cylinder head. The ECM calculates an average temperature based on inputs from the engine coolant temperature sensor, the air intake manifold temperature sensor, and an internal temperature sensor in the glow plug control module. After the required conditions are met, the glow plug control module sends an output to each of the eight glow plugs individually. The glow plug control module monitors the operation of individual glow plugs and reports malfunctions back to the ECM. The glow plugs begin activating with the igntion switch on during the wait-to-start sequence and will continue to operate after cranking if the ECM determines the glow plugs are needed.



Glow Plug

INFOID:0000000013416140

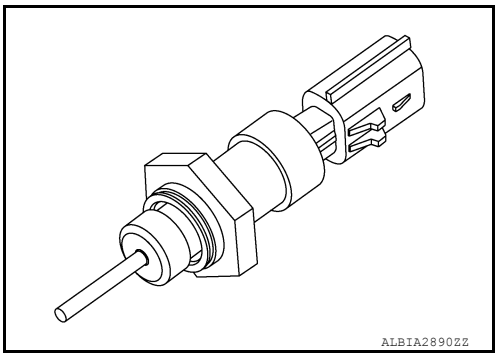
The glow plugs are threaded into the tops of the cylinder heads above each of the eight cylinders. A tapered area on the lower portion of the glow plug mates with the taper in the cylinder head to seal the glow plug opening. When energized by the glow plug control module, the glow plugs can reach temperatures over 816° C (1,500° F) within two seconds. This extra heat within the cylinder helps promote combustion of fuel when ambient temperatures are low.



Intake Manifold Temperature Sensor

INFOID:0000000013416144

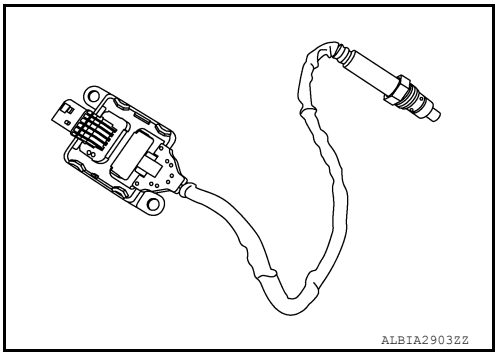
The intake manifold temperature sensor measures the temperature of the combined charge air and EGR before it enters the intake manifold. This is the last air temperature reading the ECM receives before air enters the combustion chambers.



Intake NOx Sensor

INFOID:0000000013461025

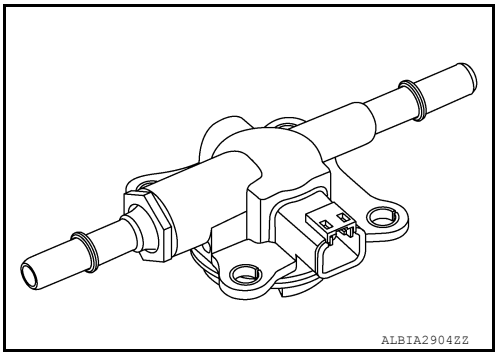
The intake NOx sensor is the first sensor mounted on the aftertreatment tubing, just in front of the DOC. This sensor measures the quantity of NOx in the exhaust gas before it enters the aftertreatment system. The intake NOx sensor includes a unique processor that is mounted externally from the sensor, and also includes a heater to bring the sensor to operating temperature quickly. The intake NOx sensor also detects the oxygen level in the exhaust.
The ECM compares the intake and outlet NOx sensor readings to determine the amount of NOx reduction that is achieved in the aftertreatment system, and to determine how much DEF to inject into the exhaust stream.



Lift Pump

INFOID:0000000013461018

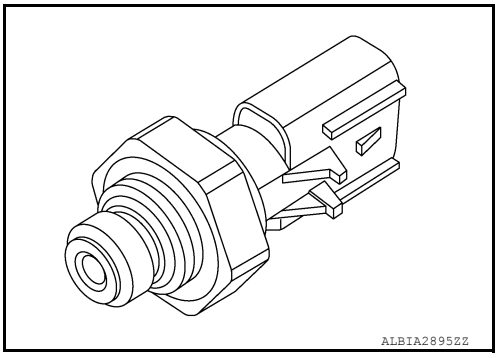
Whenever the ignition is cycled ON, the lift pump operates for approximately 1 minute to prime the fuel system. Normal lift pump supply pressure is approximately 350 to 600 kPa absolute (3.5 to 6 bar) (51 to 87 psi) with the engine cranking or running.



Low Pressure Turbocharger Boost Pressure Sensor

INFOID:0000000013416146

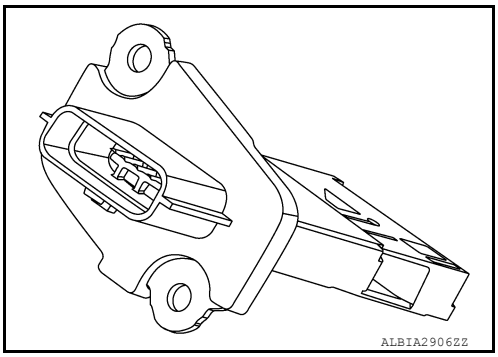
The low pressure turbocharger boost pressure sensor is located on the compressor outlet side of the low pressure turbocharger. This sensor monitors charge air pressure in the compressor outlet tubing.



Mass Air Flow Sensor

INFOID:0000000013416147

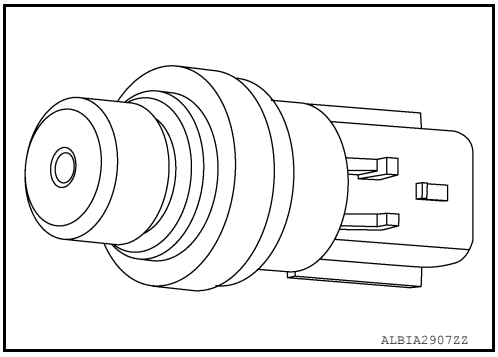
The MAF sensor is located on the intake air duct just after the air filter housing. The ECM uses data from the MAF sensor and other air intake sensors to determine the quantity of air entering the engine. In addition, the MAF sensor has a major impact on EGR calculations and Selective Catalytic Reduction (SCR) dosing.



Oil Pressure Switch

INFOID:0000000013416148

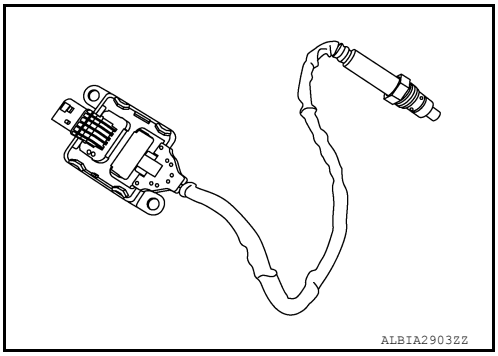
The oil pressure switch detects engine oil pressure and transmits a voltage signal to the ECM.



Outlet NOx Sensor

INFOID:0000000013461024

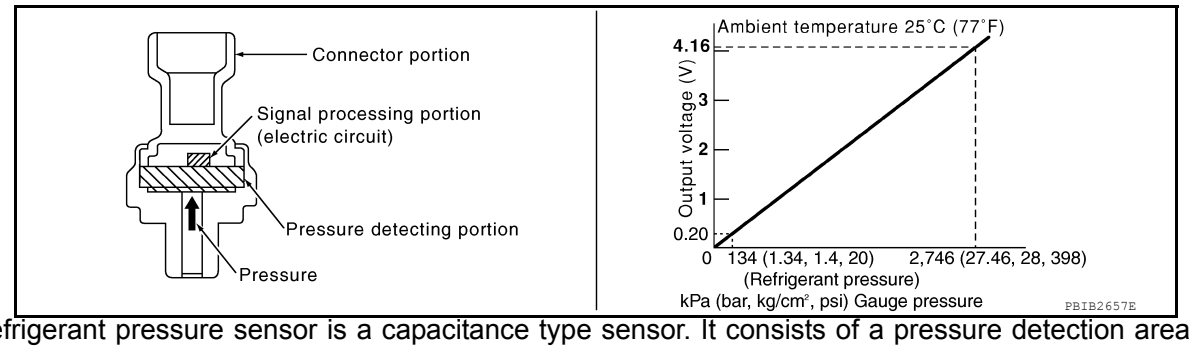
The outlet NOx sensor is located at the back of the aftertreatment system, downstream of the ASC. The outlet NOx sensor measures the NOx quantity that remains after all aftertreatment has occurred. This sensor also includes a heater to bring the sensor up to operating temperature quickly. The ECM compares the inlet and outlet NOx sensor values to determine if the aftertreatment system is efficiently removing NOx. If NOx levels remain too high at the outlet NOx sensor, the ECM may command additional EGR or additional DEF dosing to lower these levels.



Refrigerant Pressure Sensor

INFOID:0000000013416149

The refrigerant pressure sensor converts high-pressure side refrigerant pressure into voltage and outputs it to ECM. The ECM operates cooling system protection and idle speed control according to the voltage value that is inputted.



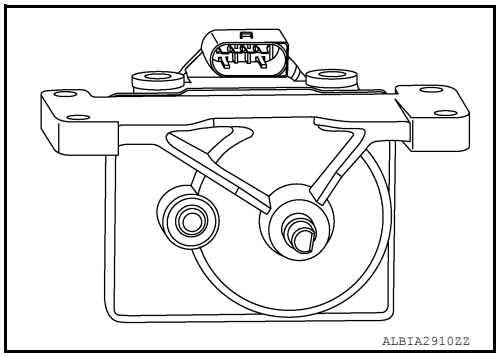
The refrigerant pressure sensor is a capacitance type sensor. It consists of a pressure detection area and a signal processing area. The pressure detection area, which is a variable capacity condenser, changes internal static capacitance according to pressure force. The signal processing area detects the static capacitance of

the pressure detection area, converts the static capacitance into a voltage value, and transmits the voltage value to the ECM.

Rotary Turbine Control Valve Actuator

INFOID:0000000013416143

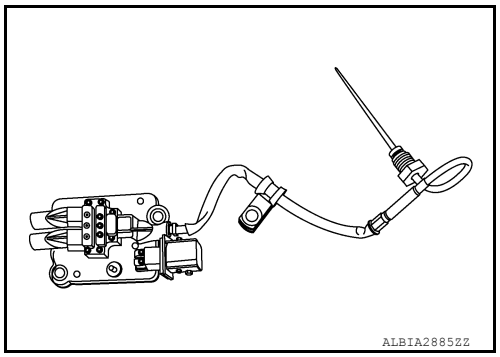
The rotary turbine control valve actuator is located at the top rear portion of the air intake manifold. The rotary turbine control valve actuator controls the position of the rotary turbine control valve based on commands from the ECM. The actuator assembly also includes a sensor that monitors the position of the rotary turbine control valve actuator. This position information is used by the ECM for control of the rotary turbine control valve.



SCR Temperature Sensor Module

INFOID:0000000013461023

- The SCR temperature sensor module is located on the SCR catalyst and consists of a module and two temperature sensor probes.
- The SCR temperature sensor module is used to measure the temperature of exhaust gas.

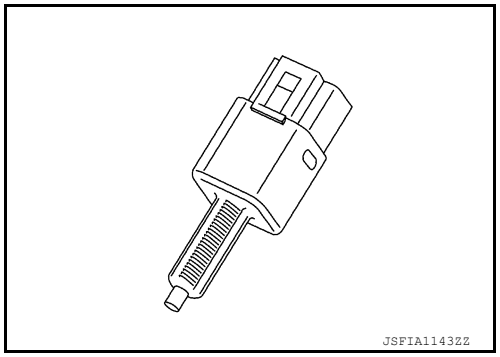


Stop Lamp Switch/ASCD Cancel Switch

INFOID:0000000013416150

STOP LAMP SWITCH

Stop lamp switch signal is sent to ECM via CAN communication line from the combination meter or BCM. This signal is used mainly to decrease the engine speed when the vehicle is driven.



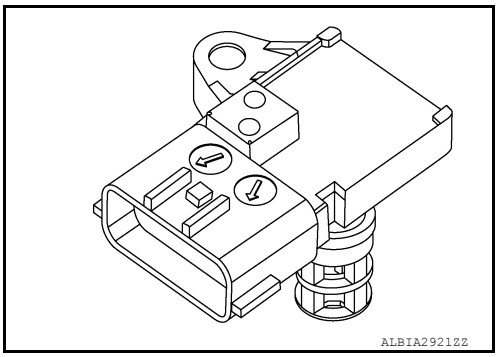
BRAKE PEDAL POSITION SWITCH

Brake pedal position switch is installed to brake pedal bracket.
ECM detects the state of the brake pedal according to the input signal sent from brake pedal position switch.

Turbocharger Compressor Intake Pressure/Temperature Sensor

INFOID:0000000013416153

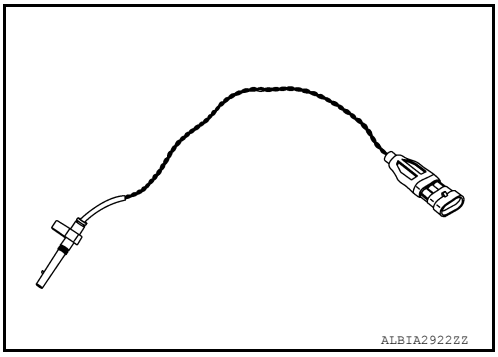
The turbocharger compressor intake pressure/temperature sensor is located on top of the air filter housing. This sensor monitors the temperature and pressure of air in the intake air duct, and can help the ECM determine air filter restriction and changes in altitude.



Turbocharger Speed Sensor

INFOID:0000000013416154

The turbocharger speed sensor is located on the top of the high pressure turbocharger compressor housing. This sensor monitors the rotational speed of the high pressure turbocharger to protect against over-speed conditions.



Water In Fuel Sensor

INFOID:0000000013416156

Water in Fuel (WIF) sensor detects the presence of water in the bottom of the stage 1 fuel filter housing and illuminates an icon in the combination meter.

TURBOCHARGER BOOST CONTROL : System Description

INFOID:0000000013416158

DESCRIPTION

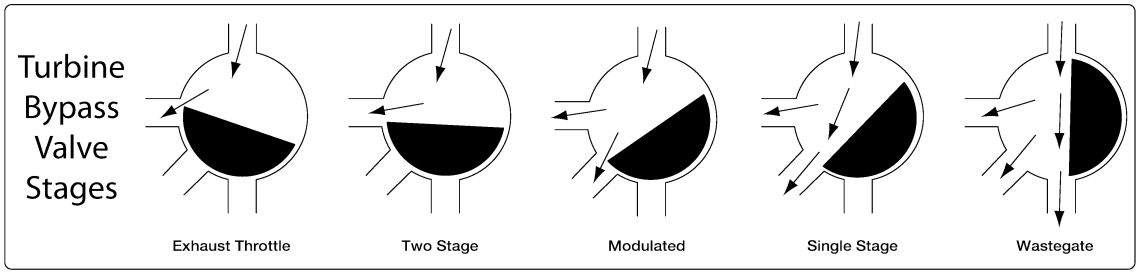
The turbocharger uses exhaust gas energy from the engine to turn the turbine wheel. The turbine wheel drives the compressor wheel through a common shaft. The impeller on the low-pressure compressor wheel in turn draws intake air through the air filter and inlet plumbing into the compressor housing of the turbocharger. The low pressure turbocharger pressurizes the air and feeds into the high-pressure turbocharger to further pressurize the intake flow. The air is then delivered to the charge-air cooler.

The turbine, compressor wheel, and shaft are supported by two rotating bearings in the bearing housing. Passages in the bearing housing direct filtered, pressurized engine oil to the shaft bearings and thrust bearings. The oil is used to lubricate and cool the rotating components. Oil then drains from the bearing housing to the engine sump through the oil drain connection. An adequate supply of good, filtered oil is very important to the life of the turbocharger.

The compressor bypass valve controls the amount of air that goes into the high-pressure turbocharger. The compressor bypass valve actuator is mounted on the compressor outlet connection, vacuum driven, and controlled by the Engine Control Module (ECM) via the compressor bypass valve solenoid.

TURBOCHARGER BOOST CONTROL OF EACH CONDITION

Exhaust Throttle



ALBIA2924GB

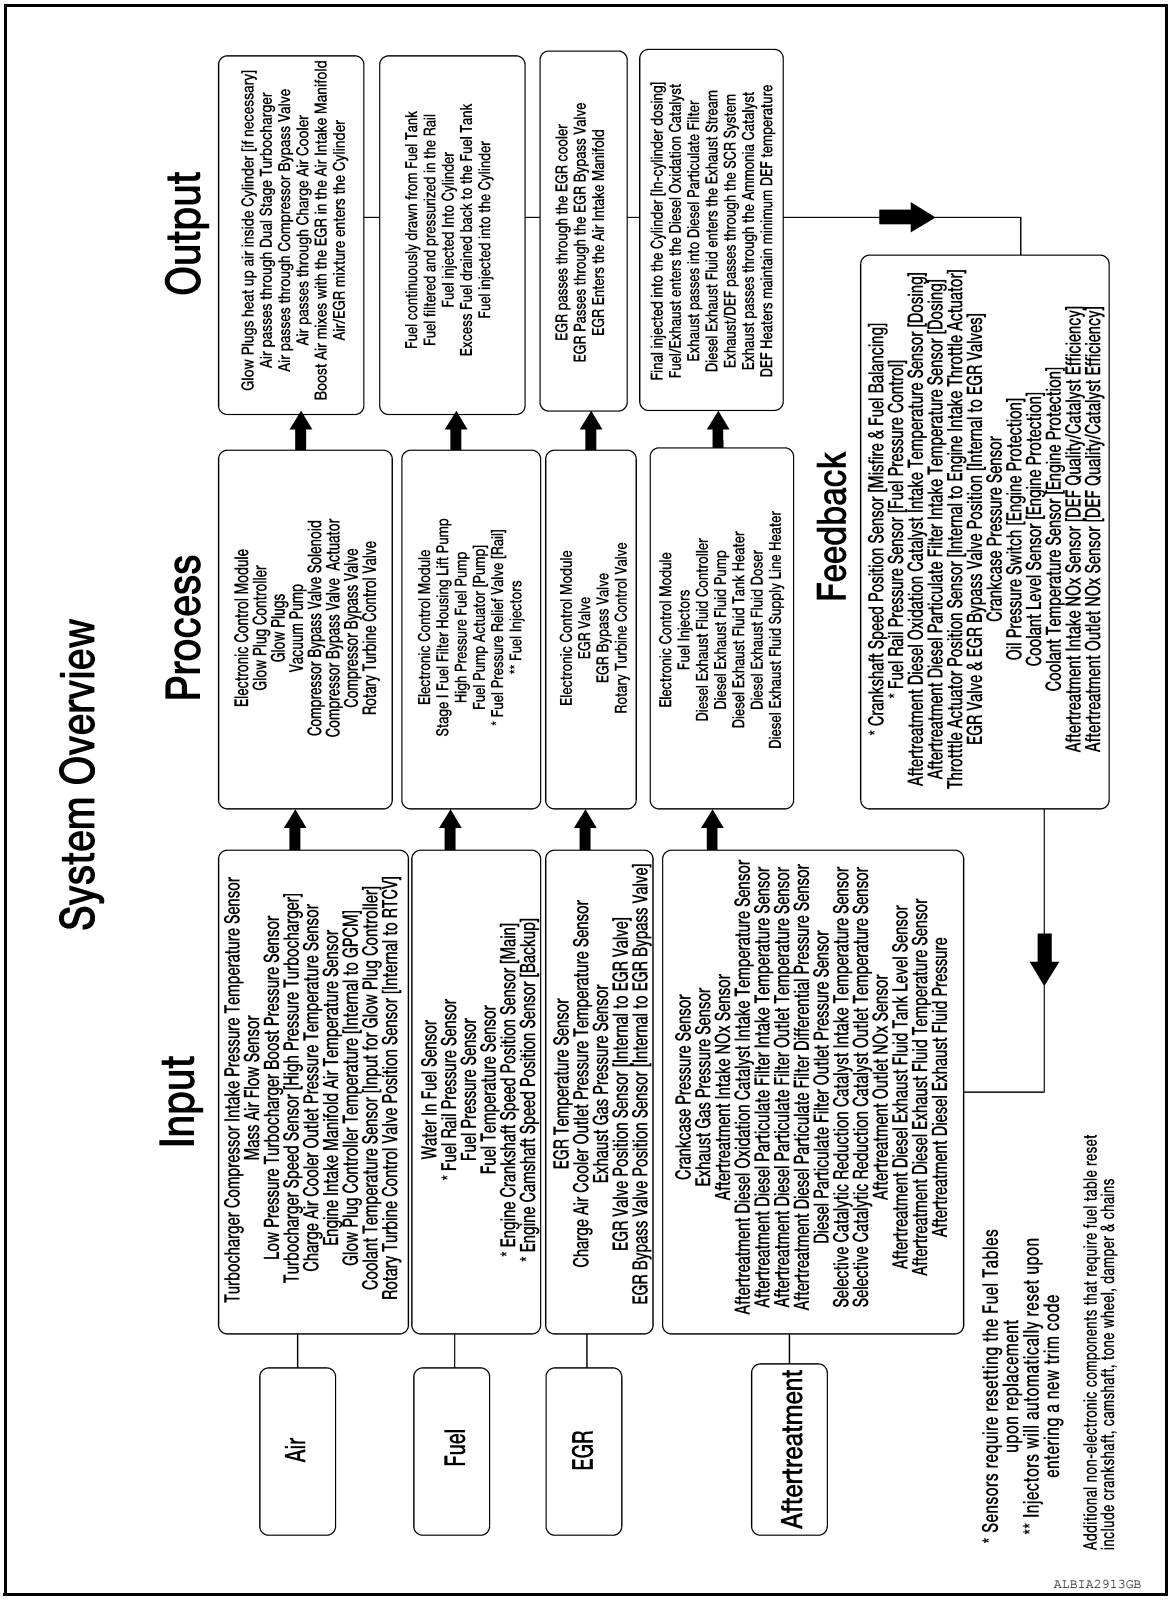
SYSTEM DIAGRAM



SYSTEM DESCRIPTION

The air intake system and exhaust system components work together to provide the correct amount of intake charge flow into the engine.

- Turbocharger assembly
- Turbocharger compressor bypass valve
- Charge-air cooler
- Air intake connection
- Air intake manifold
- Glow plugs
- Glow plug controller

The high-pressure and low-pressure turbochargers are serviceable as an assembly or can be replaced separately. The high-pressure turbocharger has a speed sensor mounted on its compressor housing.

The turbocharger uses exhaust gas energy from the engine to turn the turbine wheel. The turbine wheel drives the compressor wheel through a common shaft. The impeller on the low-pressure compressor wheel in turn draws intake air through the air filter and inlet plumbing into the compressor housing of the turbocharger. The low pressure turbocharger pressurizes the air and feeds into the high-pressure turbocharger to further pressurize the intake flow. The air is then delivered to the charge-air cooler.

Engine lubricating oil is used to lubricate the bearings and provide cooling for the turbochargers. The lubricating oil is supplied to the turbocharger through the supply line at engine operating pressure. The supply line feeds separately and feeds both turbochargers. A return line for the high-pressure turbocharger drains into the back of the engine block. The low-pressure turbocharger drains through its mount on the engine block.

The turbine, compressor wheel, and shaft are supported by two rotating bearings in the bearing housing. Passages in the bearing housing direct filtered, pressurized engine oil to the shaft bearings and thrust bearings. The oil is used to lubricate and cool the rotating components. Oil then drains from the bearing housing to the engine sump through the oil drain connection. An adequate supply of good, filtered oil is very important to the life of the turbocharger. Make sure a high quality oil is used and the oil and the oil filter are changed in accordance with the maintenance recommendations.

The compressor bypass valve controls the amount of air that goes into the high-pressure turbocharger. The compressor bypass valve actuator is mounted on the compressor outlet connection, vacuum driven, and controlled by the Engine Control Module (ECM) via the compressor bypass valve solenoid.

This engine uses a chassis-mounted charge-air cooler to improve engine performance. This system also uses large diameter piping to transfer the air from the engine turbocharger to the charge-air cooler, then returns the air from the charge-air cooler to the engine intake manifold. As the intake air is compressed by the turbocharger, the air temperature increases. This heated air is then passed through the charge-air cooler, which cools the air. Cool air is more dense, which allows more air to be compressed into the cylinder, yielding higher combustion efficiency. The charge-air cooler outlet pressure/temperature sensor is located first on the air intake connection. Then, the EGR mixes in from the EGR bypass valve and EGR cooler. Further upstream, the engine intake manifold air temperature sensor measures the intake charge temperature before entering the air intake manifold.

The air intake manifold separates the intake flow to feed the right and left bank cylinders. The glow plugs are threaded into the cylinder head and heat the intake charge to facilitate engine starting in cold weather.

Intake Air Flow Description

Air Cleaner

Air first flows through the air cleaner, where foreign material and debris are removed.

Air Inlet Piping and Low-Pressure Turbocharger

Air then flows through the air inlet piping to the low-pressure turbocharger compressor inlet. Air is compressed and goes to the high-pressure turbocharger for more pressure or bypasses the high-pressure turbocharger via the turbocharger compressor bypass valve. The intake charge is compressed to a level of pressure deter-

mined by the Engine Control Module (ECM). The ECM regulates the level of pressure in the intake system via the rotary turbine control valve and the turbocharger compressor bypass valve.

Charge-Air Cooler

After the air flows out of the turbocharger compressor outlet connection, it gets passed through a charge-air cooler to remove some of the heat generated by compressing the air. By lowering the temperature of the air, its density is increased. The increased density of the air allows the engine to meet emissions levels while maintaining a higher level of performance.

Air Intake Connection Adapter, Air Intake Connection, and Air Intake Manifold

From the outlet of the charge-air cooler, air flows into the air intake connection. From here, the intake air mixes with the EGR before flowing into the air intake manifold, where the EGR and fresh air mixture is distributed to the cylinders.

Fuel System Priming

NOTE:
If the starting motor is engaged for 30 or more seconds without the engine starting, the starting motor will be locked out from operating to allow for proper cooling of the starting motor. During this time, the WAIT TO START lamp, if equipped, will flash for 2 minutes. Once the lamp stops flashing, the starting motor will be allowed to function.

It is not necessary to vent air from the high pressure fuel system before starting the engine. After a filter change or running the fuel tank dry, complete the following:

- Key ON vehicle for 60 seconds to prime the fuel system. After 60 seconds, crank the engine for a maximum of 30 seconds or until the engine fires. If it does not fire, repeat this step.
- When the engine does start, it may operate erratically and with increased noise levels for a few minutes. This is a normal condition as air is being removed from the system.

EGR Valve

The Exhaust Gas Recirculation (EGR) cooler is best serviced as an assembly of the EGR cooler and the bracket.

The Exhaust Gas Recirculation (EGR) system recirculates exhaust gas to the intake manifold. This system makes a major contribution to the reduction of diesel engine NOx emissions. A gas-coolant liquid exchanger cools the EGR gas flow.

Aftertreatment Diesel Particulate Filter

The aftertreatment Diesel Particulate Filter (DPF) differential pressure sensor tubes connect the aftertreatment DPF differential pressure sensor to the ports on the aftertreatment system. There are two aftertreatment DPF differential pressure sensor tubes. One tube connects to the aftertreatment system upstream of the aftertreatment DPF and the other connects downstream of the aftertreatment DPF.

To make sure of proper function of the drain holes and condensate drainage in the pressure sensor and related tubing, the DPF device must be mounted such that the tubes integral to the pressure sensor are oriented downward. Horizontally-mounted devices must be installed such that the axis of the housing and the pressure sensor are within ±10° of vertical.

ENGINE CONTROL SYSTEM : Fail safe

DTC RELATED ITEM

DTC No.	Detected condition	Action taken when DTC is CRNT
U0106 U0307 U0407	ECM communication with glow plug control module (CAN2).	Glow plug operation disabled.
P0383	Glow plug control module supply voltage less than 6V.	
P0384	Glow plug control module supply voltage greater than 16V.	
P064C	Glow plug control module internal error.	
P06E5		
P263E	Glow plug control module internal temperature greater than 125° C (257° F).	
U010E U11C1	ECM communication with DEF control module (CAN2).	• DEF fluid injection disabled. • Engine torque reduced. • Vehicle speed limited to 8 km/h (5 mph).
U029D	ECM communication with intake NOx sensor (CAN2).	
P1C54	ECM detects NOx conversion efficiency of intake NOx sensor critically low.	
P2048	ECM detects DEF dosing valve circuit open, short high or short low.	
P20B7	ECM detects DEF dosing heater temperature not rising when commanded ON.	
P2201	ECM detects intake NOx sensor not reading 0 while in motoring (non fueling) condition.	
U029E	ECM communication with outlet NOx sensor (CAN2).	• Engine torque reduced. • Vehicle speed limited to 8 km/h (5 mph).
P1C70	ECM detects engine operated for extended period with critical faults.	
P203F	DEF tank level critically low.	
P20E8	• DEF supply pump assembly unable to successfully prime. • DEF control unit detects DEF supply pressure does not reach 460 kPa during priming, or less than 400 kPa during dosing.	
P20E9	DEF control unit detects diesel exhaust fluid pressure greater than 600 kPa (87 psi).	
P2BA7	DEF tank level critically low.	

DTC No.	Detected condition	Action taken when DTC is CRNT
U02A2	ECM communication with DEF quality sensor (CAN2).	Engine torque reduced.
P0016	ECM detects crankshaft position does not match camshaft position.	
P0087	ECM detects measured fuel rail pressure below commanded fuel rail pressure by at least 200 bar (2,900 psi).	
P0088	ECM detects fuel rail pressure greater than commanded fuel rail pressure by 200 bar (2,900 psi) or fuel rail pressure exceeded 2150 bar (31,183 psi).	
P0184	Difference between fuel temperature and ambient temperature is greater than 15°C (59° F) or 25° C (77° F).	
P0252	ECM detects fuel pump actuator overheated.	
P0524	ECM detects engine oil pressure less than 60 kPa.	
P061A	Fueling commands inconsistent with engine running conditions.	
P061B		
P1451	ECM detects soot load of diesel particulate filter reached first stage plugging.	
P203B	DEF control module detects DEF tank level sensor signal circuit less than 0.3V.	
P203C		
P203D	DEF control module detects DEF tank level sensor signal circuit greater than 4.8V.	
P205C	DEF control module detects DEF tank temperature sensor signal circuit less than 0.17V.	
P205D		
P206B	DEF quality sensor reports an internal error.	
P21C4	ECM detects DEF fluid line heater relay driver signal short to voltage.	
P229E	Internal circuit error detected in outlet NOx sensor.	
P2413	ECM detects EGR temperature greater than 250° C (482° F).	
P2BAC	ECM detects critical DTCs related to engine operation are CRNT and engine continues to operate.	

DTC No.	Detected condition	Action taken when DTC is CRNT
U040D	ECM communication with rotary turbine control valve actuator (CAN2).	• Active and stationary regeneration of diesel particulate filter disabled. • EGR valve operation disabled. • Engine torque reduced.
P009E	ECM detects fuel pressure relief valve closed-loop compensation value outside calibrated limits.	
P00AF	Rotary turbine control valve actuator detects internal error.	
P009E	ECM detects fuel pressure relief valve closed-loop compensation value outside calibrated limits.	
P00AF	Rotary turbine control valve actuator detects internal error.	
P0107	ECM detects charge air cooler outlet pressure signal voltage less than 0.2V.	
P0108	ECM detects charge air cooler outlet pressure signal voltage greater than 4.8V.	
P0237	ECM detects low pressure turbocharger boost pressure sensor signal voltage less than 0.2V.	
P0238	ECM detects low pressure turbocharger boost pressure sensor signal voltage greater than 4.8V.	
P0405	ECM detects EGR valve position signal voltage less than 0.3 V.	
P0406	ECM detects EGR valve position signal voltage greater than 4.7V.	
P046C	ECM detects EGR valve unable to reach commanded position.	
P0489	ECM detects low voltage on EGR valve.	
P0490	ECM detects high voltage on EGR valve.	
P1A62	Turbocharger failed to detect endpoint or stop references.	
P200C	DPF temperature sensor module temperature reading greater than 810° C (1,490° F).	
P2262	Rotary turbine control valve actuator could not meet commanded position.	
P226C	ECM detects difference between actual and commanded turbocharger position is too large.	
P22CB	ECM detects compressor bypass solenoid circuit shorted low.	
P22CC	ECM detects compressor bypass solenoid circuit open or shorted high.	
P242F	ECM detects soot load of DPF filter exceeds maximum.	
P244A	ECM detects DPF differential pressure too low.	
P245C	ECM detects EGR bypass valve circuit short to ground.	
P245D	ECM detects EGR bypass valve circuit short to voltage.	
P2493	ECM detects EGR bypass valve stuck.	
P2494	ECM detects EGR bypass valve position signal voltage less than 0.3V.	
P2495	ECM detects EGR bypass valve position signal voltage greater than 4.7V.	

DTC No.	Detected condition	Action taken when DTC is CRNT
U040F	DEF control module communication with ECM (CAN2).	• DEF fluid injection disabled. • Engine torque reduced.
U3017	ECM communication with SCR temperature sensor module (CAN2).	
P1624	DPF temperature sensor module reports an internal error.	
P1625	DPF temperature sensor module supply voltage greater than 18V.	
P1626	DPF temperature sensor module supply less than 6.5V.	
P1627	DPF temperature sensor module internal temperature greater than 150° C (302° F).	
P1628	ECM detects SCR temperature sensor module intermittent supply voltage resulting in internal module reset.	
P202E	ECM detects DEF dosing valve stuck.	
P204A	DEF dosing valve unable to maintain commanded pressure.	
P204C	ECM detects DPF differential pressure sensor signal voltage less than 0.5V.	
P204D	ECM detects DPF differential pressure sensor signal voltage greater than 4.5V.	
P207F	• DEF quality sensor detects DEF concentration below critical threshold. • DEF quality sensor unable to determine DEF concentration.	
P208A	DEF control module detects an open circuit in DEF dosing pump motor phases.	
P208C	DEF control module detects DEF dosing pump motor circuit short to ground.	
P208D	DEF control module detects DEF dosing pump motor circuit short to voltage.	
P20FF	ECM detects and internal error in DEF control module via CAN2.	
P214C	ECM detects SCR temperature sensor module above critical threshold.	
P21CA	DEF control module supply voltage greater than 5.1V or less than 4.8V.	
P2202	Internal circuit error detected in intake NOx sensor.	
P2454	ECM detects DPF sensor differential pressure signal voltage less than 0.25V.	
P2455	ECM detects DPF sensor differential pressure signal voltage greater than 4.7V.	
P2456	ECM detects DPF outlet pressure greater than 1.5 kPa (0.22 psi) or less than 1.5 kPa (0.22 psi).	
P2470	SCR temperature sensor module signal out of range low.	
P2471	SCR temperature sensor module signal out of range high.	
P2472	ECM detects SCR temperature sensor module signal irrational.

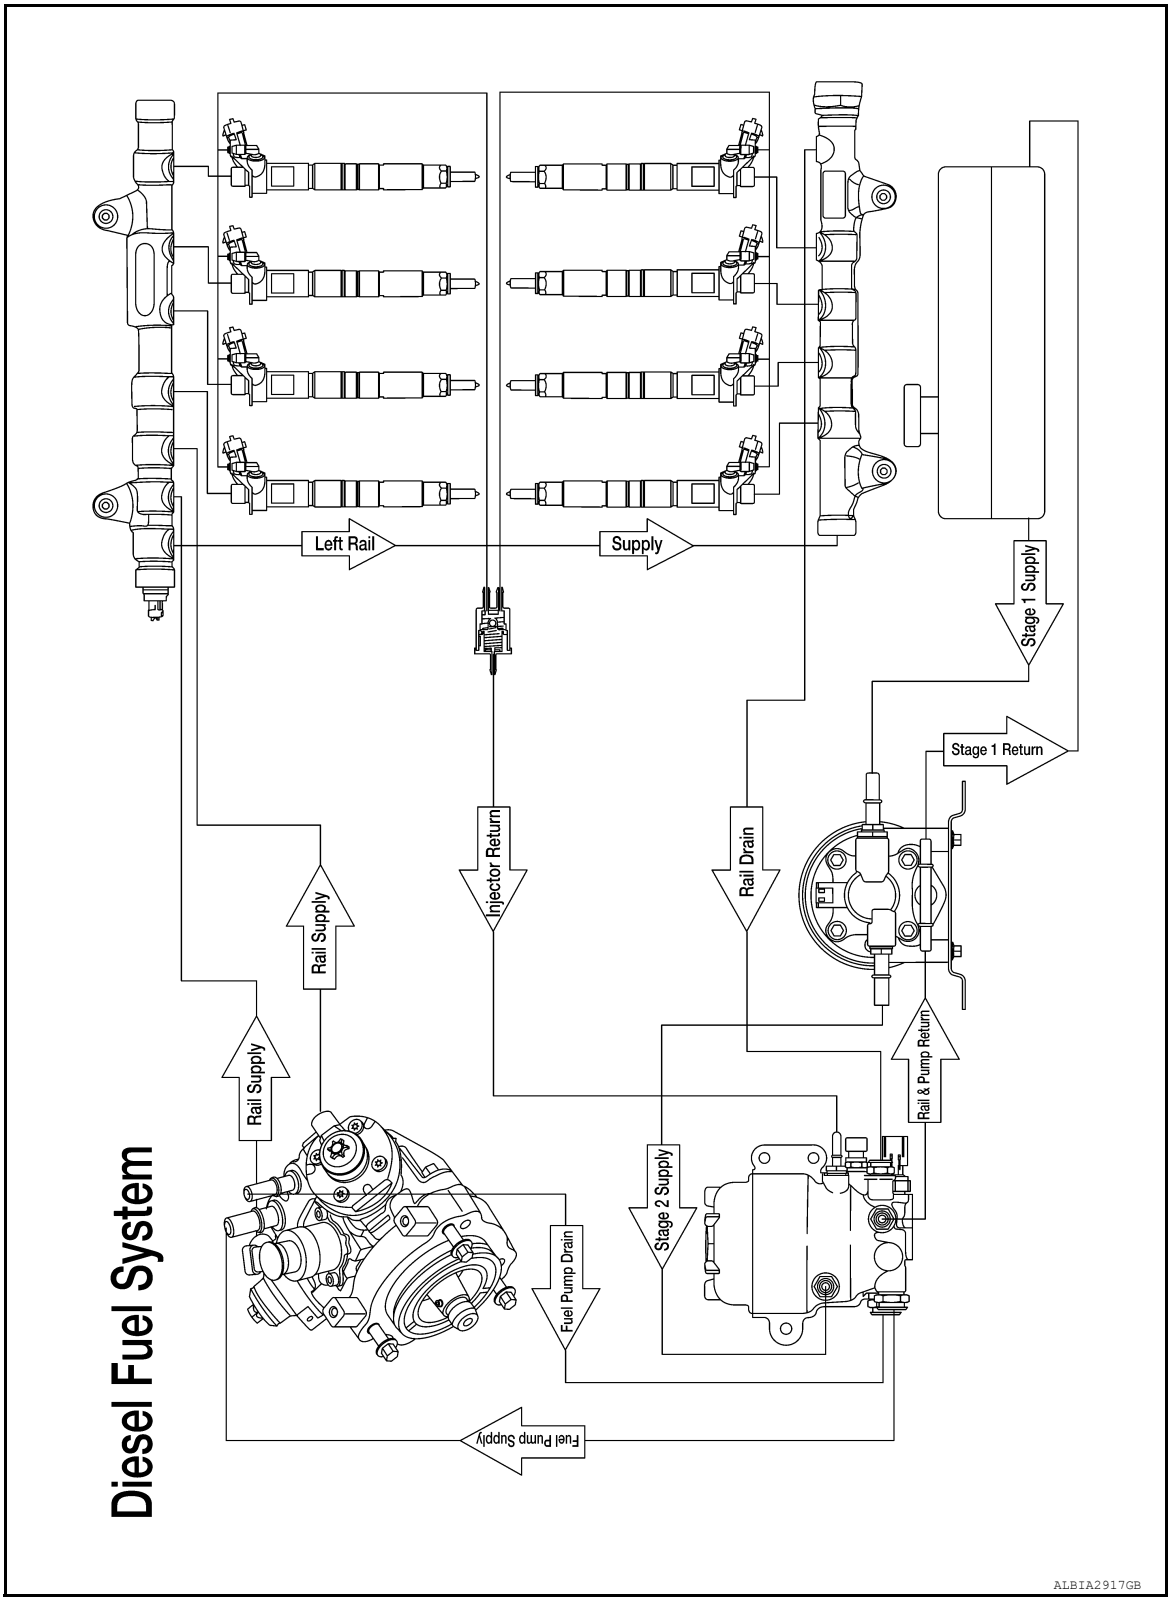
P242D	DPF temperature sensor module detects an open or short to voltage condition.	
P245F	ECM detects DPF differential pressure greater than 1.5 kPa (0.44 Hg).	ECM uses default value for DPF differential pressure sensor.
P2460	ECM detects DPF differential pressure sensor signal voltage less than 0.25V.	• ECM uses default value for DPF differential pressure sensor. • Active and stationary regeneration of diesel particulate filter disabled. • Engine torque reduced.
P2461	ECM detects DPF differential pressure sensor signal voltage greater than 4.7V.	
P2462	ECM detects DPF differential pressure greater than 1.5 kPa (0.44 Hg).	• ECM uses default value for DPF differential pressure sensor. • Active and stationary regeneration of diesel particulate filter disabled. • EGR valve operation disabled. • Engine torque reduced.
P2463	ECM detects soot load of diesel particulate filter moderately severe.	• Mobile regeneration of diesel particulate filter disabled. • EGR valve operation disabled. • Engine torque reduced.
P2483	ECM detects SCR temperature sensor module signal irrational.	• ECM uses default value for SCR catalyst outlet temperature. • DEF fluid injection disabled. • Engine torque reduced.
P2541	ECM detects fuel pressure signal voltage less than 0.2V.	• ECM uses default value for fuel delivery pressure reading. • Engine torque reduced.
P2542	ECM detects fuel pressure signal voltage greater than 4.8V.	ECM uses default value for fuel delivery pressure reading.
P2579	ECM detects turbocharger shaft stuck.	ECM estimates turbocharger speed.
P2580	ECM detects turbocharger speed less than 15,000 rpm.	

FUEL SUPPLY CONTROL

FUEL SUPPLY CONTROL : System Description

INFOID:0000000013472094

SYSTEM DIAGRAM



FUEL SUPPLY

Fuel System

The fuel system on the Cummins 5.0L V8 Turbo Diesel engine includes low pressure, high pressure, and return paths. The following information introduces the main components of the fuel delivery system and traces the flow of fuel from the fuel tank to the injectors and back to the fuel tank.

Fuel Inlet Restriction

A vacuum gauge can be installed between the fuel tank and the stage 1 fuel filter lift pump assembly to check for fuel line restriction. If the fuel inlet restriction is too high, check the fuel lines from the tank for proper size. Make certain there are no kinks or bends in the fuel lines and the fuel lines are not clogged between the fuel supply line and the inlet to the lift pump. The maximum allowed fuel inlet line restriction vacuum at idle is 20 kPa (6 in-Hg). With the engine running, there should not be any air bubbles in the clear pressure adapter test line at the Stage 1 fuel filter inlet. Air bubbles are a sign of severe inlet restriction, loose suction-side fittings, or a system that is not yet primed. If the fuel inlet restriction is too high, check the fuel lines from the tank for proper size. Make certain there are no kinks or bends in the fuel lines and the fuel lines are not clogged. Check the fuel supply tanks for debris (plastic wrappers, paper, etc.) that can intermittently block the fuel pickup tubes.

Check the fuel lines for internal damage, such as damaged wall linings, that can intermittently block fuel flow.

- Check the fuel supply tanks for debris (plastic wrappers, paper, etc.) that can intermittently block the fuel pickup tubes.
- Check the fuel lines for internal damage, such as damaged wall linings, that can intermittently block fuel flow.
- Check the fuel tank vents or fill cap vents for plugging.
- Make sure there are no clogged fuel strainers or filters or malfunctioning check valves.

Stage 1 Fuel Filter Housing

The stage 1 fuel filter housing is located just in front of the fuel tank. The stage 1 fuel filter housing includes the following components:

- 5-micron fuel filter with replaceable O-ring: filters particles and water from the fuel.
- 12-volt fuel lift pump: supplies low-pressure fuel to the stage 2 filter housing and high pressure.
- Water in fuel (WIF) sensor: detects the presence of water in the bottom of the stage 1 fuel filter housing and illuminates an icon in the combination meter.
- Water/fuel separator drain valve: 1/4-turn drain valve used for draining unwanted water from the filter housing.
- Thermal recirculating valve: when fuel is cold, this valve redirects fuel back to the unfiltered side of the stage 1 fuel filter housing rather than to the fuel tank
- Pressure relief valve to protect the 12-volt lift pump.

Lift Pump

Whenever the ignition is cycled ON, the lift pump operates for approximately 1 minute to prime the fuel system. Normal lift pump supply pressure is approximately 350 to 600 kPa absolute (3.5 to 6 bar) (51 to 87 psi) with the engine cranking or running.

Stage 2 Fuel Filter Housing

The stage 2 fuel filter housing is mounted on the intake manifold at the left side of the engine. This assembly also serves as a supply and return manifold for fuel. The stage 2 fuel filter housing includes the following components:

- 3.5-micron fuel filter with replaceable O-ring: filters particles in the fuel.
- Fuel Pressure Sensor: senses lift pump pressure in the stage 2 filter housing after the filter.
- Fuel Temperature Sensor: senses the temperature of fuel to help calculate fuel delivery requirements based on viscosity.

High Pressure Fuel Pump

The high pressure fuel pump is located at the front of the engine valley. The 2-cylinder pump is sealed to the cylinder block with bolts and an O-ring and is driven by a chain and sprocket at a 1:1 ratio to the crankshaft. The fuel pump is timed from the factory and includes an alignment key that is turned to the 2 o'clock position when cylinder 1 is at TDC.

The high pressure fuel pump is the first component in the high pressure side of the fuel system.The pump can generate fuel pressures up to 29,000 psi (2,000 bar) under high-load operation. When filtered fuel from the stage 2 filter enters the pump, it is either pumped to the fuel rail or delivered back to the stage 2 fuel filter housing, depending on fuel pressure needs. A cascade overflow valve within the pump regulates fuel for lubrication and regulates fuel to the fuel pump actuator and to the fuel return. A high pressure check valve within the pump keeps high pressure from damaging the pump.

Fuel Rail Pressure Sensor

The fuel rail pressure sensor monitors the fuel pressure within the fuel rails and communicates this data to the ECM. The ECM uses fuel pressure data to adjust the PWM signal to the fuel pump actuator and fuel pressure relief valve to achieve the desired fuel pressure for optimum fuel injection.

Fuel Pressure Relief Valve

The fuel pressure relief valve is a normally open, PWM valve. The ECM monitors fuel rail pressure sensor data and adjusts the PWM signal to the fuel pump actuator and fuel pressure relief valve to maintain the desired fuel pressure. The fuel pressure relief valve can bleed excess fuel rail pressure from the rails through the fuel rail return line back to the stage 2 fuel filter housing.

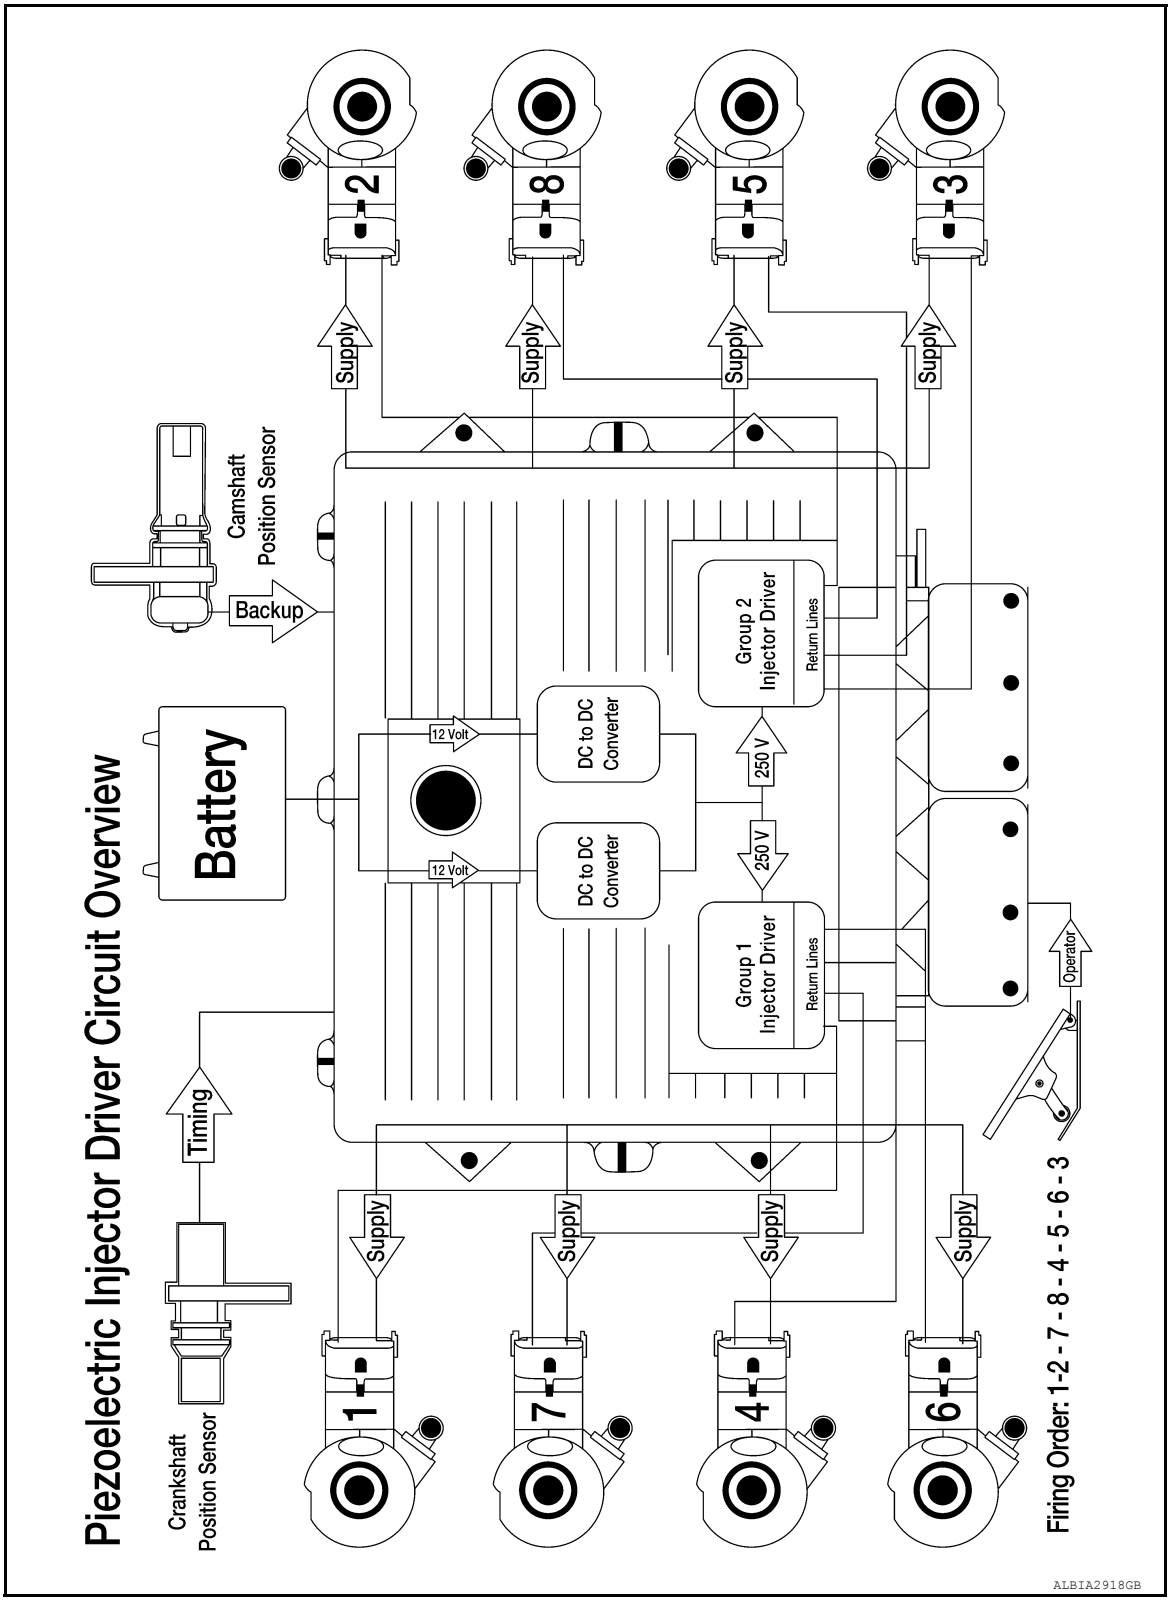
When the engine is turned off, the fuel pressure relief valve opens, allowing fuel pressure inside the rail to depressurize. It may take up to 10 minutes for high pressure to bleed down enough to service high pressure fuel system components.

FUEL INJECTION CONTROL

FUEL INJECTION CONTROL : System Description

INFOID:0000000013472100

SYSTEM DIAGRAM



SYSTEM DESCRIPTION

If the fuel injector, fuel rail pressure sensor or fuel pressure relief valve is replaced, the fuel table reset procedure must be performed with CONSULT. The fuel table reset will reset the data tables for corresponding components to factory default values (unlearned values).

Fuel Injectors

Fuel Injector Supply Lines

Fuel injector supply lines carry high pressure fuel from the fuel rails to the supply fittings on the fuel injectors. Each supply line includes a vibration isolator to enhance durability. Always note the position of the fuel injector supply line prior to removal so it can be installed in the same orientation. As with all fuel system fittings, ports should be capped for the duration of the repair to prevent debris from entering the fuel system. When installing a fuel injector supply line, hand tighten the fittings first and then torque to specification. Finally, perform the high pressure fuel system leak test to make sure the system does not leak.

Fuel Rail Return Line

A fuel rail return line is located between the left fuel rail and the stage 2 fuel filter housing. When the ECM determines that fuel pressure should be reduced in the fuel rails, the fuel pressure relief valve allows fuel in the rail to be drained to the stage 2 fuel filter housing (return manifold) through the fuel rail return line.

If the fuel rail return line becomes restricted, a no-start condition may occur. If the fuel system cannot control fuel rail pressure by bleeding fuel from the rails, fuel flow will stop.

Fuel Injectors

This engine uses eight piezoelectric fuel injectors to supply atomized fuel to the cylinders for combustion. Fuel is supplied to the top of the injector, and return fuel is directed back to the stage 2 filter housing through a return line. Injector hold-down clamps are used to secure pairs of adjacent injectors. Each injector includes a replaceable O-ring and a replaceable sealing washer where the injector seals in the cylinder head. A special tool must be used to remove the injectors without damage.

Piezoelectric injectors require electrical current, high pressure fuel, low pressure fuel, and reversed electrical current to inject fuel and close the injector after injection. Piezoelectric injectors use high and low fuel pressure within the injector and piezo crystals within a stack of ceramic discs. High pressure fuel near the top of the high pressure control chamber holds the injector needle in place until it is time to inject. When the ECM sends current through the piezo stack, the piezo crystals expand. This expansion is amplified by the hydraulic pressure of the fuel in the low pressure chamber to move the control valve. High pressure fuel in the control chamber exits to the low pressure chamber when the control valve opens. This action unseats the injector needle and fuel is injected. To close the injector, current must flow in the opposite direction (reverse polarity) to retract the piezo crystals and allow fuel pressure in the injector to seat the injector needle.

The ECM includes two individual injector driver circuits and two internal DC to DC converters. These converters step the 12V feed from the battery up to 170V when the injectors are connected. Each converter controls four injectors, with each driver controlling every other injector in the firing order. Immediately following injection, the polarity of the injector circuit is reversed, allowing the piezo stack to retract.

The injector driver circuit is set up so that companion cylinders are on the same group of injectors on the driver circuit. The circuit is designed to supply the 250V to only a single group of injectors at one time so that a short in one of the groups will not adversely affect the other group. When the circuit is operating with the piezoelectric injectors connected, the circuit will supply 170V with amperage as high as 19 amps. However, if the injector is disconnected, the voltage can be as high as 250V. It is never advised to disconnect piezoelectric injectors while running as engine damage or physical injury can occur.

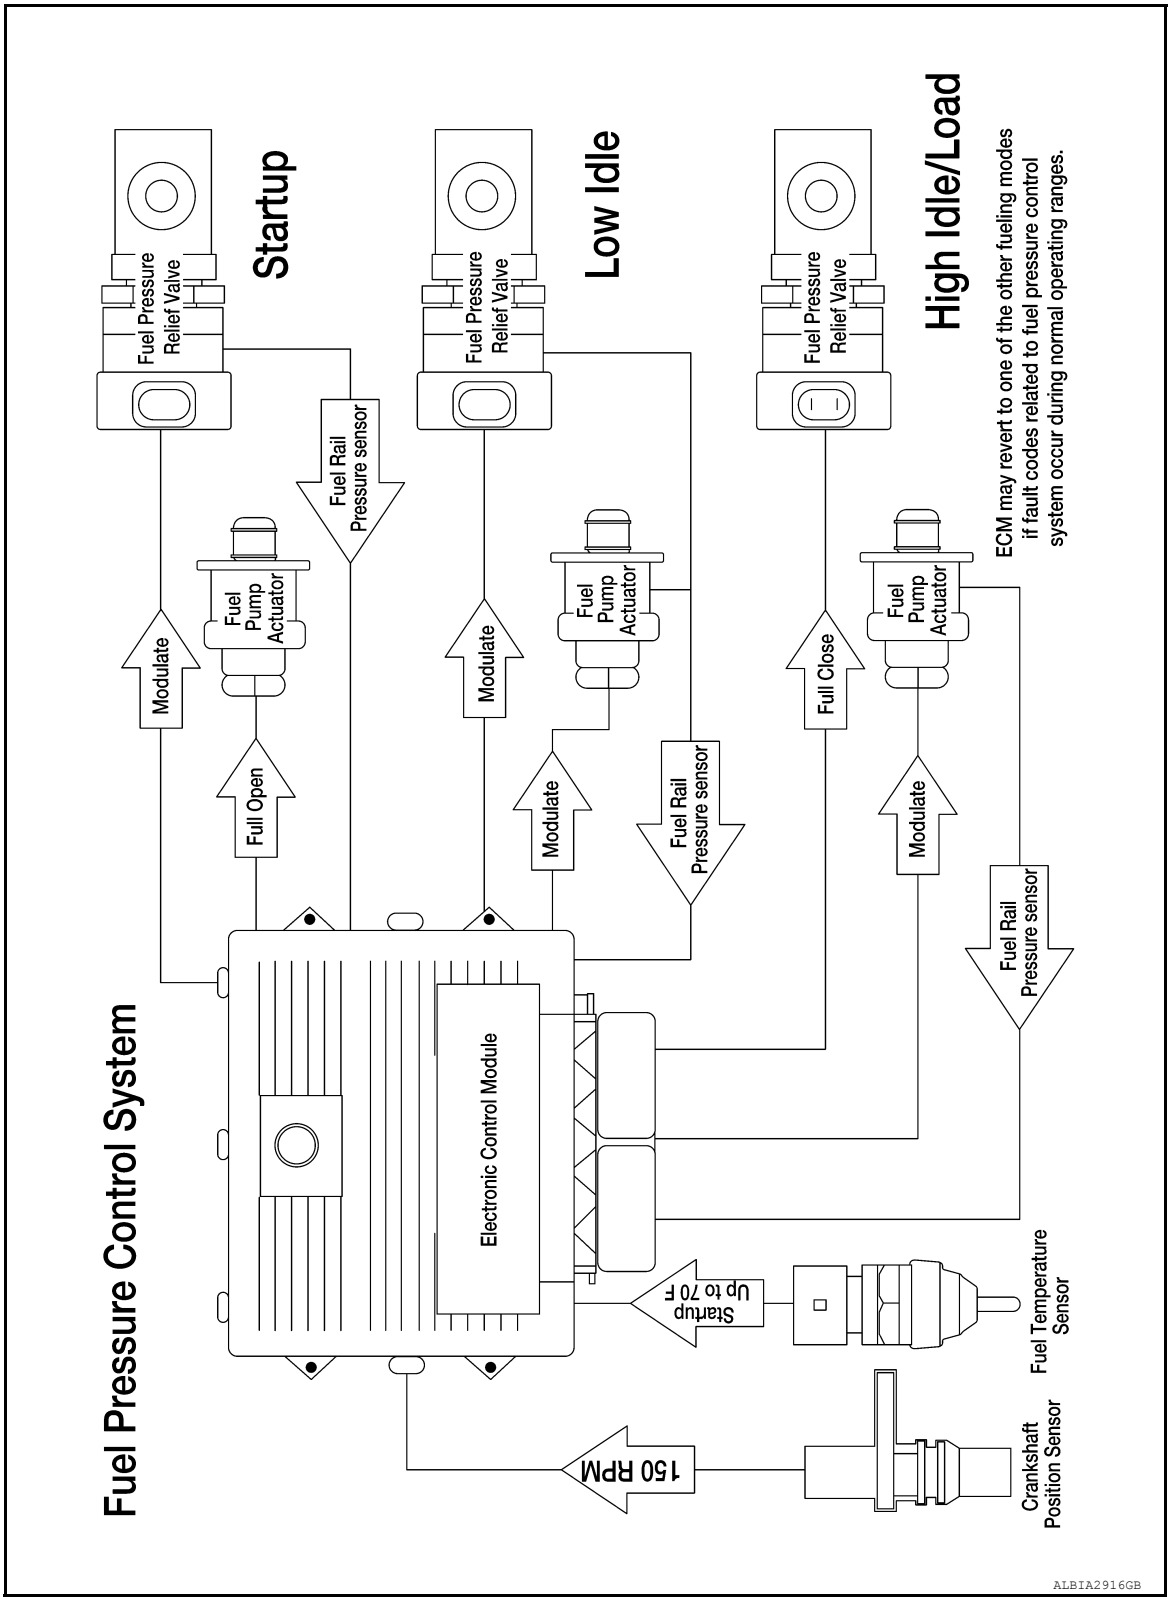
Primary inputs for injection include the accelerator pedal sensor input (driver) and the crankshaft position sensor. After the ECM determines top dead center of cylinder number 1 on the compression stroke at startup (using the camshaft position sensor), the ECM then relies on the crankshaft position sensor to control the timing of the injections. A variety of other inputs affect injection timing and volume, such as charge air cooler outlet pressure, coolant temperature, and speed/load conditions. At least 150 rpm and a minimum rail pressure of 1,800 psi is necessary for the engine to start.

FUEL PRESSURE CONTROL

FUEL PRESSURE CONTROL : System Description

INFOID:0000000013472103

SYSTEM DIAGRAM



SYSTEM DESCRIPTION

The ECM controls fuel rail pressure by opening, closing, or modulating the fuel pump actuator and fuel pressure relief valve. Various fueling modes are available based on engine load, temperatures, and pressures. The following fueling modes are available:

- Startup: This mode is used until fuel temperature reaches approximately 70° F. The ECM modulates the fuel pressure relief valve while allowing the fuel pump actuator to stay open.
- Low Idle: The ECM modulates the fuel pump actuator and fuel pressure relief valve as needed to achieve the desired fuel rail pressure.
- High Idle/Load: This mode is used under high load conditions. The ECM closes the fuel pressure relief valve to help build fuel pressure for additional fuel delivery needs. The ECM modulates the fuel pump actuator as necessary to maintain a higher fuel pressure.

ENGINE TORQUE CONTROL

ENGINE TORQUE CONTROL : System Description

INFOID:0000000013416169

SYSTEM DESCRIPTION

The torque function can be explained by the following:
- Accessories torque management
- Engine torque losses
- Minimum available torque
- Maximum available torque
- Fast set-points to complete torque request
- Final torque requests setting

ACCESSORIES TORQUE MANAGEMENT

Air Conditioning Power

The amount of power absorbed by the air conditioning is useful for the engine control to compute the torque requirement for air conditioning. Therefore, ECM can adapt dynamically the engine speed regulation depending on the load variations.

The power absorbed by the air conditioning depends on the refrigerant pressure and the compressor speed.

The air conditioning system power correction for idle speed regulation avoids engine speed undershoots and overshoots at the compressor compressed volume variation.

ENGINE TORQUE LOSSES

The torque losses are the sum of three components: the rubbing, the pumping, and the torque losses caused by accessories consumption.
- The basic friction torque loss uses the coolant temperature sensor and the engine speed for the torque correction.
- the pumping torque is an estimation of the mean indicated torque in the low pressure cycle by using intake air and exhaust gas pressures, the engine capacity displacement, the number of cylinders, and the form factor of the low pressure cycle.
- Accessories′ consumption is caused by additional electrical (electric consumers) and mechanical (air conditioning) components.

MINIMUM AVAILABLE TORQUE

The minimum available torque is used for the minimum driver set point calculation and the intersystem information.

The minimum torque is designed with a hyperbolic shape depending on the difference between the engine speed and the idle speed set-point:
- When the engine speed is under the idle speed set-point, the minimum torque is equal to the hyperbolic torque which increases to avoid engine stalling.
- When the engine speed is over an engine speed threshold, the minimum torque reaches the engine torque losses with a ramp.

When the engine starts, a specific torque set-point is calculated to ensure the engine start. This torque is dependent on the engine speed and the coolant temperature.

At first, a calculation of the starting torque value is performed. In case of a difficult start (too long), this torque may be increased thanks to ramp.

The start torque offset is progressively set to zero to ensure a transition with the current torque set-point.

MAXIMUM AVAILABLE TORQUE

The maximum available torque results in a minimum selection including all powertrain constraints:
- Transmission torque limitation
- Maximum engine torque
- Torque reduction for the heating protection
- Torque for the smoke limitation

• Fail-safe

Transmission torque limitation

This limitation is the maximum torque to protect the transmission from a mechanical overload:

• The limitation value is directly supplied by the automatic transmission.

Maximum engine torque

The maximum torque depends on the engine speed and the manifold air pressure. It is corrected by:

• The soot mass value in order to take into account the limitations due to the particulate filter
• The atmospheric pressure
• The intake pressure temperature sensor

The maximum engine also depends on the combustion mode (the normal or the regeneration combustion mode). In some conditions (DPF clogging, etc.), this maximum available torque is reduced in order to keep the engine within its safety working limits.

Torque reduction for the heating protection

This torque limitation is dedicated to the protection of the engine from an overheating. This limitation calculation depends on the engine speed, the engine coolant temperature, the intake air temperature and the vehicle speed.

Torque for the smoke limitation

This torque limitation is used to reduce the smoke emissions during a high torque driver request. The maximum fuel mass that can be injected is limited according to the maximum richness depending on the gear ratio, the engine speed, and the intake air mass flow. This value is corrected depending on the vehicle speed and the coolant temperature.

Fail-safe

The ECM limits engine torque in case of malfunction of engine component or ECM.

Depending on the engine components, ECM activates the fail-safe mode of the torque limitation level 1 (low limitation), level 2 (moderate limitation), or level 3 (severe limitation function of vehicle speed).

FAST SET-POINTS TO COMPLETE TORQUE REQUEST

For each combustion mode (the normal combustion mode, the regeneration combustion mode, and the protection combustion mode), a torque model is designed to calculate the total fuel mass quantity, the estimated mean effective torque, the combustion efficiency and the current fuel consumption for the final torque set-point and the engine current speed.

The total fuel mass quantity is corrected to take into account the main injection advance deviation and the mass air flow deviation.

For each combustion mode, the after and the post injection relative efficiencies are calculated to determine the fuel mass quantity needed to perform the engine inner torque.

The after injection relative efficiency is equal to one in normal combustion mode and to zero in a regeneration combustion mode or in a protection combustion mode.

The post injection relative efficiency is a function of the post injection timing and the difference between the current and the basic post injection timing.

FINAL TORQUE REQUESTS SETTING

The final torque requests are computed by the arbitration with the driver request, the intersystem torque request, and the torque limitations.

The engine torque losses and the idle speed torque are added.

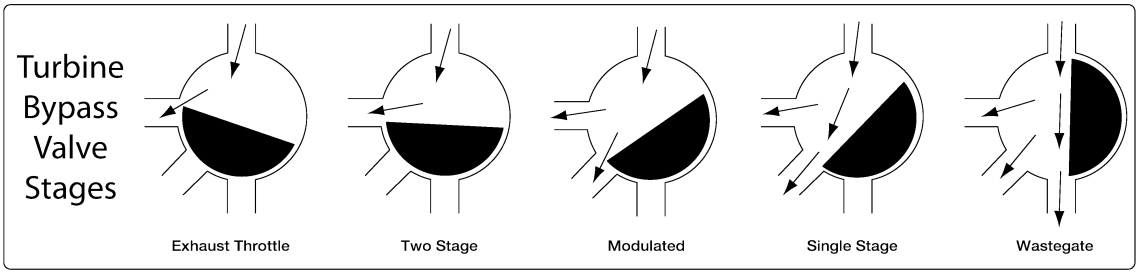
The static torque is the maximum available torque. The raw torque is used by the turbocharger and the EGR regulations.

The set-point torque is used for fuel mass calculation.

TURBOCHARGER BOOST CONTROL

TURBOCHARGER BOOST CONTROL : System Description

INFOID:0000000013416166



ALBIA2924GB

DESCRIPTION

The ECM controls the positions of the compressor bypass valve and rotary turbine control valve to produce different turbocharger modes, depending on the driving condition or aftertreatment system needs. The following 5 positions describe these different turbocharger modes.

CAUTION:

To stop the engine immediately after high-load driving, park the vehicle with the engine at idle before turning OFF the ignition switch.

Exhaust Throttle

Exhaust Throttle mode is used at lower engine speeds and lower torque situations. During Exhaust Throttle mode, air enters the low pressure turbocharger compressor. The compressor bypass valve is closed. Air travels into, and is compressed in the high pressure turbocharger compressor because it is the only path for air flow when the compressor bypass valve is closed. The rotary turbine control valve is positioned to restrict exhaust flow. This creates heat for the aftertreatment system during regeneration, drives additional EGR into the intake manifold, and provides a faster engine warm-up.

Two Stage

Two Stage operation is used when boost pressure is needed quickly, such as high load conditions off idle. During Two Stage mode, air enters the low pressure turbocharger compressor.The compressor bypass valve is closed. Air travels into, and is compressed in the high pressure turbocharger compressor because it is the only path for air flow when the compressor bypass valve is closed. The rotary turbine control valve directs all exhaust flow to the high pressure turbocharger turbine first, and then to the low pressure turbocharger turbine. The high pressure turbocharger spins, producing boost quickly to eliminate turbo lag.

Two Stage Modulated

Two Stage Modulated operation occurs when transitioning between Two Stage and Single Stage operation. When Two Stage Modulated operation is needed, the compressor bypass valve opens. When the compressor bypass valve opens, the path of least resistance becomes the passage from the low pressure turbocharger compressor to the charge air cooler. The rotary turbine control valve directs exhaust flow in varying proportions to both high and low pressure turbocharger turbines.

Single Stage

Single Stage operation occurs when maximum boost is needed for higher speeds or high loads when the high pressure turbocharger can no longer supply sufficient air volume to achieve desired boost. During Single Stage operation, the compressor bypass valve remains open, allowing unrestricted air flow from the low pressure turbocharger to the charge air cooler. The rotary turbine control valve directs full exhaust flow to the low pressure turbocharger turbine with only residual exhaust gas exposed to the high pressure turbocharger turbine.

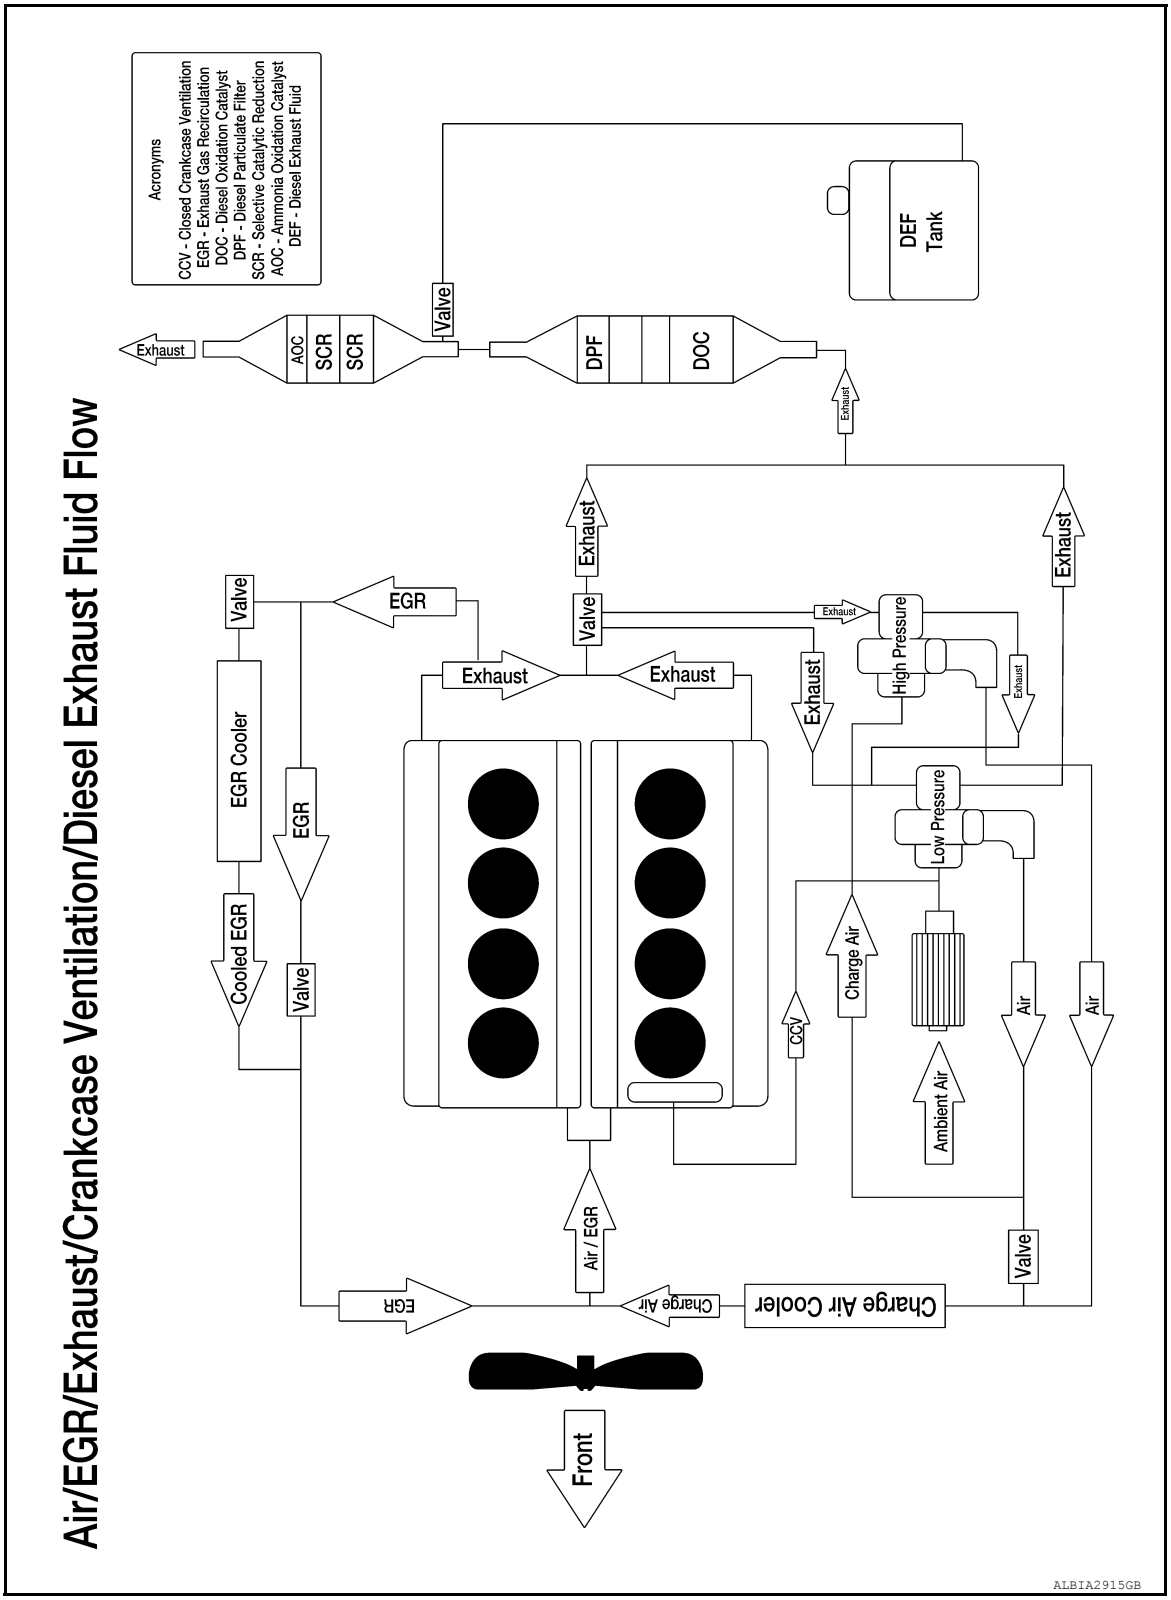
Wastegate

Wastegate operation is used to limit boost pressure. During Wastegate operation, the compressor bypass valve remains open, allowing unrestricted air flow from the low pressure turbocharger to the charge air cooler. The rotary turbine control valve directs exhaust flow directly to the aftertreatment system, bypassing both turbines.

EGR SYSTEM

EGR SYSTEM : System Description

INFOID:0000000013416167



DESCRIPTION

The EGR system is designed to reduce oxides of nitrogen (NOx) in the exhaust stream that result from diesel combustion. The following information describes the function of EGR components and EGR operation.

EXHAUST MANIFOLDS AND EGR PIPING

After combustion, exhaust gases exit the combustion chambers through the exhaust manifolds and enter the EGR piping. Exhaust gases can take three distinct directions, depending on which is the path of least resis-

tance. The ECM controls the positions of the rotary turbine control valve, EGR valve, and EGR cooler bypass valve to determine the paths that exhaust gas takes.

EGR VALVE

The EGR valve is located on the right side of the engine at the back of the EGR cooler. The ECM varies the position of the EGR valve to regulate the amount of exhaust gas that enters the EGR cooler from the right bank EGR pipe. The EGR valve includes an internal sensor that provides EGR valve position to the ECM. The EGR valve may close under certain conditions like cold start, low engine speeds or loads, or if active EGR DTCs are present.

EGR COOLER

The EGR cooler is located on the right side of the engine just outside the air intake manifold. The EGR cooler assembly includes a cast iron coolant manifold that secures the cooler to the air intake manifold. The EGR cooler receives engine coolant from the water pump and circulates coolant through the manifold and cooler to lower the temperature of exhaust gases before they are recirculated into the combustion chamber as cooled EGR. When EGR gases are cooled, combustion temperatures are lowered, and as a result, NOx levels are also lowered. Coolant flows through the EGR cooler in the same direction as exhaust gas flow. The EGR valve is also cooled by engine coolant.

EGR COOLER BYPASS VALVE

The EGR cooler bypass valve is located behind the air intake connector. The EGR cooler bypass valve allows EGR to be diverted around the EGR cooler and directly into the charge air stream when conditions require (cold start, regeneration, or times when combustion temperatures must be raised.) The EGR cooler bypass valve includes an internal sensor that communicates EGR cooler bypass valve position to the ECM. The EGR cooler bypass valve is also cooled by engine coolant.

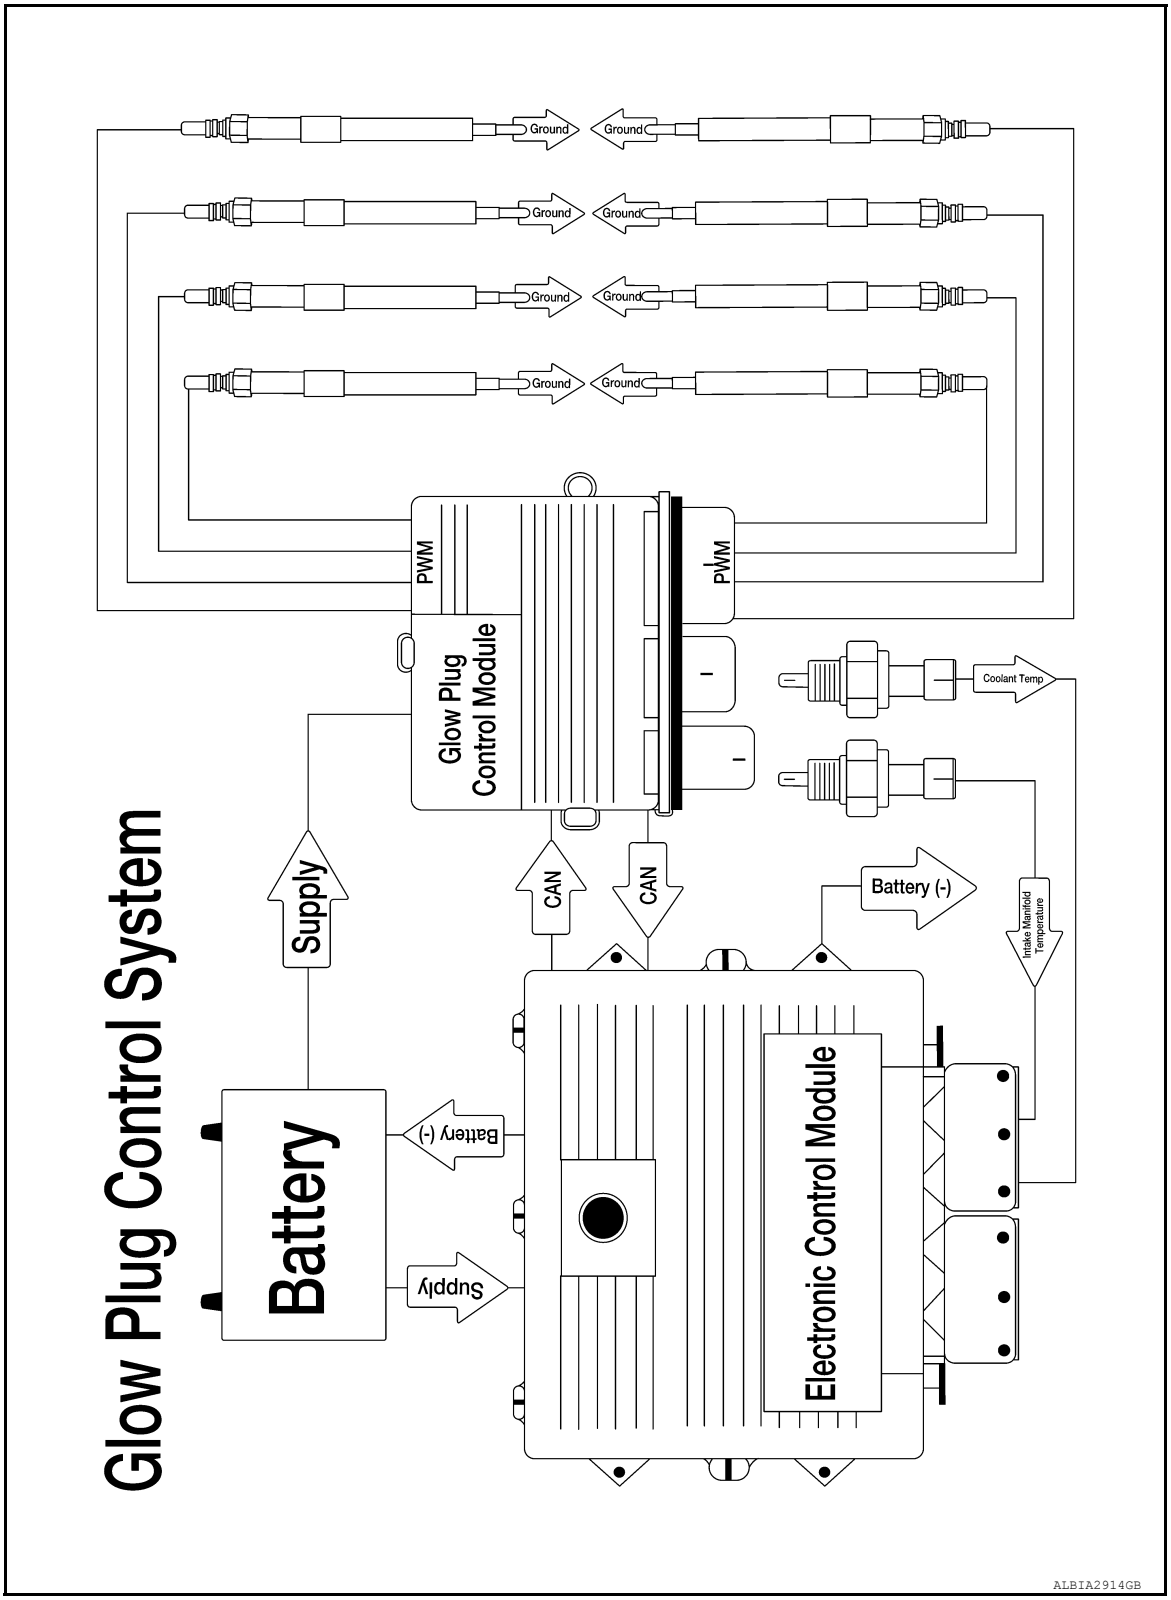
EGR FLOW CALCULATIONS

During Exhaust Throttle mode, the ECM closes the EGR valve and opens the EGR cooler bypass valve to prevent EGR cooling. This is done to heat the engine quicker during cold start and for regeneration. For all other turbocharger modes, the ECM opens or closes the EGR valve and EGR cooler bypass valve as needed based on pressures and temperatures. The ECM compares the charge air cooler outlet pressure sensor and exhaust gas pressure sensor measurements to help determine the EGR flow relative to the position sensors in the EGR valve and EGR cooler bypass valve. The ECM also uses the EGR temperature sensor to determine the temperature of EGR gases before they mix with charge air. If this temperature is too high, the ECM may command the EGR valve closed to protect the EGR cooler from high temperature damage. The ECM also uses the air intake manifold temperature sensor to calculate EGR entering the air intake manifold prior to combustion. CONSULT data monitor item “FAF/EGR AIR FLOW” displays the combination of mass air flow and EGR air flow.

GLOW CONTROL

GLOW CONTROL : System Description

INFOID:0000000013416173



SYSTEM DESCRIPTION

The glow plug control system is controlled by the ECM and the glow plug control module. The glow plug control module is located in the back left corner of the engine compartment to the left of the brake booster. The glow plug control module receives fused power directly from the batteries. The ECM communicates with the glow plug control module over the CAN. The glow plugs are grounded through the cylinder head. The ECM calculates an average temperature based on inputs from the engine coolant temperature sensor, the air intake

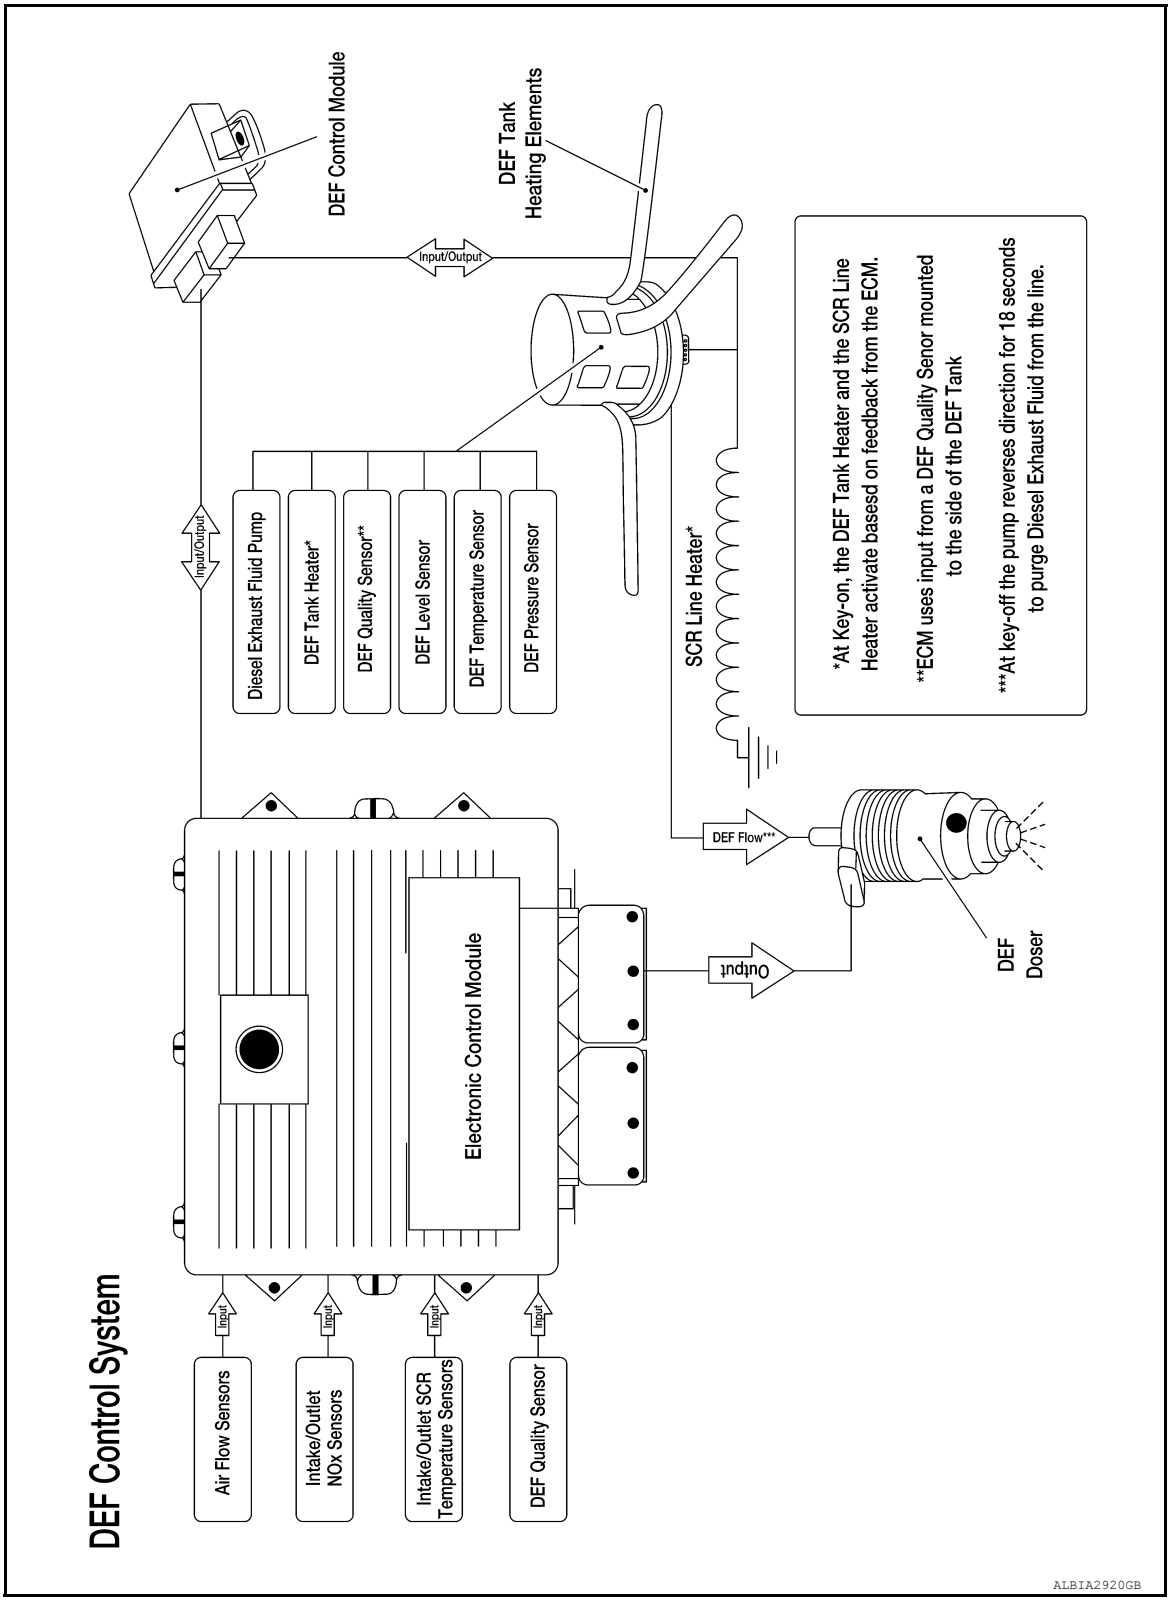
manifold temperature sensor, and an internal temperature sensor in the glow plug control module. After the required conditions are met, the glow plug control module sends an output to each of the eight glow plugs individually. The glow plug control module monitors the operation of individual glow plugs and reports failures back to the ECM. Glow plugs begin activating when the ignition switch is on during the wait-to-start sequence, and will continue to operate after cranking if the ECM determines the glow plugs are needed.

DEF CONTROL SYSTEM

DEF CONTROL SYSTEM : System Description

INFOID:0000000013472106

SYSTEM DIAGRAM



SYSTEM DESCRIPTION

The EGR system is very effective at reducing NOx emissions in the engine, but current NOx emissions standards require additional measures to further reduce this pollutant. As a result, the Cummins 5.0L V8 Turbo Diesel engine uses a comprehensive DEF system in conjunction with a SCR system to reduce NOx levels.

NOTE:

DEF may be referred to as “Reductant” in the CONSULT.

Diesel Exhaust Fluid

DEF is a non-toxic, non-flammable liquid that is injected into the exhaust stream to help convert NOx into harmless tailpipe emissions. DEF is composed of purified water and 32.5% urea. DEF is readily available from the pump at many fuel stations, or it can be obtained in containers. DEF is not harmful to handle, but it can be corrosive to certain metals. DEF may be stored in sealed containers, away from direct sunlight, and in temperatures between -5° and 25° C (23° and 77° F) for up to 18 months. However, for each 5° C (9° F) increment in above this recommended temperature, shelf life is reduced by 6 months. In addition, DEF should not remain in the DEF tank of an unused vehicle for more than 6 months. DEF has a freezing point of approximately -11° C (12° F). Water should never be added to DEF. Adding water to DEF will change the DEF concentration, which will reduce SCR effectiveness. Chemicals introduced by adding unpurified water can also corrode or damage aftertreatment components or damage the DEF dosing valve. In addition, adding water to DEF will raise the freezing point. DEF concentration can be tested using a refractometer that is calibrated for DEF.

DEF Tank

The DEF tank is mounted under the vehicle, behind the fuel tank. The DEF tank stores DEF that is used by the SCR system. DEF is added to the tank through a filler neck to the right of the diesel fuel filler neck. The DEF tank houses numerous components of the DEF system, including:

- DEF control unit
- DEF pump assembly
- DEF fluid line and heater
- DEF quality sensor

DEF Control Module

The DEF control module is mounted on the side of the DEF tank. The DEF control module monitors DEF component readiness and communicates this status to the ECM.

DEF Quality Sensor

A DEF quality sensor is also mounted on the side of the DEF tank. This sensor detects the level of urea in the DEF to ensure the DEF concentration is acceptable for effective dosing (approximately 32.5% urea). If the DEF quality sensor detects an incorrect DEF concentration, the DEF warning lamp in the combination meter will illuminate. In some cases, the MIL may also illuminate.

DEF Pump Assembly

The DEF pump assembly is mounted to the bottom of the DEF tank. The DEF pump is secured to the tank with a locking ring and O-ring seal. The DEF pump assembly includes the following components:

- DEF pump with non-replaceable filter
- DEF tank heater
- DEF level sensor
- DEF temperature sensor
- DEF pressure sensor
- DEF dosing line heater

The DEF pump is commanded by the DEF control unit based on communication from the ECM. The DEF control unit monitors the DEF temperature, DEF pressure, and DEF level sensors to determine if the pump should operate. When commanded to operate (dosing state), the DEF pump maintains pressure up to 90 psi in the DEF dosing line. DEF dosing will be covered in the upcoming topics in this section.

DEF Tank Heater

The DEF pump assembly includes a DEF tank heater to thaw frozen DEF in the tank. The DEF heater is a series of heated strips that are designed to evenly thaw frozen DEF in the tank. The DEF temperature sensor detects the temperature of the DEF and determines if tank heater operation is necessary. The DEF pump will not prime until the DEF temperature has reached a sufficient temperature for dosing to occur. The DEF heater will activate and continue to heat the DEF based on pre-programmed values in the ECM.

DEF Temperature Sensor

The DEF temperature sensor is used as a key input for determining DEF heater and DEF pump operation.

DEF Level Sensor

The DEF level sensor reports the quantity of DEF in the DEF tank to the ECM. DEF level can be checked in the combination meter at any time.

DEF Pressure Sensor

The DEF pressure sensor monitors the pressure in the DEF dosing line to make sure adequate pressure is available for DEF dosing. The DEF pressure sensor also monitors the line pressure after engine shut down to ensure DEF has been purged from the line.

DEF Dosing Line Heater

A DEF dosing line heater is located at the end of the DEF dosing line where it meets the DEF pump. This heater is used to heat the dosing line between the DEF pump and the DEF dosing valve to prevent freezing.

DEF Dosing Valve

The DEF dosing valve is located on the decomposition tube. The DEF dosing valve is a PWM valve that injects a fine mist of DEF into the exhaust stream when commanded by the ECM. This injection of DEF is sometimes called SCR dosing because the SCR catalyst uses DEF to chemically convert NOx to nitrogen and water.

DEF Dosing Condition

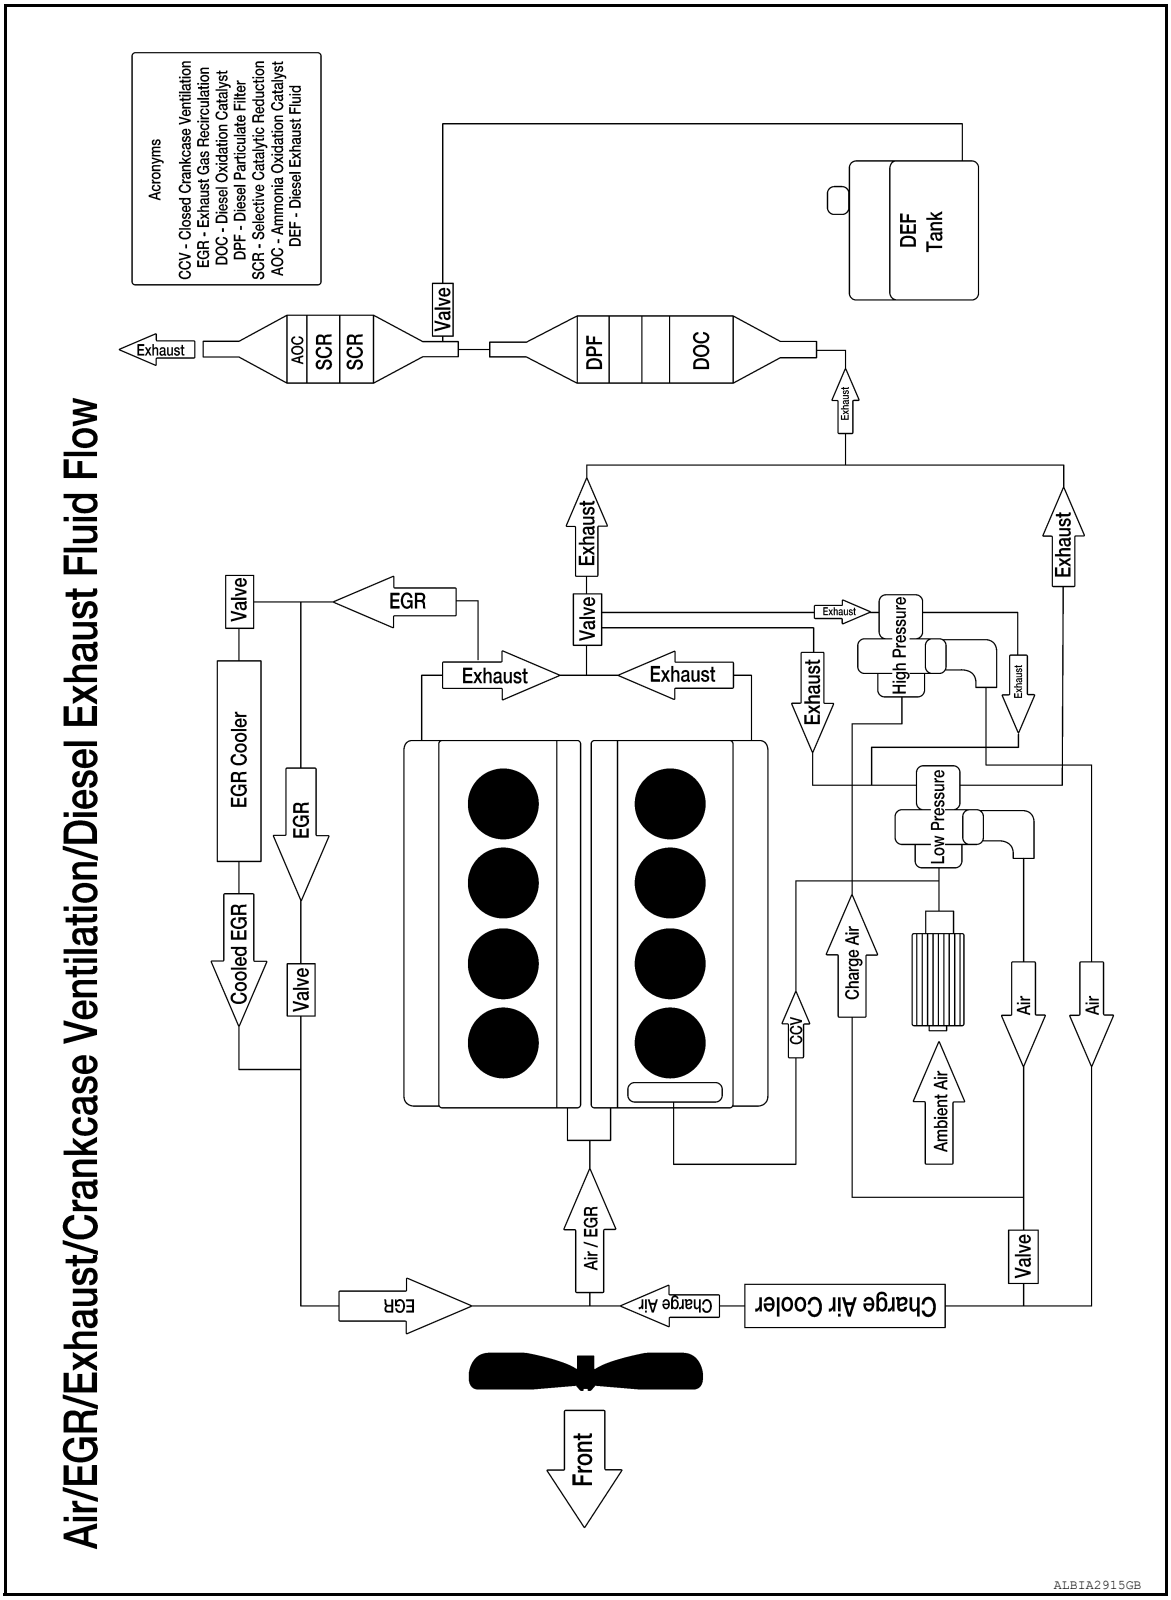
Certain conditions must be met for the DEF system to be active and ready to dose. Effective dosing requires the following:

- DEF tank level must be above 6% filled with DEF.
- DEF quality must be verified.
- The SCR intake and SCR outlet temperatures must be at least 392° F (200° C).
- Both NOx sensors must be turned on and reading NOx levels.
- No active SCR system diagnostic trouble codes can be present.
- DEF temperature must be above 27°F (-3°C).

AFTER TREATMENT SYSTEM

AFTER TREATMENT SYSTEM : System Description

INFOID:0000000013416171



SYSTEM DESCRIPTION

This system has two main functions:

- Use the present oxygen in exhaust gases to transform the CO in CO2, and the HC in CO2 and H2O.
- Increase the temperature of exhaust gases (with the exothermal energy of the oxidation reaction) to allow the regeneration in the DPF (Diesel Particulate Filter).

To be effective, the catalytic converter must reach the working temperature of 400° C (752° F) to possess an essential role in the operation of regeneration of the DPF.

The term “exhaust aftertreatment” refers to the use of additional components in the exhaust system that help produce chemical reactions to reduce harmful tailpipe emissions. It also includes many sensors that help determine system operation and evaluate the effectiveness of the system in reducing these emissions. The aftertreatment system is primarily used to reduce Particulate Matter (PM) and oxides of nitrogen (NOx) emissions. PM may also be referred to as soot.

The front of the aftertreatment system includes the Diesel Oxidation Catalyst (DOC), Diesel Particulate Filter (DPF), and various sensors that measure temperatures, pressures, and incoming NOx content. Soot is oxidized in this front portion of the system. The second part of the aftertreatment system includes the decomposition tube, Diesel Exhaust Fluid (DEF) dosing valve and associated components for DEF dosing, Selective Catalytic Reduction (SCR) catalysts, Ammonia Slip Catalyst (ASC), and various sensors that measure temperatures, pressures and outgoing NOx content. NOx is significantly reduced in this second part of the aftertreatment system.

AFTERTREATMENT SYSTEM

Aftertreatment components are presented in the order of exhaust flow from the front of the aftertreatment system to the end of the aftertreatment system. Mechanical components are presented first, followed by control modules and sensors.

Diesel Oxidation Catalyst (DOC)

The DOC is the first element in the aftertreatment system. The DOC is a flow-through catalyst that uses hydrocarbons (unburned fuel) to create heat in the aftertreatment system. This heat is necessary for the DPF to oxidize soot and for chemical reactions to occur in the entire aftertreatment system. The DOC cannot be cleaned or replaced individually; it is part of the entire DOC/DPF assembly.

Diesel Particulate Filter (DPF)

The DPF is located directly downstream of the DOC. The DPF is a wall-flow design that allows exhaust gas to pass through while collecting particulate matter (soot). When exhaust temperature reaches at least 600°F (316°C), the soot begins to oxidize in the DPF. The DPF cannot be removed and cleaned, and cannot be replaced individually; it is part of the entire DOC/DPF assembly.

Decomposition Tube

The decomposition tube is located downstream of the DPF and is considered the first part of the SCR system. The decomposition tube serves as the mounting point for the DEF dosing valve. Decomposition refers to the process of injecting DEF into the hot exhaust stream to produce chemical reactions that produce carbon dioxide and provide ammonia for the SCR catalysts.

Selective Catalytic Reduction (SCR) Catalyst

The SCR catalyst is located downstream of the decomposition tube. The SCR catalyst is a two-part, flow-through catalyst that is effective at reducing NOx. When ammonia and NOx from the decomposition tube flow through the SCR catalyst, nitrogen (N2) and water vapor (H2O) are produced.

Ammonia Oxidation Catalyst (AOC)

The AOC is located downstream of the second SCR catalyst. The AOC is a flow-through catalyst that removes any trace amounts of ammonia from the exhaust stream before the exhaust exits the aftertreatment system. This component may also be called the ammonia brick.

DIESEL EXHAUST FLUID (DEF) SYSTEM

The EGR system is very effective at reducing NOx emissions in the engine, but current NOx emissions standards require additional measures to further reduce this pollutant. As a result, the Cummins 5.0L V8 Turbo Diesel engine uses a comprehensive DEF system in conjunction with an SCR system to reduce NOx levels.

NOTE:

DEF may be referred to as “Reductant” in the CONSULT.

REGENERATION

The purpose of regeneration is to burn the particulates accumulated in the filter. In presence of oxygen, the particulate combustion regeneration occurs naturally when the temperature of exhaust gases exceeds 570° C (1,058° F). In urban driving conditions, the engine barely reaches high temperature, and the exhaust gas temperature consequently varies between 150° C (302° F) and 200° C (392° F). Therefore, the DPF regeneration system is necessary to burn and eliminate soot particulates accumulated in DPF. The DPF regeneration is automatically performed while driving, and this does not influence driving conditions.

A DPF differential pressure sensor detects filter load status (particulate mass) and triggers the regeneration operation. This takes place by means of a controlled combustion that raises the exhaust gas temperature up between 550° C (1,022° F) and 650° C (1,202° F) at the filter intake.
Regeneration is continuously executed according to the following.

Regarding driving conditions:
- Vehicle speed
- Ambient pressure
- Temperature upstream DPF
- Engine coolant temperature

DPF charging level criteria:
- Soot mass [(computed using DPF charging curves (exhaust gas flow according to differential pressure)]
- Simulated soot mass [computed using mapped soot mass emission speed (g/s)]
- Driven distance since last successful regeneration
- Regeneration error counter

ECM activates many engine management functions to ensure good regeneration efficiency:
- Fuel system: A specific injection pattern using post injections is activated.
- Air system: EGR volume control valve is closed and throttle valve (intake) is used to control engine air flow. In regeneration mode, other boost pressure set points are defined.

REGULATION OF TEMPERATURE BEFORE DPF

Regulation of the exhaust gas temperature before DPF is needed to complete a secure regeneration. This strategy uses the dosing (exhaust line) injector and engine fuel injectors.
ECM computes the fuel mass flow injected by injectors according to several parameters:
- Exhaust line temperature before DPF
- Atmospheric pressure
- Intake air temperature
- Differential pressure of the DPF
- Minimum level of fuel
- Engine speed
- Engine torque

AUTOMATIC SPEED CONTROL DEVICE (ASCD)

AUTOMATIC SPEED CONTROL DEVICE (ASCD) : System Description

INFOID:0000000013416174

BASIC ASCD SYSTEM

Automatic Speed Control Device (ASCD) allows a driver to keep vehicle at predetermined constant speed without depressing accelerator pedal. Driver can set vehicle speed in advance between approximately 40 km/h (25 MPH) and 170 km/h (105 MPH).
ECM controls fuel injector to regulate engine speed.
Operation status of ASCD is indicated on the information display in the combination meter. If any malfunction occurs in ASCD system, it automatically deactivates control.
NOTE:
Always drive vehicle in a safe manner according to traffic conditions and obey all traffic laws.

SET OPERATION

Press ASCD MAIN switch. (CRUISE will be indicated on the information display.)
When vehicle speed reaches a desired speed between approximately 40 km/h (25 MPH) and 170 km/h (105 MPH), press COAST/SET switch. (SET will be indicated on the information display.)

ACCELERATE OPERATION

If the ACCEL/RES switch is pressed during cruise control driving, vehicle speed will increase until the switch is released or vehicle speed reaches maximum speed controlled by the system.
And then ASCD will keep the new set speed.

CANCEL OPERATION

When any of following conditions exist, cruise operation will be canceled.
- CANCEL switch is pressed.
- More than 2 switches at ASCD steering switch are pressed at the same time (Set speed will be cleared).
- Brake pedal is depressed.
- Clutch pedal is depressed or gear position is changed to N (neutral) position.
- Vehicle speed decreased under 15% of the set speed from the set speed.

• TCS system is operated.

When the ECM detects any of the following conditions, the ECM will cancel the cruise operation and inform the driver by blinking indicator.

• Engine coolant temperature is slightly higher than the normal operating temperature; CRUISE indicator may blink slowly.
  When the engine coolant temperature decreases to the normal operating temperature, CRUISE indicator will stop blinking and the cruise operation will be able to work by pressing COAST/SET switch or ACCEL/RES switch.
• Malfunction for some self-diagnoses regarding ASCD control: SET indicator will blink quickly.

If MAIN switch is turned to OFF during ASCD is activated, all of ASCD operations will be canceled and vehicle speed memory will be erased.

COAST OPERATION

When the COAST/SET switch is pressed during cruise control driving, vehicle set speed will decrease until the switch is released, and then ASCD will keep the new set speed.

RESUME OPERATION

When the ACCEL/RES switch is pressed after cancel operation other than pressing ASCD MAIN switch is performed, vehicle speed will return to last set speed. To resume vehicle set speed, the vehicle must meet the following conditions.

• Brake pedal is released.
• Clutch pedal is released.
• Vehicle speed is greater than 40 km/h (25 MPH) and less than 170 km/h (105 MPH).

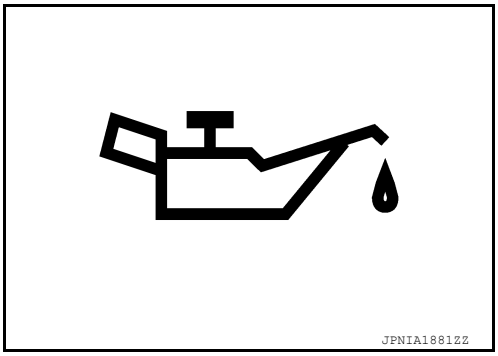
WARNING LAMPS/INDICATOR LAMPS

WARNING LAMPS/INDICATOR LAMPS : Engine Oil Pressure Warning Lamp

INFOID:0000000013416175

DESIGN/PURPOSE

When engine oil pressure is low, the oil pressure warning lamp informs the driver of low oil pressure to prevent damage to the engine.



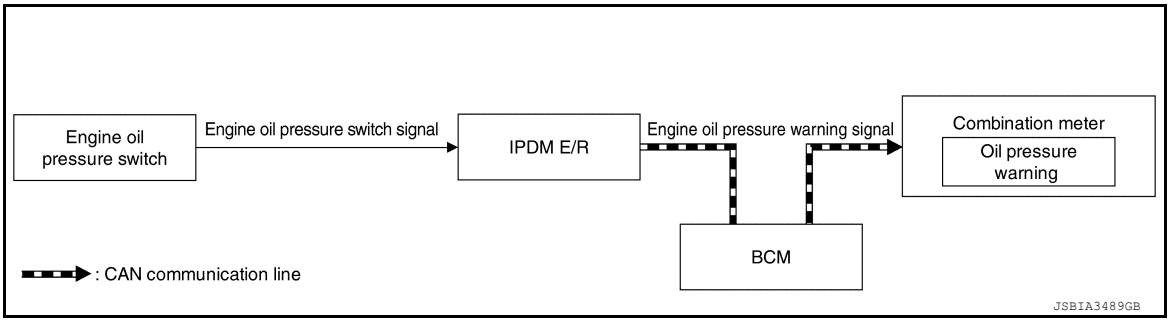
BULB CHECK

Not applicable

OPERATION AT COMBINATION METER CAN COMMUNICATION CUT-OFF OR UNUSUAL SIGNAL

For the operation for CAN communication blackout or abnormal signal reception, refer to MWI-17, "METER SYSTEM : Fail-safe".

SYSTEM DIAGRAM

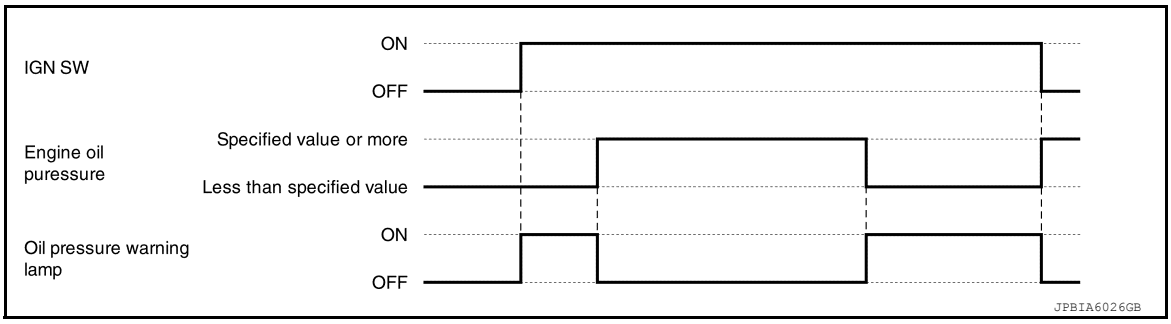


SIGNAL PATH
IPDM E/R received the engine oil pressure switch status from the oil pressure switch. With engine running when the oil pressure switch is OFF and at least 5 seconds, IPDM E/R transmits the engine oil pressure warning signal to combination meter via CAN communication through BCM. Then the engine oil pressure warning displays.

LIGHTING CONDITION
When any of the following conditions is satisfied:
- Ignition switch: OFF
- Engine oil pressure is the specified value or more.

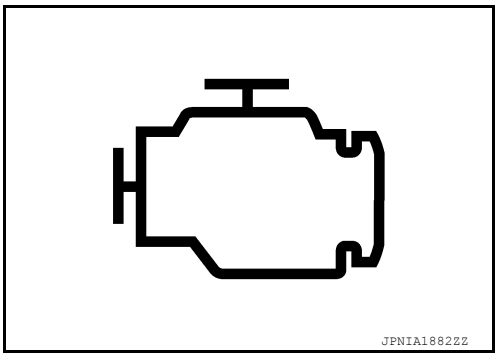
SHUTOFF CONDITION
When any of the following conditions is satisfied:
- Ignition switch: OFF
- Engine oil pressure is the specified value or more.

TIMING CHART



WARNING LAMPS/INDICATOR LAMPS : Malfunction Indicator Lamp (MIL)
INFOID:0000000013416176

DESIGN/PURPOSE
When a malfunction which increases exhaust gases is detected, ECM turns ON MIL and informs the driver of the necessity of inspection and repair.
When a malfunction which causes damage to the catalyst is detected, ECM immediately blinks MIL to alert the driver.
NOTE:
- ECM turns ON MIL (yellow) when an emission-related malfunction occurs or when a component part specified by local laws and regulations becomes inoperable three trips in a row.
- ECM may turn ON MIL (red) when a malfunction occurs in the engine.

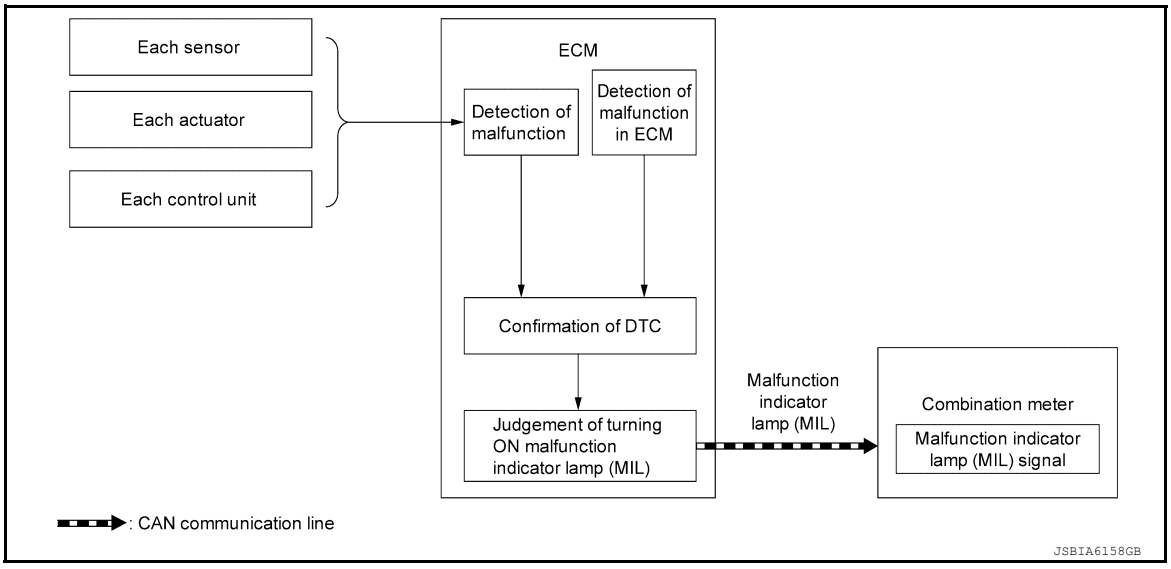


BULB CHECK
The bulb turns ON after turning ON the ignition switch (engine stop) and turns OFF after restarting the engine.

SYNCHRONIZATION WITH MASTER WARNING LAMP
Not applicable

OPERATION AT COMBINATION METER CAN COMMUNICATION CUT-OFF OR UNUSUAL SIGNAL
For the operation for CAN communication blackout in the combination meter, refer to MWI-17, "METER SYSTEM : Fail-safe".

SYSTEM DIAGRAM



SIGNAL PATH

- When the lighting conditions of the malfunction indicator lamp (MIL) are satisfied, ECM transmits a malfunction indicator lamp (MIL) signal to the combination meter via CAN communication.
- The combination meter turns ON or blinks the malfunction indicator lamp (MIL) according to a signal received from ECM.

LIGHTING CONDITION

When all of the following conditions are satisfied:

- Ignition switch: ON
- DTC which influences on exhaust gases is judged.

NOTE:

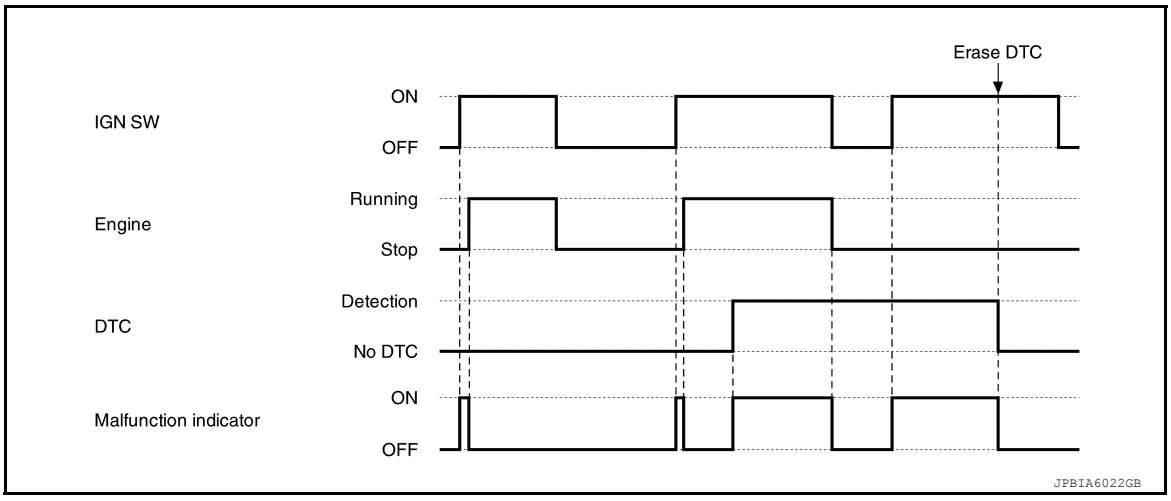
- For DTCs that the malfunction indicator lamp turns ON and the number of DTC diagnosis trips, refer to MWI-35, "DTC Index".

SHUTOFF CONDITION

When any of the following conditions is satisfied:

- Ignition switch: OFF
- Erase DTC.

TIMING CHART

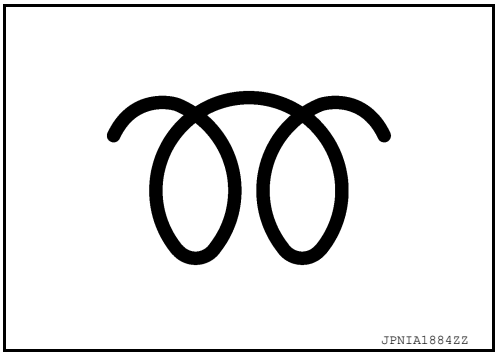


WARNING LAMPS/INDICATOR LAMPS : Glow Indicator Lamp

INFOID:0000000013416177

DESIGN/PURPOSE

The glow indicator lamp turns ON in quick preheat mode and informs the driver that the glow plug is under preheating condition.



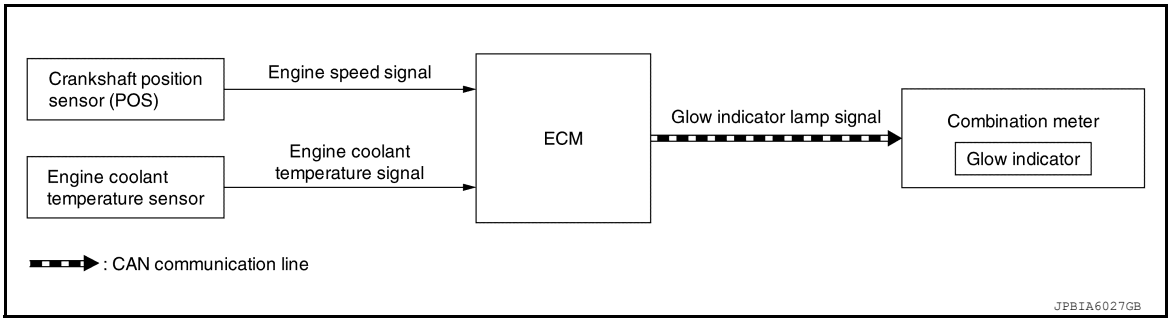
BULB CHECK

Not applicable

OPERATION AT COMBINATION METER CAN COMMUNICATION CUT-OFF OR UNUSUAL SIGNAL

For the operation for CAN communication blackout or abnormal signal reception, refer to MWI-35, "Fail-safe".

SYSTEM DIAGRAM



SIGNAL PATH

- ECM performs the glow control according to an IGN ON signal, water temperature signal, and engine speed signal. ECM transmits a glow indicator lamp signal to the combination meter in quick preheat mode via CAN communication.
- The combination meter turns ON the glow indicator lamp according to a glow indicator lamp signal received from ECM via CAN communication.

LIGHTING CONDITION

When any of the following conditions is satisfied:

- Ignition switch: ON.
- Mode: Quick preheat mode.

NOTE:

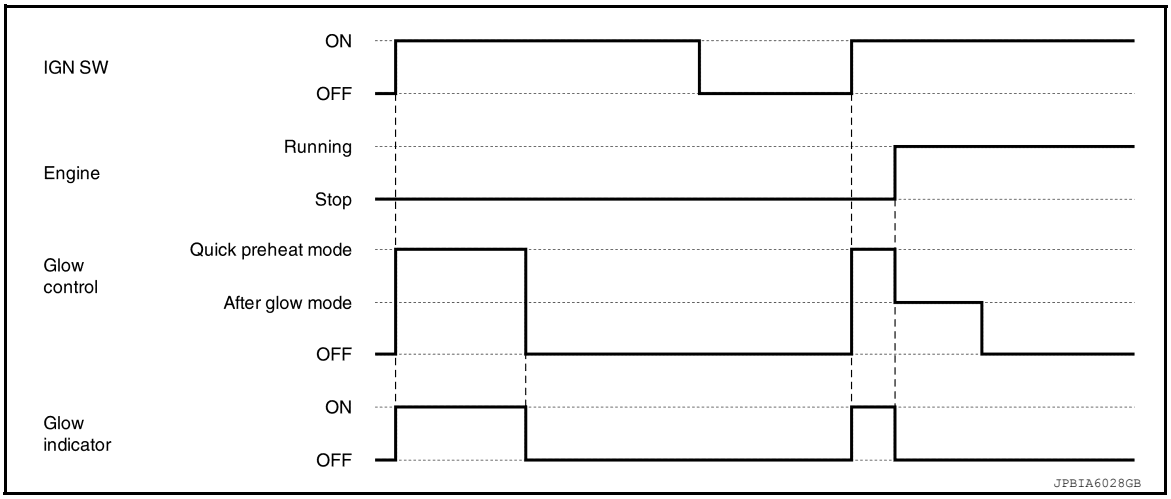
The glow indicator lamp does not turn ON in after glow mode.

SHUTOFF CONDITION

When any of the following conditions is satisfied:

- Ignition switch: OFF.
- Quick preheat mode is complete.
- Engine start.

TIMING CHART



WARNING LAMPS/INDICATOR LAMPS : DPF (Diesel Particulate Filter) Warning Lamp

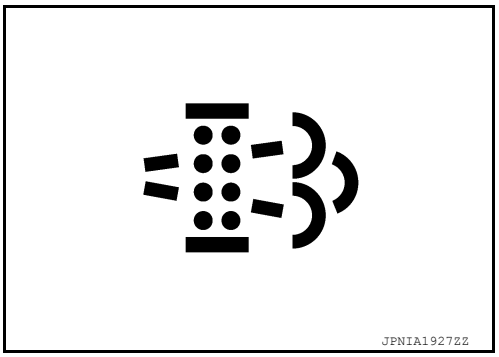
INFOID:0000000013416178

DESIGN/PURPOSE

When a certain amount of PM (particulate matter) accumulates in the DPF (Diesel Particulate Filter), the warning lamp/indicator lamp turns ON to inform the driver of the necessity of the DPF (Diesel Particulate Filter) regeneration.

NOTE:

For the outline of DPF (Diesel Particulate Filter) control and regeneration, refer to EC-82, "AFTER TREATMENT SYSTEM : System Description".



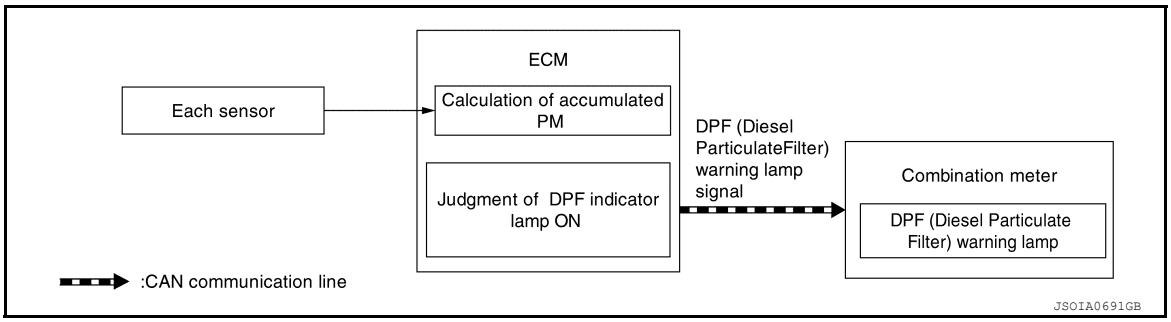
BULB CHECK

The bulb turns ON when the ignition switch is turned ON (engine stop) and turns OFF after the engine is started.

OPERATION AT COMBINATION METER CAN COMMUNICATION CUT-OFF OR UNUSUAL SIGNAL

For the operation for CAN communication blackout or abnormal signal reception, refer to MWI-35, "Fail-safe".

SYSTEM DIAGRAM



SIGNAL PATH

- When calculating and judging that the amount of PM (particulate matter) accumulated in DPF (Diesel Particulate Filter) reaches the specified amount, ECM transmits a DPF warning lamp signal to the combination meter via CAN communication.
- The combination meter turns ON the DPF (Diesel Particulate Filter) warning lamp according to a DPF (Diesel Particulate Filter) warning lamp signal received from ECM via CAN communication.

LIGHTING CONDITION

When all of the following conditions are satisfied:

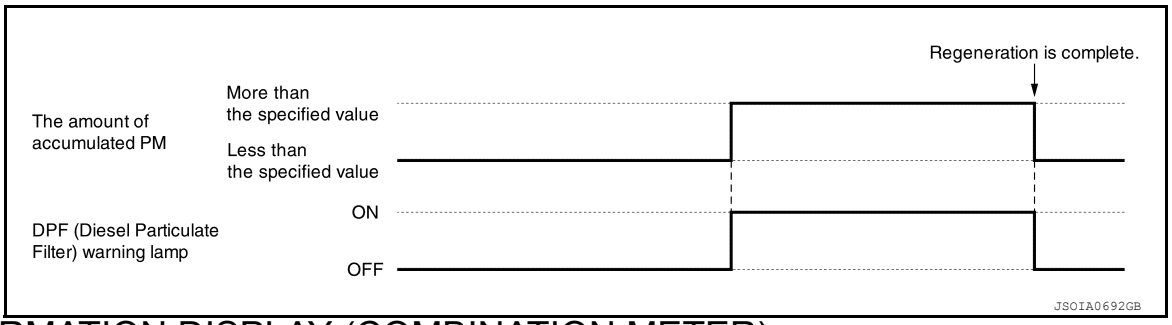
- Ignition switch: ON
- The amount of PM in DPF (Diesel Particulate Filter) is more than the specified amount.

SHUTOFF CONDITION

When any of the following conditions is satisfied:

- Ignition switch: OFF
- The amount of PM in DPF (Diesel Particulate Filter) is less than the specified amount. (Regeneration is complete.)

TIMING CHART



INFORMATION DISPLAY (COMBINATION METER)

INFORMATION DISPLAY (COMBINATION METER) : ASCD Indicator

INFOID:0000000013416179

Item	Symbol	Function

INFORMATION DISPLAY (COMBINATION METER) : Engine Oil Pressure Warning

INFOID:0000000013416180

DESIGN/PURPOSE

When engine oil pressure is low, the engine oil pressure warning informs the driver of low oil pressure to prevent damage to the engine.

Symbol	Message
	• Low Oil Pressure • Stop Vehicle

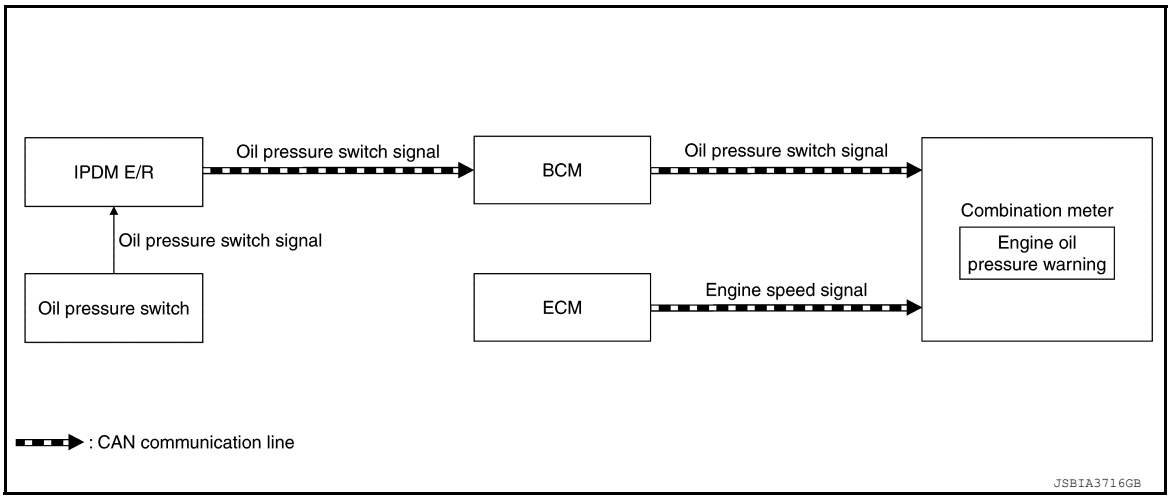
BULB CHECK

Not applicable

OPERATION AT COMBINATION METER CAN COMMUNICATION CUT-OFF OR UNUSUAL SIGNAL

For the operation for CAN communication blackout or abnormal signal reception, refer to MWI-35, "Fail-safe".

SYSTEM DIAGRAM



SIGNAL PATH

- IPDM E/R receives a signal from the engine oil pressure switch and transmits an oil pressure switch signal to BCM via CAN communication.
- BCM transmits the received oil pressure switch signal to the combination meter via CAN communication.
- The information display (on combination meter) engine oil pressure warning is SHOWN/HIDDEN according to the oil pressure switch signal received from BCM.

LIGHTING CONDITION

When all of the following conditions for at least 5 seconds are satisfied:

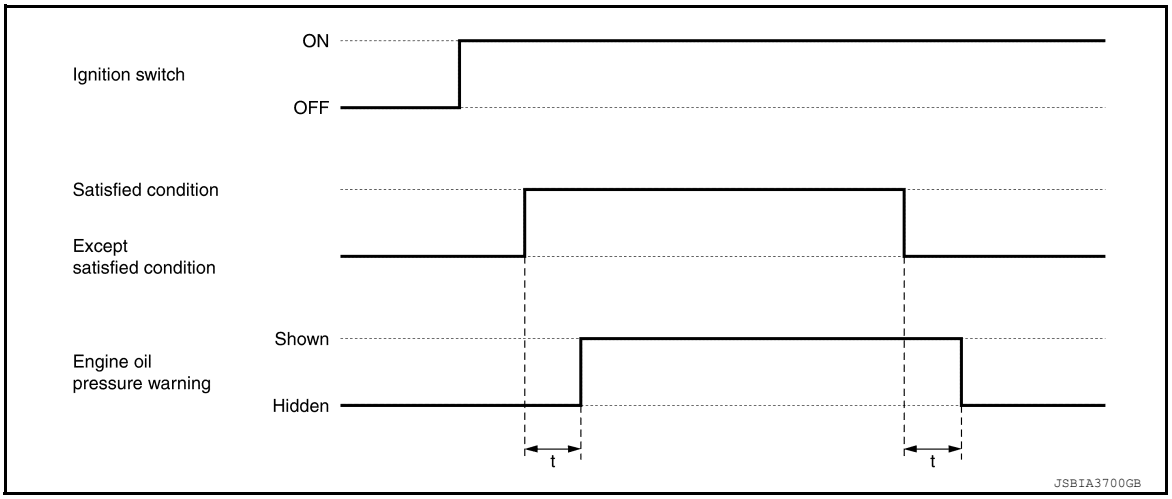
- Ignition switch: ON
- Engine oil pressure is less than specified value. (Oil pressure switch signal: ON)
- Engine speed is more than 500 rpm.

SHUTOFF CONDITION

When any of the following conditions is satisfied:

- Ignition switch: OFF
- Engine oil pressure is the specified value or more. (Oil pressure switch signal: OFF)
- Engine speed is less than 500 rpm.

TIMING CHART



t: 100 ms

WARNING/INDICATOR/CHIME LIST

WARNING/INDICATOR/CHIME LIST : Warning lamps/Indicator lamps

INFOID:0000000013416181

Name	Design	Arrangement/Function
Engine oil pressure warning lamp		Regarding the function, refer to EC-85, "WARNING LAMPS/INDICATOR LAMPS : Engine Oil Pressure Warning Lamp".
Malfunction indicator lamp (MIL)		Regarding the function, refer to EC-86, "WARNING LAMPS/INDICATOR LAMPS : Malfunction Indicator Lamp (MIL)".
Glow indicator lamp		Regarding the function, refer to EC-87, "WARNING LAMPS/INDICATOR LAMPS : Glow Indicator Lamp".
DPF (Diesel Particulate Filter) warning lamp		Regarding the function, refer to EC-89, "WARNING LAMPS/INDICATOR LAMPS : DPF (Diesel Particulate Filter) Warning Lamp".

WARNING/INDICATOR/CHIME LIST : Warning/Indicator (On Information Display)

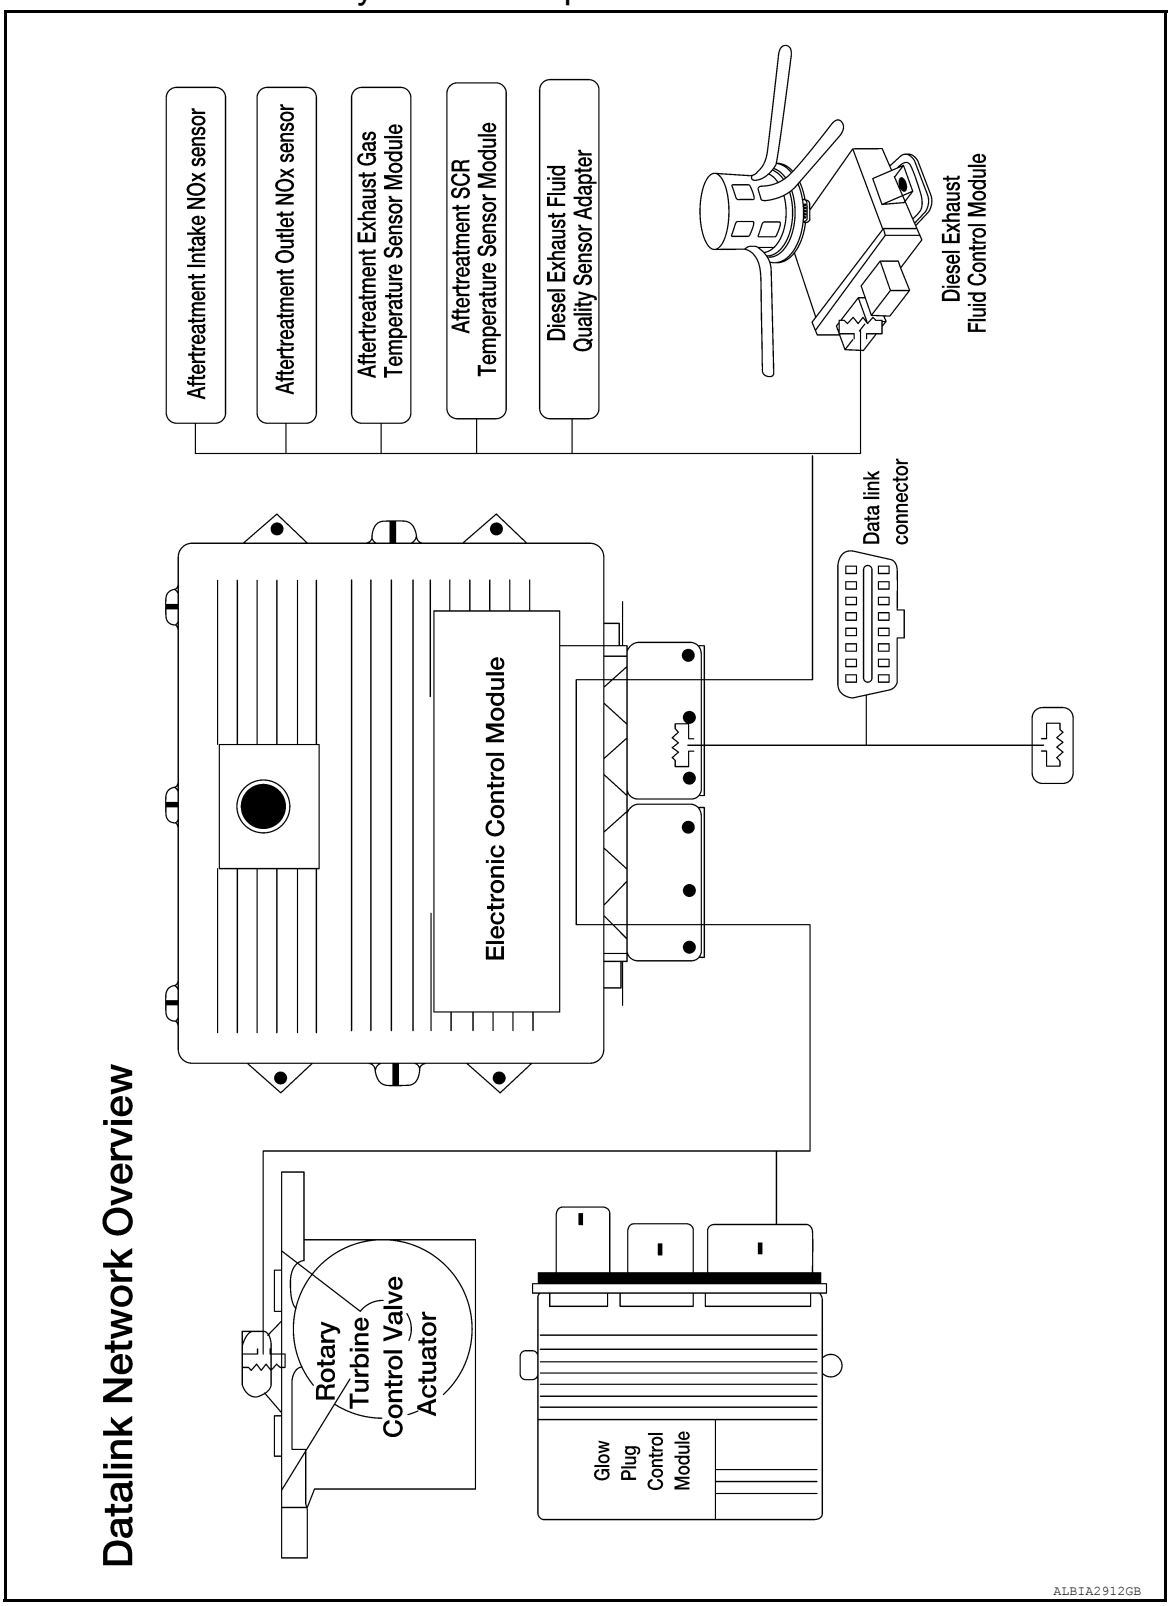
INFOID:0000000013416182

Name	Function
ASCD indicator	Refer to EC-90, "INFORMATION DISPLAY (COMBINATION METER) : ASCD Indicator".
Engine oil pressure warning	Refer to EC-90, "INFORMATION DISPLAY (COMBINATION METER) : Engine Oil Pressure Warning".

CAN COMMUNICATION

CAN COMMUNICATION : System Description

INFOID:0000000013416183



CAN (Controller Area Network) is a serial communication line for real time application. It is an on-vehicle multiplex communication line with high data communication speed and excellent error detection ability. Many electronic control units are equipped onto a vehicle, and each control unit shares information and links with other control units during operation (not independent). In CAN communication, control units are connected with 2 communication lines (CAN H-line, CAN L-line), allowing a high rate of information transmission with less wiring. Each control unit transmits/receives data but selectively reads required data only.

Refer to LAN-70, "CAN COMMUNICATION SYSTEM : CAN Communication Signal Chart" for details about CAN communication.

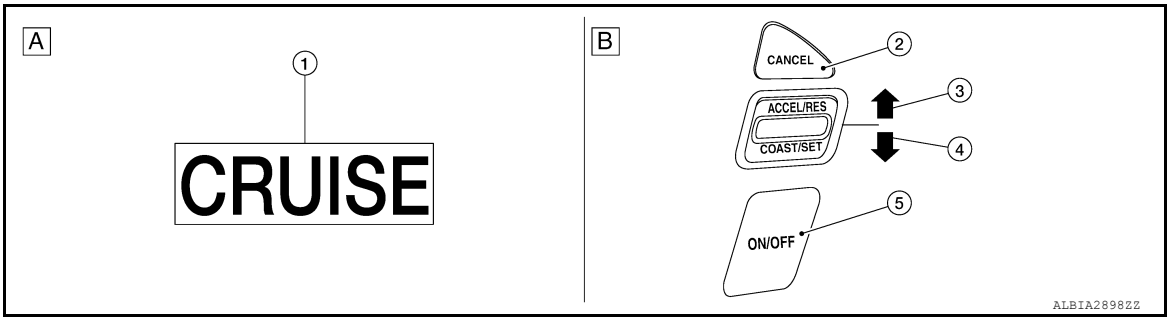
OPERATION

AUTOMATIC SPEED CONTROL DEVICE (ASCD)

AUTOMATIC SPEED CONTROL DEVICE (ASCD) : Switch Name and Function

INFOID:0000000013416184

SWITCHES AND INDICATORS



A On the combination meter
B On the steering wheel
① ASCD indicator
② CANCEL switch
③ ACCEL/RES
④ COAST/SET
⑤ MAIN switch

SET SPEED RANGE

ASCD system can be set to the following vehicle speed.

Minimum speed (Approx.)	Maximum speed (Approx.)
40 km/h (25 MPH)	170 km/h (105 MPH)

SWITCH OPERATION

Item	Function
CANCEL switch	Cancels the cruise control driving.
ACCEL/RES switch	• Resumes the set speed. • Increases speed incrementally during cruise control driving.
COAST/SET switch	• Sets desired cruise speed. • Decreases speed incrementally during cruise control driving.
MAIN switch	Master switch to activate the ASCD system.

Refer to EC-84, "AUTOMATIC SPEED CONTROL DEVICE (ASCD) : System Description" for ASCD operating instructions.

OIL CONTROL SYSTEM

OIL CONTROL SYSTEM : Switch Name and Function

INFOID:0000000013416185

SWITCH OPERATION

Item	Function
Engine oil switch	Refer to MWI-102, "Description".

RESET OPERATION

CAUTION:

When an alert was displayed, change the engine oil, and reset the engine oil data.

1. Turn ignition switch ON.
2. On information display, select “Settings” >> “Maintenance” >> “Service”.
3. Press “ENTER” switch until “YES/NO” appears.
4. Select “YES”.

5. Check that “– – –” is displayed.

ON BOARD DIAGNOSTIC (OBD) SYSTEM

Diagnosis Description

INFOID:0000000013416186

DESCRIPTION

This system uses two malfunction indicator lamps. When detecting a system error, ECM turns ON the malfunction indicator lamp to alert the driver of the presence of malfunction. Refer to MWI-12, "METER SYSTEM : Combination Meter".

MALFUNCTION INDICATOR LAMP (MIL) (YELLOW)

ECM turns ON MIL (yellow) when an emission-related malfunction occurs.

MALFUNCTION INDICATOR LAMP (MIL) (RED)

ECM may turn ON MIL (red) when a severe malfunction related to high temperature occurs in the engine.

GST (Generic Scan Tool)

INFOID:0000000013831638

When GST is connected with a data link connector equipped on the vehicle side, it will communicate with the control module equipped in the vehicle and then enable various kinds of diagnostic tests. Refer to GI-51, "Description".

NOTE:

Service $0A is not applied for regions where it is not mandated.

DIAGNOSIS SYSTEM (ECM)

System Readiness Test (SRT) Code

INFOID:0000000013830832

System Readiness Test (SRT) code is specified in Service $01 of SAE J1979/ISO 15031-5.
As part of an enhanced emissions test for Inspection & Maintenance (I/M), certain states require the status of SRT be used to indicate whether the ECM has completed self-diagnosis of major emission systems and components. Completion must be verified in order for the emissions inspection to proceed.
If a vehicle is rejected for a State emissions inspection due to one or more SRT items indicating “INCMP”, use the information in this Service Manual to set the SRT to “CMPLT”.
In most cases the ECM will automatically complete its self-diagnosis cycle during normal usage, and the SRT status will indicate “CMPLT” for each application system. Once set as “CMPLT”, the SRT status remains “CMPLT” until the self-diagnosis memory is erased.
Occasionally, certain portions of the self-diagnostic test may not be completed as a result of the customer's normal driving pattern; the SRT will indicate “INCMP” for these items.

NOTE:
The SRT will also indicate “INCMP” if the self-diagnosis memory is erased for any reason or if the ECM memory power supply is interrupted for several hours.
If, during the state emissions inspection, the SRT indicates “CMPLT” for all test items, the inspector will continue with the emissions test. However, if the SRT indicates “INCMP” for one or more of the SRT items the vehicle is returned to the customer untested.

NOTE:
If permanent DTC is stored or MIL illuminates during the state emissions inspection, the vehicle is also returned to the customer untested even though the SRT indicates “CMPLT” for all test items. Therefore, it is important to check SRT (“CMPLT”), DTC (No DTCs) and permanent DTC (NO permanent DTCs) before the inspection.

SRT SET TIMING

SRT is set as “CMPLT” after self-diagnosis has been performed one or more times. Completion of SRT is done regardless of whether the result is OK or NG. The set timing is different between OK and NG results and is shown in the table below.

Self-diagnosis result		Example				
		Diagnosis	Ignition cycle ← ON →	OFF	← ON →	OFF ← ON → OFF ← ON →
All OK	Case 1	P0401	OK (1)	— (1)	OK (2)	— (2)
		P0402	OK (1)	— (1)	— (1)	OK (2)
		P040B	OK (1)	OK (2)	— (2)	— (2)
		SRT of EGR	“CMPLT”	“CMPLT”	“CMPLT”	“CMPLT”
	Case 2	P0401	OK (1)	— (1)	— (1)	— (1)
		P0402	— (0)	— (0)	OK (1)	— (1)
		P040B	OK (1)	OK (2)	— (2)	— (2)
		SRT of EGR	“INCMP”	“INCMP”	“CMPLT”	“CMPLT”
NG exists	Case 3	P0401	OK	OK	—	—
		P0402	—	—	—	—
		P040B	NG	—	NG	NG (Consecutive NG)
		(1st trip) DTC	1st trip DTC	—	1st trip DTC	DTC (= MIL ON)
		SRT of EGR	“INCMP”	“INCMP”	“INCMP”	“CMPLT”

OK: Self-diagnosis is carried out and the result is OK.

NG: Self-diagnosis is carried out and the result is NG.

—: Self-diagnosis is not carried out.

When all SRT related self-diagnoses show OK results in a single cycle (Ignition OFF-ON-OFF), the SRT will indicate “CMPLT”. → Case 1 above

When all SRT related self-diagnoses show OK results through several different cycles, the SRT will indicate “CMPLT” at the time the respective self-diagnoses have at least one OK result. → Case 2 above
If one or more SRT related self-diagnoses show NG results in 2 consecutive cycles, the SRT will also indicate “CMPLT”. → Case 3 above
The table above shows that the minimum number of cycles for setting SRT as “INCMP” is the number one (1) for each self-diagnosis (Case 1 & 2) or the number two (2) for one of self-diagnoses (Case 3). However, in preparation for the state emissions inspection, it is unnecessary for each self-diagnosis to be executed twice (Case 3) for the following reasons:

- The SRT will indicate “CMPLT” at the time the respective self-diagnoses have one (1) OK result.
- The emissions inspection requires “CMPLT” of the SRT only with OK self-diagnosis results.
- During SRT driving pattern, the 1st trip DTC (NG) is detected prior to “CMPLT” of SRT and the self-diagnosis memory must be erased from the ECM after repair.
- If the 1st trip DTC is erased, all the SRT will indicate “INCMP”.

NOTE:
SRT can be set as “CMPLT” together with the DTC(s). Therefore, DTC check must always be carried out prior to the state emission inspection even though the SRT indicates “CMPLT”.

Permanent Diagnostic Trouble Code (Permanent DTC)

INFOID:0000000013830833

Permanent DTC is defined in SAE J1979/ISO 15031-5 Service $0A.
ECM stores a DTC issuing a command of turning on MIL as a permanent DTC and keeps storing the DTC as a permanent DTC until ECM judges that there is no presence of malfunction.
Permanent DTCs cannot be erased by using the erase function of CONSULT or Generic Scan Tool (GST) and by disconnecting the battery to shut off power to ECM. This prevents a vehicle from passing the in-use inspection without repairing a malfunctioning part.
When not passing the in-use inspection due to more than one permanent DTC, permanent DTCs should be erased, referring to this manual.

NOTE:

- The important items in in-use inspection are that MIL is not ON, SRT test items are set, and permanent DTCs are not included.
- Permanent DTCs do not apply for regions that permanent DTCs are not regulated by law.

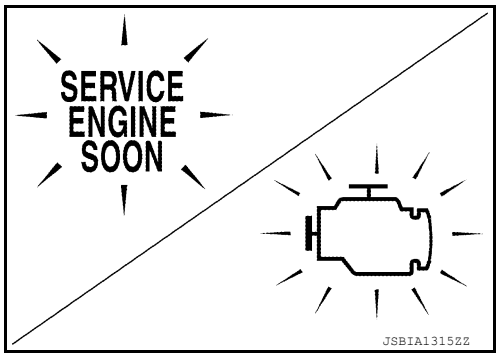
PERMANENT DTC SET TIMING

The setting timing of permanent DTC is stored in ECM with the lighting of MIL when a DTC is confirmed.

Malfunction Indicator Lamp (MIL)

INFOID:0000000013830834

When emission related ECU detects a malfunction in the emission control systems components and/or the powertrain control components (which affect vehicle emissions), it turns on/blinks MIL to inform the driver that a malfunction has been detected.



1. The MIL illuminates when ignition switch is turned ON (engine is not running).
   NOTE:
   Check the MIL circuit if MIL does not illuminate. Refer to EC-174, "Work Flow".
2. When the engine is started, the MIL should go off.
   NOTE:
   If MIL continues to illuminate/blink, perform self-diagnoses and inspect/repair accordingly because an emission related ECU has detected a malfunction in the emission control systems components and/or the powertrain control components (which affect vehicle emissions).

On Board Diagnosis Function

INFOID:0000000013830835

ON-BOARD DIAGNOSIS ITEM

The on-board diagnostic system has the following functions.

Diagnostic test mode	Function
Bulb check	MIL can be checked.
SRT status	ECM can read if SRT codes are set.

Diagnostic test mode	Function
Malfunction warning	If ECM detects a malfunction, it illuminates or blinks MIL to inform the driver that a malfunction has been detected.
Self-diagnostic results	DTCs or 1st trip DTCs stored in ECM can be read.

BLUB CHECK MODE

Description
This function allows damage inspection in the MIL bulb (blown, open circuit, etc.).

Operation Procedure

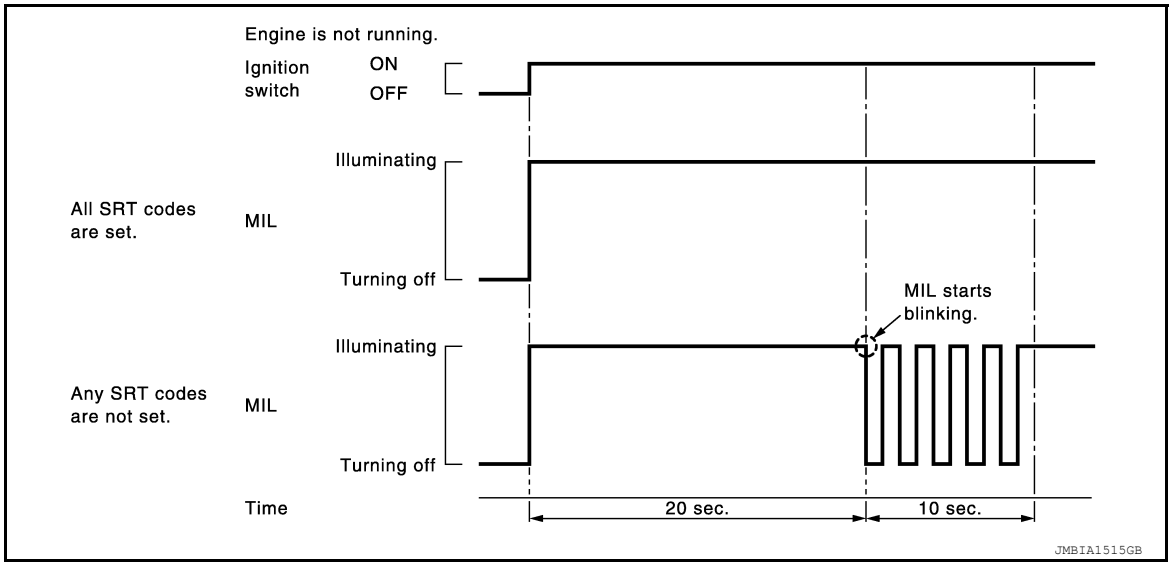
1. Turn ignition switch ON.
2. The MIL on the instrument panel should stay ON.
   If it remains OFF, check MIL circuit. Refer to EC-149, "Wiring Diagram".

SRT STATUS MODE

Description
This function allows to read if ECM has completed the self-diagnoses of major emission control systems and components. For SRT, refer to EC-98, "System Readiness Test (SRT) Code".

Operation Procedure

1. Turn ignition switch ON and wait 20 seconds.
2. SRT status is indicated as shown blow.
   - ECM continues to illuminate MIL if all SRT codes are set.
   - ECM blinks MIL for about 10 seconds if all SRT codes are not set.



MALFUNCTION WARNING MODE

Description
In this function ECM turns on or blinks MIL when it detects a malfunction in the emission control system components and/or the powertrain control components (which affect vehicle emissions) to inform the driver that a malfunction has been detected.

Operation Procedure

1. Turn ignition switch ON.
2. Check that MIL illuminates.
   If it remains OFF, check MIL circuit. Refer to EC-149, "Wiring Diagram".
3. Start engine and let it idle.
   - For two trip detection logic diagnoses, ECM turns on MIL when it detects the same malfunction twice in the two consecutive driving cycles.
   - For 1st trip detection logic diagnoses, ECM turns on MIL when it detects a malfunction in one driving cycle.
   - ECM blinks MIL when it detects a malfunction that may damage the three way catalyst (misfire).

SELF-DIAGNOSTIC RESULTS MODE

Description

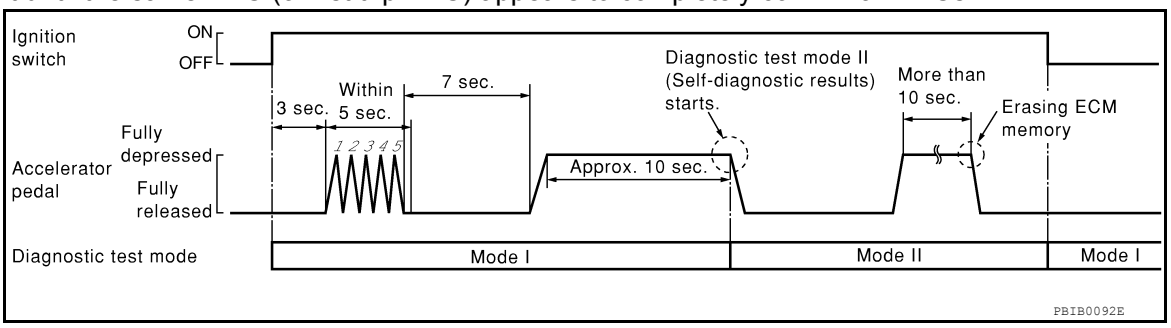
This function allows to indicate DTCs or 1st trip DTCs stored in ECM according to the number of times MIL is blinking.

How to Set Self-diagnostic Results Mode

NOTE:

- It is better to count the time accurately with a clock.
- After ignition switch is turned off, ECM is always released from the “Self-diagnostic results” mode.

1. Confirm that accelerator pedal is fully released, turn ignition switch ON and wait 3 seconds.
2. Repeat the following procedure quickly five times within 5 seconds.
   - Fully depress the accelerator pedal.
   - Fully release the accelerator pedal.
3. Wait 7 seconds, fully depress the accelerator pedal and keep it depressed for approx. 10 seconds until the MIL starts blinking.
   NOTE:
   Do not release the accelerator pedal for 10 seconds if MIL starts blinking during this period. This blinking is displaying SRT status and is continued for another 10 seconds.
4. Fully release the accelerator pedal.
   ECM has entered to Self-diagnostic results mode.
   NOTE:
   Wait until the same DTC (or 1st trip DTC) appears to completely confirm all DTCs.

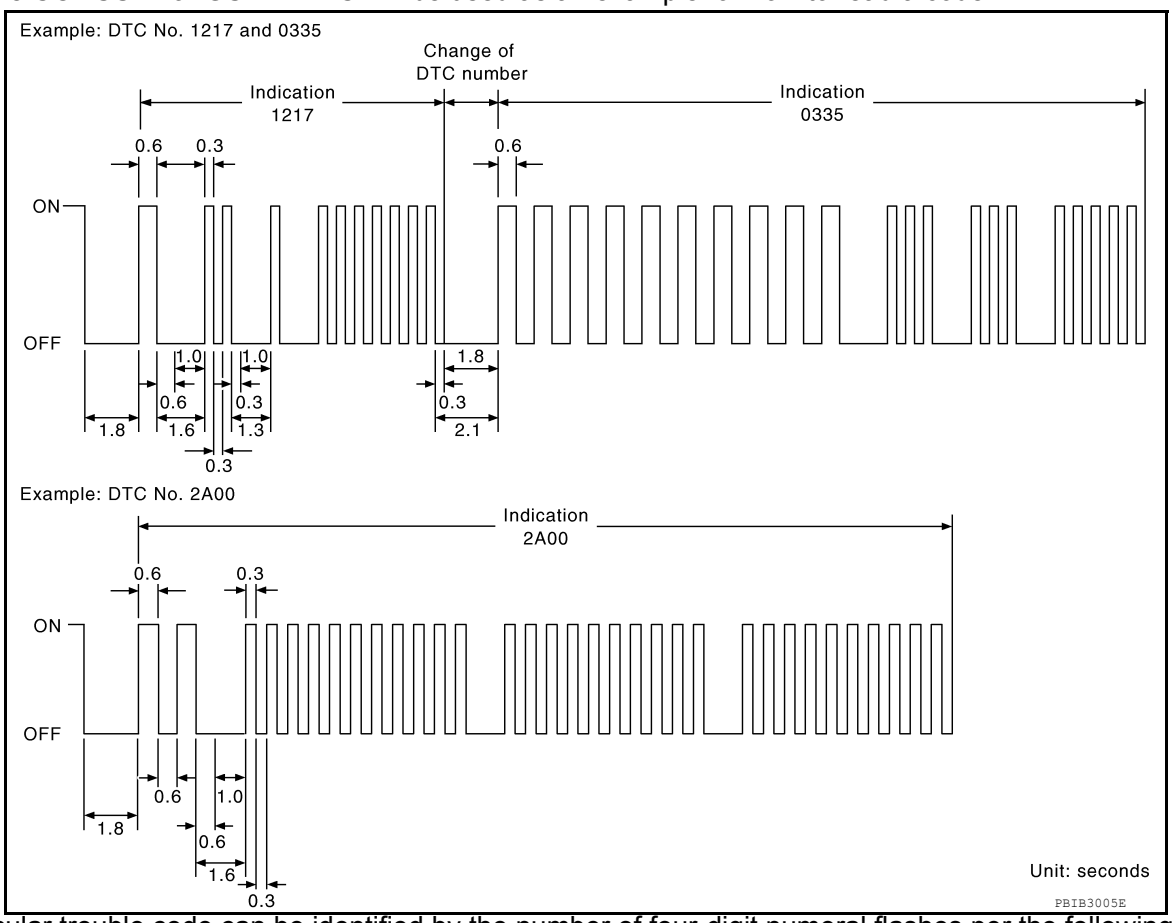


How to Read Self-diagnostic Results

The DTC and 1st trip DTC are indicated by the number of blinks of the MIL as shown below.

The DTC and 1st trip DTC are displayed at the same time. If the MIL does not illuminate in diagnostic test mode I (Malfunction warning), all displayed items are 1st trip DTCs. If only one code is displayed when the MIL illuminates in “malfunction warning” mode, it is a DTC; if two or more codes are displayed, they may be either

DTCs or 1st trip DTCs. DTC No. is same as that of 1st trip DTC. These unidentified codes can be identified by using the CONSULT or GST. A DTC will be used as an example for how to read a code.



A particular trouble code can be identified by the number of four-digit numeral flashes per the following.

Number	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Flashes	10	1	2	3	4	5	6	7	8	9	11	12	13	14	15	16

The length of time the 1,000th-digit numeral flashes on and off is 1.2 seconds consisting of an ON (0.6-seconds) - OFF (0.6-seconds) cycle.
The 100th-digit numeral and lower digit numerals consist of a 0.3-seconds ON and 0.3-seconds OFF cycle.
A change from one digit numeral to another occurs at an interval of 1.0-second OFF. In other words, the later numeral appears on the display 1.3 seconds after the former numeral has disappeared.
A change from one trouble code to another occurs at an interval of 1.8-seconds OFF.
In this way, all the detected malfunctions are classified by their DTC numbers. The DTC 0000 refers to no malfunction. Refer to EC-135, "DTC Index".

How to Erase Self-diagnostic Results

By performing this procedure, ECM memory is erased and the following diagnostic information is erased as well.

- Diagnostic trouble codes
- 1st trip diagnostic trouble codes
- Freeze frame data
- 1st trip freeze frame data
- System readiness test (SRT) codes
- Test values

NOTE:

Also, if a battery terminal is disconnected, ECM memory is erased and the diagnostic information as listed above is erased. (The amount of time required for erasing may vary from a few seconds to several hours.)

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

4. Turn ignition switch ON.
5. Set ECM in Self-diagnostic results.
6. The diagnostic information has been erased from the backup memory in the ECM.
   Fully depress the accelerator pedal and keep it depressed for more than 10 seconds.
7. Fully release the accelerator pedal, and confirm the DTC 0000 is displayed.

CONSULT Function

INFOID:0000000013416187

FUNCTION

Diagnostic test mode	Function
Self Diagnostic Result	Self diagnostic results such as DTC can be read and erased quickly.*
Data Monitor	Input/Output data in the ECM can be read.
Work support	This mode enables a technician to adjust some devices faster and more accurately by following the indications on the CONSULT unit.
Active Test	Diagnostic Test Mode in which CONSULT drives some actuators apart from the ECMs and also shifts some parameters in a specified range.
ECU Identification	ECM part number can be read.

*: The following emission-related diagnostic information is cleared when the ECM memory is erased.

- Diagnostic trouble codes

SELF DIAGNOSTIC MODE

Self Diagnostic Item

Regarding items detected in “SELF DIAG RESULTS” mode, refer to EC-135, "DTC Index".

DATA MONITOR MODE

NOTE:

The following table includes information (items) inapplicable to this vehicle. For information (items) applicable to this vehicle, refer to CONSULT display items.

Monitor item	Unit	Description
DPF OPERTING STATE	NONE	DPF filter not applicable for the application.
	OK	DPF filter operating normally.
	DENOX	DPF control system operating in a NOx catalyst regeneration.
	MSRGN	DPF filter currently operating in a non-service induced (mobile) regeneration event.
	DESOX	DPF control system operating in a NOx catalyst regeneration.
	PRTCT	DPF control system operating in a condition to protect the DPF.
	H2ODB	DPF control system operating in a condition to warm up.
	HCDB	DPF control system operating in a condition to warm up.
	NMRGN	DPF filter currently operating in a service induced (stationary) regeneration event.
	SCRTM	DPF control system operating in a condition to warm up SCR system.
	MNTN	DPF control system operating in a condition to warm up.
	MDRT	DPF control system has detected the SCR system to be operating in moderate mode.
DPF OUTLET PRESS	-3 – +3 kPa G	Indicates the gauge pressure reading of the DPF outlet.
DPF OUTLET PRESS SENS V	0 – 5V	Indicates the voltage reading of the DPF outlet pressure sensor.
DEF QLTY SENS	31 – 34%	Indicates the measured quality of the diesel exhaust fluid in the pump.
INTAKE NOX	ppm	Indicates the parts per million (ppm) NOx measurement prior to the diesel oxidation catalyst.

Monitor item	Unit	Description
INTAKE NOX CORRCTD	ppm	Indicates the filtered parts per million (ppm) NOx measurement prior to the diesel oxidation catalyst.
INTAKE NOX READNG STBL	NA	Indicates the parts per million (ppm) measurement is not available.
	NG	Indicates the parts per million (ppm) measurement is inaccurate.
	OK	Indicates the parts per million (ppm) measurement is accurate.
	ERROR	Indicates the parts per million (ppm) measurement is in error.
DPF FACEPLUG COUNT	≥	Indicates the number of times the ECM has detected the DPF is face plugged.
AFT MAINTENANCE STATUS	Inactive≥	Indicates the aftertreatment reset request has not been requested.
	ACTIV	Indicates the aftertreatment reset request has been requested.
	CMPLT	Indicates the aftertreatment data has been reset.
	PROHB	Indicates the aftertreatment reset request could not be completed due to a condition detected by ECM.
AFT NOX OUT TEST STATUS	NG	Indicates the test has determined a condition that caused a decision of Fail/Bad.
	OK	Indicates the test has determined a condition that caused a decision of OK/GOOD.
	NA	Indicates the test is actively executing.
	ACTIV	Indicates the test has not been aborted for execution.
	ABORT	Indicates the test has been requested for some ECM detected condition.
	NS	Indicates the test is not supported.
OUTLET NOX	ppm	Indicates the parts per million (ppm) NOx measurement after the SCR system.
OUTLET NOX CORRCTD	ppm	Indicates the filtered parts per million (ppm) NOx measurement after the SCR system.
ACC POS SENS 2 SPLY V	4.7 – 5.2V	Indicates the voltage supply value for the accelerator pedal position (APP) sensor 2.
ACC POS SENS 2 V	0 – 2V	Indicates the measured voltage value for the accelerator pedal position (APP) sensor 2.
ACC POS SENS SPLY V	4.7 – 5.2V	Indicates the voltage supply value for the accelerator pedal position (APP) sensor 1.
ACC POS SENS V	1 – 4V	Indicates the measured voltage value for the accelerator pedal position (APP) sensor 1.
OUTLET NOX RDNG STBL	NA	Indicates the parts per million (ppm) measurement is not available.
	NG	Indicates the parts per million (ppm) measurement is inaccurate.
	OK	Indicates the parts per million (ppm) measurement is accurate.
	ERROR	Indicates the parts per million (ppm) measurement is in error.
DPF DOSING CMD	ON	Indicates the DEF injector is dosing.
	OFF	Indicates the DEF injector is not dosing.

Monitor item	Unit	Description
AFT DPF REGEN STATUS	INACT	Indicates the stationary regen has not been requested.
	ACTIV	Indicates the stationary regen has been requested.
	CMPLT	Indicates the stationary regen request was been completed as requested.
	FAULT	Indicates the ECM has detected a DTC which prevents the test from executing.
	PROHB	Indicates the ECM has detected a non DTC related prevention condition.
	SERBK	Indicates the ECM has detected the stop lamp switch being activated.
	PRKBK	Indicates the ECM has detected the park brake switch being activated.
	THRTL	Indicates the ECM has detected the accelerator pedal being depressed to a value greater than 0%.
	INGR	Indicates the ECM has detected the transmission to be in any position other than P (park).
	PTO	Indicates the ECM has detected a PTO request.
	OEMSN	Indicates the ECM has detected the supplied sensor is at or below requested comparison value.
	VEHSP	Indicates the ECM has detected the vehicle to be moving or VSS failure.
	AIRHD	Indicates the ECM has detected a failure with a air handling system.
	GOV	Indicates the ECM has detected a condition in which the service test could not be performed.
	EPD	Indicates the ECM is currently operating in an engine protection condition.
	Ewo	Indicates the ECM has detected low engine coolant temperature.
TIME SINCE ACTIVE REGEN	Hr	Indicates the amount of time since a non mobile regeneration event.
TIME SINCE REACT REGEN	Hr	Indicates the amount of time since a mobile regeneration event.
DPF SOOT LOAD MNTR	gm	Indicates the DPF estimated soot load value.
SOOT LOAD MNTR STATUS	NORM	Indicates the DPF is operating in normal soot condition.
	LOW	Indicates the DPF is operating in least severe soot condition.
	MED	
	HIGH	Indicates the DPF is operating in moderately severe soot condition.
	SEV	Indicates the DPF is operating in most severe soot condition.
BOOST PRESSURE	-10.3 – +10.3 kPa	Indicates the measured gauge pressure prior to entering the intake manifold (Key ON/engine OFF).
BOOST PRES SENS V	0 – 5V	Indicates the measured sensor voltage of the boost pressure sensor.
Byte order	L ENDI	Indicates the data shall not be byte swapped.
	B ENDI	Indicates the data shall be interpreted as byte swapped.
DOC INLET TEMP	≥ 250°C	Indicates the diesel oxidation catalyst inlet measured temperature.
DPF INLET TEMP	200°C > DOC INLET TEMP	Indicates the diesel oxidation catalyst outlet measured temperature.
DPF DELTA PRESS SENS V	0 – 5V	Indicates the measured sensor voltage of the DPF differential pressure sensor.
DPF DELTA PRESS	-3 – +3 kPa	Indicates the measured pressure difference across the DPF.
DPF OUTLET TEMP	°C	Indicates the DPF outlet measured temperature.
CAC OUT TEMP	± 5.5°C of ambient temperature	Indicates the charge air cooler outlet measured temperature.
CAC OUT TEMP SENS V	0 – 5V	Indicates the measured sensor voltage of the charge air cooler outlet temperature sensor.

Monitor item	Unit	Description
ACCEL PEDAL POS	%	Indicates the interpreted pedal position in percentage as determined by the ECM.
COOLANT LEVEL	NG	Indicates the coolant level to be at a system hindrance level.
	OK	Indicates the coolant level to be normal.
	LOW	Indicates the coolant level to be at a slightly low value.
COOLANT TEMP	90.5 – 105.5°C	Indicates the measured coolant temperature.
ENGINE COOLANT TEMPERATURE SEN VOLTAGE	0 – 5V	Indicates the measured sensor voltage of the coolant temperature sensor.
BATTERY VOLTAGE	11 – 14V	Indicates the measured battery voltage as seen by the ECM.
CC ACCEL S/W	OFF	Indicates the ACCEL/RES switch is not pressed.
	ON	Indicates the ACCEL/RES switch is pressed.
CRUISE CANCEL S/W	OFF	Indicates the CANCEL switch is not pressed.
	ON	Indicates the CANCEL switch is pressed.
CRUISE COAST SW	OFF	Indicates the COAST/SET switch is not pressed.
	ON	Indicates the COAST/SET switch is pressed.
CC TARGET SPEED	km/h / mph	Indicates the vehicle speed that cruise control is currently attempting to hold to.
CRUISE CNTL STAT	OFF	Indicates the cruise control is not active.
	ON	Indicates the cruise control is active.
DEF PRIME TEST STATUS	INACT	Indicates the test is currently not executing.
	ACTIV	Indicates the test is currently executing.
	ENGSP	Indicates the test has aborted/is not running due to engine speed.
	FAULT	Indicates the test has aborted/is not running due to CRNT DTC.
	RTYLM	Indicates the test retry limit has been reached.
	PURGE	Indicates the DEF system is purging.
	TMPLO	Indicates the DEF tank temperature is below proper test condition.
	FROZE	Indicates the DEF fluid has been detected to be frozen.
	TANKLO	Indicates the DEF tank level is below proper test condition.
	PRIMTO	Indicates the DEF system is unable to prime.
	PRIME	Indicates the DEF system is priming.
	LPRESS	Indicates the DEF system has detected low DEF line pressure.
	PROHB	Indicates the test is could not execute due to vehicle condition.
DPF SOOT LOAD	gm	Indicates the quantity of soot in the DPF.
DEF LINE HTR STAT	OFF	Indicates the DEF heater is not energized.
	ON	Indicates the DEF heater is energized.
DEF LINE PRESS	kPa	Indicates the DEF line pressure measured by the DEF tank's built in pressure sensor.
DEF LAMP STATUS	OFF	Indicates the DEF lamp is OFF. DEF level is in the normal range
	ON	Indicates the DEF lamp is ON. DEF level is in the low range
	BLINK	Indicates the DEF lamp is flashing. DEF level is in the very low range
DUAL VALVE FUEL CNTRL	VOL	Indicates the fuel system is currently in a fuel volume controlled state (high idle/load).
	PRESS	Indicates the fuel system is currently in a fuel pressure controlled state (start-up).
	BOTH	Indicates the fuel system is currently in a fuel pressure and volume controlled state (low idle).

Monitor item	Unit	Description
TOTAL KEY ON TIME	Numerical	Indicates the accumulated number of seconds the ECM has been in a Key ON state.
VARIANT ID	Numerical	Indicates the current tool interface version number currently supported by the ECM.
EGR BYPASS VLV CMD	%	Indicates the EGR cooler bypass valve's commanded position.
EGR BYPASS VLV POS V	0 – 5V	Indicates the EGR cooler bypass valve's position sensor voltage.
EGR COOLER EFFICIENCY	%	Indicates the overall effectiveness of the EGR cooler to lower exhaust gas temperature.
EGR ORIFICE TEMP	± 5.5°C of ambient temperature	Indicates EGR path's measured temperature.
EGR ORIFICE TEMP V	0 – 5V	Indicates the EGR temperature sensor voltage.
EGR VALVE POS	%	Indicates the EGR valve's actual measured position.
EGR VALVE POS CMD	%	Indicates the EGR valve's actual commanded position.
EGR POS/S VOLT	V	Indicates the EGR valve position sensor voltage.
ELECTRIC LIFT PUMP CMD	OFF	Indicates the fuel pump relay is not energized.
	ON	Indicates the fuel pump relay is energized.
TOTAL ENGINE RUN TIME	Numerical	Indicates the amount of time the engine has been in the RUN state.
ENGINE SPEED	RPM	Indicates the engine speed computed from the CKP and CMP sensors.
CAM SPD SPLY STAT	NG	Indicates the CMP sensor supply voltage is inadequate.
	OK	Indicates the CMP sensor supply voltage is OK.
	NA	Indicates the CMP sensor supply voltage is non existent.
CAM SPD SIGNAL STATUS	OK	Indicates the ECM has detected the correct CMP pulse signal.
	VOLTLO	Indicates the ECM has detected a low voltage CMP pulse signal.
	VOLTHI	Indicates the ECM has detected a high voltage CMP pulse signal.
	NA	Indicates the ECM has detected no CMP pulse signal.
CAM/CRANK SYNC	NOPUL	Indicates the ECM has detected no pulse signal.
	OK	Indicates the ECM is able to determine a synch between CMP and CKP sensors.
	NG	Indicates the ECM is unable to determine a synch between CMP and CKP sensors.
	START	Indicates the ECM is trying to detect a synch between CMP and CKP sensors.
CRANK SPD SPLY STAT	NG	Indicates the CKP sensor supply voltage is inadequate.
	OK	Indicates the CKP sensor supply voltage is OK.
	NA	Indicates the CKP sensor supply voltage is non existent.
CRANK SPD SIGNAL STATUS	OK	Indicates the ECM has detected the correct CKP pulse signal.
	VOLTLO	Indicates the ECM has detected a low voltage CKP pulse signal.
	VOLTHI	Indicates the ECM has detected a high voltage CKP pulse signal.
	NA	Indicates the ECM has detected no CKP pulse signal.
CRANK SPD SYNC	NOPUL	Indicates the ECM has detected no pulse signal.
	OK	Indicates the ECM is able to determine a synch between CMP and CKP sensors.
	NG	Indicates the ECM is unable to determine a synch between CMP and CKP sensors.
	START	Indicates the ECM is trying to detect a synch between CMP and CKP sensors.
ENGINE SPEED SIG SEL	CRNK	Indicates the ECM is using CKP sensor for engine speed.
	CAM	Indicates the ECM is using CMP sensor for engine speed.

Monitor item	Unit	Description
ENGINE SPEED STATUS	NG	Indicates the ECM has detected a faulty condition in engine speed processing.
	DGRD	Indicates the ECM has detected a concern with engine speed processing.
	OK	Indicates the ECM has detected that engine speed processing is OK.
	STOP	Indicates the ECM is in a condition where engine speed processing has stopped.
EXHAUST PRESS	± 5% of barometric air pressure (kPa)	Indicates the exhaust pressure measured.
EXHAUST PRESS SENS V	0 – 5V	Indicates the exhaust pressure sensor voltage.
FAN CLTCH PWM DC	0 – 100%	Indicates the status of the fan clutch.
ENGINE FAN CTRL	OFF	Indicates nothing is currently requesting fan actuation.
	IMT	Indicates high intake manifold temperature detection.
	CLNT	Indicates high coolant temperature detection.
	ENG	Indicates engine speed conditions and control have been satisfied.
	DFTL	Indicates the control condition is in an error state.
	EXTRN	Indicates an external source request.
	AC	Indicates an A/C system request.
	TOOL	Indicates Active Test is currently executing.
	ENGBK	Indicates an engine brake request.
	OTHER	Indicates another non-specific condition request.
	FUEL	Indicates high fuel temperature detection.
	OEMP1	Indicates specific pressure sensor 1 request.
	OEMP2	Indicates specific pressure sensor 2 request.
	OEMT1	Indicates specific temperature sensor 1 request.
	OEMT2	Indicates specific temperature sensor 2 request.
	EXHDR	Indicates high exhaust temperature detection.
	REGEN	Indicates DPF regeneration event detected.
	DLINE	Indicates a driveline engine brake request.
	CAC	Indicates high charge air cooler temperature detection.
FAN SPEED	RPM	Indicates the measured value of fan speed.
FUEL RAIL PRESSURE	bar A	Indicates the absolute measured fuel pressure on the common rail.
FUEL RAIL PRESS CMD	250 – 2000 bar	Indicates the fuel pressure commanded on the common rail.
FUEL RAIL PRESS RQSTD	bar	Indicates the fuel pressure commanded during Active Test.
FUEL RAIL PRESS V	0 – 5V	Indicates the signal voltage value detected by the ECM for the fuel rail pressure sensor.
FUEL SPLY PRESS	450 – 700 kPa	Indicates the measured fuel pressure from lift pump to stage 2 fuel filter.
FUEL SPLY PRESS V	0 – 5V	Indicates the signal voltage value detected by the ECM for the fuel supply pressure.
FUEL TEMP	< 75°C	Indicates the measured fuel temperature at the stage 2 fuel filter.
FUEL TEMP SEN V	0 – 5V	Indicates the signal voltage value detected by the ECM for the fuel supply sensor.
GLOW PLUG CMD STATUS	OFF	Indicates the ECM is commanding the glow plugs OFF.
	ON	Indicates the ECM is commanding the glow plugs ON.
INTAKE MANIFOLD TEMP	± 5.5°C of ambient temperature	Indicates the measured fresh air temperature at the air inlet connection.

Monitor item	Unit	Description
INTAKE MFOLD TEMP SENS V	0 – 5V	Indicates the signal voltage value detected by the ECM for the fuel temperature sensor.
TURBO PRESS SENSOR	± 5% of barometric air pressure (kPa)	Indicates the measured pressure from the low pressure turbo side sensor.
TURBO PRESS SENSOR V	0 – 5V	Indicates the signal voltage value detected by the ECM for the low pressure turbo side sensor.
MASS AIR FLOW	Kg/min	Indicates the translated rate of fresh air flow into the engine.
FUEL PMP ACT CMD	0 – 2A	Indicates the current (amps) being commanded of the fuel pump actuator.
FUEL PMP ACT FDBK	0 – 2A	Indicates the current (amps) feedback being received from the fuel pump actuator.
MILEAGE SINCE LAST OIL RESET	Numerical	Indicates the actual vehicle distance traveled as calculated by ECM since last oil change reset.
OIL PRESSURE	kPa G	Indicates the calculated value of the oil pressure.
FUEL PRESS RELIEF CRNT	0 – 2A	Indicates the current (amps) being commanded of the fuel pressure control valve.
FUEL PRESS RELIEF FBK	0 – 2A	Indicates the current (amps) feedback being received from the pressure control valve.
MAX FUEL RAIL PRESS	bar	Indicates the max fuel rail pressure detected by the ECM in current operation cycle.
VEHICLE SPEED	km/h / mph	Indicates the vehicle speed computed from the output speed sensor signal.
SCR INLET TEMP	°C	Indicates the SCR inlet measured temperature.
SCR OUTLET TEMP	°C	Indicates the SCR outlet measured temperature.
DEF LINE HTR OP STATE	INIT	Indicates the DEF line heater is preparing to turn ON.
	DFRST	Indicates the DEF line heater is partially ON.
	ON	Indicates the DEF line heater is currently ON.
	OFF	Indicates the DEF line heater is currently OFF.
	N/A	Indicates the DEF line heater is not available.
DEF PUMP STATE	INIT	Indicates the DEF pump is preparing to engage.
	OFF	Indicates the DEF pump is currently OFF.
	PRIME	Indicates the DEF pump is priming.
	DOSE	Indicates the DEF pump is dosing.
	PURGE	Indicates the DEF pump is purging.
	WAIT	Indicates the DEF pump is waiting to purge.
	TIMEOUT	Indicates the DEF pump is not communicating with the ECM.
DEF TANK HTR OPERATION STATE	DFRST	Indicates the DEF tank heater is partially ON.
	ON	Indicates the DEF tank heater is currently ON.
	OFF	Indicates the DEF tank heater is currently OFF.
	N/A	Indicates the DEF tank heater is not available.
SEN SUPPLY N-1 VOL	4.7 – 5.2 V	Indicates ECM output voltage of sensor supply 1.
SEN SUPPLY N-3 VOL	4.7 – 5.2 V	Indicates ECM output voltage of sensor supply 3.
SEN SUPPLY N-4 VOL	4.7 – 5.2 V	Indicates ECM output voltage of sensor supply 4.
SEN SUPPLY N-5 VOL	4.7 – 5.2 V	Indicates ECM output voltage of sensor supply 5.
SEN SUPPLY N-6 VOL	4.7 – 5.2 V	Indicates ECM output voltage of sensor supply 6.
BRAKE SWITCH	ON	Indicates the brake pedal is depressed.
	OFF	Indicates the brake pedal is not depressed.

Monitor item	Unit	Description
BRAKE SWITCH SIG 2	ON	Indicates the brake pedal is depressed.
	OFF	Indicates the brake pedal is not depressed.
TURBO COMP IN TEMP V	0 – 5V	Indicates the signal voltage value detected by the ECM for turbocharger compressor inlet.
TURBO COMP IN TEMP	± 5.5°C of ambient temperature	Indicates the measured temperature at turbocharger compressor inlet.
TURBO SPEED	< 40 KR/M	Indicates the measured speed at which the turbocharger is rotating.
DEF TANK LEVEL	%	Indicates actual DEF tank level.
UREA TANK TEMP	°C	Indicates the measured temperature of the DEF fluid within the DEF tank.
DEF TANK TEMP SENS V	0 – 5V	Indicates the signal voltage value detected by the ECM for DEF tank temperature.
WAIT START CMD	ON	Indicates the Wait to Start lamp is ON.
	OFF	Indicates the Wait to Start lamp is OFF.
WATER IN FUEL V	0 – 5V	Indicates the measured signal voltage from the water in fuel sensor.
WATER IN FUEL	NOWTR	Indicates no water in fuel detected.
	WTR	Indicates water in fuel detected.
TOTAL WATER IN FUEL TIME	Numerical	Indicates the total time water has been detected in the fuel over the life of the ECM.
ENGINE OPER STATE	Fueling stop state	Indicator of which fueling selection is controlling the engine.
DEF PUMP ASH	gm	Indicates the amount of ash estimated in the DPF.
ENGINE SERIAL NUMBER	Numerical	Indicates the engine serial number.
CRANKCASE PRESS	-0.63 – +0.63 kPa	Indicates the purging value for the DEF line is closed.
CRANKCASE PRESS V	0 – 5V	Indicates the signal voltage as measured by the ECM for crankcase pressure sensor.
DEF QUALITY SENSOR TEMP	°C	Indicates the temperature as measured by the DEF quality sensor.
DEF DOSING VALVE POS CMD	Close	Indicates the current position commanded for the DEF injector.
	Open	
DEF REVERT VALVE POS	Close	Indicates the purging value for the DEF line.
	Open	
DEF PUMP DUTY CYCLE	0 – 100%	Indicates the current dosing commanded of the DEF pump.
COMP BYPASS VALVE TEST STAT	INACT	Indicates the module is currently not executing the test.
	ACTIV	Indicates the module is currently executing the test.
	VSSPD	Indicates the test has detected vehicle speed.
	BATLO	Indicates the test has detected battery voltage below test threshold condition.
INTAKE O2 STATE	NG	Indicates the oxygen reading is not valid.
	READY	Indicates the oxygen reading is OK.
	ERROR	Indicates the oxygen reading is not valid.
	NA	Indicates the oxygen reading is not available.
INTAKE O2	%	Indicates the current percent oxygen level detected at the inlet of the SCR component.
IGN STATE	On	Indicates the current state of the ignition switch as detected by the ECM.
	Off	
NO OF KEY OFF EVENTS	Numerical	Indicates the number of times the ECM has fully powered down.
NO OF KEY ON EVENTS	Numerical	Indicates the number of times the ECM has fully powered up.
INSTANTANEOUS PERCENT LOAD	%	Indicates the percentage load on the engine at any given point.

Monitor item	Unit	Description
ENGINE TORQUE	Nm	Indicates the torque amount the engine is producing.
TOTAL FUELING	mg/stroke	Indicates the amount of fuel being dispersed at a given time.
FAF/EGR AIR FLOW	Kg/min	Indicates the calculated combined fresh and EGR air flow.
A/C PRESS SW	ON	Indicates the current state of the A/C pressure switch.
	OFF	
PUSHER FAN SPEED STATUS	ON	Indicates the current state of the pusher fan.
	OFF	
OIL PRESSURE SENS V	0 – 5V	Indicates measured signal voltage from the oil pressure sensor.
RTCV ACTUATOR POS	0 – 100%	Indicates the actual rotary control valve actuator position.
RTCV CALIB STATUS	INACT	Indicates the module is currently not executing the test.
	ACTIV	Indicates the module is currently executing the test.
	FAIL	Indicates the rotary turbine control valve system is suspect.
	CCOMP	Indicates the rotary turbine control valve actuator has performed calibrate successfully.
	ENGSP	Indicates the test has aborted/is not running due to engine speed.
	FAULT	Indicates the test has aborted/is not running due to CRNT DTC.
RTCV HYSTERESIS STATUS	INACT	Indicates the module is currently not executing the test.
	ACTIV	Indicates the module is currently executing the test.
	PASS	Indicates the rotary turbine control valve system functions as expected.
	FAIL	Indicates the rotary turbine control valve system is suspect.
	ERROR	Indicates the test has aborted/is not running due to CRNT DTC.
	LOCLT	Indicates the test has detected coolant temperature below test minimum threshold.
	HICLT	Indicates the test has detected coolant temperature above test maximum threshold.
	ENGSP	Indicates the test has aborted/is not running due to engine speed.
	BATLO	Indicates the test has detected battery voltage below test threshold condition.
	PROHB	Indicates the test could not execute due to vehicle condition.
TURBO COMP INLET PRESS	± 1 kPa of barometric air pressure	Indicates the absolute measured pressure at turbocharger compressor inlet.
TURBO COMP INLET PRESS V	0 – 5V	Indicates the signal voltage as measured by the ECM for fresh air flow pressure.

NOTE:
Any monitored item that does not match the vehicle being diagnosed is deleted from the display automatically.

WORK SUPPORT MODE

Work Item

Work item	Description	Usage
Reset fuel consumption short term log	In this mode, VIN is registered in ECM.	When registering VIN in ECM.
AFT maintenance	In this mode, aftertreatment maintenance is performed.	The amount of particulate matter in DPF reaches a high level.

Work item	Description	Usage
Reset fuel and timing learn tables	In this mode, physical characteristics of replaced component are matched with a preset value in the ECM.	• When injector is replaced.* • When fuel rail pressure sensor is replaced. • When fuel pressure relief valve is replaced. • When crankshaft position sensor is replaced.* • When camshaft position sensor is replaced.
VIN REGISTRATION	In this mode, specific vehicle build is identified.	To identify any possible build variations.
ENTERINJECTOR CODES	In this mode, fuel injector adjustment value is registered.	• When ECM is replaced.* • When fuel injector(s) is replaced.
SAVE COMPUTER DATA	In this mode, save data that is in ECM.	When ECM is replaced.*
WRITE SAVED DATA	In this mode, write data stored by “SAVE COMPUTER DATA” in "WORK SUPPORT" mode to ECM.	When ECM is replaced.*
RTCV actuator calibrate	In this mode, the rotary turbine control valve (RTCV) end limits are learned.	When the RTCV is disconnected or replaced.
Engine serial number	In this mode, engine serial number is learned.	To identify engine specific components.

*: The necessary operation is different depending on the operation result of ECM data save or write. Always perform the operation according to procedures. Refer to EC-178, "Description".

ACTIVE TEST MODE

Test item	Condition	Judgment	Check item (Remedy)
DPF Regeneration	• Engine: Running • Self-directed test once selection is made in CONSULT.	Increases RPM and cleans up the aftertreatment system.	Performance of the aftertreatment system.
DPF System Leak Test	• Ignition switch: ON • DPF pump is energized while the tank pressure sensor is monitored.	Determines whether there is a leak by means of checking the pressure drop.	DPF system is checked for leaks.
DPF Dosing Unit Override Test	• Ignition switch: ON • DPF pump and dosing valves are energized while checking the spray pattern of the dosing valve.	Dosing valve is operated.	Dosing valve spray pattern.
Fuel System Leakage Test	• Engine: Running • High and low fuel pump are operating while the fuel pressure sensor is monitored for any reading drop.	High pressure fuel pump is driven while stage 1 fuel pump is energized.	Fuel system is checked for leaks.
DEF Line Heater Test	• Ignition switch: ON • DEF line heater is energized while the temperature is monitored.	DEF line heater is operated.	DEF line heater is checked for providing heat.
DEF Tank Heater Test	• Ignition switch: ON • DEF tank heater is energized while the temperature is monitored.	DEF tank heater is operated.	DEF tank heater is checked for providing heat.
RTCV Hysteresis Test	• Ignition switch: ON • Checking the operation of the rotary turbine control valve (RTCV).	RTCV is operated.	RTCV is checked for proper operation.
Fuel Supply Pump Override Test	• Ignition switch: ON • Stage 1 fuel pump is energized while the fuel pressure sensor is monitored for pressure drop.	Stage 1 fuel pump is operated.	Fuel system is checked for leaks.

Test item	Condition	Judgment	Check item (Remedy)
Cylinder Cutout Test	• Engine: Running • Power is suspended from the specific injector.	Injector is checked for making a difference.	Fuel injector.
Engine Fan Override Test	• Engine: Running • Duty cycle of fan is changed and checked.	Fan clutch is operated.	Fan clutch is checked.
Electric Fan Override Test	• Ignition switch: ON • Electric fan motor is commanded ON.	Electric fan motor is operated.	Electric fan motor is checked for proper operation.
HPCR Fuel Act Override	• Engine: Running • High pressure fuel system is energized.	Fuel pump is operated.	Fuel system and valves are checked for proper operation.

ECU DIAGNOSIS INFORMATION

ECM

Reference Value

INFOID:0000000013391110

VALUES ON THE DIAGNOSIS TOOL

Monitor Item	Condition	Value/Status
DPF OPERTING STATE	DPF filter not applicable for the application.	NONE
	DPF filter operating normally.	OK
	DPF control system operating in a NOx catalyst regeneration.	DENOX
	DPF filter currently operating in a non-service induced (mobile) regeneration event.	MSRGN
	DPF control system operating in a NOx catalyst regeneration.	DESOX
	DPF control system operating in a condition to protect the DPF.	PRTCT
	DPF control system operating in a condition to warm up.	H2ODB
	DPF control system operating in a condition to warm up.	HCDB
	DPF filter currently operating in a service induced (stationary) regeneration event.	NMRGN
	DPF control system operating in a condition to warm up SCR system.	SCRTM
	DPF control system operating in a condition to warm up.	MNTN
	DPF control system has detected the SCR system to be operating in moderate mode.	MDRT
DPF OUTLET PRESS	Indicates the gauge pressure reading of the DPF outlet.	-3 – +3 kPa G
DPF OUTLET PRESS SENS V	Indicates the voltage reading of the DPF outlet pressure sensor.	0 – 5V
DEF QLTY SENS	Indicates the measured quality of the diesel exhaust fluid in the pump.	31 – 34%
INTAKE NOX	Indicates the parts per million (ppm) NOx measurement prior to the diesel oxidation catalyst.	ppm
INTAKE NOX CORRCTD	Indicates the filtered parts per million (ppm) NOx measurement prior to the diesel oxidation catalyst.	ppm
INTAKE NOX READNG STBL	Indicates the parts per million (ppm) measurement is not available.	NA
	Indicates the parts per million (ppm) measurement is inaccurate.	NG
	Indicates the parts per million (ppm) measurement is accurate.	OK
	Indicates the parts per million (ppm) measurement is in error.	ERROR
DPF FACEPLUG COUNT	Indicates the number of times the ECM has detected the DPF is face plugged.	≥
AFT MAINTENANCE STATUS	Indicates the aftertreatment reset request has not been requested.	Inactive
	Indicates the aftertreatment reset request has been requested.	ACTIV
	Indicates the aftertreatment data has been reset.	CMPLT
	Indicates the aftertreatment reset request could not be completed due to a condition detected by ECM.	PROHB

Monitor Item	Condition	Value/Status
AFT NOX OUT TEST STATUS	Indicates the test has determined a condition that caused a decision of Fail/Bad.	NG
	Indicates the test has determined a condition that caused a decision of OK/GOOD.	OK
	Indicates the test is actively executing.	NA
	Indicates the test has not been aborted for execution.	ACTIV
	Indicates the test has been requested for some ECM detected condition.	ABORT
	Indicates the test is not supported.	NS
OUTLET NOX	Indicates the parts per million (ppm) NOx measurement after the SCR system.	ppm
OUTLET NOX CORRCTD	Indicates the filtered parts per million (ppm) NOx measurement after the SCR system.	ppm
OUTLET NOX READNG STBL	Indicates the parts per million (ppm) measurement is not available.	NA
	Indicates the parts per million (ppm) measurement is inaccurate.	NG
	Indicates the parts per million (ppm) measurement is accurate.	OK
	Indicates the parts per million (ppm) measurement is in error.	ERROR
DPF DOSING CMD	Indicates the DEF injector is dosing.	ON
	Indicates the DEF injector is not dosing.	OFF
AFT DPF REGEN STATUS	Indicates the stationary regen has not been requested.	INACT
	Indicates the stationary regen has been requested.	ACTIV
	Indicates the stationary regen request was been completed as requested.	CMPLT
	Indicates the ECM has detected a DTC which prevents the test from executing.	FAULT
	Indicates the ECM has detected a non DTC related prevention condition.	PROHB
	Indicates the ECM has detected the stop lamp switch being activated.	SERBK
	Indicates the ECM has detected the park brake switch being activated.	PRKBK
	Indicates the ECM has detected the accelerator pedal being depressed to a value greater than 0%.	THRTL
	Indicates the ECM has detected the transmission to be in any position other than P (park).	INGR
	Indicates the ECM has detected the vehicle to be moving or VSS failure.	VEHSP
	Indicates the ECM has detected a condition in which the service test could not be performed.	GOV
	Indicates the ECM is currently operating in an engine protection condition.	EPD
	Indicates the ECM has detected low engine coolant temperature.	Ewo
TIME SINCE ACTIVE REGEN	Indicates the amount of time since a non mobile regeneration event.	Hr
TIME SINCE REACT REGEN	Indicates the amount of time since a mobile regeneration event.	Hr
DPF SOOT LOAD MNTR	Indicates the DPF estimated soot load value.	gm
SOOT LOAD MNTR STATUS	Indicates the DPF is operating in normal soot condition.	NORM
	Indicates the DPF is operating in least severe soot condition.	LOW
		MED
	Indicates the DPF is operating in moderately severe soot condition.	HIGH
	Indicates the DPF is operating in most severe soot condition.	SEV

Monitor Item	Condition	Value/Status
ACC POS SENS 2 SPLY V	Indicates the voltage supply value for the accelerator pedal position (APP) sensor 2.	4.7 – 5.2V
ACC POS SENS 2 V	Indicates the measured voltage value for the accelerator pedal position (APP) sensor 2.	0 – 2V
ACC POS SENS SPLY V	Indicates the voltage supply value for the accelerator pedal position (APP) sensor 1.	4.7 – 5.2V
ACC POS SENS V	Indicates the measured voltage value for the accelerator pedal position (APP) sensor 1.	1 – 4V
BATTERY VOLTAGE	Indicates the measured battery voltage as seen by the ECM.	11 – 14V
BOOST PRESSURE	Indicates the measured gauge pressure prior to entering the intake manifold.	-10.3 – +10.3 kPa
BOOST PRES SENS V	Indicates the measured sensor voltage of the boost pressure sensor.	0 – 5V
Byte order	Indicates the data shall not be byte swapped.	L ENDI
	Indicates the data shall be interpreted as byte swapped.	B ENDI
DOC INLET TEMP	Indicates the diesel oxidation catalyst inlet measured temperature.	≥ 250°C
DPF INLET TEMP	Indicates the diesel oxidation catalyst outlet measured temperature.	200°C > DOC INLET TEMP
DPF DELTA PRESS SENS V	Indicates the measured sensor voltage of the DPF differential pressure sensor.	0 – 5V
DPF DELTA PRESS	Indicates the measured pressure difference across the DPF.	-3 – +3 kPa
DPF OUTLET TEMP	Indicates the DPF outlet measured temperature.	°C
CAC OUT TEMP	Indicates the charge air cooler outlet measured temperature.	± 5.5°C of ambient temperature
CAC OUT TEMP SENS V	Indicates the measured sensor voltage of the charge air cooler outlet temperature sensor.	0 – 5V
ACCEL PEDAL POS	Indicates the interpreted pedal position in percentage as determined by the ECM.	%
COOLANT LEVEL	Indicates the coolant level to be at a system hindrance level.	NG
	Indicates the coolant level to be normal.	OK
	Indicates the coolant level to be at a slightly low value.	LOW
COOLANT TEMP	Indicates the measured coolant temperature.	90.5 – 105.5°C
ENGINE COOLANT TEMPERATURE SEN VOLTAGE	Indicates the measured sensor voltage of the coolant temperature sensor.	0 – 5V
CC ACCEL S/W	Indicates the ACCEL/RES switch is not pressed.	OFF
	Indicates the ACCEL/RES switch is pressed.	ON
CRUISE CANCEL S/W	Indicates the CANCEL switch is not pressed.	OFF
	Indicates the CANCEL switch is pressed.	ON
CRUISE COAST SW	Indicates the COAST/SET switch is not pressed.	OFF
	Indicates the COAST/SET switch is pressed.	ON
CC TARGET SPEED	Indicates the vehicle speed that cruise control is currently attempting to hold to.	km/h / mph
CRUISE CNTL STAT	Indicates the cruise control is not active.	OFF
	Indicates the cruise control is active.	ON

Monitor Item	Condition	Value/Status
DEF PRIME TEST STATUS	Indicates the test is currently not executing.	INACT
	Indicates the test is currently executing.	ACTIV
	Indicates the test has aborted/is not running due to engine speed.	ENGSP
	Indicates the test has aborted/is not running due to CRNT DTC.	FAULT
	Indicates the test retry limit has been reached.	RTYLM
	Indicates the DEF system is purging.	PURGE
	Indicates the DEF tank temperature is below proper test condition.	TMPLO
	Indicates the DEF fluid has been detected to be frozen.	FROZE
	Indicates the DEF tank level is below proper test condition.	TANKLO
	Indicates the DEF system is unable to prime.	PRIMTO
	Indicates the DEF system is priming.	PRIME
	Indicates the DEF system has detected low DEF line pressure.	LPRESS
	Indicates the test is could not execute due to vehicle condition.	PROHB
DPF SOOT LOAD	Indicates the quantity of soot in the DPF.	gm
DEF LINE HTR STAT	Indicates the DEF heater is not energized.	OFF
	Indicates the DEF heater is energized.	ON
DEF LINE PRESS	Indicates the DEF line pressure measured by the DEF tank's built in pressure sensor.	kPa
DEF LAMP STATUS	Indicates the DEF lamp is OFF. DEF level is in the normal range	OFF
	Indicates the DEF lamp is ON. DEF level is in the low range	ON
	Indicates the DEF lamp is flashing. DEF level is in the very low range	BLINK
DUAL VALVE FUEL CNTRL	Indicates the fuel system is currently in a fuel volume controlled state.	VOL
	Indicates the fuel system is currently in a fuel pressure controlled state.	PRESS
	Indicates the fuel system is currently in a fuel pressure and volume controlled state.	BOTH
VARIANT ID	Indicates the current tool interface version number currently supported by the ECM.	Numerical
EGR BYPASS VLV CMD	Indicates the EGR cooler bypass valve's commanded position.	%
EGR BYPASS VLV POS V	Indicates the EGR cooler bypass valve's position sensor voltage.	0 – 5V
EGR COOLER EFFICIENCY	Indicates the overall effectiveness of the EGR cooler to lower exhaust gas temperature.	%
EGR ORIFICE TEMP	Indicates EGR path's measured temperature.	± 5.5°C of ambient temperature
EGR ORIFICE TEMP V	Indicates the EGR temperature sensor voltage.	0 – 5V
EGR VALVE POS	Indicates the EGR valve's actual measured position.	%
EGR VALVE POS CMD	Indicates the EGR valve's actual commanded position.	%
EGR POS/S VOLT	Indicates the EGR valve position sensor voltage.	V
ELECTRIC LIFT PUMP CMD	Indicates the fuel pump relay is not energized.	OFF
	Indicates the fuel pump relay is energized.	ON
TOTAL ENGINE RUN TIME	Indicates the amount of time the engine has been in the RUN state.	Numerical
ENGINE SPEED	Indicates the engine speed computed from the CKP and CMP sensors.	RPM
CAM SPD SPLY STAT	Indicates the CMP sensor supply voltage is inadequate.	NG
	Indicates the CMP sensor supply voltage is OK.	OK
	Indicates the CMP sensor supply voltage is non existent.	NA

Monitor Item	Condition	Value/Status
CAM SPD SIGNAL STATUS	Indicates the ECM has detected the correct CMP pulse signal.	OK
	Indicates the ECM has detected a low voltage CMP pulse signal.	VOLTLO
	Indicates the ECM has detected a high voltage CMP pulse signal.	VOLTHI
	Indicates the ECM has detected no CMP pulse signal.	NA
CAM/CRANK SYNC	Indicates the ECM has detected no pulse signal.	NOPUL
	Indicates the ECM is able to determine a synch between CMP and CKP sensors.	OK
	Indicates the ECM is unable to determine a synch between CMP and CKP sensors.	NG
	Indicates the ECM is trying to detect a synch between CMP and CKP sensors.	START
CRANK SPD SPLY STAT	Indicates the CKP sensor supply voltage is inadequate.	NG
	Indicates the CKP sensor supply voltage is OK.	OK
	Indicates the CKP sensor supply voltage is non existent.	NA
CRANK SPD SIGNAL STATUS	Indicates the ECM has detected the correct CKP pulse signal.	OK
	Indicates the ECM has detected a low voltage CKP pulse signal.	VOLTLO
	Indicates the ECM has detected a high voltage CKP pulse signal.	VOLTHI
	Indicates the ECM has detected no CKP pulse signal.	NA
CRANK SPD SYNC	Indicates the ECM has detected no pulse signal.	NOPUL
	Indicates the ECM is able to determine a synch between CMP and CKP sensors.	OK
	Indicates the ECM is unable to determine a synch between CMP and CKP sensors.	NG
	Indicates the ECM is trying to detect a synch between CMP and CKP sensors.	START
ENGINE SPEED SIG SEL	Indicates the ECM is using CKP sensor for engine speed.	CRNK
	Indicates the ECM is using CMP sensor for engine speed.	CAM
ENGINE SPEED STATUS	Indicates the ECM has detected a faulty condition in engine speed processing.	NG
	Indicates the ECM has detected a concern with engine speed processing.	DGRD
	Indicates the ECM has detected that engine speed processing is OK.	OK
	Indicates the ECM is in a condition where engine speed processing has stopped.	STOP
EXHAUST PRESS	Indicates the exhaust pressure measured.	± 5% of barometric air pressure (kPa)
EXHAUST PRESS SENS V	Indicates the exhaust pressure sensor voltage.	0 – 5V
FAN CLTCH PWM DC	Indicates the status of the fan clutch.	0 – 100%

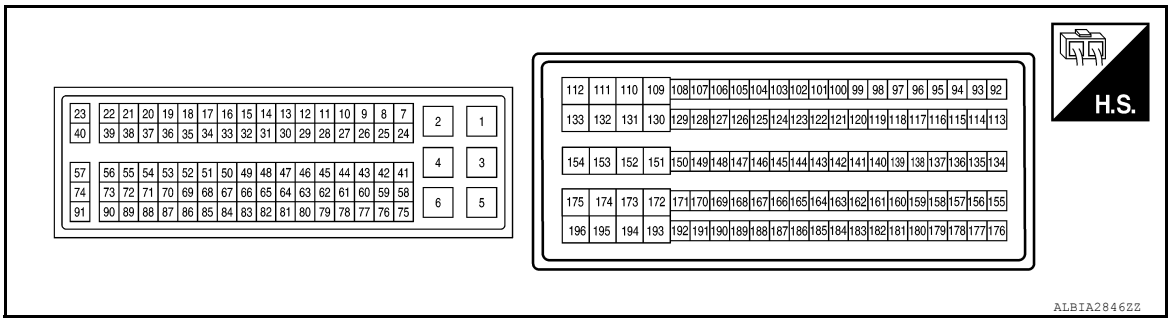
Monitor Item	Condition	Value/Status
ENGINE FAN CTRL	Indicates nothing is currently requesting fan actuation.	OFF
	Indicates high intake manifold temperature detection.	IMT
	Indicates high coolant temperature detection.	CLNT
	Indicates engine speed conditions and control have been satisfied.	ENG
	Indicates the control condition is in an error state.	DFTL
	Indicates an external source request.	EXTRN
	Indicates an A/C system request.	AC
	Indicates Active Test is currently executing.	TOOL
	Indicates an engine brake request.	ENGBK
	Indicates high fuel temperature detection.	FUEL
	Indicates high exhaust temperature detection.	EXHDR
	Indicates DPF regeneration event detected.	REGEN
	Indicates a driveline engine brake request.	DLINE
	Indicates high charge air cooler temperature detection.	CAC
FAN SPEED	Indicates the measured value of fan speed.	RPM
FUEL RAIL PRESSURE	Indicates the absolute measured fuel pressure on the common rail.	bar A
FUEL RAIL PRESS CMD	Indicates the fuel pressure commanded on the common rail.	250 – 2000 bar
FUEL RAIL PRESS RQSTD	Indicates the fuel pressure commanded during Active Test.	bar
FUEL RAIL PRESS V	Indicates the signal voltage value detected by the ECM for the fuel rail pressure sensor.	0 – 5V
FUEL SPLY PRESS	Indicates the measured fuel pressure from lift pump to stage 2 fuel filter.	450 – 700 kPa
FUEL SPLY PRESS V	Indicates the signal voltage value detected by the ECM for the fuel supply pressure.	0 – 5V
FUEL TEMP	Indicates the measured fuel temperature at the stage 2 fuel filter.	< 75°C
FUEL TEMP SEN V	Indicates the signal voltage value detected by the ECM for the fuel supply sensor.	0 – 5V
GLOW PLUG CMD STATUS	Indicates the ECM is commanding the glow plugs OFF.	OFF
	Indicates the ECM is commanding the glow plugs ON.	ON
INTAKE MANIFOLD TEMP	Indicates the measured fresh air temperature at the air inlet connection.	± 5.5°C of ambient temperature
INTAKE MFOLD TEMP SENS V	Indicates the signal voltage value detected by the ECM for the fuel temperature sensor.	0 – 5V
TURBO PRESS SENSOR	Indicates the measured pressure from the low pressure turbo side sensor.	± 5% of barometric air pressure (kPa)
TURBO PRESS SENSOR V	Indicates the signal voltage value detected by the ECM for the low pressure turbo side sensor.	0 – 5V
MASS AIR FLOW	Indicates the translated rate of fresh air flow into the engine.	Kg/min
FUEL PMP ACT CMD	Indicates the current (amps) being commanded of the fuel pump actuator.	0 – 2A
FUEL PMP ACT FDBK	Indicates the current (amps) feedback being received from the fuel pump actuator.	0 – 2A
Mileage since last oil reset	Indicates the actual vehicle distance traveled as calculated by ECM since last oil change reset.	Numerical
OIL PRESSURE	Indicates the calculated value of the oil pressure.	kPa G
FUEL PRESS RELIEF CRNT	Indicates the current (amps) being commanded of the fuel pressure control valve.	0 – 2A
FUEL PRESS RELIEF FBK	Indicates the current (amps) feedback being received from the pressure control valve.	0 – 2A

Monitor Item	Condition	Value/Status
MAX FUEL RAIL PRESS	Indicates the max fuel rail pressure detected by the ECM in current operation cycle.	bar
VEHICLE SPEED	Indicates the vehicle speed computed from the output speed sensor signal.	km/h / mph
SCR INLET TEMP	Indicates the SCR inlet measured temperature.	°C
SCR OUTLET TEMP	Indicates the SCR outlet measured temperature.	°C
DEF LINE HTR OP STATE	Indicates the DEF line heater is preparing to turn ON.	INIT
	Indicates the DEF line heater is partially ON.	DFRST
	Indicates the DEF line heater is currently ON.	ON
	Indicates the DEF line heater is currently OFF.	OFF
	Indicates the DEF line heater is not available.	N/A
DEF PUMP STATE	Indicates the DEF pump is preparing to engage.	INIT
	Indicates the DEF pump is currently OFF.	OFF
	Indicates the DEF pump is priming.	PRIME
	Indicates the DEF pump is dosing.	DOSE
	Indicates the DEF pump is purging.	PURGE
	Indicates the DEF pump is waiting to purge.	WAIT
	Indicates the DEF pump is not communicating with the ECM.	TIMEOUT
Def tank htr operation state	Indicates the DEF tank heater is partially ON.	DFRST
	Indicates the DEF tank heater is currently ON.	ON
	Indicates the DEF tank heater is currently OFF.	OFF
	Indicates the DEF tank heater is not available.	N/A
SEN SUPPLY N-1 VOL	Indicates ECM output voltage of sensor supply 1.	4.7 – 5.2 V
SEN SUPPLY N-3 VOL	Indicates ECM output voltage of sensor supply 3.	4.7 – 5.2 V
SEN SUPPLY N-4 VOL	Indicates ECM output voltage of sensor supply 4.	4.7 – 5.2 V
SEN SUPPLY N-5 VOL	Indicates ECM output voltage of sensor supply 5.	4.7 – 5.2 V
SEN SUPPLY N-6 VOL	Indicates ECM output voltage of sensor supply 6.	4.7 – 5.2 V
BRAKE SWITCH	Indicates the brake pedal is depressed.	ON
	Indicates the brake pedal is not depressed.	OFF
BRAKE SWITCH SIG 2	Indicates the brake pedal is depressed.	ON
	Indicates the brake pedal is not depressed.	OFF
TURBO COMP IN TEMP V	Indicates the signal voltage value detected by the ECM for turbocharger compressor inlet.	0 – 5V
TURBO COMP IN TEMP	Indicates the measured temperature at turbocharger compressor inlet.	± 5.5°C of ambient temperature
TURBO SPEED	Indicates the measured speed at which the turbocharger is rotating.	< 40 KR/M
DEF TANK LEVEL	Indicates actual DEF tank level.	%
UREA TANK TEMP	Indicates the measured temperature of the DEF fluid within the DEF tank.	°C
DEF TANK TEMP SENS V	Indicates the signal voltage value detected by the ECM for DEF tank temperature.	0 – 5V
WAIT START CMD	Indicates the Wait to Start lamp is ON.	ON
	Indicates the Wait to Start lamp is OFF.	OFF
WATER IN FUEL V	Indicates the measured signal voltage from the water in fuel sensor.	0 – 5V
WATER IN FUEL	Indicates no water in fuel detected.	NOWTR
	Indicates water in fuel detected.	WTR

Monitor Item	Condition	Value/Status
TOTAL WATER IN FUEL TIME	Indicates the total time water has been detected in the fuel over the life of the ECM.	Numerical
ENGINE OPER STATE	Indicator of which fueling selection is controlling the engine.	Fueling stop state
DEF PUMP ASH	Indicates the amount of ash estimated in the DPF.	gm
Engine serial number	Indicates the engine serial number.	Numerical
CRANKCASE PRESS	Indicates the purging value for the DEF line is closed.	-0.63 – +0.63 kPa
CRANKCASE PRESS VOLT	Indicates the signal voltage as measured by the ECM for crankcase pressure sensor.	0 – 5V
DEF QUALITY SENSOR TEMP	Indicates the temperature as measured by the DEF quality sensor.	°C
DEF DOSING VALVE POS CMD	Indicates the current position commanded for the DEF injector.	Close
		Open
DEF REVERT VALVE POS	Indicates the purging value for the DEF line.	Close
		Open
DEF PUMP DUTY CYCLE	Indicates the current dosing commanded of the DEF pump.	0 – 100%
Comp bypass valve test stat	Indicates the module is currently not executing the test.	INACT
	Indicates the module is currently executing the test.	ACTIV
	Indicates the test has detected vehicle speed.	VSSPD
	Indicates the test has detected battery voltage below test threshold condition.	BATLO
INTAKE O2 STATE	Indicates the oxygen reading is not valid.	NG
	Indicates the oxygen reading is OK.	READY
	Indicates the oxygen reading is not valid.	ERROR
	Indicates the oxygen reading is not available.	NA
INTAKE O2	Indicates the current percent oxygen level detected at the inlet of the SCR component.	%
IGN STATE	Indicates the current state of the ignition switch as detected by the ECM.	On
		Off
NO OF KEY OFF EVENTS	Indicates the number of times the ECM has fully powered down.	Numerical
NO OF KEY ON EVENTS	Indicates the number of times the ECM has fully powered up.	Numerical
Instantaneous percent load	Indicates the percentage load on the engine at any given point.	%
ENGINE TORQUE	Indicates the torque amount the engine is producing.	Nm
TOTAL FUELING	Indicates the amount of fuel being dispersed at a given time.	mg/stroke
FAF/EGR AIR FLOW	Indicates the calculated combined fresh and EGR air flow.	Kg/min
A/C PRESS SW	Indicates the current state of the A/C pressure switch.	On
		Off
OIL PRESSURE SENS V	Indicates measured signal voltage from the oil pressure sensor.	0 – 5V
RTCV ACTUATOR POS	Indicates the actual rotary control valve actuator position.	0 – 100%

Monitor Item	Condition	Value/Status
RTCV INSTALL/CALIB STATUS	Indicates the module is currently not executing the test.	INACT
	Indicates the module is currently executing the test.	ACTIV
	Indicates the rotary turbine control valve actuator has performed install successfully.	ICOMP
	Indicates the rotary turbine control valve system is suspect.	FAIL
	Indicates the rotary turbine control valve actuator has performed calibrate successfully.	CCOMP
	Indicates the rotary turbine control valve should have an installation performed.	IRQRD
	Indicates the test has aborted/is not running due to engine speed.	ENGSP
	Indicates the test has aborted/is not running due to CRNT DTC.	FAULT
RTCV HYSTERESIS STATUS	Indicates the module is currently not executing the test.	INACT
	Indicates the module is currently executing the test.	ACTIV
	Indicates the rotary turbine control valve system functions as expected.	PASS
	Indicates the rotary turbine control valve system is suspect.	FAIL
	Indicates the test has aborted/is not running due to CRNT DTC.	ERROR
	Indicates the test has detected coolant temperature below test minimum threshold.	LOCLT
	Indicates the test has detected coolant temperature above test maximum threshold.	HICLT
	Indicates the test has aborted/is not running due to engine speed.	ENGSP
	Indicates the test has detected battery voltage below test threshold condition.	BATLO
	Indicates the test could not execute due to vehicle condition.	PROHB
TURBO COMP INLET PRESS	Indicates the absolute measured pressure at turbocharger compressor inlet.	± 1 kPa of barometric air pressure
TURBO COMP INLET PRESS V	Indicates the signal voltage as measured by the ECM for fresh air flow pressure.	0 – 5V

TERMINAL LAYOUT



PHYSICAL VALUES

Terminal (Wire color)		Description		Condition		Reference value (Approx.)
+	–	Signal name	Input/ Output	Ignition switch	Operation

DTC RELATED ITEM

DTC No.	Detected condition	Action taken when DTC is CRNT
U0106 U0307 U0407	ECM communication with glow plug control module (CAN2).	Glow plug operation disabled.
P0383	Glow plug control module supply voltage less than 6V.	
P0384	Glow plug control module supply voltage greater than 16V.	
P064C	Glow plug control module internal error.	
P06E5		
P263E	Glow plug control module internal temperature greater than 125° C (257° F).	
U010E U11C1	ECM communication with DEF control module (CAN2).	• DEF fluid injection disabled. • Engine torque reduced. • Vehicle speed limited to 8 km/h (5 mph).
U029D	ECM communication with intake NOx sensor (CAN2).	
P1C54	ECM detects NOx conversion efficiency of intake NOx sensor critically low.	
P2048	ECM detects DEF dosing valve circuit open, short high or short low.	
P20B7	ECM detects DEF dosing heater temperature not rising when commanded ON.	
P2201	ECM detects intake NOx sensor not reading 0 while in motoring (non fueling) condition.	
U029E	ECM communication with outlet NOx sensor (CAN2).	• Engine torque reduced. • Vehicle speed limited to 8 km/h (5 mph).
P1C70	ECM detects engine operated for extended period with critical faults.	
P203F	DEF tank level critically low.	
P20E8	• DEF supply pump assembly unable to successfully prime. • DEF control unit detects DEF supply pressure does not reach 460 kPa during priming, or less than 400 kPa during dosing.	
P20E9	DEF control unit detects diesel exhaust fluid pressure greater than 600 kPa (87 psi).	
P2BA7	DEF tank level critically low.	

DTC No.	Detected condition	Action taken when DTC is CRNT
U02A2	ECM communication with DEF quality sensor (CAN2).	Engine torque reduced.
P0016	ECM detects crankshaft position does not match camshaft position.	
P0087	ECM detects measured fuel rail pressure below commanded fuel rail pressure by at least 200 bar (2,900 psi).	
P0088	ECM detects fuel rail pressure greater than commanded fuel rail pressure by 200 bar (2,900 psi) or fuel rail pressure exceeded 2150 bar (31,183 psi).	
P0184	Difference between fuel temperature and ambient temperature is greater than 15°C (59° F) or 25° C (77° F).	
P0252	ECM detects fuel pump actuator overheated.	
P0524	ECM detects engine oil pressure less than 60 kPa.	
P061A	Fueling commands inconsistent with engine running conditions.	
P061B		
P1451	ECM detects soot load of diesel particulate filter reached first stage plugging.	
P203B	DEF control module detects DEF tank level sensor signal circuit less than 0.3V.	
P203C		
P203D	DEF control module detects DEF tank level sensor signal circuit greater than 4.8V.	
P205C	DEF control module detects DEF tank temperature sensor signal circuit less than 0.17V.	
P205D		
P206B	DEF quality sensor reports an internal error.	
P21C4	ECM detects DEF fluid line heater relay driver signal short to voltage.	
P229E	Internal circuit error detected in outlet NOx sensor.	
P2413	ECM detects EGR temperature greater than 250° C (482° F).	
P2BAC	ECM detects critical DTCs related to engine operation are CRNT and engine continues to operate.	

DTC No.	Detected condition	Action taken when DTC is CRNT
U040D	ECM communication with rotary turbine control valve actuator (CAN2).	
P009E	ECM detects fuel pressure relief valve closed-loop compensation value outside calibrated limits.	
P00AF	Rotary turbine control valve actuator detects internal error.	
P009E	ECM detects fuel pressure relief valve closed-loop compensation value outside calibrated limits.	
P00AF	Rotary turbine control valve actuator detects internal error.	
P0107	ECM detects charge air cooler outlet pressure signal voltage less than 0.2V.	
P0108	ECM detects charge air cooler outlet pressure signal voltage greater than 4.8V.	
P0237	ECM detects low pressure turbocharger boost pressure sensor signal voltage less than 0.2V.	
P0238	ECM detects low pressure turbocharger boost pressure sensor signal voltage greater than 4.8V.	
P0405	ECM detects EGR valve position signal voltage less than 0.3 V.	
P0406	ECM detects EGR valve position signal voltage greater than 4.7V.	
P046C	ECM detects EGR valve unable to reach commanded position.	• Active and stationary regeneration of diesel particulate filter disabled. • EGR valve operation disabled. • Engine torque reduced.
P0489	ECM detects low voltage on EGR valve.	
P0490	ECM detects high voltage on EGR valve.	
P1A62	Turbocharger failed to detect endpoint or stop references.	
P200C	DPF temperature sensor module temperature reading greater than 810° C (1,490° F).	
P2262	Rotary turbine control valve actuator could not meet commanded position.	
P226C	ECM detects difference between actual and commanded turbocharger position is too large.	
P22CB	ECM detects compressor bypass solenoid circuit shorted low.	
P22CC	ECM detects compressor bypass solenoid circuit open or shorted high.	
P242F	ECM detects soot load of DPF filter exceeds maximum.	
P244A	ECM detects DPF differential pressure too low.	
P245C	ECM detects EGR bypass valve circuit short to ground.	
P245D	ECM detects EGR bypass valve circuit short to voltage.	
P2493	ECM detects EGR bypass valve stuck.	
P2494	ECM detects EGR bypass valve position signal voltage less than 0.3V.	
P2495	ECM detects EGR bypass valve position signal voltage greater than 4.7V.	

DTC No.	Detected condition	Action taken when DTC is CRNT
U040F	DEF control module communication with ECM (CAN2).	• DEF fluid injection disabled. • Engine torque reduced.
U3017	ECM communication with SCR temperature sensor module (CAN2).	
P1624	DPF temperature sensor module reports an internal error.	
P1625	DPF temperature sensor module supply voltage greater than 18V.	
P1626	DPF temperature sensor module supply less than 6.5V.	
P1627	DPF temperature sensor module internal temperature greater than 150° C (302° F).	
P1628	ECM detects SCR temperature sensor module intermittent supply voltage resulting in internal module reset.	
P202E	ECM detects DEF dosing valve stuck.	
P204A	DEF dosing valve unable to maintain commanded pressure.	
P204C	ECM detects DPF differential pressure sensor signal voltage less than 0.5V.	
P204D	ECM detects DPF differential pressure sensor signal voltage greater than 4.5V.	
P207F	• DEF quality sensor detects DEF concentration below critical threshold. • DEF quality sensor unable to determine DEF concentration.	
P208A	DEF control module detects an open circuit in DEF dosing pump motor phases.	
P208C	DEF control module detects DEF dosing pump motor circuit short to ground.	
P208D	DEF control module detects DEF dosing pump motor circuit short to voltage.	
P20FF	ECM detects and internal error in DEF control module via CAN2.	
P214C	ECM detects SCR temperature sensor module above critical threshold.	
P21CA	DEF control module supply voltage greater than 5.1V or less than 4.8V.	
P2202	Internal circuit error detected in intake NOx sensor.	
P2454	ECM detects DPF sensor differential pressure signal voltage less than 0.25V.	
P2455	ECM detects DPF sensor differential pressure signal voltage greater than 4.7V.	
P2456	ECM detects DPF outlet pressure greater than 1.5 kPa (0.22 psi) or less than 1.5 kPa (0.22 psi).	
P2470	SCR temperature sensor module signal out of range low.	
P2471	SCR temperature sensor module signal out of range high.	
P2472	ECM detects SCR temperature sensor module signal irrational.	
P2481	SCR temperature sensor module short to ground.	
P2482	SCR temperature sensor module open or short to voltage.	

DTC No.	Detected condition	Action taken when DTC is CRNT
U1611	ECM communication with DPF temperature sensor module (CAN2).	• Active and stationary regeneration of diesel particulate filter disabled. • Engine torque reduced.
P1484	DPF temperature sensor module reading greater than 650° C (1,202° F).	
P1613	DPF temperature sensor module internal error.	
P1614	DPF temperature sensor module supply voltage greater than 18V.	
P1615	DPF temperature sensor module supply voltage less than 6.5V.	
P1616	DPF temperature sensor module internal temperature greater than 150° C (302° F).	
P1623	ECM detects DPF temperature sensor module intermittent supply voltage resulting in internal module reset.	
P200E	DPF temperature sensor module temperature greater than 735° C (1,355° F).	
P244D	DPF outlet temperature sensor greater than 650° C (1,202° F).	
P0046	Rotary turbine control valve actuator communication with ECM.	• DEF fluid injection disabled. • EGR valve operation disabled. • Engine torque reduced.
P0102	ECM detects MAF sensor signal short to ground.	
P0049	• ECM detects turbocharger speed greater than 330k rpm for more than 5 seconds. • Engine derated due to turbocharger speed above normal operating range for 10 seconds.	• ECM estimates turbocharger speed. • Engine torque reduced.
P007C	ECM detects engine charge air cooler outlet temperature signal voltage low.	ECM uses default value for intake manifold temperature.
P007D	ECM detects engine charge air cooler outlet temperature signal voltage greater than 4.7V.	
P00C6	ECM detects fuel rail pressure less than 120 bar (1,740 psi) while cranking.	Engine may not start.
P0604	ECM detects software or calibration error.	
P0605		
P060A		
P060B		
P06B8		
P0606	ECM detects read/write error.	
P0103	ECM detects MAF sensor signal short to voltage.	• Active and stationary regeneration of diesel particulate filter disabled. • DEF fluid injection disabled. • EGR valve operation disabled. • Engine torque reduced.
P0106	ECM detects intake manifold pressure sensor reading higher or lower than expected.	
P040B	ECM detects EGR temperature too high or too low, or temperature did not rise 0.5° C (33° F) at start up.	
P0111	ECM detects intake manifold temperature sensor reading higher or lower than other temperature sensors.	• EGR valve operation disabled. • ECM uses default value for intake manifold temperature. • Engine torque reduced.
P0112	ECM detects intake manifold temperature sensor signal voltage less than 0.06V.	• EGR valve operation disabled. • Active and stationary regeneration of diesel particulate filter disabled. • ECM uses default value for intake manifold temperature. • Engine torque reduced.
P0113	ECM detects intake manifold temperature sensor signal voltage greater than 4.7V.	

DTC No.	Detected condition	Action taken when DTC is CRNT
P0116	ECM detects coolant temperature sensor reading higher or lower than other temperature sensors.	ECM uses default value for coolant temperature.
P0117	ECM detects coolant temperature sensor signal voltage less than 0.108V.	
P0118	ECM detects coolant temperature sensor signal voltage greater than 4.95V.	
P0127	ECM detects intake manifold temperature greater than 120° C (248° F) or 132° C (270° F) for longer than 5 seconds.	Maximum engine operating speed decreased.
P012B	ECM detects barometric pressure reading higher or lower than other temperature sensors.	ECM uses default value for barometric pressure.
P0182	ECM detects fuel temperature sensor signal voltage less than 0.108V.	ECM uses default value for fuel temperature.
P0183	ECM detects fuel temperature sensor signal voltage greater than 4.97V.	
P0191	ECM detects fuel rail pressure sensor signal voltage greater than 0.6V (ignition ON) or less than 0.4V (ignition OFF).	• EGR valve operation disabled. • Engine torque reduced.
P0217	ECM detects engine coolant temperature above threshold and closes EGR valve to reduce temperature.	
P2457	ECM detects EGR temperature greater than 260° C (500° F).	
P2560	ECM detects coolant level sensor signal voltage greater than 3V.	
P0192	ECM detects fuel rail pressure sensor signal voltage less than 0.2V.	ECM uses default value for fuel rail pressure.
P0193	ECM detects fuel rail pressure sensor signal voltage greater than 4.8V.	
P0201	ECM detects open in fuel injector no. 1 harness or injector.	• Fuel injector disabled. • Engine torque reduced.
P0202	ECM detects open in fuel injector no. 2 harness or injector.	
P0203	ECM detects open in fuel injector no. 3 harness or injector.	
P0204	ECM detects open in fuel injector no. 4 harness or injector.	
P0205	ECM detects open in fuel injector no. 5 harness or injector.	
P0206	ECM detects open in fuel injector no. 6 harness or injector.	
P0207	ECM detects open in fuel injector no. 7 harness or injector.	
P0208	ECM detects open in fuel injector no. 8 harness or injector.	
P0262	ECM detects fuel injector no. 1 short to voltage or low injector solenoid resistance.	
P0265	ECM detects fuel injector no. 2 short to voltage or low injector solenoid resistance.	
P0268	ECM detects fuel injector no. 3 short to voltage or low injector solenoid resistance.	
P0271	ECM detects fuel injector no. 4 short to voltage or low injector solenoid resistance.	
P0274	ECM detects fuel injector no. 5 short to voltage or low injector solenoid resistance.	
P0277	ECM detects fuel injector no. 6 short to voltage or low injector solenoid resistance.	
P0280	ECM detects fuel injector no. 7 short to voltage or low injector solenoid resistance.	
P0283	ECM detects fuel injector no. 8 short to voltage or low injector solenoid resistance.	

DTC No.	Detected condition	Action taken when DTC is CRNT
P0219	ECM detects engine speed exceeded 4,600 rpm.	Fueling to engine stops until engine speed drops to normal operating speeds
P0253	ECM detects fuel pump actuator signal voltage less than 2.7V.	• Sensed fuel rail pressure does not match commanded fuel rail pressure. • Engine torque reduced.
P0254	ECM detects fuel pump actuator signal open, short to voltage or short pin to pin.	
P0335	ECM detects loss of crankshaft position sensor signal.	ECM uses backup engine speed sensor for engine speed signal.
P0698	ECM detects crankshaft position sensor signal voltage less than 4.8V.	
P0699	ECM detects crankshaft position sensor signal voltage greater than 5.4V.	
P040C	ECM detects EGR temperature sensor signal voltage less than 0.05V.	• ECM uses default value for EGR temperature. • Active and stationary regeneration of diesel particulate filter disabled. • EGR valve operation disabled. • Engine torque reduced.
P040D	ECM detects EGR temperature sensor signal voltage greater than 4.9V.	
P0471	• ECM detects exhaust gas pressure higher or lower than other absolute pressure sensors. • ECM detects exhaust gas pressure higher or lower than expected during normal engine operation.	• ECM uses default value for exhaust gas pressure sensor. • EGR valve operation disabled. • Engine torque reduced.
P0472	ECM detects exhaust gas pressure sensor signal voltage less than 0.25V.	• ECM uses default value for exhaust gas pressure sensor. • Active and stationary regeneration of diesel particulate filter disabled. • EGR valve operation disabled. • Engine torque reduced.
P0473	ECM detects exhaust gas pressure sensor signal voltage greater than 4.75V.	
P051C	ECM detects crankcase pressure sensor signal voltage less than 0.25V.	ECM uses default value for crankcase pressure.
P051D	ECM detects crankcase pressure sensor signal voltage greater than 4.7V.	
P0544	ECM detects difference between intake NOx sensor and DPF temperature sensor module data.	• ECM uses default value for intake NOx sensor. • DEF fluid injection disabled. • Engine torque reduced.
P2031	ECM detects difference between intake NOx sensor and outlet NOx sensor data.	
P0545	DPF temperature sensor module detects a sensor short to ground.	• ECM uses default value for intake NOx sensor. • DEF fluid injection disabled. • Active and stationary regeneration of diesel particulate filter disabled. • Engine torque reduced.
P0546	DPF temperature sensor module detects a sensor open or short to voltage.	
P2032	DPF temperature sensor module detects a sensor short to ground.	
P2033	DPF temperature sensor module detects a sensor open or short to voltage.	
P062C	ECM detects vehicle speed is greater than 5 mph (8 km/h) over targeted cruise speed.	Cruise control temporarily inhibited.
P0653	ECM detects sensor supply signal voltage greater than 5.3V.	ECM uses default value for the following components: • Camshaft position sensor • Fuel rail pressure sensor • Exhaust gas pressure sensor • Low pressure turbocharger boost pressure sensor • Engine charge air cooler outlet pressure/temperature sensor • Turbocharger compressor intake pressure/temperature sensor • EGR valve • EGR bypass valve • Crankcase pressure sensor • Turbocharger speed sensor • Fuel pressure sensor

DTC No.	Detected condition	Action taken when DTC is CRNT
P0691	ECM detects fan control circuit PWM signal not at system voltage when signal commanded ON.	Fan operation disabled.
P0692	ECM detects fan control circuit PWM signal voltage greater than 0 V when signal commanded OFF.	
P06A4	ECM detects APP sensor 1 supply voltage less than 4.7V.	Engine will only idle.
P06A5	ECM detects APP sensor 1 supply voltage greater than 5.3V.	
P06D3	ECM detects APP sensor 2 supply voltage less than 4.7V.	Engine will have limp home throttle control only.
P06D4	ECM detects APP sensor 2 supply voltage greater than 5.3V.	
P2121	ECM detects values between APP sensor 1 and APP sensor 2 differ by greater than 10%.	
P2299	ECM detects accelerator pedal and brake pedal were depressed simultaneously.	
P1191	ECM detects turbocharger compressor intake temperature sensor reading higher or lower than other temperature sensors, or sensor reading erratic.	• ECM uses default value for turbocharger compressor intake temperature sensor. • Engine torque reduced.
P1192	ECM detects turbocharger compressor intake temperature sensor signal voltage less than 0.1V.	ECM uses default value for turbocharger compressor intake temperature sensor.
P1193	ECM detects turbocharger compressor intake temperature sensor signal voltage greater than 4.7V.	
P1484	ECM detects DPF temperature sensor module greater than 800° C (1472° F), or temperature differential greater than 540° C (1,004° F).	• Active and stationary regeneration of diesel particulate filter disabled. • EGR valve operation disabled.
P1A77	ECM shuts down engine due to critical aftertreatment temperature faults.	Engine shuts down after a short period of time.
P202B	DEF control module detects open or short to ground on DEF tank heater circuit.	• Diesel exhaust fluid tank heating disabled. • Engine torque reduced.
P202C	DEF control module detects short to voltage on DEF tank heater circuit.	
P2044	ECM detects DEF tank temperature signal voltage out of range high.	DEF fluid injection disabled.
P2045	ECM detects DEF tank temperature signal voltage out of range low.	
P214D	ECM detects temperature at SCR temperature sensor module above 800° C (1,472° F).	
P21CB	DEF control module detects supply voltage less than 9V.	
P21CC	DEF control module detects supply voltage greater than 16V.	
P2080	ECM detects temperature at intake NOx sensor greater than critical limit.	• ECM uses default value for intake NOx sensor. • Active and stationary regeneration of diesel particulate filter disabled.
P20B9	DEF control module detects DEF line heater open circuit.	• DEF line heater disabled. • Engine torque reduced.
P20BC	DEF control module detects DEF line heater circuit short to voltage.	
P20BB	DEF control module detects DEF line heater circuit short to ground.	• DEF line heater disabled. • DEF fluid injection disabled. • Engine torque reduced.
P2146	ECM detects injector group 1 (fuel injector no. 1, 4, 6 and 7) short to voltage or low injector solenoid resistance.	Fuel injectors disabled.
P2149	ECM detects injector group 2 (fuel injector no. 2, 3, 5 and 8) short to voltage or low injector solenoid resistance.	

DTC No.	Detected condition	Action taken when DTC is CRNT
P214A	ECM detects SCR temperature sensor module above critical threshold.	• Engine torque reduced. • Engine will be shut down if Engine Protection Shutdown is enabled.
P214B	ECM detects SCR temperature above 700° C (1,292° F).	Engine will be shut down if Engine Protection Shutdown is enabled.
P242B	ECM detects DPF outlet temperature sensor reading did not change with engine operating conditions.	• ECM uses default value for DPF outlet temperature sensor. • DEF fluid injection disabled. • Engine torque reduced.
P242C	DPF temperature sensor module detects a short to ground condition.	
P242D	DPF temperature sensor module detects an open or short to voltage condition.	
P245F	ECM detects DPF differential pressure greater than 1.5 kPa (0.44 Hg).	ECM uses default value for DPF differential pressure sensor.
P2460	ECM detects DPF differential pressure sensor signal voltage less than 0.25V.	• ECM uses default value for DPF differential pressure sensor. • Active and stationary regeneration of diesel particulate filter disabled. • Engine torque reduced.
P2461	ECM detects DPF differential pressure sensor signal voltage greater than 4.7V.	
P2462	ECM detects DPF differential pressure greater than 1.5 kPa (0.44 Hg).	• ECM uses default value for DPF differential pressure sensor. • Active and stationary regeneration of diesel particulate filter disabled. • EGR valve operation disabled. • Engine torque reduced.
P2463	ECM detects soot load of diesel particulate filter moderately severe.	• Mobile regeneration of diesel particulate filter disabled. • EGR valve operation disabled. • Engine torque reduced.
P2483	ECM detects SCR temperature sensor module signal irrational.	• ECM uses default value for SCR catalyst outlet temperature. • DEF fluid injection disabled. • Engine torque reduced.
P2541	ECM detects fuel pressure signal voltage less than 0.2V.	• ECM uses default value for fuel delivery pressure reading. • Engine torque reduced.
P2542	ECM detects fuel pressure signal voltage greater than 4.8V.	ECM uses default value for fuel delivery pressure reading.
P2579	ECM detects turbocharger shaft stuck.	ECM estimates turbocharger speed.
P2580	ECM detects turbocharger speed less than 15,000 rpm.

[1]: 1st trip DTC No. is the same as DTC No.

[2]: This number is prescribed by SAE J1979/ISO 15031-5.

[3]: In Diagnostic Test Mode II (Self diagnostic results), this number is controlled by NISSAN.

[4]: The troubleshooting for this DTC needs CONSULT.

BASIC INSPECTION

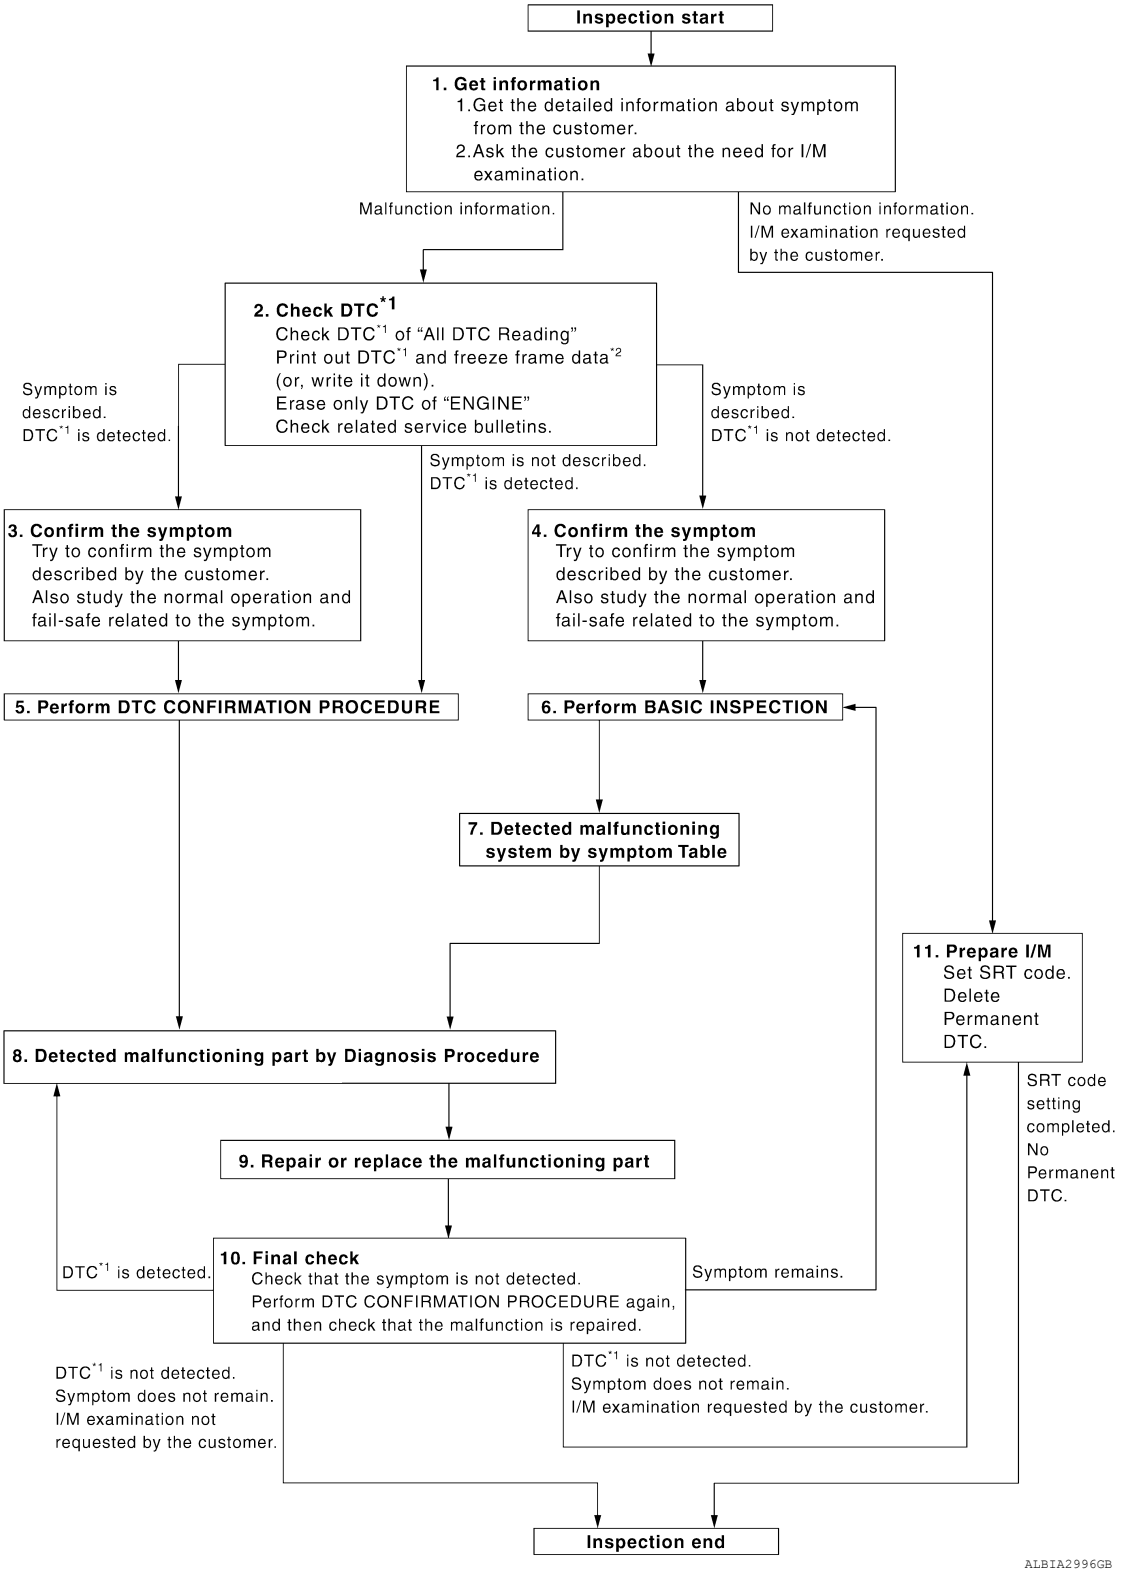
DIAGNOSIS AND REPAIR WORK FLOW

Work Flow

INFOID:0000000013404963

WORK FLOW

Overall Sequence



*1: Include 1st trip DTC.
*2: Include 1st trip freeze frame data.

Detailed Flow

1.GET INFORMATION FOR SYMPTOM

1. Get the detailed information from the customer about the symptom (the condition and the environment when the incident/malfunction occurred) using the “Diagnostic Work Sheet”.
2. Ask if the customer requests I/M examination.

Malfunction information, obtained>>GO TO 2.
No malfunction information, but a request for I/M examination>>GO TO 11.

2.CHECK DTC

1. Check DTC.
2. Perform the following procedure if DTC is displayed.

- Record DTC and freeze frame data. (Print them out with CONSULT or GST.)
- Erase DTC.
- Study the relationship between the cause detected by DTC and the symptom described by the customer. (Symptom Matrix Chart is useful. Refer to EC-1246, "Symptom Table".)

3. Check related service bulletins for information.

Are any symptoms described and any DTCs detected?

Symptom is described, DTC is detected>>GO TO 3.
Symptom is described, DTC is not detected>>GO TO 4.
Symptom is not described, DTC is detected>>GO TO 5.

3.CONFIRM THE SYMPTOM

Try to confirm the symptom described by the customer (except MIL ON).
Also study the normal operation and fail-safe related to the symptom. Refer to EC-126, "Fail safe".
Diagnosis Work Sheet is useful to verify the incident.
Verify relation between the symptom and the condition when the symptom is detected.

>> GO TO 5.

4.CONFIRM THE SYMPTOM

Try to confirm the symptom described by the customer.
Also study the normal operation and fail-safe related to the symptom. Refer to EC-126, "Fail safe".
Diagnosis Work Sheet is useful to verify the incident.
Verify relation between the symptom and the condition when the symptom is detected.

>> GO TO 6.

5.PERFORM DTC CONFIRMATION PROCEDURE

Perform DTC CONFIRMATION PROCEDURE for the displayed DTC, and then check that DTC is detected again.
If two or more DTCs are detected, refer to EC-135, "DTC Index" and determine trouble diagnosis order by performing all communication (UXXXX) DTCs before other (PXXXX) DTCs.

NOTE:

- Freeze frame data is useful if the DTC is not detected.
- Perform Component Function Check if DTC CONFIRMATION PROCEDURE is not included in Service Manual. This simplified check procedure is an effective alternative though DTC cannot be detected during this check.
  If the result of Component Function Check is NG, it is the same as the detection of DTC by DTC CONFIRMATION PROCEDURE.

Is DTC detected?

YES >> GO TO 8.
NO >> Check according to GI-43, "Intermittent Incident".

6.PERFORM BASIC INSPECTION

Perform EC-197, "Work Procedure".

>> GO TO 7.

7.DETECT MALFUNCTIONING SYSTEM BY SYMPTOM TABLE

Detect malfunctioning system according to EC-1246, "Symptom Table" based on the confirmed symptom in step 4, and determine the trouble diagnosis order based on possible causes and symptoms.

>> GO TO 8.

8.DETECT MALFUNCTIONING PART BY DIAGNOSIS PROCEDURE

Inspect according to Diagnosis Procedure of the system.

NOTE:

The Diagnosis Procedure in EC section is described based on open circuit inspection. A short circuit inspection is also required for the circuit check in the Diagnosis Procedure. For details, refer to GI-45, "Circuit Inspection".

Is a malfunctioning part detected?

YES >> GO TO 9.

NO >> Monitor input data from related sensors or check voltage of related ECM terminals using CONSULT. Refer to EC-114, "Reference Value".

9.REPAIR OR REPLACE THE MALFUNCTIONING PART

1. Repair or replace the malfunctioning part.
2. Reconnect parts or connectors disconnected during Diagnosis Procedure again after repair and replacement.
3. Check DTC. If DTC is displayed, erase it.

>> GO TO 10.

10.FINAL CHECK

When DTC was detected in step 2, perform DTC CONFIRMATION PROCEDURE or Component Function Check again, and then check that the malfunction has been completely repaired.

When symptom was described from the customer, refer to confirmed symptom in step 3 or 4, and check that the symptom is not detected.

Is DTC detected and does symptom remain?

YES-1 >> DTC is detected: GO TO 8.

YES-2 >> Symptom remains: GO TO 6.

NO-1 >> Before returning the vehicle to the customer, always erase unnecessary DTC in ECM and TCM (Transmission Control Module). If the completion of SRT is needed, drive vehicle under the specific driving pattern. Refer to EC-103, "CONSULT Function".

NO-2 >> I/M examination, requested from the customer: GO TO 11.

11.PREPARE FOR I/M EXAMINATION

1. Set SRT codes. Refer to EC-199, "Description".
2. Erase permanent DTCs. Refer to EC-205, "Description".

>> INSPECTION END

Diagnostic Work Sheet

INFOID:0000000013404964

DESCRIPTION

There are many operating conditions that lead to the malfunction of engine components. A good grasp of such conditions can make troubleshooting faster and more accurate.
In general, each customer feels differently about an incident. It is important to fully understand the symptoms or conditions for a customer complaint.
Utilize a diagnostic worksheet like the one shown below in order to organize all the information for troubleshooting.
Some conditions may cause the MIL to come on steady and DTC to be detected. Examples:

- Vehicle ran out of fuel, which caused the engine to misfire.
- Fuel filler cap was left off or incorrectly screwed on, allowing fuel to evaporate into the atmosphere.

KEY POINTS

WHAT ..... Vehicle & engine model
WHEN ..... Date, Frequencies
WHERE..... Road conditions
HOW ..... Operating conditions, Weather conditions, Symptoms

SEF907L

WORKSHEET SAMPLE

Customer name MR/MS		Model & Year	VIN
Engine #		Trans.	Mileage
Incident Date		Manuf. Date	In Service Date
Fuel and fuel filler cap		☐ Vehicle ran out of fuel causing misfire ☐ Fuel filler cap was left off or incorrectly screwed on.	
Symptoms	☐ Startability	☐ Impossible to start ☐ No combustion ☐ Partial combustion ☐ Partial combustion affected by throttle position ☐ Partial combustion NOT affected by throttle position ☐ Possible but hard to start ☐ Others [ ]	
	☐ Idling	☐ No fast idle ☐ Unstable ☐ High idle ☐ Low idle ☐ Others [ ]	
	☐ Driveability	☐ Stumble ☐ Surge ☐ Knock ☐ Lack of power ☐ Intake backfire ☐ Exhaust backfire ☐ Others [ ]	
	☐ Engine stall	☐ At the time of start ☐ While idling ☐ While accelerating ☐ While decelerating ☐ Just after stopping ☐ While loading	
Incident occurrence		☐ Just after delivery ☐ Recently ☐ In the morning ☐ At night ☐ In the daytime	
Frequency		☐ All the time ☐ Under certain conditions ☐ Sometimes	
Weather conditions		☐ Not affected	
	Weather	☐ Fine ☐ Raining ☐ Snowing ☐ Others [ ]	
	Temperature	☐ Hot ☐ Warm ☐ Cool ☐ Cold ☐ Humid °F	
Engine conditions		☐ Cold ☐ During warm-up ☐ After warm-up Engine speed 0 2,000 4,000 6,000 8,000 rpm	
Road conditions		☐ In town ☐ In suburbs ☐ Highway ☐ Off road (up/down)	
Driving conditions		☐ Not affected ☐ At starting ☐ While idling ☐ At racing ☐ While accelerating ☐ While cruising ☐ While decelerating ☐ While turning (RH/LH) Vehicle speed 0 10 20 30 40 50 60 MPH	
Malfunction indicator lamp		☐ Turned on ☐ Not turned on	

MTBL0017

SERVICE AFTER REPLACING OR REMOVING ENGINE PARTS

Description

INFOID:0000000013404965

×:Applicable

Part name	Service performed		Required service	Reference
	Replace-ment	Removal*		
ECM	×	—	Additional service when replacing ECM	EC-179
Fuel injector	×	—	Injector adjustment value registration	EC-187
DPF (Diesel Particulate Filter)	×	—	DPF (Diesel Particulate Filter) data clear	EC-186

*: Harness connector disconnection included.

ADDITIONAL SERVICE WHEN REPLACING ECM

Description

INFOID:0000000013404966

When replacing ECM, this procedure must be performed.
NOTE:
The necessary operation is different depending on the operation result of ECM data save or write. Always perform the operation according to procedures. (For details, refer to EC-179, "Work Procedure".)

Work Procedure

INFOID:0000000013404967

1.SAVE ECM DATA

1. Turn ignition switch OFF and wait at least 1 minute.
2. Reconnect all harness connectors disconnected.
3. Turn ignition switch ON.
4. Select “SAVE COMPUTER DATA” in “Work support” mode of “ENGINE” using CONSULT.
5. Follow the instructions on CONSULT display.
   NOTE:
   Necessary data in ECM is copied and saved to CONSULT.

Is operation completed successfully?

YES >> GO TO 2.
NO >> GO TO 7.

2.REPLACE THE ECM

1. Turn ignition switch OFF and wait at least 1 minute.
2. Replace the ECM. Refer to EC-1254, "Removal and Installation".

>> GO TO 3.

3.PERFORM PROGRAMMING

Refer to CONSULT Operation Manual.

>> GO TO 4.

4.PERFORM ECM KEY ID REGISTRATION

Refer to CONSULT Operation Manual NATS-IVIS/NVIS.

>> GO TO 5.

5.PERFORM CONFIGURATION REGISTRATION

1. Turn ignition switch OFF and wait at least 1 minute.
2. Turn ignition switch ON.
3. Check that the battery voltage is between 11V and 14V.
4. Wait at least 10 seconds.
   CAUTION:
   During this step, never perform any vehicle operation.
5. If necessary, perform configuration registration using CONSULT function.

>> GO TO 6.

6.WRITE ECM DATA

1. Select “WRITE SAVED DATA” in “Work support” mode of “ENGINE” using CONSULT.
2. Follow the instructions on CONSULT display.
   NOTE:
   The data saved by “WRITE SAVED DATA” is written to ECM.

Is operation completed successfully?

YES >> GO TO 12.
NO >> GO TO 10.

7.REPLACE THE ECM

1. Turn ignition switch OFF and wait at least 1 minute.
2. Replace the ECM. Refer to EC-1254, "Removal and Installation".

>> GO TO 8.

8.PERFORM PROGRAMMING

Refer to CONSULT Operation Manual.

>> GO TO 9.

9.PERFORM ECM KEY ID REGISTRATION

Refer to CONSULT Operation Manual NATS-IVIS/NVIS.

>> GO TO 10.

10.PERFORM CONFIGURATION REGISTRATION

1. Turn ignition switch OFF and wait at least 1 minute.
2. Turn ignition switch ON.
3. Check that the battery voltage is between 11V and 14V.
4. Wait at least 10 seconds.
   CAUTION:
   During this step, never perform any vehicle operation.
5. If necessary, perform configuration registration using CONSULT function.

>> GO TO 11.

11.PERFORM INJECTOR ADJUSTMENT VALUE REGISTRATION

Perform EC-187, "Description".

>> GO TO 12.

12.PERFORM VIN REGISTRATION

Perform EC-188, "Description".

>> GO TO 13.

13.PERFORM SERVICE REGENERATION

Perform EC-182, "Aftertreatment DPF Regeneration Test".

>> GO TO 14.

14.CHANGE ENGINE OIL

Refer to LU-34, "Changing Engine Oil".

>> GO TO 15.

15.CHECK DTC

1. Turn ignition switch OFF and wait at least 1 minute.
2. Turn ignition switch ON.
3. Check DTC. If DTC is displayed, erase it.

>> Inspection End.

DIESEL PARTICLE FILTER REGENERATION

Aftertreatment SCR Performance Test

INFOID:0000000013461035

GENERAL INFORMATION

- Use the following procedure for additional information on the aftertreatment system. Refer to EX-42, "Removal and Installation".
- The following procedure contains information on how to perform an SCR Performance Test using CONSULT.
- The CONSULT SCR Performance Test uses the intake nitrogen oxides (NOx) sensor and outlet NOx sensor readings to test the efficiency of the SCR catalyst.

INSPECTION

- Use CONSULT to check for DTCs. If **any** DTCs are present, follow the corresponding diagnosis procedure before performing **any** part of this procedure.
- The DTC diagnosis procedure, in some cases, will refer back to this procedure to complete the diagnostics.

TEST

WARNING:

Exhaust system components can become hot enough during operation and testing to cause burns or ignite and melt combustible materials. The exhaust and exhaust components can remain hot after the vehicle stops moving and has been shut down. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning repairs or service. Make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

Before performing an SCR Performance Test, follow the steps listed below:

- Select an appropriate location to park the vehicle:
  - On a surface that will **not** burn or melt under high temperatures (such as clean concrete or gravel, **not** grass or asphalt).
  - Away from anything that can burn, melt, or explode.
- Nothing within 0.6 m (2 ft) of the exhaust outlet.
- Nothing that can burn, melt, or explode within 1.5 m (5 ft) (such as gasoline, wood, paper, plastics, fabric, compressed gas containers, and hydraulic lines).
- Park the vehicle securely.
  - Set the parking brake.
  - Place the transmission in P (Park).
  - Set the wheel chocks at the front and rear of at least one tire.
- Set up a safe exhaust area.
  - If bystanders can possibly enter the area, use barriers to keep people at least 1.5 m (5 ft) from the exhaust outlet during the SCR Performance Test.
  - When indoors, attach an exhaust discharge pipe rated for at least 800° C (1,500° F).
  - Keep a fire extinguisher nearby.
- Check exhaust system surfaces.
  - Confirm that nothing is on or near the exhaust system surfaces (such as tools, rags, grease, or debris).
- Prepare for engine speed changes during the SCR Performance Test.
  - Stay clear of the engine compartment.
- Begin the SCR Performance Test.
  - CONSULT **must** be used to perform the SCR Performance Test.
  - The engine will create enough heat to run the test. Engine speed will increase and the turbocharger can whistle loudly during the testing process. Once the test is complete, the engine will automatically return to normal idle speed.
- Monitor the area.
  - Make sure that the vehicle and surrounding area are monitored during the SCR Performance Test. If **any** unsafe condition occurs, shut the engine OFF immediately.

To stop the test, engage the brake or throttle pedal, or turn the engine OFF.

Once the test is complete, exhaust gas and exhaust surface temperatures will remain elevated for 3 to 5 minutes.

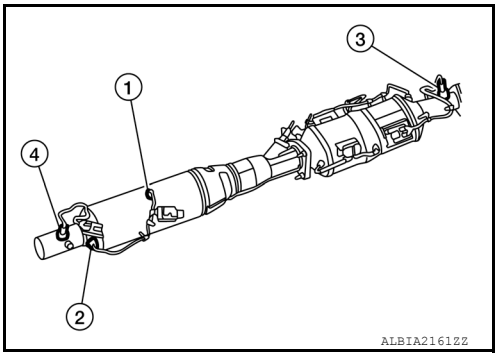
1. Before starting the SCR Performance Test, inspect the exhaust piping for leaks, cracks, and loose connections.

Tighten the exhaust clamps, if necessary. Inspect the exhaust and system for leaks. Tighten clamps as necessary. Refer to the appropriate procedure or equipment manufacturer service information for torque specifications.
Any leaks in the exhaust system will cause the SCR Performance Test to be less efficient. This will result in the test running longer and possibly **not** completing.

2. Select “SCR Performance Test” in “Active Test” mode of “ENGINE” using CONSULT.
3. Follow the instructions on CONSULT display.
   To stop the SCR Performance Test at **any** time during the test:
   - Select End on the CONSULT screen.
   - Depress the brake.
   - Depress the accelerator pedal.
   - Turn the engine off.
4. The SCR Performance Test will perform the following actions:
   Clean the aftertreatment system of **any** diesel exhaust fluid deposits.
   - Cleaning the aftertreatment system of diesel exhaust fluid deposits can take up to 2 hours to complete. If deposits are detected after 2 hours of run time, the test will time out.

   Perform a NOx sensor rationality test.
   - The intake NOx sensor (1) and outlet NOx sensor (2) readings will be compared to determine if they are working properly.
   - If one, or both, of the NOx sensors fail the rationality test, the test will stop and a pop-up message will be displayed, stating that the NOx sensor has failed and troubleshooting is required.

   
   Check the SCR catalyst efficiency.
   - Diesel exhaust fluid will be injected into the aftertreatment system and the outlet NOx sensor reading will be compared to the intake NOx sensor reading to determine the efficiency of the SCR catalyst.
   - If the SCR catalyst fails the efficiency test, a pop-up message will be displayed, stating that the SCR catalyst **must** be replaced.
5. During the SCR Efficiency Test, the following will be monitored:
   - SCR inlet temperature (1)
   - SCR outlet temperature (2)
   - Intake NOx sensor reading (3)
   - Outlet NOx sensor reading (4)

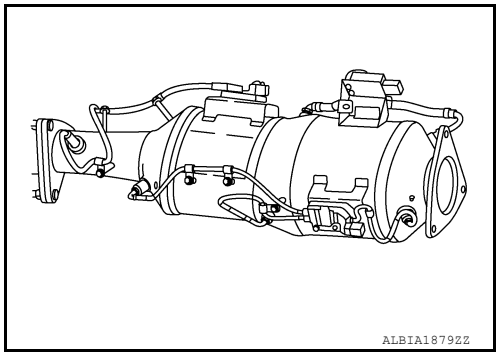
   


6. Once the SCR Performance Test is started, follow the instructions on CONSULT display. When the test is started, the engine idle speed will be raised automatically to the required level.
   - Through engine controls, the engine will operate in a manner to build exhaust heat. The turbocharger will emit a slight whining noise during this test. This is normal.
   - Once the SCR Performance Test is complete, the engine will automatically return to normal idle speed.
7. Once the test is complete, check for current DTCs and/or engine indicator lamps. If **any** current DTCs are present, follow the appropriate DTC diagnosis procedure.

Aftertreatment DPF Regeneration Test

INFOID:0000000013461036

GENERAL INFORMATION



Use the following procedure for additional information on the aftertreatment system. Refer to EX-10, "System Description".
The following procedure contains information about how to inspect the diesel particulate filter (DPF) and perform a stationary regeneration.
There are two main steps when checking the DPF:
- The Initial Check section of this procedure is used to determine the condition of the DPF without removal of the diesel oxidation catalyst diesel particulate filter (DOC DPF). The Initial Check step should be used to determine if the DPF has malfunctioned due to progressive damage.
- The Test section of the procedure explains how to perform a stationary regeneration using CONSULT. The Test step should **only** be performed when troubleshooting procedures and/or engine indicator lamps indicate this is necessary.

If the DPF requires replacement, before replacement:
- Troubleshoot and clear all DTCs.
- Verify the correct fuel type is being used.
- Troubleshoot **any** oil consumption complaint.
- Troubleshoot **any** coolant consumption complaint.
- Inspect the diesel oxidation catalyst (DOC) inlet. Refer to EX-42, "Removal and Installation".

The CONSULT DPF Stationary Regeneration Test can be used to:
- Regenerate an aftertreatment DPF.
- Recover the aftertreatment diesel oxidation catalyst and aftertreatment DPF after coolant contamination.
- Reset the stored soot load in the engine control module (ECM).
- Check the aftertreatment diesel oxidation catalyst efficiency.
- Check for the presence of the DOC.
- Check for the correct installation of the temperature sensors.

The DPF Stationary Regeneration Test can be used to regain functionality of the DOC and DPF after either or both have been exposed to coolant.
The temperatures that are achieved during regeneration are high enough to evaporate the coolant out of both components and return them to normal operating specifications.
NOTE:
If these components are suspected of having coolant contamination, do **not** perform the Snap Acceleration Test before performing the regeneration.

INITIAL CHECK

1. Using CONSULT, check for DTCs. If **any** DTCs are present, follow the corresponding diagnosis procedure before performing **any** part of this procedure.
   - The DTC diagnosis procedure, in some cases, will refer back to this procedure to complete the diagnostics.
   - Inspection of the exhaust system outlet can reveal the condition of the DPF. The exhaust system outlet should appear clean with little to **no** exhaust residue/soot buildup.
   - The DPF is **not** 100% efficient. Some accumulation of exhaust residue/soot is normal and does **not** indicate a malfunctioning DPF.
   - A heavy buildup of exhaust residue/soot can indicate a malfunctioning DPF.

   To determine if the exhaust residue/soot accumulation on the exhaust system outlet is the result of a malfunctioning DPF, perform one of the following:
   - Snap Acceleration Test. Refer to EC-189, "Work Procedure".
   - Clean the last 152 to 254 mm (6 to 10 in) of the exhaust system outlet. Operate the vehicle for one shift or trip and inspect the exhaust system outlet for exhaust residue/soot accumulation.
   - Inspect the aftertreatment DPF. Refer to EX-42, "Removal and Installation".

TEST

WARNING:
Exhaust system components can become hot enough during operation and testing to cause burns or ignite and melt combustible materials. The exhaust and exhaust components can remain hot after the vehicle stops moving and has been shut down. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning repairs or service. Make sure that no combustible materials are located where they are likely to come in contact with hot exhaust or exhaust components.

NOTE:
If the stationary regeneration is being performed to recover either the DOC or DPF, or both, after coolant contamination, the DOC does **not** need to be removed or inspected unless there are current DTCs that require inspection as part of the DTC troubleshooting steps.
Before performing stationary regeneration, follow the steps listed below:
- Select an appropriate location to park the vehicle.
  - On a surface that will **not** burn or melt under high temperatures (such as clean concrete or gravel, **not** grass or asphalt)
  - Away from anything that can burn, melt, or explode
- Nothing within 0.6 m (2 ft) of the exhaust outlet
- Nothing that can burn, melt, or explode within 1.5 m (5 ft) (such as gasoline, wood, paper, plastics, fabric, compressed gas containers, and hydraulic lines)
- Park the vehicle securely.
  - Set the parking brake.
  - Place the transmission in P (Park).
  - Set the wheel chocks at the front and rear of at least one tire.
- Set up a safe exhaust area.
  - If bystanders can possibly enter the area, use barriers to keep people at least 1.5 m (5 ft) from the exhaust outlet during regeneration.
  - When indoors, attach an exhaust discharge pipe rated for at least 800° C (1,500° F).
  - Keep a fire extinguisher nearby.
- Check exhaust system surfaces.
  - Confirm that nothing is on or near the exhaust system surfaces (such as tools, rags, grease, or debris).
- Prepare for engine speed changes during regeneration.
  - Stay clear of the engine compartment.
- Begin the stationary regeneration.
  - CONSULT can be used to perform regeneration by starting the DPF Regeneration Test.
  - The engine will create enough heat to regenerate the DPF. Engine speed will increase and the turbocharger can whistle loudly during the regeneration process. Once the DPF is regenerated, the engine will automatically return to normal idle speed.
  - Make sure that the vehicle and surrounding area is monitored during regeneration. If **any** unsafe condition occurs, shut the engine off immediately.
- Monitor the area.
  - Make sure that the vehicle and surrounding area are monitored during regeneration. If **any** unsafe condition occurs, shut the engine OFF immediately.

To stop a stationary regeneration, engage the brake or throttle pedal, or turn off the engine.
Once regeneration is complete, exhaust gas and exhaust surface temperatures will remain elevated for 3 to 5 minutes.

1. Select “DPF Regeneration” in “Active Test” mode of “ENGINE” using CONSULT.
2. Follow the instructions on CONSULT display.
   To stop the stationary regeneration test at **any** time during the test:
   - Select End on CONSULT screen.
   - Depress the brake.
   - Depress the accelerator pedal.
   - Turn the engine off.
3. During the Aftertreatment DPF Regeneration Test, the following will be monitored:
   - Aftertreatment DPF Soot Load: Informs the user of the current soot load of the filter.
     - Normal: No regeneration is necessary.
     - Above Normal: Least Severe Level - A stationary regeneration can be performed.
     - Above Normal: Moderately Severe Level - A stationary regeneration can be performed.
     - Above Normal: Most Severe Level - A stationary regeneration should **not** be performed unless the filter is cleaned or a new filter has been installed and the troubleshooting steps indicate it should be performed.
   - DPF Outlet Temperature
   - DPF Inlet Temperature
   - Diesel Oxidation Catalyst Inlet Temperature
4. Before starting the Aftertreatment DPF Regeneration Test, inspect the exhaust piping for leaks, cracks, and loose connections. Refer to EX-19, "Checking Exhaust System".
   Tighten the exhaust clamps (if necessary). Refer to EX-24, "Exploded View".

Any leaks in the exhaust system will cause the Aftertreatment DPF Regeneration Test to be less efficient in reducing the soot load of the filter. This will result in the test running longer and possibly **not** completing.

5. Once the Aftertreatment DPF Regeneration Test is started, follow the instructions on CONSULT display. When the test is started, the engine idle speed will be raised automatically to the required level.
   The engine will, through engine controls, operate in a manner to build exhaust heat. The turbocharger will emit a slight whining noise during this test. This is normal.
   Once the Aftertreatment DPF Regeneration Test is complete, the engine will automatically return to normal idle speed.
6. Once the test is complete, check for current DTCs and/or engine indicator lamps for high diesel particulate soot load after performing the Aftertreatment DPF Regeneration Test. If **any** current DTCS are present, follow the appropriate DTC diagnosis procedure.

DIESEL PARTICULATE FILTER DATA CLEAR

Description

INFOID:0000000013404978

Perform “AFT maintenance” in “Work support” mode of “ENGINE” with CONSULT when oxidation catalyst with diesel particulate filter is replaced with a new one. Based on the signal from sensors, ECM estimates the amount of particulate matter in diesel particulate filter and stores the value in EEPROM as diesel particulate filter data. When oxidation catalyst with diesel particulate filter is replaced with a new one, there is a difference between diesel particulate filter data stored in ECM and the actual amount of particulate matter in diesel particulate filter because no particulate matter is trapped in new diesel particulate filter. In this case, ECM cannot perform regeneration control correctly. So perform “AFT maintenance” in “Work support” mode of “ENGINE” using CONSULT to clear diesel particulate filter data stored in ECM. Refer to EC-186, "Work Procedure".

CAUTION:

Never perform “AFT maintenance” in “Work support” mode of “ENGINE” using CONSULT when oxidation catalyst with diesel particulate filter is not replaced with a new one. Diesel particulate filter may be damaged because regeneration is not performed at appropriate timing.

Work Procedure

INFOID:0000000013404979

1.PERFORM AFT MAINTENANCE

1. Turn ignition switch ON.
2. Select “AFT maintenance” in “Work support” mode of “ENGINE” using CONSULT.
3. Follow the instructions on CONSULT display.

>> Inspection End.

INJECTOR ADJUSTMENT VALUE REGISTRATION

Description

INFOID:0000000013404968

Injector adjustment value indicates manufacturing tolerance and the value is printed on the top of fuel injector. The injector adjustment value which is correctly stored in ECM is needed for precise fuel injection control.
A performance of emission control and drivability may affect when there is a mismatch between the following two values:
- The injector adjustment value stored in ECM
- The injector adjustment value of the injector which is installed on the vehicle

Injector Adjustment Value Registration must be performed after the following cases:
- Injector(s) are replaced.
- Injector Adjustment Value Registration for the replaced fuel injector must be performed.
- ECM is replaced.
- Injector Adjustment Value Registration for all the fuel injectors must be performed.

NOTE:
The necessary operation is different depending on the operation result of ECM data save or write. Always perform the operation according to procedures. Refer to EC-179, "Description".

Work Procedure

INFOID:0000000013404969

1.START

NOTE:
- **Before performing this procedure, record injector adjustment value printed on a fuel injector.**

1. Turn ignition switch ON (engine stopped).
2. Select “ENTER INJECTOR CODES” in “Work support” mode of “ENGINE” using CONSULT.
3. Touch “START”.
   NOTE:
   When touching “START”, CONSULT reads injector adjustment values stored in ECM.
4. Select the number of the cylinder which needs Injector Adjustment Value Registration.
5. Input injector adjustment value.
6. Repeat step 4 - 5 until there is no cylinder which needs Injector Adjustment Value Registration, and touch “START”.
   NOTE:
   When touching “START”, injector adjustment values stored in CONSULT are written onto ECM memory.
7. Check that the following values are same for each cylinder:

- Injector adjustment value which is printed on a fuel injector.
- Injector adjustment value which is displayed on CONSULT screen.

NOTE:
- In this step, CONSULT reads injector adjustment values stored in ECM and displays the values on the CONSULT screen. This is for checking if injector adjustment values are written onto ECM memory correctly.
- If DTC is detected, perform DTC Confirmation Procedure for the DTC, and check if the same DTC is detected again.

8. Turn ignition switch OFF and wait at least 1 minute.

>> Inspection End.

VIN REGISTRATION

Description

INFOID:0000000013404982

VIN Registration is an operation to register VIN in ECM. It must be performed each time ECM is replaced. (For details, refer to EC-188, "Work Procedure".)

Work Procedure

INFOID:0000000013404983

1.CHECK VIN

Check the VIN of the vehicle and note it. Refer to GI-34, "Identification Number".

>> GO TO 2.

2.PERFORM VIN REGISTRATION

With CONSULT

1. Turn ignition switch ON and engine stopped.
2. Select “VIN REGISTRATION” in “Work support” mode of “ENGINE”.
3. Follow the instructions on CONSULT display.

>> Inspection End.

SNAP ACCELERATION TEST

Work Procedure

INFOID:0000000013404989

NOTE:
If any DTCs are present, diagnose DTCs before performing any part of this procedure.

AFTERTREATMENT CONNECTED

Monitoring the condition of the exhaust leaving the exhaust system outlet during a Snap Acceleration Test can reveal the condition of the aftertreatment diesel particulate filter (DPF).

NOTE:
The engine must be at minimum operating temperature or above when completing this test

1. Place vehicle transmission in N (Neutral) and apply the parking brake.
2. Start and idle the engine.
3. Rapidly depress the accelerator pedal from 0-100%. This can be performed multiple times, if necessary.
4. Check for black smoke exiting the exhaust stack as the engine is accelerated from low idle to high idle.
   NOTE:
   In some applications, a Snap Acceleration Test may not provide the conditions necessary to reveal a malfunctioning aftertreatment DPF. If there is a heavy buildup of exhaust residue/soot on the exhaust system outlet and a Snap Acceleration Test does not reveal a condition outlined in the following steps, it may be necessary to perform a brief acceleration run under partial to full load.

- White smoke can indicate condensation in the exhaust and/or some unburned fuel. White smoke is not an indication of a malfunction of the aftertreatment system.
- Visible gray smoke or faint black smoke out of the exhaust system outlet indicates that the aftertreatment DPF is damaged. Inspect the aftertreatment DPF.
- Visible black smoke out of the exhaust system outlet indicates a malfunction of the aftertreatment DPF.

AFTERTREATMENT DISCONNECTED

WARNING:
The exhaust and exhaust components can remain hot after the engine has been shut down or secured. To avoid the risk of fire, property damage, burns or other serious personal injury, allow the exhaust system to cool before beginning this procedure or repair and make sure that no combustible materials are located where they might come in contact with hot exhaust or exhaust components.

1. Remove the diesel oxidation catalyst diesel particulate filter (DOC DPF) assembly. Refer to EX-42, "Removal and Installation".
2. Place vehicle transmission in N (Neutral) and apply the parking brake.
3. Start and idle the engine.
4. Quickly depress the accelerator pedal from 0-100%. Hold for 5 seconds and then release. This can be performed multiple times, if necessary.
5. Check for black smoke exiting the turbocharger turbine outlet as the engine is accelerated from low idle to high idle and at high idle.

- A small puff of black smoke upon acceleration that clears at a steady high idle speed is normal.
- White smoke during the Snap Acceleration Test does not indicate a malfunction.
- Heavy black smoke indicates other upstream engine issues that need to be diagnosed.

6. Connect the diesel oxidation catalyst diesel particulate filter (DOC DPF) assembly. Refer to EX-42, "Removal and Installation".
7. Inspect the exhaust piping for leaks, cracks, and loose connections.
8. Perform the Aftertreatment DPF Regeneration. Refer to EC-182, "Aftertreatment DPF Regeneration Test".
9. Check for current DTCs and/or engine indicator lamps for high aftertreatment diesel particulate soot load. If any current DTCs are present. Refer to EC-135, "DTC Index".

CYLINDER CUTOUT TEST

Description

INFOID:0000000013460508

Use the Single-Cylinder Cutout Test to remove individual cylinders from the engine firing cycle and to monitor a running engine while the selected cylinder is disabled. The system displays the rpm values while the cylinder is disabled.

Work Procedure

INFOID:0000000013460509

1.PERFORM CYLINDER CUTOUT TEST

With CONSULT

1. Engine running at idle and A/C OFF.
2. Select “Cylinder Cutout Test” in “” mode of “ENGINE”.
3. Follow the instructions on CONSULT display.

>> Inspection End.

DEF SYSTEM LEAK TEST

Work Procedure

INFOID:0000000013460493

GENERAL INFORMATION

If the aftertreatment diesel exhaust fluid (DEF) dosing system has been serviced or repaired, it will be necessary to prime the DEF dosing system in order to check for proper operation.
This test will cause the DEF dosing unit to draw DEF from the tank and pressurize it in the DEF dosing valve supply line. During this test, the dosing unit will continuously run and all unused DEF will return to the tank. An audible pumping noise will be noticeable during the test

INITIAL SETUP

NOTE:
It may be necessary to allow the aftertreatment system time to cool to allow for accessibility to check for leaking components.

- Make sure the DEF tank is full of DEF.
- Make sure the DEF is not frozen. If the DEF is frozen, it will be necessary to run the engine to allow the system to thaw.
- Make sure all DEF dosing system lines are properly connected to the DEF tank and the DEF dosing valve.
- Connect CONSULT.

PRIME

1. Turn ignition switch ON.
2. Select “DEF System Leak Test” in “Active Test” mode of “ENGINE” using CONSULT.
3. Touch “Start”. During the initialization of this test, a note will appear on the screen indicating that the system has reached a primed state.

NOTE:

- The dosing system should prime in under 1 minute for a system without leaks. If the dosing system does not prime, it may be due to a leak in the dosing valve or supply line.
- If the system fails to prime, a key cycle will be required before attempting to run the DEF System Leak Test again.
- The DEF System Leak Test can only be attempted twice consecutively. A key cycle will be required before attempting to run the DEF System Leak Test again after two attempts.

INSPECT

NOTE:
If the system is unable to prime due to leaks, it will be necessary to turn the ignition switch OFF in order to stop the dosing unit. The dosing unit cannot be stopped using CONSULT.
While the test is running, inspect all DEF lines, fittings, and connections for external leaks.

NOTE:

- If the system cannot build pressure, it will attempt to prime multiple times before setting a DTC.
- If any DTCs occur while running this test, reference the appropriate DTC. Refer to EC-135, "DTC Index".

FINISHING STEPS

- During the test, a small quantity of DEF is sprayed into the aftertreatment decomposition tube. After completion of the test, it is necessary to run the engine at high idle for 5 minutes in order to prevent DEF deposits from forming in the aftertreatment decomposition tube.
- Check for DTCs using CONSULT.

DEF DOSING UNIT OVERRIDE TEST

Work Procedure

INFOID:0000000013460495

GENERAL INFORMATION

Perform a dosing cycle to check the:
- Aftertreatment diesel exhaust fluid (DEF) dosing valve spray characteristics.
- Amount of DEF to be delivered in a specified time (6 minutes).

INITIAL CHECK

- Check for any leaks, blockages, or restrictions in the DEF line between the aftertreatment DEF dosing unit and the aftertreatment DEF dosing valve.
- Check for an adequate amount of DEF in the DEF tank prior to starting this test.
- Check the concentration and quality of the DEF.

PREPARATION

NOTE:
Low battery voltage can cause the dosing volume to be low. Check the batteries. See equipment manufacturer service information.
- Disconnect the batteries. Refer to PG-174, "Battery Disconnect".
- Remove the aftertreatment DEF dosing valve. Refer to EX-64, "Removal and Installation".

SETUP

WARNING:
To reduce the risk of personal injury, do not get Diesel Exhaust Fluid (DEF) in your eyes as it contains urea. In case of contact, immediately flush eyes with large amounts of water for a minimum of 15 minutes. Do not swallow. In the event DEF is ingested, contact a physician immediately. Reference the Safety Data Sheet (SDS) for additional information.
CAUTION:
- **Care should be taken when handling and/or disconnecting the DEF line from the aftertreatment DEF dosing valve. The intake connection of the aftertreatment DEF dosing valve is plastic and can be easily damaged.**
- **Do not connect a 12V or 24V supply to the aftertreatment DEF dosing valve as this will cause permanent damage.**

NOTE:
It is usually easier to capture the DEF in a clean container and then transfer it to the measuring device for the final measurement.
Obtain a clear plastic container (large enough to hold the aftertreatment DEF dosing valve) and a graduated beaker, or equivalent. A measuring cup that is marked in milliliters (ml) or ounces (oz) can also be used.
The measuring device must be capable of measuring between 0 ml (0.0 oz) and 500 ml (17.0 oz) in 5 ml (0.34 oz) increments
1. Connect the electrical and DEF lines.
2. Place the aftertreatment DEF dosing valve into the container.
3. When the test begins, briefly monitor the spray pattern of the DEF exiting the aftertreatment DEF dosing valve. Check for the following:

- Signs of larger drops and/or dripping DEF from the tip.
- Spray pattern that is not symmetrical (sprays more to one side).

NOTE:
- When the test is started, the dosing system will first prime. During this process, the aftertreatment DEF dosing valve will open intermittently to purge air from the system. In doing so, some DEF will be sprayed from the tip. This is a normal operating characteristic.
- When the test is being performed, the aftertreatment DEF dosing valve will spray a very fine mist of DEF. To prevent fine mist from escaping into the air and to make sure of an accurate measurement, place a clean shop towel or cover over the valve and container.

FLOW TEST

NOTE:
Prior to performing this test, if not already directed by a DTC, view and troubleshoot any DTCs.
1. Turn the ignition switch ON.
2. Select “DEF Dosing Unit Override Test” in “Active Test” mode of “ENGINE” using CONSULT.
3. Touch “Start”.
4. Follow the instructions on CONSULT display.

NOTE:
CONSULT will start the test and will inject the DEF for 6 minutes. CONSULT will automatically disable the injector at the end of the test. If the test needs to be stopped before finishing, touch “End”.

5. Perform the test three times. The amount of DEF measured for each test must be within specification.

DEF dosing valve volume : 85-115 mm (2.9-3.9 in)

6. If the amount of DEF is not within specification, verify the DEF filter is not plugged and check for leaks, blockages, or restrictions in the DEF line between the DEF dosing unit and the DEF dosing valve.
NOTE:
- Do not pour the DEF back into the DEF tank. Dispose of the DEF in accordance with local environmental regulations.
- The DEF dosing valve may have been plugged by debris. Inspect the DEF dosing unit filter for signs of contamination and debris prior to installing the new DEF dosing valve.

7. Disconnect the electrical and DEF lines.

FINISHING STEPS

- Install the DEF dosing valve. Refer to EX-64, "Removal and Installation".
- Connect the batteries. Refer to PG-174, "Battery Disconnect".

ROTARY TURBINE CONTROL VALVE ACTUATOR TEST

Description

INFOID:0000000013460496

The test confirms the rotary control valve can achieve all positions in its operating range. The test results determine if further inspection is required of the following components:

- Rotary turbine control valve linkage and actuators
- Turbocharger

Work Procedure

INFOID:0000000013460497

1.PERFORM RTCV HYSTERESIS TEST

1. Turn ignition switch ON.
2. Select “RTCV Hysteresis Test” in “Active Test” mode of “ENGINE” using CONSULT.
3. Touch “Start”.
4. Follow the instructions on CONSULT display.

>> Inspection End.

ROTARY TURBINE CONTROL VALVE ACTUATOR CALIBRATION

Description

INFOID:0000000013460498

The rotary turbine control valve actuator must be calibrated to the rotary turbine control valve. This step must be performed to be sure proper turbocharger operation is achieved.
(For details, refer to EC-195, "Work Procedure".)

Work Procedure

INFOID:0000000013460499

1.PERFORM ROTARY TURBINE CONTROL VALVE ACTUATOR CALIBRATION

CONSULT
1. Turn ignition switch ON.
2. Select “RTCV actuator calibrate” in “Work support” mode of “ENGINE”.
3. **NOTE:**
   The calibrate command must only be performed with the actuator mounted to the engine and attached to the linkage.
   Touch “Calibrate”.
4. Follow the instructions on CONSULT display.
5. If CONSULT indicates the procedure was stopped or failed, turn the ignition switch OFF for 70 seconds, then turn the ignition switch ON and repeat steps 3 through 4.
6. Using CONSULT, erase "ENGINE" diagnostic trouble codes.

>> GO TO 2.

2.VERIFY ROTARY TURBINE CONTROL VALVE ACTUATOR CALIBRATION

Operate the engine to be sure the turbocharger actuator operates correctly and all turbocharger actuator DTCs are past.

>> Inspection End.

FAN OVERRIDE TEST

Work Procedure

INFOID:0000000013460596

1.PERFORM ENGINE FAN OVERRIDE TEST

CONSULT

1. Engine running at idle and A/C OFF.
2. Select “Engine Fan Override Test” in “Active Test” mode of “ENGINE”.
3. Touch “Start”.
4. Follow the instructions on CONSULT display.

>> Inspection End.

BASIC INSPECTION

Work Procedure

INFOID:0000000013790777

1.INSPECTION START

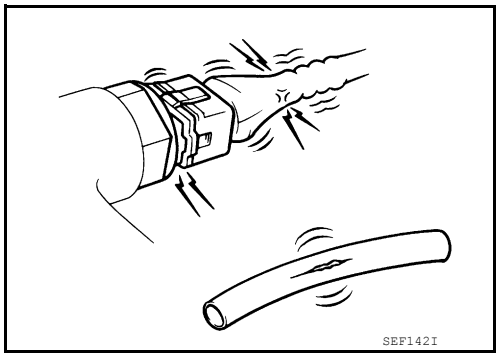
1. Check service records for any recent repairs that may indicate a related incident.
2. Check the current need for scheduled maintenance, especially for fuel filter and air cleaner filter. Refer to EC-1249, "Inspection".
3. Open hood and check the following:

- Harness connectors for improper connections
- Vacuum hoses for splits, kinks, or improper connections
- Wiring for improper connections, pinches, or cuts

4. Confirm that electrical or mechanical loads are not applied.

- Headlamp switch is OFF.
- Air conditioner switch is OFF.
- Steering wheel is in the straight-ahead position, etc.

5. Start engine and warm it up to the normal operating temperature.



>> GO TO 2.

2.CHECK IDLE SPEED

Check idle speed.
For procedure, refer to EC-1249, "Inspection".
For specification, refer to EM-521, "GENERAL SPECIFICATIONS".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 3.

3.CHECK FOR INTAKE AIR LEAK

Listen for an intake air leak after the mass air flow sensor.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace the malfunctioning part.

4.BLEED AIR FROM FUEL SYSTEM

1. Stop engine.
2. Bleed air from fuel system. Refer to FL-24, "Low-Pressure System Check".

>> GO TO 5.

5.CHECK IDLE SPEED AGAIN

1. Start engine.
2. Check idle speed.
   For procedure, refer to EC-1249, "Inspection".
   For specification, refer to EM-521, "GENERAL SPECIFICATIONS".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 6.

6.DRAIN WATER FROM FUEL FILTER

1. Stop engine.
2. Drain water from fuel filter. Refer to FL-31, "Drain".

>> GO TO 7.

7. CHECK IDLE SPEED AGAIN

1. Start engine.
2. Check idle speed.
   For procedure, refer to EC-1249, "Inspection".
   For specification, refer to EM-521, "GENERAL SPECIFICATIONS".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 8.

8. CHECK AIR CLEANER FILTER

1. Stop engine.
2. Check air cleaner filter for clogging or breaks.

Is the inspection result normal?

YES >> GO TO 9.
NO >> Replace air cleaner filter.

9. CHECK BATTERY VOLTAGE

Check battery voltage.

Voltage: More than 12.13V

Is the inspection result normal?

YES >> GO TO 11.
NO >> GO TO 10.

10. CHECK BATTERY

Refer to PG-164, "How to Handle Battery".

Is the inspection result normal?

YES >> Check charging system. Refer to CHG-23, "Work Flow (With EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)" or CHG-29, "Work Flow (Without EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)".
NO >> Repair or replace the malfunctioning part.

11. CHECK COMPRESSION PRESSURE

Check compression pressure. Refer to EM-195, "Compression Check".

Is the inspection result normal?

YES >> GO TO 12.
NO >> Follow the instruction of “CHECKING COMPRESSION PRESSURE”.

12. CHECK IDLE SPEED AGAIN

Check idle speed.
For procedure, refer to EC-1249, "Inspection".
For specification, refer to EM-521, "GENERAL SPECIFICATIONS".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Check fuel injector. Refer to FL-24, "Low-Pressure System Check". And then, GO TO 2.

HOW TO SET SRT CODE

Description

INFOID:0000000013830826

OUTLINE

In order to set all SRTs, the self-diagnoses as in the “SRT ITEM” table must have been performed at least once. Each diagnosis may require actual driving for a long period of time under various conditions.

SRT ITEM

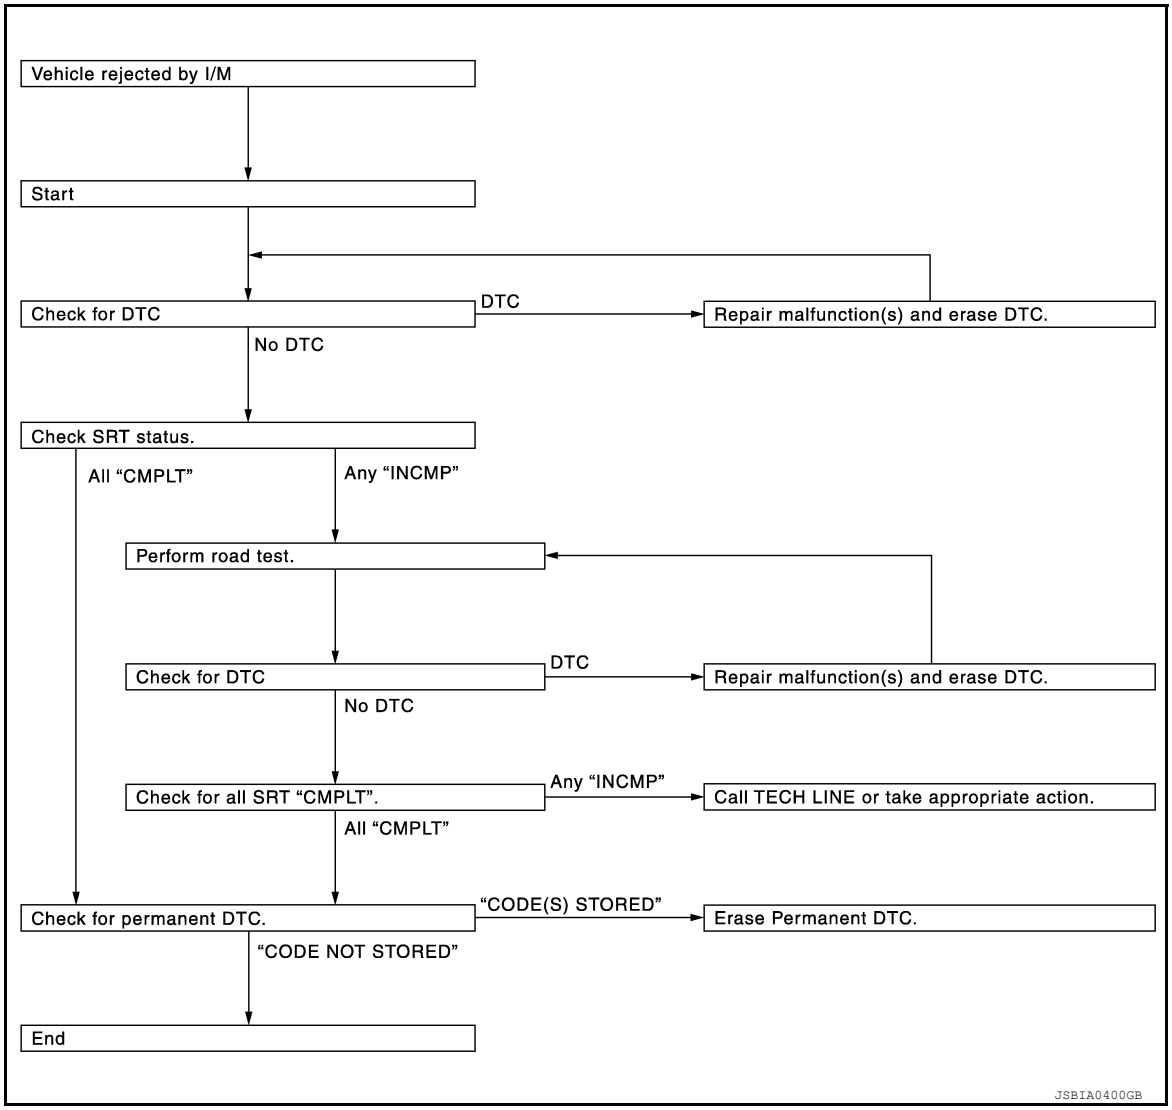
The table below shows required self-diagnostic items to set the SRT to “CMPLT”.

SRT item (CONSULT indication)	Performance Priority*	Required self-diagnostic items to set the SRT to “CMPLT”	Corresponding DTC No.
EGR/VVT SYSTEM	1	EGR and EGR cooler functions	P0406, P040C, P040D, P2457, P245C, P245D, P2493
	2	EGR and EGR cooler functions	P0401, P0402, P0405, P040B, P046C, P2494, P2495
PARTICULATE MATTER SENSOR	—	Not equipped. This item is listed, but not applied currently	N/A
EXHAUST GAS SYSTEM	1	Exhaust gas monitoring	P0489, P0490, P2080, P2413, P2471, P2482
	2	Exhaust gas monitoring	P0544, P0545, P0546, P2031, P2032, P2033, P242B, P242C, P242D, P2470, P2472, P2481, P2483
BOOST PRESSURE	1	Turbo charger boost pressure system	P0046, P0047, P004E, P00AF, P0237, P0238, P0262
	2	Turbo charger boost pressure system	P0263, P226C
NOx/SCR after monitor ready	1	NOx and SCR monitoring	P1C54, P1C70, P20EE, P214A, P214B, P214C, P214D, P2201, P2BA7, P2BAC, P2BAF
	2	NOx and SCR monitoring	U029D, U029E, U059E, U059F, P1C55, P1C56, P2202, P2209, P220A, P220B, P221A, P229E, P229F, P22A7, P2BAD
CATALYST	1	Catalyst efficiency	P0420, P1484, P200E
	2	Catalyst efficiency	P0421

*: If completion of several SRTs is required, perform driving patterns (DTC confirmation procedure), one by one based on the priority for models with CONSULT.

SRT SERVICE PROCEDURE

If a vehicle has failed the state emissions inspection due to one or more SRT items indicating “INCMP”, review the flowchart diagnostic sequence, referring to the following flowchart.

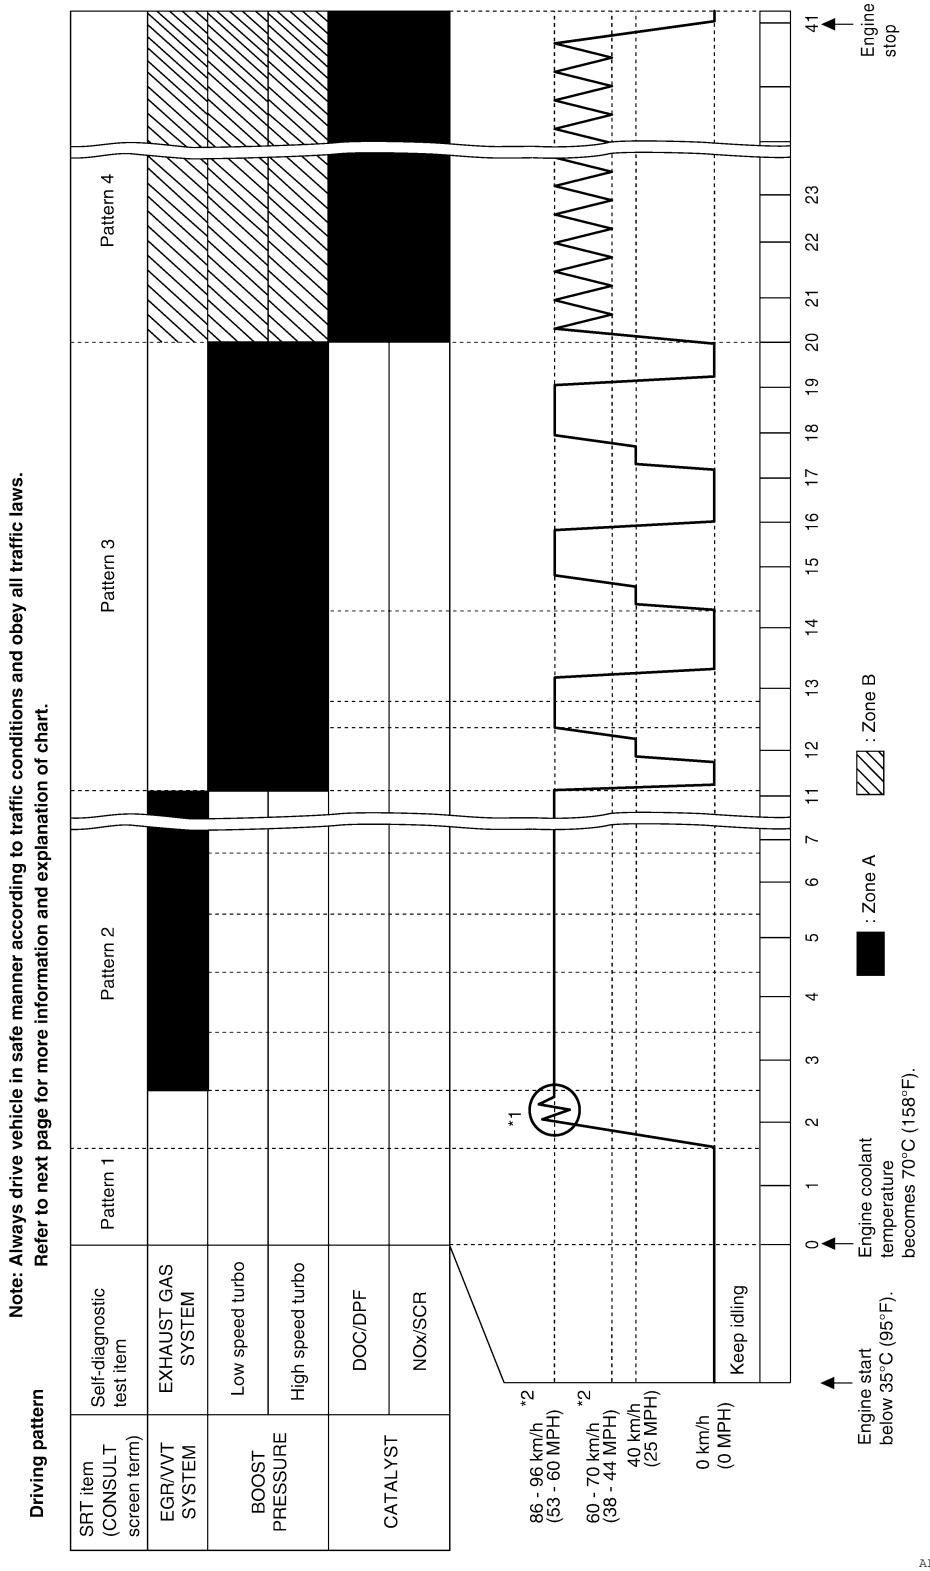


SRT Set Driving Pattern

INFOID:0000000013830827

CAUTION:

Always drive the vehicle in safe manner according to traffic conditions and obey all traffic laws.



ALBIA3001GB

*1: Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
*2: Checking the vehicle speed with GST is advised.

- The time required for each diagnosis varies with road surface conditions, weather, altitude, individual driving habits, etc.
  Zone A refers to the range where the time, required for the diagnosis under normal conditions*, is the shortest.

Zone B refers to the range where the diagnosis can still be performed if the diagnosis is not completed within zone A.

*: Normal conditions refer to the following:

- Sea level
- Flat road
- Ambient air temperature: 20 - 30°C (68 - 86°F)
- Diagnosis is performed as quickly as possible under normal conditions.
  Under different conditions [For example: ambient air temperature other than 20 - 30°C (68 - 86°F)], diagnosis may also be performed.

Work Procedure

INFOID:0000000013830828

1.CHECK DTC

Check DTC.

Is any DTC detected?

YES >> Repair malfunction(s) and erase DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK SRT STATUS

WITH CONSULT
Select “SRT STATUS” in “DTC & SRT CONFIRMATION” mode with CONSULT.
WITHOUT CONSULT
Perform “SRT status” mode with EC-98, "System Readiness Test (SRT) Code".
WITH GST
Select Service $01 with GST.

Is SRT code(s) set?

YES >> GO TO 10.
NO-1 >> With CONSULT: GO TO 3.
NO-2 >> Without CONSULT: GO TO 4.

3.DTC CONFIRMATION PROCEDURE

1. Select “SRT WORK SUPPORT” in “DTC & SRT CONFIRMATION” mode with CONSULT.
2. For SRT(s) that is not set, perform the corresponding “DTC CONFIRMATION PROCEDURE” according to the “Performance Priority” in the “SRT ITEM” table. Refer to EC-98, "System Readiness Test (SRT) Code".
3. Check DTC.

Is any DTC detected?

YES >> Repair malfunction(s) and erase DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 9.

4.PERFORM ROAD TEST

- Check the “Performance Priority” in the “SRT ITEM” table. Refer to EC-98, "System Readiness Test (SRT) Code".
- Perform the most efficient SRT set driving pattern to set the SRT properly. Refer to the applicable driving pattern below.
  In order to set all SRTs, the SRT set driving pattern must be performed at least once.

>> GO TO 5.

5.PATTERN 1

1. Check the vehicle condition;

- Engine coolant temperature is −10 to 35°C (14 to 95°F).
- Fuel tank temperature is more than 0°C (32°F).

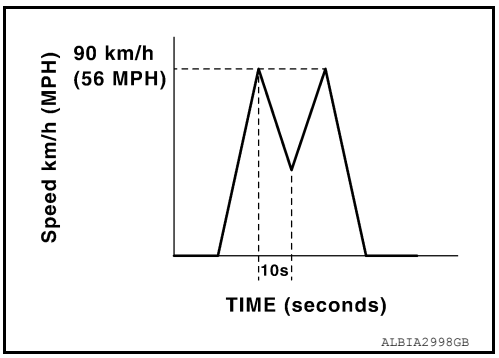
2. Start the engine.
3. Keep engine idling until the engine coolant temperature is greater than 70°C (158°F)

>> GO TO 6.

6.PATTERN 2

1. Accelerate the vehicle to reach a speed of 90 km/h (56 MPH).
   CAUTION:
   Always drive vehicle at safe speed.
2. Release the accelerator pedal for more than 10 seconds.
3. Accelerate to reach a speed of 90 km/h (56 MPH) again.
4. Bring the vehicle to a complete stop.

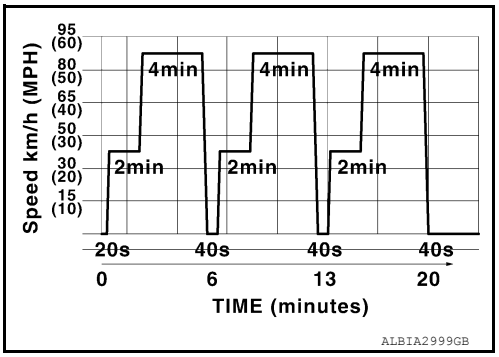
NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.



>> GO TO 7.

7.PATTERN 3

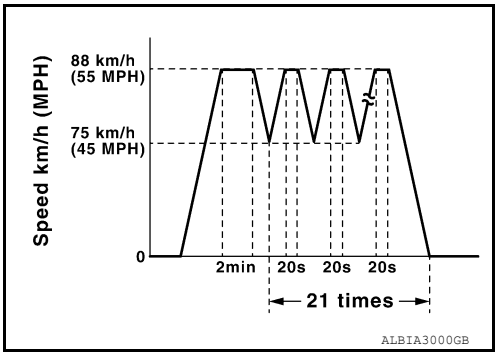
1. Accelerate the vehicle to reach 40 km/h (25 MPH), and continue at this speed for 2 minutes.
2. Increase vehicle speed to 88 km/h (55 MPH), and continue at this speed for 4 minutes.
3. Bring the vehicle to a complete stop by braking as little as possible and idle for 40 seconds.
4. Repeat steps 1 through 3 two more times.



>> GO TO 8.

8.PATTERN 4

1. Accelerate the vehicle to reach 88 km/h (55 MPH), and continue at this speed for 2 minutes.
2. Release the accelerator to decrease vehicle speed to 75 km/h (45 MPH).
3. Accelerate to 88 km/h (55MPH), and continue at this speed for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.



>> GO TO 9.

9.CHECK SRT STATUS

WITH CONSULT
Select “SRT STATUS” in “DTC & SRT CONFIRMATION” mode with CONSULT.
WITHOUT CONSULT
Perform “SRT status” mode with EC-98, "System Readiness Test (SRT) Code".
WITH GST
Select Service $01 with GST.

Is SRT(s) set?

YES >> GO TO 10.
NO >> Call TECH LINE or take appropriate action.

10.CHECK PERMANENT DTC

NOTE:
Permanent DTC cannot be checked with a tool other than CONSULT or GST.
With CONSULT
Select “SRT STATUS” in “DTC & SRT CONFIRMATION” mode with CONSULT.
With GST

Select Service $0A with GST.

Is permanent DTC(s) detected?

YES >> Refer to EC-205, "Description".
NO >> END

HOW TO ERASE PERMANENT DTC

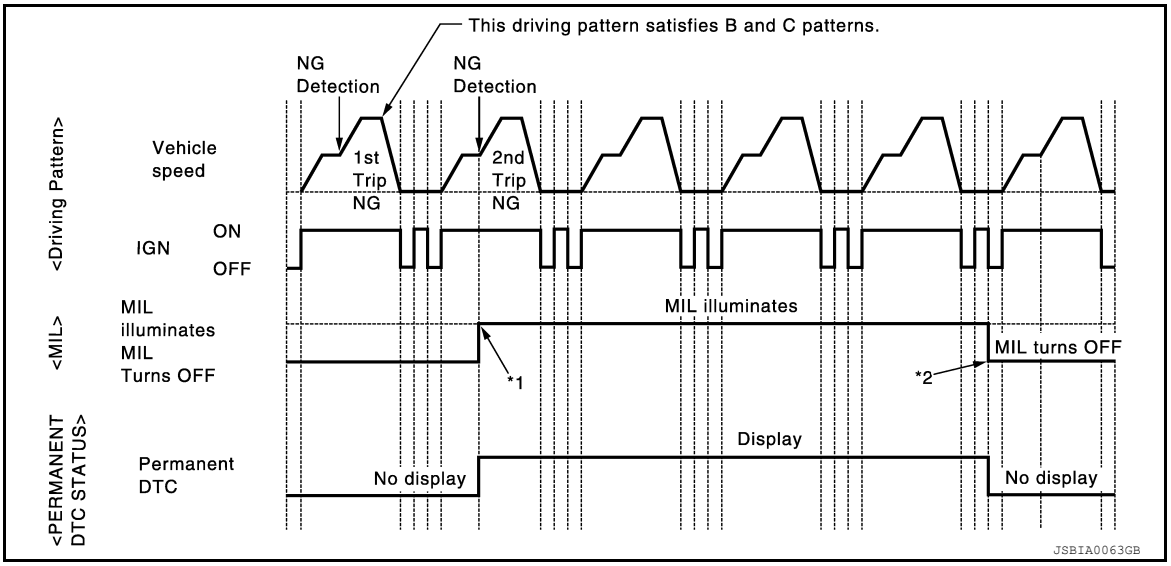
Description

INFOID:0000000013830830

OUTLINE

When a DTC is stored in ECM

When a DTC is stored in ECM and MIL is ON, a permanent DTC is erased with MIL shutoff if the same malfunction is not detected after performing the driving pattern for MIL shutoff three times in a raw.



*1: When the same malfunction is detected in two consecutive trips, MIL will illuminate.

*2: MIL will turn off after vehicle is driven 3 times without any malfunctions.

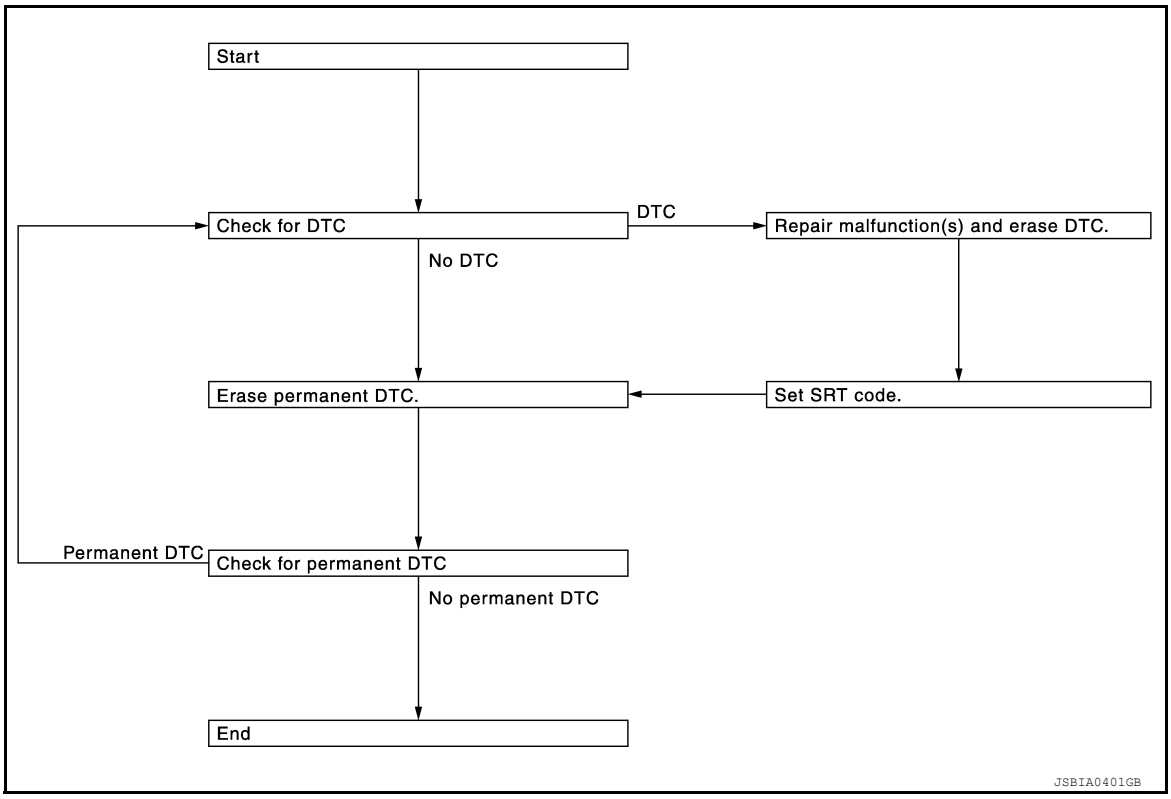
When a DTC is not stored in ECM

The erasing method depends on a permanent DTC stored in ECM. Perform “DTC CONFIRMATION PROCEDURE” for applicable DTCs.

PERMANENT DTC ITEM

For permanent DTC items, MIL turns ON. Refer to EC-135, "DTC Index".

PERMANENT DTC SERVICE PROCEDURE



DTC/CIRCUIT DIAGNOSIS

U0002 DRIVETRAIN CAN COMMUNICATION

DTC Description

INFOID:0000000013053705

CAN (Controller Area Network) is the high speed communication line for many of the Vehicle Electronic Control Nnits (VECU).The CAN communication bus has two 2 lines (CAN high line, CAN low line). These lines are inputted to the Engine Control Module. If the ECM does not receive any messages across the CAN bus for a period of time, this fault will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a loss of communication with the OEM Communication bus for a period of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U0002	(High Speed CAN Communication Bus Performance))	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	BUS off interrupt triggered by CAN hardware
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U0002 being current on the CONSULT screen.

Is DTC U0002 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013053706

1.CHECK FOR ECM COMMUNICATION WITH CONSULT

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Verify CONSULT communication with the ECM.

Is the inspection result normal?

YES >> GO TO 2.
NO >> GO TO 4.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0562 being current on the CONSULT screen.

Is DTC P0562 detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> Go to 3.

3.CHECK DTC PRIORITY

1. Turn ignition switch ON.

2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U0002 being current on the CONSULT screen.

Is DTC U0002 detected as current?

YES >> GO TO 4.
NO >> Refer to GI-43, "Intermittent Incident".

4. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM control module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK FOR AN OPEN OR SHORT CIRCUIT IN THE ECM DATA LINK

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Disconnect the data link adapter from the service data link connector harness connector.
4. Measure the resistance between ECM connector E93 terminal 16 and terminal 33.

ECM			Resistance
Connector	Terminal	Terminal	
E93	16	33	110-130 Ω

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

6. INSPECT IPDM E/R AND FUSES

1. Turn ignition switch OFF.
2. Inspect the IPDM E/R and fuses for the following:

- Blown power supply fuses
- Power supply fuse for cracks, burns, corrosion, or discolorations
- Corrosion
- Loose or expanded pins

Is the inspection result normal?

YES >> An OEM issue has been detected. Check the following:
- Terminating resistance
- Harness and connectors
- ECM

NO >> Repair or replace error-detected parts.

U0101 CAN COMM CIRCUIT

DTC Description

INFOID:0000000013024772

The Transmission Control Module communicates to the primary engine electronic control module (ECM) through the CAN data link. Messages sent from the Transmission Control Module (TCM) are received and monitored by the ECM. If the ECM does not receive a message from Transmission Control Module (TCM), a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) did not receive a message from the transmission control module.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U0101	LOST COMM TCM (Lost Communication with TCM)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Message not received from TCM.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- A malfunctioning TCM.
- Harness and connectors.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC U0101 being current on the CONSULT screen.

Is DTC U0101 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024774

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U0101 being current on the CONSULT screen.

s DTC U0101 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC being current on the CONSULT screen.

Are multiple DTCs detected as current?

YES >> A CAN issue has been detected. Check the following:
- Terminating resistances
- IPDM E/R
- Harness and connectors

NO >> A TCM issue has been detected. Check the following:
- TCM to data link connection
- Voltage to TCM

- Harness and connectors
- Malfunctioning TCM

U0106 LOST COMMUNICATION (GLOW OUTPUT STAGE)

DTC Description

INFOID:0000000013250930

The Glow Plug Control Module controls the timing and intensity of the glow plug outputs on the engine using data provided by the ECM through the CAN2 communication lines. The Glow Plug Control Module will not activate the glow plugs if the glow plug module reads a temperature greater than a calibrated amount. The Glow Plug Control Module receives fused power directly from the battery, and switched power through the ECM relay.

DTC DETECTION LOGIC

This DCT is triggered when the ECM loses CAN2 communications with the glow plug control module.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U0106	(Lost Communication With Glow Plug Control Module)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Message not received.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Harness and connectors
- Glow plug control module

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC U0106 being current on the CONSULT screen.

Is DTC U0106 current?

YES >> Go to EC-211, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013250931

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U0106 being current or being past on more than 1 count on the CONSULT screen.

Is DTC U0106 detected as current or past for more than 1 count?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FOR CORRECT ELECTRICAL SYSTEM VOLTAGE SETTING IN CONSULT

1. Turn ignition switch ON.
2. Connect CONSULT and make sure the electrical system voltage setting is correct for the engine configuration.
   NOTE:
   To check the voltage configuration of the engine, disconnect ECM connector E93 and measure the voltage from ECM connector E93 terminal 83 to ground.

Is the electrical system voltage setting correct for the engine configuration?

YES >> GO TO 3.
NO >> Use CONSULT to configure the electrical system voltage to match the engine configuration.

3.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U010E being current or being past on more than 1 count on the CONSULT screen.

Is DTC U010E detected as current or past for more than 1 count?

YES >> GO TO 9.
NO >> GO TO 4.

4.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTCs U029D, U029E, U02A2, U1611 or U1612 being current or being past on more than 1 count on the CONSULT screen.

Are DTCs U029D, U029E, U02A2, U1611 or U1612 detected as current or past for more than 1 count?

YES >> GO TO 8.
NO >> GO TO 5.

5.INSPECT GLOW PLUG CONTROL MODULE AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug control module harness connector F102.
3. Inspect the glow plug control module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect glow plug control module harness connector F102.
3. Turn ignition switch ON.
4. Check voltage between glow plug control module connector F102 terminal 7 and ground.

Glow plug control module		Ground	Condition	Voltage (Approx.)
Connector	Terminal			
F102	7	–	Ignition switch ON	> 10.8 V
			Cranking engine	

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7.CHECK FOR AN OPEN OR SHORT CIRCUIT IN THE GLOW PLUG CONTROL MODULE DATA LINK

1. Turn ignition switch OFF.
2. Disconnect the glow plug control module harness connector F102.
3. Disconnect the data link adapter from the service data link connector harness connector.
4. Measure the resistance between glow plug control module connector F102 terminal 4 and terminal 5.

Glow plug control module connector F102		Resistance
Terminal	Terminal	
4	5	54 – 66 Ω

Is the inspection result normal?

YES >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> GO TO 9.

8. INSPECT IPDM E/R AND FUSES

1. Turn ignition switch OFF.
2. Inspect the IPDM E/R and fuses for the following:

- Blown power supply fuses
- Power supply fuse for cracks, burns, corrosion, or discolorations
- Corrosion
- Loose or expanded pins

Is the inspection result normal?

YES >> Repair or replace error-detected parts.
NO >> GO TO 9.

9. CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link connector harness connector.
3. Measure the resistance between Cummins data link connector F190 terminal 1 and terminal 2.

Cummins data link connector F190		Resistance
Terminal	Terminal	
1	2	54 – 66 Ω

Is the inspection result normal?

YES >> GO TO 11.
NO >> GO TO 10.

10. CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link connector harness connector.
3. Disconnect the ECM harness connector E93.
4. Measure the resistance between Cummins data link connector F190 terminal 1 and terminal 2.

Cummins data link connector F190		Resistance
Terminal	Terminal	
1	2	108 – 132 Ω

Is the inspection result normal?

YES >> A malfunction has been detected in the aftertreatment side of the CAN2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".
NO >> A malfunction has been detected in the engine side of the CAN2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

11. CHECK CAN2 COMMUNICATION LINE (+) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 1 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	1	–	0.1 – 4.5V

Is the inspection result normal?

YES >> GO TO 12.
NO >> Repair or replace error-detected parts.

12. CHECK CAN2 COMMUNICATION LINE (–) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 2 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	2	–	0.1 – 4.5V

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

U010C CAN COMMUNICATION

DTC Description

INFOID:0000000013268421

The rotary turbine control valve and linkage is electronically controlled by the rotary turbine control valve actuator. This actuator is a smart device and receives information via the CAN communication lines from the primary engine control module (ECM). The rotary turbine control valve actuator performs its own diagnostics and reports malfunctions back to the primary engine ECM, using the CAN 2 communications lines. The ECM then decodes the error message and converts it to a fault code.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U010C	(Lost Communication With Turbocharger/Supercharger Control Module "A")	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Message not received.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

The Engine Control Module (ECM) did not receive a valid CAN 2 communication message from the rotary control valve actuator for more than 1 second.

POSSIBLE CAUSE

- No voltage to turbo actuator from ECM
- Rapid cycling of the ignition switch
- Harness and connectors
- Damaged termination resistor in engine data link harness

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition ON.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC U010C being current on the CONSULT screen.

Is DTC U010C current?

YES >> Go to EC-215, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013268422

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U010C being current on the CONSULT screen.

Is DTC U010C detected as current or more than one past count?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC being current on the CONSULT screen.

Are DTCs U029E, U0106, U029D, U1611 or U1612 detected as current or are there more than one past count?

YES >> GO TO 7.
NO >> GO TO 3.

3.INSPECT ROTARY TURBINE CONTROL VALVE ACTUATOR AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect rotary turbine control valve actuator harness connector F146.
3. Inspect the rotary turbine control valve actuator connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect rotary turbine control valve actuator harness connector F146.
3. Turn ignition switch ON.
4. Check voltage between rotary turbine control valve actuator connector F146 terminal 1 and 4.

Rotary turbine control valve actuator			Voltage (Approx.)
Connector	Terminal	Terminal	
F146	1	4	>10.8V

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 5.

5.INSPECT BATTERY TERMINAL CONNECTIONS

1. Turn ignition switch OFF.
2. Inspect the battery terminal connections for the following:

- Loose connector
- Corroded terminals
- Moisture in or on the connector
- Dirt or debris on the connector
- Wire insulation damage

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FOR OPEN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect rotary turbine control valve actuator harness connector F146.
3. Check voltage between rotary turbine control valve actuator harness connector F146 terminal 4 and ground.

Rotary turbine control valve actuator		(–)	Voltage (Approx.)
Connector	Terminal		
F146	4	Ground	>10.8V

Is the inspection result normal?

YES >> An open or high resistance is present in the rotary turbine control valve actuator ground circuit. Repair or replace error-detected parts.
NO >> An open or high resistance is present in the rotary turbine control valve actuator power supply circuit. Repair or replace error-detected parts.

7.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.INSPECT CAN 2 COMMUNICATION HARNESS FOR OPEN

1. Turn ignition switch OFF.
2. Disconnect rotary turbine control valve actuator connector F146.
3. Disconnect ECM connector F101.
4. Measure the resistance between rotary turbine control valve actuator connector F146 terminal 3 and ECM connector F101 terminal 123.
5. Measure the resistance between rotary turbine control valve actuator connector F146 terminal 2 and ECM connector F101 terminal 102.

Rotary turbine control valve actuator		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F146	3	F101	123	<10 Ω
	2		102	

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace error-detected parts.

9.INSPECT CAN 2 COMMUNICATION HARNESS FOR SHORT CIRCUIT

1. Turn ignition switch OFF and wait at least 1 minute for the DEF control module to completely power down.
2. Disconnect outlet NOx sensor harness connector C33, intake NOx sensor harness connector C31, DPF temperature sensor module connector C29, SCR temperature sensor C30, rotary turbine control valve actuator connector F146, glow plug control module F102 and ECM connector E93 and F101.
3. Measure the resistance between ECM connector E93 terminal 35 and all other ECM connector E93 terminals.
4. Measure the resistance between ECM connector E93 terminal 18 and all other ECM connector E93 terminals.
5. Measure the resistance between ECM connector F101 terminal 123 and all other ECM connector F101 terminals.
6. Measure the resistance between ECM connector F101 terminal 102 and all other ECM connector F101 terminals.

ECM			Resistance
Connector	Terminal (+)	Terminal (–)	
E93	35	All others	>100K Ω
	18		
F101	123		
	102		

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair or replace error-detected parts.

10. INSPECT CAN 2 COMMUNICATION HARNESS FOR SHORT TO GROUND

1. Turn ignition switch OFF and wait at least 1 minute for the DEF control module to completely power down.
2. Measure the resistance between all ECM connector E93 terminals and ground.
3. Measure the resistance between all ECM connector F101 terminals and ground.

ECM			Resistance
Connector	Terminal (+)	Terminal (–)	
E93	All terminals	Ground	>100K Ω
F101	All terminals		

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11. CHECK CAN 2 COMMUNICATION TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect rotary turbine control valve actuator harness connector F146 and ECM harness connector F101.
3. Measure the resistance between ECM harness connector F101 terminals 123 and 102.

ECM			Resistance
Connector	Terminal	Terminal	
F101	123	102	110-130 Ω

Is the inspection result normal?

YES >> GO TO 14.
NO >> GO TO 12.

12. CHECK CAN 2 COMMUNICATION TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect rotary turbine control valve actuator harness connector F146 and ECM harness connector E93.
3. Measure the resistance between ECM harness connector E93 terminals 35 and 18.

ECM			Resistance
Connector	Terminal	Terminal	
E93	3	2	110-130 Ω

Is the inspection result normal?

YES >> Repair or replace error-detected parts.
NO >> GO TO 13.

13. CHECK CAN 2 COMMUNICATION TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect rotary turbine control valve actuator harness connector F146.
3. Measure the resistance between rotary turbine control valve actuator harness connector F146 terminals 3 and 2.

Rotary turbine control valve actuator			Resistance
Connector	Terminal	Terminal	
F146	3	2	110-130 Ω

Is the inspection result normal?

YES >> Repair or replace error-detected parts.
NO >> Replace rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".

14. CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect rotary turbine control valve actuator harness connector F146.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC U010C being current on the CONSULT screen.

Is DTC U010C detected as current or more than one past count?

YES >> Replace rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".
NO >> Removal and installation of rotary turbine control valve actuator harness connector F146 corrected the fault.

15. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is U010C DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

U010E CAN COMMUNICATION

DTC Description

INFOID:0000000013296292

The aftertreatment diesel exhaust fluid controller is the central control for the selective catalytic reduction (SCR) diesel exhaust fluid dosing system, and handles the dosing activity, tank level sensing, tank temperature sensing, line heating, and tank heating. The diesel exhaust fluid controller communicates to the engine control module (ECM) via the CAN2 communication lines.

DTC DETECTION LOGIC

The ECM and the aftertreatment diesel exhaust fluid controller lost communication via the CAN2 communication line, or the ECM has detected the aftertreatment diesel exhaust fluid controller had gone into waiting to shutdown mode.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U010E	(Lost Communication With Reductant Control Module)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Message not received.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- No voltage to DEF control module
- No ground to DEF control module
- Harness and connectors
- Damaged DEF control module
- Blown or missing fuses on battery and ignition inputs to the DEF control module

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC U010E being current on the CONSULT screen.

Is DTC U010E current?

YES >> Go to EC-220, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013296293

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U010E being current on the CONSULT screen.

Is DTC U010E detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC being current on the CONSULT screen.

Are DTCs U0106, U010C, U029D, U02A2, U1611 or U1612 detected as current?

YES >> GO TO 7.
NO >> GO TO 3.

3.INSPECT DEF CONTROL MODULE AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect DEF control module harness connector C35.
3. Inspect the glow plug control module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts. GO TO 8.

4.CHECK POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect DEF control module harness connector C35.
3. Turn ignition switch ON.
4. Check voltage between DEF control module connector C35 terminals 3 and 7.

DEF control module connector C35		Condition	Voltage (Approx.)
Terminal	Terminal		
3	7	Ignition switch ON	> 10.8 V
		Cranking engine	

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5.CHECK FOR OPEN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect DEF control module harness connector C35.
3. Turn ignition switch ON.
4. Check voltage between DEF control module harness connector C35 terminal 3 and ground.

DEF control module		Ground	Condition	Voltage (Approx.)
Connector	Terminal			
C35	3	–	Ignition switch ON	> 10.8 V
			Cranking engine	

Is the inspection result normal?

YES >> An open or high resistance is present in the DEF control module ground circuit. Repair or replace error-detected parts.
NO >> An open or high resistance is present in the DEF control module supply circuit. Repair or replace error-detected parts.

6.CHECK TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect DEF control module harness connector C35.
3. Disconnect the data link adapter from the service data link connector harness connector.
4. Measure the resistance between DEF control module harness connector C35 terminals 5 and 6.

DEF control module connector C35		Resistance
Terminal	Terminal	
5	6	54 – 66 Ω

Is the inspection result normal?

YES >> Replace DEF control module. Refer to EC-1259, "Removal and Installation".
NO >> GO TO 8.

7. INSPECT IPDM E/R AND FUSES

1. Turn ignition switch OFF.
2. Inspect the IPDM E/R and fuses for the following:

- Blown power supply fuses
- Power supply fuse for cracks, burns, corrosion, or discolorations
- Corrosion
- Loose or expanded pins

Is the inspection result normal?

YES >> Repair or replace error-detected parts.
NO >> GO TO 8.

8. CHECK TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link connector harness connector.
3. Measure the resistance between Cummins data link connector harness connector F190 terminals 1 and 2.

Cummins data link connector F190		Resistance
Terminal	Terminal	
1	2	54 – 66 Ω

Is the inspection result normal?

YES >> GO TO 10.
NO >> GO TO 9.

9. CHECK TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Disconnect the data link adapter from the service data link connector harness connector.
4. Measure the resistance between Cummins data link connector harness connector F190 terminals 1 and 2.

Cummins data link connector F190		Resistance
Terminal	Terminal	
1	2	108 – 132 Ω

Is the inspection result normal?

YES >> A concern has been found in the aftertreatment side of the CAN2 communication line circuit. Repair or replace error-detected parts.
NO >> A concern has been found in the engine side of the CAN2 communication line circuit.Repair or replace error-detected parts.

10. CHECK CAN2 COMMUNICATION LINE (+) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 1 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	1	–	0.1 – 4.5V

Is the inspection result normal?

YES >> GO TO 11.
NO >> A short circuit has been found in the CAN2 communication line circuit. Repair or replace error-detected parts.

11. CHECK CAN2 COMMUNICATION LINE (–) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 2 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	2	–	0.1 – 4.5V

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> A short circuit has been found in the CAN2 communication line circuit. Repair or replace error-detected parts.

U029D COMMUNICATION WITH NOX SENSOR 1

DTC Description

INFOID:0000000013053709

The aftertreatment intake NOx (nitrogen oxides) sensor is a smart device and communicates with the engine control module (ECM) via the CAN2 communication lines. The aftertreatment intake NOx sensor performs internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and can not be replaced individually. The aftertreatment intake NOx sensor is used to measure the NOx emissions at the intake of the aftertreatment system.

DTC DETECTION LOGIC

This DTC is triggered when the ECM loses CAN2 communications with the aftertreatment intake NOx sensor.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U029D	Timeout error check (Lost Communication With NOX Sensor "A")	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Message not received.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC U029D being current on the CONSULT screen.

Is DTC U029D current?

YES >> Go to EC-224, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013053710

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U029D being current or being past on more than 1 count on the CONSULT screen.

Is DTC U029D detected as current or past for more than 1 count?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FOR CORRECT ELECTRICAL SYSTEM VOLTAGE SETTING IN CONSULT

1. Turn ignition switch ON.
2. Connect CONSULT and make sure the electrical system voltage setting is correct for the engine configuration.
   NOTE:
   To check the voltage configuration of the engine, disconnect ECM connector E93 and measure the voltage from ECM connector E93 terminal 83 to ground.

Is the electrical system voltage setting correct for the engine configuration?

YES >> GO TO 3.
NO >> Use CONSULT to configure the electrical system voltage to match the engine configuration.

3.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U010E being current or being past on more than 1 count on the CONSULT screen.

Is DTC U010E detected as current or past for more than 1 count?

YES >> GO TO 10.
NO >> GO TO 4.

4.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTCs U0106, U029D, U02A2, U1611 or U1612 being current or being past on more than 1 count on the CONSULT screen.

Are DTCs U0106, U029D, U02A2, U1611 or U1612 detected as current or past for more than 1 count?

YES >> GO TO 9.
NO >> GO TO 5.

5.INSPECT INTAKE NOX SENSOR AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect intake NOx sensor harness connector C31.
3. Inspect the intake NOx sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect intake NOx sensor harness connector C31.
3. Turn ignition switch ON.
4. Check voltage between intake NOx sensor connector C31 terminal 4 and terminal 3.

Intake NOx sensor connector C31		Condition	Voltage (Approx.)
Terminal	Terminal		
4	3	Ignition switch ON	> 10.8 V
		Cranking engine	

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7.CHECK POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect intake NOx sensor harness connector C31.
3. Turn ignition switch ON.
4. Check voltage between intake NOx sensor connector C31 terminal 4 and ground.

Intake NOx sensor		Ground	Condition	Voltage (Approx.)
Connector	Terminal			
C31	4	(–)	Ignition switch ON	> 10.8 V
			Cranking engine	

Is the inspection result normal?

YES >> An open or high resistance is present on the ground circuit. Repair or replace error-detected parts.
NO >> An open or high resistance is present on the battery supply circuit. Repair or replace error-detected parts.

8.CHECK FOR AN OPEN OR SHORT CIRCUIT IN THE INTAKE NOX SENSOR DATA LINK

1. Turn ignition switch OFF.
2. Disconnect the intake NOx sensor harness connector C31.
3. Disconnect the data link adapter from the service data link connector harness connector.
4. Measure the resistance between intake NOx sensor harness connector C31 terminal 1 and 2.

Intake NOx sensor connector C31		Resistance
Terminal	Terminal	
1	2	54 – 66 Ω

Is the inspection result normal?

YES >> Replace intake NOx sensor. Refer to EX-45, "Removal and Installation".
NO >> GO TO 10.

9.INSPECT IPDM E/R AND FUSES

1. Turn ignition switch OFF.
2. Inspect the IPDM E/R and fuses for the following:

- Blown power supply fuses
- Power supply fuse for cracks, burns, corrosion, or discolorations
- Corrosion
- Loose or expanded pins

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair or replace error-detected parts.

10.CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link connector harness connector.
3. Measure the resistance between Cummins data link connector F190 terminal 1 and terminal 2.

Cummins data link connector F190		Resistance
Terminal	Terminal	
1	2	54 – 66 Ω

Is the inspection result normal?

YES >> GO TO 12.
NO >> GO TO 11.

11.CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link connector harness connector.
3. Disconnect the ECM harness connector E93.
4. Disconnect intake NOx sensor harness connector C31.
5. Measure the resistance between intake NOx sensor connector C31 terminal 1 and terminal 2.

Cummins data link connector F190		Resistance
Terminal	Terminal	
1	2	108 – 132 Ω

Is the inspection result normal?

YES >> A malfunction has been detected in the aftertreatment side of the CAN2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

NO >> A malfunction has been detected in the engine side of the CAN2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

12. CHECK CAN2 COMMUNICATION LINE (+) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 1 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	1	(–)	0.1 – 4.5V

Is the inspection result normal?

YES >> GO TO 13.

NO >> Repair or replace error-detected parts.

13. CHECK CAN2 COMMUNICATION LINE (–) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 2 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	2	(–)	0.1 – 4.5V

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".

NO >> Repair or replace error-detected parts.

U029E COMMUNICATION WITH NOX SENSOR 2

DTC Description

INFOID:0000000013053711

The aftertreatment outlet NOx (nitrogen oxides) sensor is a smart device and communicates with the engine control module (ECM) via the CAN2 communication lines. The aftertreatment outlet NOx sensor performs its own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment outlet NOx sensor is used to measure the NOx emissions at the outlet of the aftertreatment system.

DTC DETECTION LOGIC

The ECM lost communication with the aftertreatment outlet NOx sensor via the CAN2 communication lines.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U029E	Timeout error check (Lost Communication With NOX Sensor "B")	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Message not received.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC U029E being current on the CONSULT screen.

Is DTC U029E current?

YES >> Go to EC-228, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013053712

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U029E being current or being past on more than 1 count on the CONSULT screen.

Is DTC U029E detected as current or past for more than 1 count?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FOR CORRECT ELECTRICAL SYSTEM VOLTAGE SETTING IN CONSULT

1. Turn ignition switch ON.
2. Connect CONSULT and make sure the electrical system voltage setting is correct for the engine configuration.
   NOTE:
   To check the voltage configuration of the engine, disconnect ECM connector E93 and measure the voltage from ECM connector E93 terminal 83 to ground.

Is the electrical system voltage setting correct for the engine configuration?

YES >> GO TO 3.
NO >> Use CONSULT to configure the electrical system voltage to match the engine configuration.

3.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U010E being current or being past on more than 1 count on the CONSULT screen.

Is DTC U010E detected as current or past for more than 1 count?

YES >> GO TO 10.
NO >> GO TO 4.

4.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTCs U0106, U029D, U02A2, U1611 or U1612 being current or being past on more than 1 count on the CONSULT screen.

Are DTCs U0106, U029D, U02A2, U1611 or U1612 detected as current or past for more than 1 count?

YES >> GO TO 9.
NO >> GO TO 5.

5.INSPECT OUTLET NOX SENSOR AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect outlet NOx sensor harness connector C33.
3. Inspect the outlet NOx sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect outlet NOx sensor harness connector C33.
3. Turn ignition switch ON.
4. Check voltage between outlet NOx sensor connector C33 terminal 4 and terminal 3.

Outlet NOx sensor connector C33		Condition	Voltage (Approx.)
Terminal	Terminal		
4	3	Ignition switch ON	> 10.8 V
		Cranking engine	

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7.CHECK POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect outlet NOx sensor harness connector C33.
3. Turn ignition switch ON.
4. Check voltage between outlet NOx sensor connector C33 terminal 4 and ground.

Outlet NOx sensor		Ground	Condition	Voltage (Approx.)
Connector	Terminal			
C33	4	–	Ignition switch ON	> 10.8 V
			Cranking engine	

Is the inspection result normal?

YES >> An open or high resistance is present on the ground circuit. Repair or replace error-detected parts.
NO >> An open or high resistance is present on the battery supply circuit. Repair or replace error-detected parts.

8. CHECK FOR AN OPEN OR SHORT CIRCUIT IN THE OUTLET NOX SENSOR DATA LINK

1. Turn ignition switch OFF.
2. Disconnect the outlet NOx sensor harness connector C33.
3. Disconnect the data link adapter from the service data link connector harness connector.
4. Measure the resistance between outlet NOx sensor harness connector C33 terminal 1 and 2.

Outlet NOx sensor connector C33		Resistance
Terminal	Terminal	
1	2	54 – 66 Ω

Is the inspection result normal?

YES >> Replace outlet NOx sensor. Refer to EX-48, "Removal and Installation".
NO >> GO TO 10.

9. INSPECT IPDM E/R AND FUSES

1. Turn ignition switch OFF.
2. Inspect the IPDM E/R and fuses for the following:

- Blown power supply fuses
- Power supply fuse for cracks, burns, corrosion, or discolorations
- Corrosion
- Loose or expanded pins

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair or replace error-detected parts.

10. CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link connector harness connector.
3. Measure the resistance between Cummins data link connector F190 terminal 1 and terminal 2.

Cummins data link connector F190		Resistance
Terminal	Terminal	
1	2	54 – 66 Ω

Is the inspection result normal?

YES >> GO TO 12.
NO >> GO TO 11.

11. CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link connector harness connector.
3. Disconnect the ECM harness connector E93.
4. Disconnect outlet NOx sensor harness connector C33.
5. Measure the resistance between outlet NOx sensor connector C33 terminal 1 and terminal 2.

Cummins data link connector F190		Resistance
Terminal	Terminal	
1	2	108 – 132 Ω

Is the inspection result normal?

YES >> A malfunction has been detected in the aftertreatment side of the CAN2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

NO >> A malfunction has been detected in the engine side of the CAN2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

12. CHECK CAN2 COMMUNICATION LINE (+) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 1 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	1	–	0.1 – 4.5V

Is the inspection result normal?

YES >> GO TO 13.

NO >> Repair or replace error-detected parts.

13. CHECK CAN2 COMMUNICATION LINE (–) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 2 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	2	–	0.1 – 4.5V

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".

NO >> Repair or replace error-detected parts.

U02A2 CAN COMMUNICATION

DTC Description

INFOID:0000000013111621

The DEF quality sensor is a smart device and communicates with the engine electronic control module (ECM) via the CAN2 communication lines. The DEF quality sensor receives power and ground directly from the battery. The sensor performs its own internal diagnostics and reports malfunctions back to the ECM via the CAN2 communication lines. The DEF quality sensor is used to measure the concentration of the DEF in the tank.

DTC DETECTION LOGIC

The ECM lost communication with the aftertreatment DEF quality sensor via the CAN2 communication lines.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U02A2	(Lost Communication With Reductant Quality Module)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Message not received.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Harness and connectors
- DEF quality sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC U02A2 being current on the CONSULT screen.

Is DTC U02A2 current?

YES >> Go to EC-232, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013111622

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U02A2 being current or being past for more than 1 count on the CONSULT screen.

Is DTC U0106 detected as current or past for more than 1 count?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC being current on the CONSULT screen.

Is DTC P0687 detected as current?

YES >> Refer to EC-780, "DTC Description".
NO >> GO TO 3.

3.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTCs U0106, U010C, U029D, U029E, U1611 or U1612 being current or being past for more than 1 count on the CONSULT screen.

Are DTCs U0106, U010C, U029D, U029E, U1611 or U1612 detected as current or past for more than 1 count?

YES >> GO TO 8.
NO >> GO TO 4.

4.INSPECT DEF QUALITY SENSOR AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect DEF quality sensor harness connector C203.
3. Inspect the DEF qualify sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect DEF quality sensor harness connector C203.
3. Turn ignition switch ON.
4. Check voltage between DEF quality sensor connector C203 terminals 1 and 4.

DEF quality sensor connector			Condition	Voltage (Approx.)
Connector	Terminal			
C203	1	4	Ignition switch ON	> 10.8 V
			Cranking engine	

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6.CHECK POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect DEF quality sensor harness connector C203.
3. Turn ignition switch ON.
4. Check voltage between DEF quality sensor connector C203 terminal 1 and ground.

DEF quality sensor		Ground	Condition	Voltage (Approx.)
Connector	Terminal			
C203	1	–	Ignition switch ON	> 10.8 V
			Cranking engine	

Is the inspection result normal?

YES >> An open or high resistance is present on the ground circuit. Repair or replace error-detected parts.

NO >> An open or high resistance is present on the battery supply circuit. Repair or replace error-detected parts.

7.CHECK FOR AN OPEN OR SHORT CIRCUIT IN THE DEF QUALITY SENSOR DATA LINK

1. Turn ignition switch OFF.
2. Disconnect the DEF quality sensor harness connector C203.
3. Disconnect the data link adapter from the service data link connector harness connector.
4. Measure the resistance between DEF quality sensor harness connector C203 terminals 2 and 3.

DEF quality sensor connector			Resistance
Connector	Terminal		
C203	2	3	54 – 66 Ω

the inspection result normal?

YES >> Replace DEF quality sensor. Refer to EX-75, "Exploded View".
NO >> GO TO 9.

8.INSPECT IPDM E/R AND FUSES

1. Turn ignition switch OFF.
2. Inspect the IPDM E/R, fuses and ECM relay for the following:

- Blown power supply fuses
- Power supply fuses and ECM relay for cracks, burns, corrosion, or discolorations
- Corrosion
- Loose or expanded pins

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace error-detected parts.

9.CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link connector harness connector.
3. Measure the resistance between Cummins data link connector F190 terminal 1 and terminal 2.

Cummins data link connector			Resistance
Connector	Terminal		
F190	1	2	54 – 66 Ω

Is the inspection result normal?

YES >> GO TO 11.
NO >> GO TO 10.

10.CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link connector harness connector.
3. Disconnect the ECM harness connector E93.
4. Measure the resistance between Cummins data link connector F190 terminal 1 and terminal 2.

Cummins data link connector			Resistance
Connector	Terminal		
F190	1	2	108 – 132 Ω

Is the inspection result normal?

YES >> A malfunction has been detected in the aftertreatment side of the CAN2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".
NO >> A malfunction has been detected in the engine side of the CAN2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

11.CHECK CAN2 COMMUNICATION LINE (+) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 1 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	1	–	0.1 – 4.5V

Is the inspection result normal?

YES >> GO TO 12.
NO >> A short circuit has been detected in the CAN2 communication line circuit. Repair or replace error-detected parts.

12. CHECK CAN2 COMMUNICATION LINE (–) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 2 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	2	–	0.1 – 4.5V

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> A short circuit has been detected in the CAN2 communication line circuit. Repair or replace error-detected parts.

U0307 CAN COMMUNICATION

DTC Description

INFOID:0000000013099931

The glow plug control module controls the timing and intensity of the glow plug output using data provided by the ECM through the CAN2 communication lines. The glow plug control module will not activate the glow plugs if the glow plug control module reads a temperature greater than the calibrated amount. The glow plug control module receives fused power from the battery supply circuit and ignition power from the ECM relay.

DTC DETECTION LOGIC

The ECM detected a software mismatch with the glow plug control module.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U0307	Software Incompatibility With Glow Plug Control Module 1 (Glow plug control module - out of calibration)	Diagnosis condition	Continuously when ignition switch is ON or the engine is running.
		Signal (terminal)	—
		Threshold	Incorrect software ID received.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Glow Plug Control Module
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U0307 being current on the CONSULT screen.

Is DTC U0307 current?

YES >> Go to EC-236, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099932

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U0106 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U0307 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Replace the glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

U0402 DRIVETRAIN CAN COMMUNICATION (TCM)

DTC Description

INFOID:0000000013053719

The transmission control module communicates to the engine control module (ECM) through the CAN data link. Messages sent from the transmission control module are received and monitored by the ECM. If the ECM does not receive a message from transmission control module, a DTC will be set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) did not receive a message from the transmission control module.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U0402	INVALID DATA RECEIVED FROM TCM (Invalid Data Received From Transmission Control Module)	Diagnosis condition	Continuously when ignition switch is ON or the engineis running.
		Signal (terminal)	(–)
		Threshold	Invalid status data received from transmission control module.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Transmission control module
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U0402 being current on the CONSULT screen.

Is DTC U0402 current?

YES >> Go to EC-237, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013053720

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U0101 being current on the CONSULT screen.

Is DTC U0101 detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U0402 being current on the CONSULT screen.

Is DTC U0402 detected as current?

YES >> Replace transmission control module. Refer to TM-222, "Removal and Installation".
NO >> Inspection End.

U0407 CAN COMMUNICATION

DTC Description

INFOID:0000000013099929

The glow plug control module controls the timing and intensity of the glow plug outputs on the engine using data provided by the ECM through the CAN2 communication lines. The glow plug control module will not activate the glow plugs if the glow plug control module reads a temperature greater than a calibrated amount. The glow plug control module receives fused power directly from the battery and switched power through the smart power relay.

DTC DETECTION LOGIC

The Engine Control Module (ECM) received an invalid message from the glow plug control module.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U0407	(Invalid Data Received From Glow Plug Control Module)	Diagnosis condition	Continuously when ignition switch is ON or the engine is running.
		Signal (terminal)	(–)
		Threshold	Invalid status data received from glow plug control module.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow Plug Control Module

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U0407 being current on the CONSULT screen.

Is DTC U0407 current?

YES >> Go to EC-238, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099930

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U0407 being current on the CONSULT screen.

Is DTC U0407 detected as current?

YES >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> Inspection End.

U040D CAN COMMUNICATION

DTC Description

INFOID:0000000013102935

The rotary turbine control valve and linkage are electronically controlled by the rotary turbine control valve actuator. This actuator is a smart device and receives information via the CAN2 communication lines from the Engine Control Module (ECM). The rotary turbine control valve actuator performs its own diagnostics and reports malfunctions back to the ECM using the CAN2 communications lines. The ECM then decodes the error message and converts it to a DTC.

DTC DETECTION LOGIC

- The ECM has detected a calibration incompatibility between the RTC actuator and the ECM.
- The ECM has detected an incorrect RTC actuator installed on the turbocharger.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U040D	Invalid Data Received From Turbocharger Control Module “A” (Engine turbocharger turbine bypass actuator - out of calibration)	Diagnosis condition	Engine running.
		Signal (terminal)	—
		Threshold	The motor type received from the turbine bypass valve smart device does not equate to the expected motor type.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- ECM
- Incorrect RTC actuator
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC U040D being current on the CONSULT screen.

Is DTC U040D current?

YES >> Go to EC-239, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102936

1.CHECK DTC PRIORITY

1. Cycle the ignition switch ON several times, waiting 30 seconds between each cycle.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U040D being current on the CONSULT screen.

Is DTC U040D detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT ROTARY TURBINE CONTROL VALVE ACTUATOR AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.

2. Disconnect rotary turbine control valve actuator harness connector F146.
3. Inspect the rotary turbine control valve actuator connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK DTC PRIORITY

1. Connect rotary turbine control valve actuator harness connector F146.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Erase DTCs.
5. Turn ignition switch OFF.
6. Disconnect linkage from rotary turbine control valve actuator.
7. Turn ignition switch ON.
8. Rotary turbine control valve actuator should span.
9. Check for DTC U040D being current on the CONSULT screen.

Is DTC U040D detected as current?

YES >> Replace rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".
NO >> GO TO 4.

4. CHECK ROTARY TURBINE CONTROL VALVE ACTUATOR LINKAGE

Inspect the rotary turbine control valve actuator linkage.

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Replace rotary turbine control valve actuator linkage. Refer to EM-412, "Removal and Installation".

U040F CAN COMMUNICATION

DTC Description

INFOID:0000000013111795

The aftertreatment diesel exhaust fluid controller is the central control for the selective catalytic reduction (SCR) diesel exhaust fluid dosing system and handles the dosing activity, tank level sensing, tank temperature sensing, line heating, and tank heating. The diesel exhaust fluid controller communicates to the engine control module (ECM) via the CAN2 communication lines.

DTC DETECTION LOGIC

The aftertreatment diesel exhaust fluid controller (DCU) did not receive specific dosing request messages from the Engine Control Module (ECM).

DTC	CONSULT screen terms (Trouble diagnosis content)		DTC detection condition	
U040F	(Invalid Data Received From Reductant Control Module)	1	Diagnosis condition	Ignition switch is ON or engine running.
			Signal (terminal)	(–)
			Threshold	The flange controller unit (FCU) has detected an engine control module (ECM) SAE aftertreatment 1 SCR dosing system requests 1 message that is out of sequence.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running.
		2	Diagnosis condition	Ignition switch is ON or engine running.
			Signal (terminal)	(–)
			Threshold	• The flange controller unit (FCU) has not received the SAE aftertreatment 1 SCR dosing system requests 1 message from the ECM. or • The FCU has not received the SAE aftertreatment 1 SCR dosing system requests 2 message from the ECM. or • The FCU has not received the SAE ambient conditions message from the ECM. or • The FCU has not received the diagnostic override message from the ECM.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Harness and connectors
- DEF control module
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U040F being current on the CONSULT screen.

Is DTC U040F current?

YES >> Go to EC-242, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013111796

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U010E being current on the CONSULT screen.

Is DTC U010E detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.INSPECT DEF CONTROL MODULE AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect DEF control module harness connector C35.
3. Inspect the DEF control module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect DEF control module harness connector C35.
3. Turn ignition switch ON and wait 30 seconds.
4. Check for DTC U010E being current on the CONSULT screen.

Is DTC U010E detected as current?

YES >> GO TO 4.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

4.CHECK DTCS AND VERIFY CONDITION

1. Turn ignition switch OFF.
2. Connect DEF control module harness connector C35.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC U040F become current?

YES >> GO TO 5.
NO >> The removal and installation of the connector corrected the issue.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken

- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC U040F being past on the CONSULT screen.

Is DTC U040F detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Replace the DEF control module. Refer to EC-1259, "Removal and Installation".

U0415 CAN COMMUNICATION

DTC Description

INFOID:0000000013053721

The anti-lock brake system communicates to the primary engine control module (ECM) through the CAN data link. Messages sent from the anti-lock brake system are received and monitored by the ECM. If the ECM does not receive a message from anti-lock brake system, a fault will be set.

DTC DETECTION LOGIC

The engine control module (ECM) received an error message from the anti-lock brake system (ABS) controller.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U0415	VDC CAN CIR2 (Invalid Data Received From Anti-Lock Brake System Control Module)	Diagnosis condition	Continuously when ignition switch is ON or the engine is running.
		Signal (terminal)	(–)
		Threshold	ECM received an error message from the ABS actuator and electric unit (control unit).
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- ABS actuator and electric unit (control unit)
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U0415 being current on the CONSULT screen.

Is DTC U0415 current?

YES >> Go to EC-244, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013053722

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U0415 being current on the CONSULT screen.

Is DTC U0415 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK CURRENT CAN DTCS

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for multiple CAN DTCs being current on the CONSULT screen.

Multiple CAN DTCs current?

YES >> CAN issue has been detected, check the following:
- Terminating resistances
- IPDM E/R
- Harness and connectors

NO >> ABS issue has been detected, check the following:
- ABS actuator and electric unit (control unit) voltage

- ABS actuator and electric unit (control unit)
- Harness and connectors

U0426 CAN COMMUNICATION (IMMOBILIZER)

DTC Description

INFOID:0000000013111967

The immobilizer anti-theft device communicates with the ECM through the CAN communication lines. Messages sent from the immobilizer anti-theft device are received by the ECM and are used to control the anti-theft features. If the ECM does not receive a message from the immobilizer anti-theft device, a DTC is set.

DTC DETECTION LOGIC

- The ECM received an invalid identification message from the immobilizer anti-theft device.
- The ECM received a key code error from the immobilizer anti-theft device.
- The ECM received a no key error from the immobilizer anti-theft device.
- Immobilizer anti-theft device has detected too many attempts to start vehicle with an invalid key. Engine start has been locked out.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
U0426	Invalid Data Received From Vehicle Immobilizer Control Module (Immobilizer ID invalid, key code error, no key error, lock mode error - condition exists)	1	Diagnosis condition	Continuously when ignition switch is ON or the engine is running
			Signal (terminal)	—
			Threshold	ECM cannot receive feedback message from immobilizer within expected period of time or ECM receives feedback from immobilizer, but message indicates communication error.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running.
		2	Diagnosis condition	Continuously when ignition switch is ON or the engine is running.
			Signal (terminal)	—
			Threshold	ECM verification process at end of ignition ON communication fails 5 times.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running.
		3	Diagnosis condition	Continuously when ignition switch is ON or the engine is running.
			Signal (terminal)	—
			Threshold	ECM receives message from immobilizer indicating key programmed in transponder carries wrong key code.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running.
		4	Diagnosis condition	Continuously when ignition switch is ON or the engine is running.
			Signal (terminal)	—
			Threshold	ECM receives message from immobilizer indicating no key is programmed in transponder.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Immobilizer anti-theft device
- Harness or connectors
- Invalid key
- Rapid key cycles may cause this DTC to set.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U0426 being current on the CONSULT screen.

Is DTC U0426 current?

YES >> Go to EC-247, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013111968

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for CAN communication DTCs being current on the CONSULT screen.

Are CAN communication DTCs detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U0426 being current on the CONSULT screen.

Is DTC U0426 detected as current?

YES >> An immobilizer anti-theft device issue has been detected. Refer to SEC-12, "NISSAN VEHICLE IMMOBILIZER SYSTEM-NATS : System Description".
NO >> Refer to GI-43, "Intermittent Incident".

U059E CAN COMMUNICATION

DTC Description

INFOID:0000000013053713

The aftertreatment intake NOx (nitrogen oxides) sensor is a smart device and communicates with the engine control module (ECM) via the CAN 2 communication lines. The aftertreatment intake NOx sensor performs internal diagnostics and reports malfunctions back to the primary ECM using the CAN 2 communication lines. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment intake NOx sensor is used to measure the NOx emissions at the intake of the aftertreatment system.

DTC DETECTION LOGIC

The aftertreatment intake NOx sensor reading was not valid.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U059E	TIMEOUT ERROR CHECK (Invalid Data Received From NOX Sensor "A")	Diagnosis condition	Aftertreatment diesel oxidation catalyst intake temperature sensor has been above 150° C (302° F) for 5 seconds while the engine is running.
		Signal (terminal)	(–)
		Threshold	NOx sensor reading is not valid due to internal control loops within the sensor being unstable.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Intake NOx sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and operate the engine to raise exhaust temperatures. This can be done by either driving the vehicle or initiating a stationary regeneration using CONSULT.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
   NOTE:
   Aftertreatment diesel oxidation catalyst intake temperature must be above 150° C (302° F) for 5 seconds before the aftertreatment intake NOx sensor can run its internal diagnostics.
3. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
4. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
5. Check for DTC U059E being current on the CONSULT screen.

Is DTC U059E current?

YES >> Go to EC-248, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013053714

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- U029D
- P2202

- P220A

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U059E being current on the CONSULT screen.

Is DTC U059E detected as current?

YES >> Replace intake NOx sensor. Refer to EX-45, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

U059F CAN COMMUNICATION

DTC Description

INFOID:0000000013053715

The aftertreatment outlet NOx (nitrogen oxides) sensor is a smart device and communicates with the engine control module (ECM) via the CAN 2 communication lines. The aftertreatment outlet NOx sensor performs its own internal diagnostics and reports malfunctions back to the primary ECM using the CAN2 communication lines. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment outlet NOx sensor is used to measure the NOx emissions at the outlet of the aftertreatment system.

DTC DETECTION LOGIC

The aftertreatment outlet NOx sensor reading was not valid.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U059F	TIMEOUT ERROR CHECK (Invalid Data Received From NOX Sensor "B")	Diagnosis condition	Aftertreatment SCR outlet temperature has been above 200° C (392° F) for a calibrated period of time while the engine is running.
		Signal (terminal)	(–)
		Threshold	Percent of time > 50% when NOx sensor reading is valid since internal control loops within the sensor have stabilized is invalid
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Outlet NOx sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch ON.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U059F being current on the CONSULT screen.

Is DTC U059F current?

YES >> Go to EC-250, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013053716

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- U029E
- P220B
- P229E

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U059F being current on the CONSULT screen.

Is DTC U059F detected as current?

YES >> Replace outlet NOx sensor. Refer to EX-48, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

U1000 CAN COMMUNICATION CIRCUIT

DTC Description

INFOID:0000000013053717

CAN (Controller Area Network) is a serial communication line for real time applications. It is an on-vehicle multiplex communication line with high data communication speed and excellent error detection ability. Modern vehicles are equipped with many electronic control units, and each control unit shares information and links with other control units during operation (not independent). In CAN communication, control units are connected with 2 communication lines (CAN high, CAN low), allowing a high rate of information transmission with less wiring. Each control unit transmits/receives data but selectively reads required data only. Refer to LAN-70, "CAN COMMUNICATION SYSTEM : CAN Communication Signal Chart".

DTC DETECTION LOGIC

- The ECM did not receive a message from the ABS actuator and electric unit (control unit).
- The ECM did not receive a message from the A/C auto amp. (automatic air conditioner) or front air control (manual air conditioner).
- The ECM did not receive a message from the air bag diagnosis sensor unit.
- The ECM did not receive a message from the body control module (BCM).
- The ECM did not receive a message from the combination meter.

DTC No.	CONSULT screen terms (Trouble diagnosis content)	DTC Detection Condition		
U1000	CAN COMM CIRCUIT (CAN communication circuit)	1	Diagnosis condition	When ignition switch is ON.
			Signal (terminal)	—
			Threshold	Message not received from ABS actuator and electric unit (control unit) or torque values from ABS actuator and electric unit (control unit) exceed maximum or heartbeat counter value from ABS actuator and electric unit (control unit) is not incrementing
			Diagnosis delay time	Diagnostic runs continuously when ignition switch is ON or engine is running.
		2	Diagnosis condition	When ignition switch is ON.
			Signal (terminal)	—
			Threshold	Message not received from air bag diagnosis sensor unit
			Diagnosis delay time	Diagnostic runs continuously when ignition switch is ON or engine is running.
		3	Diagnosis condition	When ignition switch is ON.
			Signal (terminal)	—
			Threshold	Message not received from body control unit (BCM)
			Diagnosis delay time	Diagnostic runs continuously when ignition switch is ON or engine is running.
		4	Diagnosis condition	When ignition switch is ON.
			Signal (terminal)	—
			Threshold	Message not received from combination meter
			Diagnosis delay time	Diagnostic runs continuously when ignition switch is ON or engine is running.
		5	Diagnosis condition	When ignition switch is ON.
			Signal (terminal)	—
			Threshold	Message not received from immobilizer
			Diagnosis delay time	Diagnostic runs continuously when ignition switch is ON or engine is running.
		6	Diagnosis condition	When ignition switch is ON.
			Signal (terminal)	—
			Threshold	Heartbeat counter value from transmission control unit (TCU) is not incrementing
			Diagnosis delay time	Diagnostic runs continuously when ignition switch is ON or engine is running.

POSSIBLE CAUSE

- Harness and connectors
- ABS actuator and electric unit (control unit)
- A/C auto amp. (automatic air conditioner)
- Air bag diagnosis sensor unit
- Body control module (BCM)
- Combination meter
- Front air control (manual air conditioner)

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.

2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U1000 being current on the CONSULT screen.

Is DTC U1000 current?

YES >> Go to EC-254, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013053718

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U1000 being current on the CONSULT screen.

Is DTC U1000 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for multiple CAN communication DTCs being current on the CONSULT screen.

Are multiple CAN communication DTCs detected as current?

YES >> Repair or replace error-detected parts.
NO >> Refer to GI-43, "Intermittent Incident".

U11C1 CAN COMMUNICATION

DTC Description

INFOID:0000000013111793

The aftertreatment diesel exhaust fluid controller is the central control for the selective catalytic reduction (SCR) diesel exhaust fluid dosing system, and handles the dosing activity, tank level sensing, tank temperature sensing, line heating, and tank heating. The diesel exhaust fluid controller communicates to the engine control module (ECM) via the CAN 2 communication lines.

DTC DETECTION LOGIC

The Engine Control Module (ECM) sent an unreadable or missing message to the diesel exhaust fluid controller via the CAN 2 communication lines.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U11C1	(Reductant Control Module Received Implausible Data From ECM/PCM)	Diagnosis condition	Ignition switch is ON or engine running.
		Signal (terminal)	(–)
		Threshold	The Flange Control Unit (FCU) has detected that the internal data set checksum does not match the expected value.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Harness and connectors
- DEF control module
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U11C1 being current on the CONSULT screen.

Is DTC U11C1 current?

YES >> Go to EC-255, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013111794

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U11C1 being current on the CONSULT screen.

Is DTC U11C1 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for other DTCs being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.INSPECT DEF CONTROL MODULE AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect DEF control module harness connector C35.
3. Inspect the DEF control module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR AN OPEN OR SHORT CIRCUIT IN THE DEF CONTROL MODULE DATA LINK

1. Turn ignition switch OFF.
2. Disconnect the DEF control module harness connector C35.
3. Disconnect the data link adapter from the service data link harness connector.
4. Measure the resistance between DEF control module connector C35 terminals 5 and 6.

DEF control module			Resistance
Connector	Terminal		
C35	5	6	54 – 66 Ω

Is the inspection result normal?

YES >> Replace DEF control module. Refer to EC-1259, "Removal and Installation".
NO >> GO TO 5.

5. CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link harness connector.
3. Measure the resistance between Cummins data link connector F190 terminals 1 and 2.

Cummins data link connector			Resistance
Connector	Terminal		
F190	1	2	54 – 66 Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6. CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link connector harness connector.
3. Disconnect the ECM harness connector E93.
4. Measure the resistance between Cummins data link connector F190 terminals 1 and 2.

Cummins data link connector			Resistance
Connector	Terminal		
F190	1	2	108 – 132 Ω

Is the inspection result normal?

YES >> A malfunction has been detected in the aftertreatment side of the CAN 2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

NO >> A malfunction has been detected in the engine side of the CAN 2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

7. CHECK CAN2 COMMUNICATION LINE (+) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 1 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	1	–	0.1 – 4.5V

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK CAN2 COMMUNICATION LINE (–) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 2 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	2	–	0.1 – 4.5V

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace harness for a short.

U1611 CAN COMMUNICATION

DTC Description

INFOID:0000000013111615

The aftertreatment diesel particulate filter temperature sensor module is a smart device that communicates with the engine control module via the CAN 2 communication lines. The aftertreatment diesel particulate filter temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using the CAN 2 communication lines. The aftertreatment diesel particulate filter temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature, and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the aftertreatment diesel particulate filter temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a loss of communication with the aftertreatment diesel particulate filter temperature sensor module.

DTC	CONSULT screen terms (Trouble diagnosis content)		DTC detection condition	
U1611	(Loss Communication with DPF Temperature Sensor Module)	1	Diagnosis condition	Ignition switch is ON or engine running.
			Signal (terminal)	(–)
			Threshold	CAN 2 communication proprietary EGTS triple cold junction message not received.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running.
		2	Diagnosis condition	Ignition switch is ON or engine running.
			Signal (terminal)	(–)
			Threshold	CAN 2 communication proprietary EGTS triple message not received.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Harness and connectors
- Low battery voltage
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U1611 being current on the CONSULT screen.

Is DTC U1611 current?

YES >> Go to EC-258, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013111616

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U1611 being current or more than 1 past count on the CONSULT screen.

Is DTC U1611 detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U010E being current or more than 1 past count on the CONSULT screen.

Is DTC U010E detected?

YES >> GO TO 9.
NO >> GO TO 3.

3.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current or more than 1 past count on the CONSULT screen:

- P0106
- P029D
- P029E
- P02A2
- P1612

Is applicable DTC detected?

YES >> GO TO 8.
NO >> GO TO 4.

4.INSPECT DPF TEMPERATURE SENSOR MODULE AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect DPF temperature sensor module harness connector C29.
3. Inspect the DPF temperature sensor module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK THE DPF TEMPERATURE SENSOR MODULE SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the DPF temperature sensor module harness connector C29.
3. Turn ignition switch ON.
4. Measure the voltage between DPF temperature sensor module harness connector C29 terminals 3 and 4.

DPF temperature sensor module			Voltage (Approx.)
Connector	Terminal	Terminal	
C29	3	4	> 10.8V

Is inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6.CHECK THE DPF TEMPERATURE SENSOR MODULE VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect the DPF temperature sensor module harness connector C29.
3. Turn ignition switch ON.

4. Measure the voltage between DPF temperature sensor module harness connector C29 terminal 3 and ground.

DPF temperature sensor module		Ground	Voltage (Approx.)
Connector	Terminal		
C29	3	—	> 10.8V

Is inspection result normal?

YES >> Repair or replace harness for an open ground circuit.
NO >> Repair or replace harness for an open battery voltage supply circuit.

7.CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the DPF temperature sensor module harness connector C29.
3. Disconnect the data link adapter from the service data link harness connector.
4. Measure the resistance between DPF temperature sensor module harness connector C29 terminals 1 and 2.

DPF temperature sensor module			Resistance
Connector	Terminal		
C29	1	2	54 – 66 Ω

Is the inspection result normal?

YES >> Replace DPF temperature sensor module. Refer to EX-52, "Removal and Installation".
NO >> GO TO 9.

8.CHECK FOR IPDM E/R AND FUSES

1. Turn ignition switch OFF.
2. Check the IPDM E/R and fuses:

- Check for a blown aftertreatment sensor power supply fuse.
- Inspect the DPF temperature sensor power supply fuse for cracks, burns, corrosion, or discoloration.
- Inspect the IPDM E/R for loose or expanded pins.
- Inspect the IPDM E/R for corrosion.

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace error-detected parts.

9.CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link harness connector.
3. Measure the resistance between Cummins data link connector F190 terminals 1 and 2.

Cummins data link connector			Resistance
Connector	Terminal		
F190	1	2	54 – 66 Ω

Is the inspection result normal?

YES >> GO TO 11.
NO >> GO TO 10.

10.CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link harness connector.
3. Disconnect the ECM harness connector E93.
4. Measure the resistance between Cummins data link connector F190 terminal 1 and terminal 2.

Cummins data link connector			Resistance
Connector	Terminal		
F190	1	2	108 – 132 Ω

Is the inspection result normal?

YES >> A malfunction has been detected in the aftertreatment side of the CAN 2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

NO >> A malfunction has been detected in the engine side of the CAN 2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

11. CHECK CAN2 COMMUNICATION LINE (+) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 1 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	1	–	0.1 – 4.5V

Is the inspection result normal?

YES >> GO TO 12.

NO >> Repair or replace error-detected parts.

12. CHECK CAN2 COMMUNICATION LINE (–) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 2 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	2	–	0.1 – 4.5V

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".

NO >> Repair or replace harness for a short.

U1612 CAN COMMUNICATION

DTC Description

INFOID:0000000013102933

The aftertreatment SCR (selective catalytic reduction) temperature sensor module is a smart device that communicates with the engine control module via the CAN 2 communication lines. The aftertreatment SCR temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using the CAN 2 communication lines. The aftertreatment SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the aftertreatment SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a loss of communication with the aftertreatment SCR temperature sensor module.

DTC	CONSULT screen terms (Trouble diagnosis content)		DTC detection condition	
U1612	(Loss Communication with SCR Temperature Sensor Module)	1	Diagnosis condition	Ignition switch is ON or engine running.
			Signal (terminal)	(–)
			Threshold	J1939 proprietary EGTS dual cold junction message not received.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running.
		2	Diagnosis condition	Ignition switch is ON or engine running.
			Signal (terminal)	(–)
			Threshold	J1939 proprietary EGTS triple message not received.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Harness and connectors
- Low battery voltage
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC U1612 being current on the CONSULT screen.

Is DTC U1612 current?

YES >> Go to EC-262, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102934

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U1612 being current or more than 1 past count on the CONSULT screen.

Is DTC U1612 detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U010E being current or more than 1 past count on the CONSULT screen.

Is DTC U010E detected?

YES >> GO TO 9.
NO >> GO TO 3.

3.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current or more than 1 past count on the CONSULT screen:

- P0106
- P029D
- P029E
- P02A2
- P1611

Is applicable DTC detected?

YES >> GO TO 8.
NO >> GO TO 4.

4.INSPECT SCR TEMPERATURE SENSOR MODULE AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect SCR temperature sensor module harness connector C30.
3. Inspect the SCR temperature sensor module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK THE SCR TEMPERATURE SENSOR MODULE SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the SCR temperature sensor module harness connector C30.
3. Turn ignition switch ON.
4. Measure the voltage between SCR temperature sensor module harness connector C30 terminals 3 and 4.

SCR temperature sensor module			Voltage (Approx.)
Connector	Terminal	Terminal	
C30	3	4	> 10.8V

Is inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6.CHECK THE DPF TEMPERATURE SENSOR MODULE VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect the SCR temperature sensor module harness connector C30.
3. Turn ignition switch ON.

4. Measure the voltage between DPF temperature sensor module harness connector C30 terminal 3 and ground.

SCR temperature sensor module		Ground	Voltage (Approx.)
Connector	Terminal		
C30	3	—	> 10.8V

Is inspection result normal?

YES >> Repair or replace harness for an open ground circuit.
NO >> Repair or replace harness for an open battery voltage supply circuit.

7.CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the SCR temperature sensor module harness connector C30.
3. Disconnect the data link adapter from the service data link harness connector.
4. Measure the resistance between SCR temperature sensor module harness connector C30 terminals 1 and 2.

SCR temperature sensor module			Resistance
Connector	Terminal		
C30	1	2	54 – 66 Ω

Is the inspection result normal?

YES >> Replace DPF temperature sensor module. Refer to EX-52, "Removal and Installation".
NO >> GO TO 9.

8.CHECK FOR IPDM E/R AND FUSES

1. Turn ignition switch OFF.
2. Check the IPDM E/R and fuses:

- Check for a blown aftertreatment sensor power supply fuse.
- Inspect the SCR temperature sensor power supply fuse for cracks, burns, corrosion, or discoloration.
- Inspect the IPDM E/R for loose or expanded pins.
- Inspect the IPDM E/R for corrosion.

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace error-detected parts.

9.CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link harness connector.
3. Measure the resistance between Cummins data link connector F190 terminals 1 and 2.

Cummins data link connector			Resistance
Connector	Terminal		
F190	1	2	54 – 66 Ω

Is the inspection result normal?

YES >> GO TO 11.
NO >> GO TO 10.

10.CHECK FOR TERMINATING RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the data link adapter from the service data link harness connector.
3. Disconnect the ECM harness connector E93.
4. Measure the resistance between Cummins data link connector F190 terminal 1 and terminal 2.

Cummins data link connector			Resistance
Connector	Terminal		
F190	1	2	108 – 132 Ω

Is the inspection result normal?

YES >> A malfunction has been detected in the aftertreatment side of the CAN2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

NO >> A malfunction has been detected in the engine side of the CAN2 communication line circuit. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

11. CHECK CAN2 COMMUNICATION LINE (+) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 1 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	1	–	0.1 – 4.5V

Is the inspection result normal?

YES >> GO TO 12.

NO >> Repair or replace error-detected parts.

12. CHECK CAN2 COMMUNICATION LINE (–) FOR SHORT

1. Turn ignition switch ON.
2. Check voltage between Cummins data link connector F190 terminal 2 and ground.

Cummins data link connector		Ground	Voltage (Approx.)
Connector	Terminal		
F190	2	–	0.1 – 4.5V

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".

NO >> Repair or replace harness for a short.

U3017 CAN COMMUNICATION

DTC Description

INFOID:0000000013102943

The real-time clock consists of a timing chip internal to the engine control module (ECM) which monitors engine off time, i.e.how long the engine has been shut down.

DTC DETECTION LOGIC

The engine off timer was not counting correctly and does not match other timers in the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
U3017	(Control Module Timer/Clock Performance)	1	Diagnosis condition	When ignition switch is ON
			Signal (terminal)	(–)
			Threshold	Number of times that the engine off timer displays the same value ≥ 5 counts.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	When ignition switch is ON
			Signal (terminal)	(–)
			Threshold	Real-time clock elapsed time - 721 seconds > 120 seconds.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF for 1 minute.
   NOTE:
   Ensure engine coolant temperature is above 70°C (158°F).
2. Turn ignition switch ON for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC U3017 being current on the CONSULT screen.

Is DTC U3017 current?

YES >> Go to EC-266, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102944

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0606 being current on the CONSULT screen.

Is DTC P0606 detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch OFF for at least 1 minute.
2. Turn ignition switch ON for 15 minutes.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC U3017 being current on the CONSULT screen.

Is DTC U3017 detected as current?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

P0016 CKP - CMP CORRELATION

DTC Description

INFOID:0000000013073576

The crankshaft position and camshaft position sensors are Hall effect type sensors. The engine control module (ECM) provides a 5V supply to the position sensor and a return circuit. As the teeth on the crankshaft speed ring or the dimples in the back of the camshaft gear move past the position sensor, a signal is generated on the position sensor signal circuit. The ECM interprets this signal and converts it to an engine speed. A missing tooth on the crankshaft gear is used by the ECM to determine the position of the engine.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the crankshaft position does not match the camshaft position signal input to the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0016	CMP/CKP_RELATION (Crankshaft Position – Camshaft Position Correlation)	1	Diagnosis condition	Engine running
			Signal (terminal)	Camshaft position (168)
			Threshold	• Maximum camshaft tone wheel tooth angle offset from radial < 5.56° • Minimum camshaft tone wheel tooth angle offset from radial > -10.11°
			Diagnosis delay time	Diagnostic runs continuously when engine is running
		2	Diagnosis condition	Engine running
			Signal (terminal)	Camshaft position (168)
			Threshold	• Maximum camshaft tone wheel tooth angle offset relative to crankshaft < -6.7° • Minimum camshaft tone wheel tooth angle offset relative to crankshaft > 5.12°
			Diagnosis delay time	Diagnostic runs continuously when engine is running

POSSIBLE CAUSE

- Camshaft position sensor
- Crankshaft position sensor
- Crankshaft tone wheel
- Engine timing

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0016 being current on the CONSULT screen.

Is DTC P0016 current?

YES >> Go to EC-268, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073577

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0016 being only current DTC on the CONSULT screen.

Is DTC P0016 detected as only current DTC?

YES >> GO TO 2.
NO >> Refer to EC-135, "DTC Index".

2. INSPECT ENGINE AND VEHICLE GROUNDS

1. Turn ignition switch OFF.
2. Inspect the engine and vehicle grounding:
- Check all engine block, starter, generator, chassis, and battery grounds.
- Verify all grounds are present and properly grounded.
- Verify all connections are free of corrosion and tight.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT CRANKSHAFT POSITION SENSOR

1. Turn ignition switch OFF.
2. Inspect the crankshaft sensors for damage.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace crankshaft position sensor. Refer to EM-336, "Removal and Installation".

4. INSPECT CRANKSHAFT TONE WHEEL

1. Turn ignition switch OFF.
2. Inspect the crankshaft tone wheel for:
- Missing or bent teeth
- Cracks
- Damaged surfaces

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace crankshaft tone wheel. Refer to TM-247, "2WD : Removal and Installation" or TM-251, "4WD : Removal and Installation".

5. INSPECT CAMSHAFT POSITION SENSOR

1. Turn ignition switch OFF.
2. Inspect the camshaft position sensor for damage.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace camshaft position sensor. Refer to EM-315, "Removal and Installation".

6. INSPECT CAMSHAFT GEARS

1. Turn ignition switch OFF.
2. Inspect the camshaft gears for:
- Excessive wear
- Fretting
- Damaged surfaces

Is the inspection result normal?

YES >> GO TO 7.
NO >> Replace camshaft gears. Refer to EM-366, "Removal and Installation".

7. INSPECT STATIC TIMING

1. Turn ignition switch OFF.
2. Remove the valve covers.
3. Rotate the engine to top dead center for the number 1 cylinder. Verify the camshaft gear timing marks are properly aligned.
4. Inspect the timing.

Is the inspection result normal?

YES >> Inspection End.
NO >> Repair or replace error-detected parts.

P0046 TC BOOST CONTROL CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013073823

The rotary turbine control valve and linkage are electronically controlled by the rotary turbine control valve actuator. This actuator is a smart device and receives information via the CAN 2 communication lines from the engine control module (ECM). The rotary turbine control valve actuator performs its own diagnostics and reports malfunctions back to the ECM, using the CAN 2 communication lines. The ECM then decodes the error message and converts it to a DTC.

DTC DETECTION LOGIC

The turbocharger actuator was expecting to see valid CAN 2 communication lines messages from the ECM, but the actual data received was unreadable or missing.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0046	(Turbocharger/Supercharger Boost Control Solenoid "A" Circuit Range/ Performance)	1	Diagnosis condition	Ignition switch is ON or engine running.
			Signal (terminal)	(–)
			Threshold	Turbocharger bypass valve has not received a position command message for greater than or equal to a calibrated time after previously having received a command message.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Ignition switch is ON or engine running.
			Signal (terminal)	(–)
			Threshold	Turbocharger bypass valve has not received a message from the ECM.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Rotary turbine control valve actuator
- Harness or connector
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P0046 being current on the CONSULT screen.

Is DTC P0046 current?

YES >> Go to EC-270, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073824

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U010C being current on the CONSULT screen.

Is DTC U010C detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. INSPECT ROTARY TURBINE CONTROL VALVE ACTUATOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect rotary turbine control valve actuator harness connector F146.
3. Inspect the harness connector and rotary turbine control valve actuator pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect rotary turbine control valve actuator harness connector F146.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC U010C become current?

YES >> GO TO 4.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

4. CHECK DTCS AND VERIFY ACTUATOR CONDITION

1. Turn ignition switch OFF.
2. Connect the rotary turbine control valve actuator harness connector F146.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0046 current?

YES >> GO TO 5.
NO >> The removal and installation of the connector corrected the issue.

5. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.

NO >> Repair or replace error-detected parts.

6. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P0046 being past on the CONSULT screen.

Is DTC P0046 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Replace the rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".

P0047 TC BOOST CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013073827

The rotary turbine control valve and linkage are electronically controlled by the rotary turbine control valve actuator. This actuator is a smart device and receives information via the CAN 2 communication lines from the engine control module (ECM). The rotary turbine control valve actuator performs its own diagnostics and reports malfunctions back to the ECM using the CAN 2 communication lines. The ECM then decodes the error message and converts it to a DTC.

DTC DETECTION LOGIC

The turbocharger actuator is not compatible with the ECM software.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0047	(Turbocharger/Supercharger Boost Control Solenoid "A" Circuit Low)	Diagnosis condition	Ignition switch is ON or engine running.
		Signal (terminal)	(–)
		Threshold	The voltage for turbocharger bypass valve smart device is less than a calibrated value.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Rotary turbine control valve actuator
- Harness or connector
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P0047 being current on the CONSULT screen.

Is DTC P0047 current?

YES >> Go to EC-273, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073828

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- P0562
- P0563
- P0687

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- U0106
- U010C
- U010E
- U029D
- U029E
- U1611
- U1612

Is applicable DTC detected?

YES >> Replace IPDM E/R. Refer to PCS-43, "Removal and Installation of IPDM E/R".
NO >> GO TO 3.

3.CHECK BATTERY TERMINALS

1. Turn ignition switch OFF.
2. Check the battery terminal connections.

Are the battery terminal connections tight and corrosion free?

YES >> GO TO 4.
NO >> Tighten and clean the terminals.

4.CHECK BATTERY VOLTAGE

1. Turn ignition switch ON.
2. Measure the voltage from the positive battery terminal to the negative battery terminal.

Is the battery voltage at least 12V?

YES >> GO TO 5.
NO >> Charge or replace battery(s). Refer to PG-176, "Removal and Installation - CUMMINS 5.0L".

5.INSPECT ROTARY TURBINE CONTROL VALVE ACTUATOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect rotary turbine control valve actuator harness connector F146.
3. Inspect the harness connector and rotary turbine control valve actuator pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK THE ROTARY TURBINE CONTROL VALVE ACTUATOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the rotary turbine control valve actuator harness connector F146.
3. Turn ignition switch ON.
4. Measure the voltage between rotary turbine control valve actuator harness connector F146 terminals 1 and 4.

Rotary turbine control valve actuator			Voltage (Approx.)
Connector	Terminal	Terminal	
F146	1	4	> 10V

Is inspection result normal?

YES >> Replace rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".
NO >> GO TO 7.

7. CHECK THE ROTARY TURBINE CONTROL VALVE ACTUATOR VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect the rotary turbine control valve actuator harness connector F146.
3. Turn ignition switch ON.
4. Measure the voltage between rotary turbine control valve actuator harness connector F146 terminal 4 and ground.

Rotary turbine control valve actuator		Ground	Voltage (Approx.)
Connector	Terminal		
F146	4	—	> 10V

Is inspection result normal?

YES >> Repair or replace harness for an open ground circuit.
NO >> Repair or replace harness for an open battery voltage supply circuit.

P0049 TC TURBINE OVERSPEED

DTC Description

INFOID:0000000013073451

The turbocharger speed sensor is a Hall effect type sensor. The engine control module (ECM) provides a 5V supply to the position sensor and a return circuit. As the blades of the turbocharger spin past the speed sensor, a signal is generated on the position sensor signal circuit. The ECM interprets this signal and converts it to a turbocharger speed.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the turbocharger speed was greater than 330,000 rpm for more than 5 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0049	(Turbocharger/Supercharger Turbine Overspeed)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Raw turbocharger speed value > 5,500 Hz (220K RPM)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Turbocharger speed sensor
- Harness or connector
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P0049 being current on the CONSULT screen.

Is DTC P0049 current?

YES >> Go to EC-276, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073452

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- P0103
- P0107
- P0108
- P012C
- P012D
- P0652
- P1192

- P1193
- P22CD
- P22CE

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR INTERMITTENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and clear past “ENGINE” diagnostic trouble codes.
3. Start the engine.
4. Using accelerator pedal, increase engine speed to 1500 rpm for at least 20 seconds.
5. Allow engine to idle.
6. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
7. Check for DTC P0049 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT TURBOCHARGER SPEED SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect turbocharger speed sensor harness connector F126.
3. Inspect the engine harness and turbocharger speed sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the turbocharger speed sensor harness connector F126.
3. Turn ignition switch ON.
4. Measure the voltage between turbocharger speed sensor harness connector F126 terminals 1 and 2.

Turbocharger speed sensor			Voltage (Approx.)
Connector	Terminal	Terminal	
F126	1	2	4.75V - 5.25V

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 6.

5.CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the turbocharger speed sensor harness connector F126.
4. Measure the resistance between the ECM harness connector F101 terminal 188 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	188	F101	All	> 100k Ω

Is the inspection result normal?

YES >> Replace turbocharger speed sensor. Refer to EM-399, "Removal and Installation".
NO >> Repair or replace the harness for a short.

6. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between ECM harness connector F101 terminals 106 and 127.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	106	127	4.75V -5.25V

Is the inspection result normal?

YES >> Repair or replace the harness for an open.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P004E TC BOOST CONTROL CIRCUIT INTERMITTENT

DTC Description

INFOID:0000000013073837

The dual stage turbocharger is electronically activated by the Rotary Turbine Control (RTC) actuator. The actuator is powered by the battery via the smart power relay. The RTC actuator is a smart device and receives information by the CAN 2 communication lines from the engine control module (ECM). The RTC actuator performs its own diagnostics and reports malfunctions back to the ECM, using the CAN 2 communication lines. The ECM then decodes the error message and converts it to a DTC.

DTC DETECTION LOGIC

The internal temperature of the Rotary Turbine Control (RTC) actuator exceeded 125°C (257°F) for a period of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P004E	(Turbocharger/Supercharger Boost Control Solenoid "A" Circuit Intermittent/Erratic)	Diagnosis condition	Ignition switch is ON or engine running.
		Signal (terminal)	(–)
		Threshold	Turbocharger bypass valve smart device has detected a warm temperature condition.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Rotary turbine control valve actuator
- Exhaust leak near turbocharger actuator
- Restricted air flow around turbocharger actuator

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P004E being current on the CONSULT screen.

Is DTC P004E current?

YES >> Go to EC-279, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073838

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P004E being current or more than 2 past counts on the CONSULT screen.

Is DTC P004E detected as current or more than 2 past counts?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT ROTARY TURBINE CONTROL VALVE ACTUATOR MOUNTING

1. Turn ignition switch OFF.
2. Check that rotary turbine control valve actuator is properly installed.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Relocate and/or secure the rotary turbine control valve actuator at the correct mounting location.

3. INSPECT AIR FLOW TO ROTARY TURBINE CONTROL VALVE ACTUATOR

1. Turn ignition switch OFF.
2. Check rotary turbine control valve actuator mounting for air flow restrictions or blockage that could cause the temperature sensor module to overheat such as:

- Debris on or around the actuator.
- Exhaust leaks allowing exhaust to overheat the actuator.

Is the inspection result normal?

YES >> Repair the cause of the restricted air flow.
NO >> Replace the rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".

P007B CHARGE AIR COOLER TEMPERATURE SENSOR

DTC Description

INFOID:0000000013073839

The ECM supplies 5V to the engine charge air cooler outlet pressure/temperature sensor signal circuit, and monitors the change in voltage caused by changes in the resistance of the sensor to determine the charge air cooler outlet temperature. When the intake air is cold, the sensor (or thermistor) resistance is high. The ECM signal voltage only pulls down a small amount through the sensor to a ground. Therefore, the ECM senses a high signal voltage or low temperature. When the intake air is warm, the sensor resistance is low. The signal voltage pulls down a large amount. Therefore, the ECM senses a low signal voltage, or a high temperature.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the engine charge air cooler outlet pressure/temperature sensor reading was higher or lower than estimated during engine running or after an 8 hour cold soak.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P007B	(Charge Air Cooler Temperature Sensor Circuit Range/Performance)	1	Diagnosis condition	Engine running.
			Signal (terminal)	(–)
			Threshold	Cumulative sum of error in 30 seconds is > 18,000°C, which is ≥ 24°C. Where tolerance is defined as 0°C.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	• 8 hour cold soak • Engine running.
			Signal (terminal)	(–)
			Threshold	Engine charge air cooler outlet pressure/temperature sensor is 13°C > then the tolerance of the second most accurate sensor of the remaining sensors
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Engine charge air cooler outlet pressure/temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF for 8 hours.
2. After an 8 hour cold soak, start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P007B being current on the CONSULT screen.

Is DTC P007B current?

YES >> Go to EC-281, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073840

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P007B being current on the CONSULT screen.

Is DTC P007B detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- P007C
- P007D
- Any turbocharger DTCs
- P0236
- P0237
- P0238
- P1191
- P1192
- P1193
- P22CB
- P22CC
- P22CD
- P22CE

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK CHARGE AIR COOLER OUTLET TEMPERATURE SENSOR

1. Turn ignition switch ON.
2. Connect CONSULT and select “Data Monitor” mode.
3. Select “CHARGE AIR COOLER OUTLET TEMPERATURE SENSOR” and check the indication.
4. Compare engine charge air cooler outlet pressure/temperature sensor reading to ambient air temperature.

Monitor item	Condition	Indication
CHARGE AIR COOLER OUTLET TEMPERATURE SENSOR	Ignition switch ON (Engine stopped.)	Within 5.6C (10F) of ambient air temperature

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".

4.INSPECT CHARGE AIR COOLER

Inspect the charge-air cooler:
- Inspect the charge-air cooler for cracks, holes, and other damage.
- Inspect the tubes, fins, and welds for tears, breaks, or other damage.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace charge air cooler. Refer to EM-248, "Removal and Installation".

5.INSPECT ENGINE CHARGE AIR COOLER OUTLET PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect engine charge air cooler outlet pressure/temperature sensor harness connector F140.
3. Inspect the harness connector and engine charge air cooler outlet pressure/temperature sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector

- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect engine charge air cooler outlet pressure/temperature sensor harness connector F140.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007D DTC become current?

YES >> GO TO 7.
NO >> GO TO 8.

7.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between engine charge air cooler pressure/temperature sensor harness connector F140 terminal 3 and 4.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007C DTC become current?

YES >> Replace engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".
NO >> GO TO 8.

8.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace error-detected parts.

9.CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007D DTC become current?

YES >> GO TO 10.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

10.CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.

3. Connect a jumper wire between ECM harness connector F101 terminal 110 and 127.
4. Turn ignition switch ON.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007C DTC become current?

YES >> Repair or replace engine harness.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P007C CHARGE AIR COOLER TEMPERATURE SENSOR

DTC Description

INFOID:0000000013065614

The ECM supplies 5V to the engine charge air cooler outlet pressure/temperature signal circuit, and monitors the change in voltage caused by changes in the resistance of the sensor to determine the charge air cooler outlet temperature. When the intake air is cold, the sensor (or thermistor) resistance is high. The ECM signal voltage only pulls down a small amount through the sensor to a ground. Therefore, the ECM senses a high signal voltage or low temperature. When the intake air is warm, the sensor resistance is low. The signal voltage pulls down a large amount. Therefore, the ECM senses a low signal voltage, or a high temperature.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the engine charge air cooler outlet pressure/temperature signal voltage was out of range low.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P007C	(Charge Air Cooler Temperature Sensor Circuit Low)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	Charge air cooler outlet temperature sensor voltage < 0.057V (> 130°C)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Engine charge air cooler outlet pressure/temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P007C being current on the CONSULT screen.

Is DTC P007C current?

YES >> Go to EC-285, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065615

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P007C being current on the CONSULT screen.

Is DTC P007C detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT ENGINE CHARGE AIR COOLER OUTLET PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect engine charge air cooler outlet pressure/temperature sensor harness connector F140.
3. Inspect the harness connector and engine charge air cooler outlet pressure/temperature sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins

- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect engine charge air cooler outlet pressure/temperature sensor harness connector F140.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007D DTC become current and P007C become past?

YES >> GO TO 4.
NO >> GO TO 5.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect engine charge air cooler outlet pressure/temperature sensor harness connector F140.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007C DTC become current?

YES >> Replace engine charge air cooler outlet pressure/temperature sensor. Refer to EM-449, "Removal and Installation".
NO >> The removal and installation of the connector corrected the fault.

5. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007D DTC become current and P007C become past?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.

2. Disconnect the ECM harness connector F101.
3. Disconnect the engine charge air cooler outlet pressure/temperature sensor harness connector F140.
4. Measure the resistance between the ECM harness connector terminal 110 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	110	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 8.
NO >> Repair or replace the engine harness for a short.

8. CHECK FOR A PIN-TO-GROUND SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the engine charge air cooler outlet pressure/temperature sensor harness connector F140.
4. Measure the resistance between the ECM harness connector F101 terminal 110 and ground.

ECM		Ground	Resistance
Connector	Terminal		
F101	110	—	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for a short to ground.

9. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007C DTC become current?

YES >> Troubleshooting procedures need to be repeated from the beginning. A failure mode should have been be detected.
NO >> The removal and installation of the connector corrected the fault.

P007D CHARGE AIR COOLER TEMPERATURE SENSOR

DTC Description

INFOID:0000000013065610

The ECM supplies 5V to the engine charge air cooler outlet pressure/temperature sensor signal circuit, and monitors the change in voltage caused by changes in the resistance of the sensor to determine the engine charge air cooler outlet pressure/temperature sensor. When the intake air is cold, the sensor (or thermistor) resistance is high. The ECM signal voltage only pulls down a small amount through the sensor to a ground. Therefore, the ECM senses a high signal voltage or low temperature. When the intake air is warm, the sensor resistance is low. The signal voltage pulls down a large amount. Therefore, the ECM senses a low signal voltage, or a high temperature.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the engine charge air cooler outlet pressure/temperature sensor signal was greater than 4.7V for more than 10 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P007D	(Charge Air Cooler Temperature Sensor Circuit High)	Diagnosis condition	Ignition switch ON or engine running.
		Signal (terminal)	(-)
		Threshold	Charge air cooler outlet temperature sensor value > 4.737V (< -40°C).
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Engine charge air cooler outlet pressure/temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P007D being current on the CONSULT screen.

Is DTC P007D current?

YES >> Go to EC-288, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065611

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P007D being current on the CONSULT screen.

Is DTC P007D detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT ENGINE CHARGE AIR COOLER OUTLET PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect engine charge air cooler outlet pressure/temperature sensor harness connector F140.
3. Inspect the harness connector and engine charge air cooler outlet pressure/temperature sensor pins for the following:

- Loose connector
- Corroded pins

- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect charge air cooler outlet temperature sensor harness connector F140.
3. Connect a jumper wire between engine charge air cooler pressure/temperature sensor harness connector F140 terminal 3 and 4.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007C DTC become current and P007D become past?

YES >> Replace the engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".
NO >> GO TO 4.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect engine charge air cooler outlet pressure/temperature sensor harness connector F140.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007D DTC become current?

YES >> GO TO 5.
NO >> The removal and installation of the connector corrected the fault.

5. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between ECM harness connector F101 terminal 110 and 127.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007C DTC become current and P007D become past?

YES >> GO TO 7.

NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7. CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the engine charge air cooler outlet pressure/temperature harness connector F140.
4. Measure the resistance between the ECM harness connector and the engine charge air cooler outlet pressure/temperature sensor harness connector.

ECM		Engine charge air cooler outlet pressure/temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	127	F140	4	< 10 Ω
	110		3	

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the engine harness for an open.

8. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the engine charge air cooler outlet pressure/temperature sensor harness connector F140.
4. Measure the resistance between the ECM harness connector terminal 110 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	110	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for a short.

9. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P007D DTC become past?

YES >> The removal and installation of the connector corrected the fault.
NO >> Troubleshooting procedures need to be repeated from the beginning. A failure mode should have been be detected.

P0087 FUEL RAIL PRESSURE TOO LOW

DTC Description

INFOID:0000000013073210

The engine control module (ECM) provides a 5V supply and ground to the fuel rail pressure sensor using a dedicated sensor supply circuit. The pressure sensor delivers a fuel pressure signal to the ECM of the fuel rail. During engine operating conditions, the ECM commands and monitors the fuel rail pressure. If the fuel rail pressure exceeds or falls below commanded pressure, a DTC will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the measured fuel rail pressure is below the commanded fuel rail pressure by at least 200 bar (2900 psi) for 10 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0087	LOW FUEL PRES (Fuel Rail/System Pressure - Too Low)	Diagnosis condition	Engine running
		Signal (terminal)	(-)
		Threshold	• Commanded fuel rail pressure - actual fuel rail pressure > reftable10 bar. • High pressure pump delivery volume set point ≥ 0 m3/sec.
		Diagnosis delay time	10 seconds

POSSIBLE CAUSE

- Fuel lift pump
- Air in fuel
- Leaking fuel rail pressure relief valve
- High-pressure fuel pump
- Fuel injector

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0087 being current on the CONSULT screen.

Is DTC P0087 current?

YES >> Proceed to EC-291, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073211

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for current injector DTCs.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have high past counts on the CONSULT screen:

- P008A
- P008A
- P009C
- P009D
- P0191
- P0192
- P0193
- P0252
- P0253
- P0254
- P0687
- P0686
- P2540

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK FOR LEAKS IN THE HIGH-PRESSURE FUEL SYSTEM

1. Turn ignition switch OFF.
2. Start and idle the engine.
3. Using CONSULT, perform High-Pressure Fuel System Leakage test.
4. Wait 1 minute after test is performed and check the following for leaks or moisture.

- Fuel rail supply line
- Fuel rail to fuel rail supply line
- Injector supply lines

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THE FUEL PUMP ACTUATOR AND PRESSURE RELIEF VALVE

1. Turn ignition switch ON.
2. Using CONSULT, perform High-Pressure Fuel System Actuator Override test.

Are actuators within specifications?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK INJECTOR RETURN FLOW

1. Turn ignition switch ON.
2. Start and idle the engine.
3. Using CONSULT, perform High-Pressure Fuel Injector Return Flow test.
4. Wait 1 minute after test is performed and check the following for leaks or moisture.

- Fuel rail supply line
- Fuel rail to fuel rail supply line
- Injector supply lines

Is injector return flow within specifications?

YES >> Inspection End.
NO >> Replace applicable fuel injectors. Refer to EM-427, "Exploded View".

P0088 FUEL RAIL PRESSURE TOO HIGH

DTC Description

INFOID:0000000013073127

The engine control module (ECM) provides a 5V supply and ground to the fuel rail pressure sensor using a dedicated sensor supply circuit. The pressure sensor delivers a fuel pressure signal to the ECM of the fuel rail. During engine operating conditions, the ECM commands and monitors the fuel rail pressure. If the fuel rail pressure exceeds or falls below commanded pressure, a DTC will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fuel rail pressure is greater than the commanded fuel rail pressure by 200 bar (2900 psi); or fuel rail pressure exceeded 2150 bar (31,500 psi).

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0088	HIGH_FUEL_PRES (Fuel Rail/System Pressure - Too High)	Diagnosis condition	Engine running
		Signal (terminal)	(-)
		Threshold	• Commanded fuel rail pressure - actual fuel rail pressure < reftable9 bar. • High pressure pump delivery volume set point ≤ 0 m3/sec. OR • Commanded fuel rail pressure - actual fuel rail pressure < -200 bar. • Pressure control valve (PCV) set point value < 10 bar.
		Diagnosis delay time	This diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Fuel pump actuator
- Fuel rail pressure relief valve

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0088 being current on the CONSULT screen.

Is DTC P0088 current?

YES >> Proceed to EC-293, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073128

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have high past counts on the CONSULT screen.

- P009C

- P009D
- P009E
- P0191
- P0252
- P0253
- P0254
- P0628
- P0629
- P2540

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK THE LIFT PUMP

1. Turn ignition switch ON.
2. Connect CONSULT and select “Data Monitor” mode.
3. Select “FUEL SUPPLY PRESSURE” and check the indication within 30 seconds.
4. Check fuel supply pressure in Freeze Frame Data.

Monitor item	Condition	Indication
FUEL SUPPLY PRESSURE	Ignition switch ON (Engine stopped.)	> 7 bar (102 psi)

Is the inspection result normal?

YES >> Replace lift pump. Refer to FL-43, "Removal and Installation".
NO >> GO TO 3.

3.CHECK THE FUEL PUMP ACTUATOR AND PRESSURE RELIEF VALVE

1. Turn ignition switch ON.
2. Using CONSULT, perform High-Pressure Fuel System Actuator Override test.

Are actuators within specifications?

YES >> GO TO 4.
NO >> Repair or replace error detected parts. Refer to EM-476, "Removal and Installation" or EM-474, "Removal and Installation".

4.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0088 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P008A LOW FUEL PRESSURE CONTROL SYSTEM

DTC Description

INFOID:0000000013067748

The engine control module (ECM) provides a 5V supply and ground to the fuel pressure sensor on the sensor supply circuit. The Fuel pressure sensor provides a signal to the ECM on the fuel pressure sensor signal circuit. This sensor monitors the fuel pressure from the low fuel pressure system (lift pump to the stage 2 filter).

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the measured fuel pressure is less than 4.5 bar (66 psi).

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P008A	(Low Pressure Fuel System Pressure - Too Low)	Diagnosis condition	Engine running
		Signal (terminal)	(-)
		Threshold	A severity value of fuel pump inlet pressure minus 4.5 bar interpolated from reftable31. The accumulated severity reaches 500 secs.
		Diagnosis delay time	This diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Fuel pump
- Leak between lift pump and stage 2 filter
- Fuel filter

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
6. Check for DTC P008A being current on the CONSULT screen.

Is DTC P008A current?

YES >> Proceed to EC-295, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013067749

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have high past counts on the CONSULT screen.

- P00C6
- P0461
- P0462
- P0463
- P0562
- P0563
- P0628
- P0629
- P2540
- P2541
- P2542

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.VERIFY FUEL LEVEL

1. Turn ignition switch ON.
2. Turn ignition switch OFF.
3. Verify there is fuel in the tank.
   NOTE:
   Do not rely on the fuel gauge. Check the actual tank level.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Add fuel to the tank.

3.CHECK THE LIFT PUMP VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect the lift pump harness connector F226.
3. Turn ignition switch ON.
4. Measure the voltage between lift pump harness connector F226 terminals 1 and 2, while cranking the engine.

Lift pump			Condition	Voltage (Approx.)
Connector	Terminal			
F226	1	2	Engine cranking	> 8V

Is inspection result normal?

YES >> GO TO 4.
NO >> Check lift pump relay and lift pump harness. Repair or replace if necessary.

4.CHECK THE FUEL FILTERS

Check fuel filters for restriction.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace stage 1 and 2 fuel filters. Refer to FL-39, "Removal and Installation" and FL-41, "Removal and Installation".

5.CHECK FOR AIR IN THE FUEL

Check for air in the fuel system.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Remove air from the fuel system. Repair or replace error-detected parts.

6.CHECK FOR FUEL INLET RESTRICTION

1. Check the fuel lines to the tank for proper size, leaks, bends, or clogs.
2. Check the fuel tank vents for plugging.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7.INSPECT FUEL SUPPLY LINES

Check suction and pressure side fuel supply lines for leaks or damage.

Is the inspection result normal?

YES >> Replace the lift pump. Refer to FL-43, "Removal and Installation".
NO >> Replace fuel supply line.

P009C FUEL PRESSURE RELIEF CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013065612

The circuit is a pulse-width modulation (PWM) driver in the engine control module (ECM) that controls the high pressure common rail fuel pressure relief valve. The high pressure common rail fuel pressure relief valve is grounded in the ECM. The high pressure common rail fuel pressure relief valve is normally open. The PWM duty cycle to the high pressure common rail fuel pressure relief valve depends on the difference between desired rail pressure and sensed rail pressure.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a short circuit to ground in the High Pressure Common Rail Fuel Pressure Relief Valve circuit signal or return circuit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P009C	(Fuel Pressure Relief Control Circuit Low)	Diagnosis condition	• Ignition is turned ON and before engine speed is detected. • Ignition OFF. The DTC will be active at the next ignition ON event.
		Signal (terminal)	(–)
		Threshold	PCV driver voltage < 3V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel pressure relief valve
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P009C being current on the CONSULT screen.

Is DTC P009C current?

YES >> Go to EC-297, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065613

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P009C being current on the CONSULT screen.

Is DTC P009C detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL PRESSURE RELIEF VALVE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel pressure relief valve harness connector F122.
3. Inspect the harness connector and fuel pressure relief valve pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins

- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between fuel pressure relief harness connector F122 terminal 2 and ground.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P009D DTC become current and P009C become past?

YES >> GO TO 4.
NO >> GO TO 5.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect fuel pressure relief valve harness connector F122.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P009C DTC become current?

YES >> Replace fuel pressure relief valve. Refer to EM-449, "Removal and Installation".
NO >> The removal and installation of the connector corrected the fault.

5. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between ECM harness connector F101 terminal 97 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P009D DTC become current and P009C become past?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.

2. Disconnect the ECM harness connector F101.
3. Disconnect the fuel pressure relief valve harness connector F122.
4. Measure the resistance between the ECM harness connector terminal 97 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	97	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 8.
NO >> Repair or replace the engine harness for a short.

8. CHECK FOR A PIN-TO-GROUND SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the fuel pressure relief valve harness connector F122.
4. Measure the resistance between the ECM harness connector F101 terminal 97 and ground.

ECM		Ground	Resistance
Connector	Terminal		
F101	97	—	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for a short to ground.

9. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P009C DTC become current?

YES >> Troubleshooting procedures need to be repeated from the beginning. A failure mode should have been be detected.
NO >> The removal and installation of the connector corrected the fault.

P009D FUEL PRESSURE RELIEF CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013065606

The circuit is a pulse-width modulation (PWM) driver in the engine control module (ECM) that controls the high pressure common rail fuel pressure relief valve. The high pressure common rail fuel pressure relief valve is grounded in the ECM. The high pressure common rail fuel pressure relief valve is normally open. The PWM duty cycle to the high pressure common rail fuel pressure relief valve depends on the difference between desired rail pressure and sensed rail pressure.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a short to battery, short pin-to-pin, or open circuit in the high pressure common rail fuel pressure relief valve circuit.

DTC	CONSULT screen terms (Trouble diagnosis content)		DTC detection condition	
P009D	(Fuel Pressure Relief Control Circuit High)	1	Diagnosis condition	Engine running.
			Signal (terminal)	(-)
			Threshold	PCV driver voltage < 245V
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Engine running.
			Signal (terminal)	(-)
			Threshold	PCV driver current > 10A
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel pressure relief valve
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P009D being current on the CONSULT screen.

Is DTC P009D current?

YES >> Go to EC-300, "DTC Description".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065607

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have high past counts on the CONSULT screen:

- P0563
- P0687
- P2503
- P2504

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P009D being current on the CONSULT screen.

Is DTC P009D detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT FUEL PRESSURE RELIEF VALVE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel pressure relief valve harness connector F122.
3. Inspect the harness connector and fuel pressure relief valve pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fuel pressure relief valve harness connector F122.
3. Start engine and idle for 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P009C DTC become current and P009D become past?

YES >> GO TO 5.
NO >> GO TO 6.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect fuel pressure relief valve harness connector F122.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P009D DTC become current?

YES >> Replace fuel pressure relief valve. Refer to EM-449, "Removal and Installation".
NO >> The removal and installation of the connector corrected the fault.

6.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P009D DTC become current and P009C become past?

YES >> GO TO 8.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

8. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the fuel pressure relief valve harness connector F122.
4. Measure the resistance between the ECM harness connector terminal 97 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	97	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for a short.

9. CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the fuel pressure relief valve harness connector F122.
4. Measure the resistance between the ECM harness connector F101 terminal 97 and the fuel pressure relief valve harness connector F122 terminal 2.

ECM		Fuel pressure relief valve		Resistance
Connector	Terminal	Connector	Terminal	
F101	97	F122	2	< 10 Ω

Is resistance less than 10 ohms?

YES >> GO TO 10.
NO >> Repair or replace the engine harness for an open.

10. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect all components.
3. Start the engine and idle for 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P009D DTC become current?

YES >> Troubleshooting procedures need to be repeated from the beginning. A failure mode should have been be detected.
NO >> The removal and installation of the connector corrected the fault.

P009E FUEL PRESSURE RELIEF CONTROL PERFORMANCE

DTC Description

INFOID:0000000013073512

The circuit is a pulse-width modulation (PWM) driver in the engine control module (ECM) that controls the high pressure common rail fuel pressure relief valve. The high pressure common rail fuel pressure relief valve is grounded in the ECM. The high pressure common rail fuel pressure relief valve is normally open. The PWM duty cycle to the high pressure common rail fuel pressure relief valve depends on the difference between desired rail pressure and sensed rail pressure.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected the fuel pressure relief valve closed-loop compensation value is outside of calibrated limits.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P009E	(Fuel Pressure Relief Control Performance/Stuck Off)	1	Diagnosis condition	Engine is running.
			Signal (terminal)	(-)
			Threshold	PCV Adaptation factor ≥ 1.3
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Engine is running.
			Signal (terminal)	(-)
			Threshold	PCV Adaptation factor ≤ 0.7
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel filter
- Fuel pump actuator
- Fuel pressure sensor
- Fuel pressure relief valve
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:

- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is DTC P009E current?

YES >> Go to EC-303, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073513

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have high past counts on the CONSULT screen:

- P009C
- P009D
- P0191
- P0192
- P0193
- P0252
- P0253
- P0254
- P0257
- P0686
- P0687
- P2540

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. INSPECT SMART POWER RELAY CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel rail pressure sensor harness connector F139.
3. Inspect the engine harness and fuel rail sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE FUEL FILTERS

1. Turn ignition switch OFF.
2. Check for fuel filter restriction.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace stage 1 and 2 fuel filters. Refer to FL-39, "Removal and Installation" and FL-41, "Removal and Installation".

4. CHECK THE FUEL PUMP ACTUATOR AND PRESSURE RELIEF VALVE

1. Turn ignition switch ON.
2. Using CONSULT, perform High-Pressure Fuel System Actuator Override test.

Are actuators within specifications?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. INSPECT FUEL RAIL PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel rail pressure sensor harness connector F139.
3. Inspect the engine harness and fuel rail sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins

- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fuel rail pressure sensor harness connector F139.
3. Start engine and idle for 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0193 current?

YES >> GO TO 7.
NO >> GO TO 8.

7. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between fuel rail pressure sensor harness connector F139 terminal 1 and 2.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0192 current?

YES >> Replace the fuel rail pressure sensor. Refer to EM-449, "Removal and Installation".
NO >> GO TO 8.

8. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace error-detected parts.

9. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0193 current?

YES >> GO TO 10.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

10. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between ECM harness connector F101 terminal 128 and 171.
3. Turn ignition switch ON and wait 30 seconds.

4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0192 current?

YES >> Repair or replace the engine harness.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P00AF BOOST PRESSURE CONTROL

DTC Description

INFOID:0000000013073816

The dual stage turbocharger is electronically activated by the Rotary Turbine Control (RTC) actuator. The actuator is powered by the battery via the smart power relay. The RTC actuator is a smart device and receives information by the CAN 2 communication lines from the primary engine control module (ECM). The RTC actuator performs its own diagnostics and reports malfunctions back to the primary engine ECM, using the CAN 2 communication lines. The ECM then decodes the error message and converts it to a DTC.

DTC DETECTION LOGIC

The Rotary Turbine Control (RTC) actuator detected an internal error.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P00AF	(Turbocharger/Supercharger Boost Control “A” Module Performance)	Diagnosis condition	Ignition switch is ON.
		Signal (terminal)	(–)
		Threshold	Turbocharger bypass valve smart device has detected an internal error which will prevent it from functioning normally.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Rotary turbine control valve actuator

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P00AF being current on the CONSULT screen.

Is DTC P00AF current?

YES >> Go to EC-307, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073817

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P00AF being current on the CONSULT screen.

Is DTC P00AF detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.

3. Check for DTC U010C or P0687 being current on the CONSULT screen.

Is applicable DTC detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. INSPECT ROTARY TURBINE CONTROL VALVE ACTUATOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect rotary turbine control valve actuator harness connector F146.
3. Inspect the harness connector and rotary turbine control valve actuator pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> Replace the rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation". GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR PROGRESSIVE DAMAGE TO AFTERTREATMENT SYSTEM

Perform the aftertreatment initial check procedure to test for a damaged DPF

Is the inspection result normal?

YES >> Check for active aftertreatment-related DTCs. Refer to EC-135, "DTC Index".
NO >> Replace the damaged aftertreatment component.

P00C6 FUEL RAIL PRESSURE

DTC Description

INFOID:0000000013065698

The engine control module (ECM) provides a 5V supply and ground to the fuel rail pressure sensor using a dedicated sensor supply circuit. The pressure sensor delivers a fuel pressure signal to the ECM of the fuel rail. During engine operating conditions, the ECM commands and monitors the fuel rail pressure. If the fuel rail pressure exceeds or falls below commanded pressure, a fault will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fuel rail pressure was less than 120 bar (1740 psi) while cranking.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P00C6	(Fuel Rail Pressure Too Low - Engine Cranking Bank 1)	Diagnosis condition	During engine start
		Signal (terminal)	(-)
		Threshold	Fuel rail pressure was less than 120 bar (1740 psi) while cranking
		Diagnosis delay time	This diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Fuel lift pump
- Fuel rail pressure sensor
- High-pressure fuel pump
- Leaking fuel rail pressure relief valve

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P00C6 being current on the CONSULT screen.

Is DTC P00C6 current?

YES >> Proceed to EC-309, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065699

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for current injector DTCs.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have high past counts on the CONSULT screen:

- P008A
- P0088
- P009C
- P009D
- P009E

- P0191
- P0192
- P0193
- P0252
- P0253
- P0254
- P0686
- P0687
- P2540

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. CHECK HIGH-PRESSURE FUEL SYSTEM

1. Turn ignition switch ON and wait 30 seconds for lift pump to prime.
2. Check to see if engine starts.

NOTE:
It can be necessary to crank the engine for 30 seconds to prime the fuel system.

Is the inspection result normal?

YES >> Inspection End.
NO >> GO TO 4.

4. CHECK FOR LEAKS IN THE HIGH-PRESSURE FUEL SYSTEM

1. Turn ignition switch OFF.
2. Start and idle the engine.
3. Using CONSULT, perform High-Pressure Fuel System Leakage test.
4. Wait 1 minute after test is performed and check the following for leaks or moisture.

- Fuel rail supply line
- Fuel rail to fuel rail supply line
- Injector supply lines

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK THE FUEL PUMP ACTUATOR AND PRESSURE RELIEF VALVE

1. Turn ignition switch ON.
2. Using CONSULT, perform High-Pressure Fuel System Actuator Override test.

Are actuators within specifications?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK INJECTOR RETURN FLOW

1. Turn ignition switch ON.
2. Start and idle the engine.
3. Using CONSULT, perform High-Pressure Fuel Injector Return Flow test.
4. Wait 1 minute after test is performed and check the following for leaks or moisture.

- Fuel rail supply line
- Fuel rail to fuel rail supply line
- Injector supply lines

Is injector return flow within specifications?

YES >> Inspection End.
NO >> Replace applicable fuel injectors. Refer to EM-427, "Exploded View".

P0101 MAF SENSOR

DTC Description

INFOID:0000000013024798

NOTE:
If DTC P0101 is displayed with other DTC, first perform the trouble diagnosis for other DTC.

The Mass Air Flow sensor is a frequency based device. A constant voltage is applied to a heated wire. The wire is positioned in the air stream and is heated by the electrical current that the voltage produces. As air flows across it, it cools down. The heated wire or film is a positive temperature coefficient (PTC) resistor. This means that the resistance drops when the temperature drops. The drop in resistance allows more current to flow through it in order to maintain the programmed temperature. This current is changed to a frequency which is sent to the ECM and interpreted as air flow. Adjustments to air temperature and humidity are taken into consideration since they also affect the temperature of the heated wire or film. The Mass Air Flow sensor receives a 12V power supply from the ECM.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Mass Air Flow sensor is at least 20% more than estimated:

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0101	MASS AIR FLOW (Mass or volume air flow “A” circuit range/performance)	1	Diagnosis condition	ECM detected MAF is 20% more than estimated
			Signal (terminal)	Voltage signal transmitted from MAF sensor to ECM
			Threshold	A high voltage (≥1.2 V) from the sensor is sent to ECM under light load driving condition
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	ECM detected MAF is 20% more than estimated
			Signal (terminal)	Voltage signal transmitted from MAF sensor to ECM
			Threshold	A low voltage (≤ 0.8 V from the sensor is sent to ECM under heavy load driving condition
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- MAF sensor
- Plugged air filter
- Leaks in the charge air system plumbing
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-312, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024799

1.CHECK FUEL SYSTEM DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing ENGINE diagnostic trouble codes.
3. If any fuel system or fuel injector related DTC exists, perform the confirmation procedure (diagnosis procedure) for other DTC:

- Fuel system related DTC
- Fuel injector related DTC

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK AIR FLOW DTC PRIORITY

1. Using CONSULT, check for other existing ENGINE diagnostic trouble codes.
2. If any air injection related DTC exists, perform the confirmation procedure (diagnosis procedure) for other DTC:

- NOx sensor related DTC
- EGR related DTC
- EGR bypass related DTC
- Turbocharger related DTC

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK FOR ANOTHER RELATED DTC

Check for a current DTC P221A on the CONSULT screen.

Is applicable DTC current?

YES >> Refer to EC-1057, "DTC Description"
NO >> GO TO 4.

4.CHECK MASS AIR FLOW SENSOR

Check mass air flow sensor. Refer to EC-314, "Component Inspection".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace mass air flow sensor. Refer to EM-216, "Exploded View".

5.INSPECT MASS AIR FLOW SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor from engine harness connector.
3. Remove the mass air flow sensor from its mounting location.
4. Inspect the mass air flow sensor body and heated wire measuring components for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK AIR INTAKE SYSTEM

1. Reinstall mass air flow sensor.
2. Check for an air intake leak between the air box and the intake manifold.

- Check all clamps and connectors for tightness.
- Check for disconnected or damaged air pipes.
- Perform a pressurized leak test of the system, if possible.

Was any leak found in the air intake system?

YES >> Repair or replace leaking component(s).
NO >> GO TO 7.

7.CHECK AIR FILTER CONDITION

Check the intake air filter for excessive buildup and restriction.
- Check the filter restriction monitor gauge, if equipped.
- Remove filter, if necessary, and inspect for excessive debris buildup or filter media damage.
- Insure the air filter was installed properly.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.PERFORM FUEL SYSTEM DIAGNOSTIC TEST

1. Turn ignition switch ON.
2. Using SST J-54421, perform the high pressure fuel injector drain flow test on bank 1, then on bank 2.
   NOTE:
   The purpose of this test is to check for excessive fuel drain from each injector, one bank at a time.

- Disconnect the fuel drain lines from the bank of injectors being tested.
- Plug injector drain lines with the plug provided in the kit.
- Connect the piezo adapter line drain tool connection to each of the injectors.
- Start the engine until top mark is reached or crank for 30 seconds if the engine does not start.
- The maximum permissible drain is 3 times the lowest measured drain quantity.
- A failed injector will have a higher flow and exhibits 3 times the lowest measured drain quantity.

Filling quantity up to:	Engine cranks but does not start (small diameter)		Engine starts (large diameter)	
	ml	oz	ml	oz
1	1.8	0.06	6	0.2
2	2.4	0.08	13	0.44
3	3.2	0.11	21	0.71
4	4	0.14	29	0.98
5	—	—	37	1.25
6	—	—	45	1.52
7	—	—	53	1.79

Does each fuel injector meet the specification in injector drain flow test?

YES >> • Replace mass air flow sensor. Refer to EM-216, "Removal and Installation".
• GO TO 9.
NO >> • Replace the leaking fuel injector. Refer to EM-427, "Exploded View".
• GO TO 9.

9.ERASE DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, select ENGINE and erase DTCs.
5. Operate the engine within the "Conditions for Clearing the DTC".

Is P0101 DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-311, "DTC Description".
NO >> Repair complete.

Component Inspection

INFOID:0000000013055634

1. CHECK MASS AIR FLOW SENSOR

With CONSULT

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Start engine and warm it up to normal operating temperature.
4. Connect CONSULT and select “DATA MONITOR” mode.
5. Select “MASS AIR FLOW SENSOR” and check the indication.

Monitor item	Condition	Indication (V)
MASS AIR FLOW SENSOR	Ignition switch ON (Engine stopped.)	-2 lb/min(-120 lb/hr) to 2 lb/min(120 lb/hr)

Without CONSULT

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Start engine and warm it up to normal operating temperature.
4. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
F101	187	127	Ignition switch ON (Engine stopped.)	Less than 0.8V

Is the inspection result normal?

YES >> Inspection End.

NO >> Clean or replace malfunctioning mass air flow sensor. Refer to EM-216, "Removal and Installation".

P0102 MASS AIR FLOW SENSOR

DTC Description

INFOID:0000000013062085

NOTE:
If DTC P0102 is displayed with other DTC, first perform the trouble diagnosis for other DTC.

The Mass Air Flow sensor is a frequency based device. A constant voltage is applied to a heated wire. The wire is positioned in the air stream and is heated by the electrical current that the voltage produces. As air flows across it, it cools down. The heated wire or film is a positive temperature coefficient (PTC) resistor. This means that the resistance drops when the temperature drops. The drop in resistance allows more current to flow through it in order to maintain the programmed temperature. This current is changed to a frequency which is sent to the ECM and interpreted as air flow. Adjustments to air temperature and humidity are taken into consideration since they also affect the temperature of the heated wire or film. The Mass Air Flow sensor receives a 12 volt power supply from the ECM.

DTC DETECTION LOGIC

The Mass Air Flow sensor reading is less than the specified operating range for a calibrated amount of time:

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0102	MASS AIR FLOW (Mass or volume air flow “A” circuit range/performance)	Diagnosis condition	ECM detected MAF sensor signal was shorted to ground for a period of time
		Signal (terminal)	Voltage signal transmitted from MAF sensor to ECM
		Threshold	MAF sensor value < 1,000 Hz (> 27.5 kg/min)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- MAF sensor
- Harness and connectors
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0102 being current on the CONSULT screen.

Is DTC P0102 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013062086

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0102 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FOR CURRENT DTC RELATED TO SENSOR VOLTAGE SUPPLY

Using CONSULT, check for other ″current″ ENGINE diagnostic trouble codes.

Is DTC P262D detected?

YES >> Refer to EC-1228, "DTC Description".
NO >> GO TO 3.

3. CHECK MASS AIR FLOW SENSOR

1. Inspect the intake and exhaust systems for blockage or restrictions
- Inspect the air filter for excessive dirt, soiling or other problems that can cause restricted air flow
- Inspect the charge-air cooler hoses/tubes and connections
- Inspect all air intake, crankcase vent and turbocharger related hoses/tubes and connections for damage, air leaks or blockage
- Check charge-air cooler restriction
2. Inspect the exhaust system for damaged components that could cause exhaust flow blockage.

Are any blockages or damages found?

YES >> Repair or replace damaged or restricted component.
NO >> GO TO 4.

4. INSPECT MASS AIR FLOW SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor from engine harness connector.
3. Remove the mass air flow sensor from its mounting location.
4. Inspect the mass air flow sensor body and heated wire for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK MASS AIR FLOW SENSOR SUPPLY VOLTAGE AT SENSOR

1. Turn ignition switch ON.
2. Check the voltage between MAF sensor supply voltage and return circuit terminals.

MAF sensor			Voltage (V) Approx.
Connector	Terminal (+)	Terminal (-)	
F104	2	3	Battery voltage

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 8.

6. CHECK MASS AIR FLOW SENSOR POWER SUPPLY FOR SHORT CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM connector F101.
3. Wait 30 seconds.
4. Measure the resistance between MAF sensor supply voltage and return circuit terminals.

MAF sensor			Resistance
Connector	Terminal	Terminal	
F104	2	3	> 100 KΩ

Is the inspection result normal?

YES >> GO TO 7.
NO >> • Repair or replace harness for a short circuit.
• GO TO 11.

7. CHECK MASS AIR FLOW SENSOR SIGNAL FOR SHORT CIRCUIT

Measure the resistance between MAF sensor signal circuit and return circuit terminals.

MAF sensor			Resistance
Connector	Terminal	Terminal	
F104	1	3	> 100 KΩ

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace harness for a short circuit.
• GO TO 11.

8. CHECK MASS AIR FLOW SENSOR SIGNAL FOR OPEN CIRCUIT

Measure the resistance of the MAF sensor signal circuit between the MAF sensor and the ECM.

MAF sensor		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F104	1	F101	187	< 10Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> • Repair or replace harness for a open circuit.
• GO TO 11.

9. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

Inspect the ECM connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 10.
NO >> • Repair or replace error-detected parts.
• GO TO 11.

10. CHECK SENSOR SUPPLY VOLTAGE AT THE ECM

1. Turn ignition switch ON.
2. With ECM connector F101 disconnected, check the voltage between MAF sensor supply voltage and return circuit pins at the ECM.

ECM			Voltage (V) Approx.
Connector	Terminal (+)	Terminal (-)	
F101	138	127	Battery voltage

Is the inspection result normal?

YES >> • Repair open circuit in harness or connectors.
• GO TO 11.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".

• GO TO 11.

11.CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON.
4. Using CONSULT, erase ENGINE diagnostic trouble codes.
5. Operate the engine within the ″Conditions for setting the DTC″.
6. Using CONSULT, check for ENGINE diagnostic trouble codes.

Is P0102 DTC detected?

YES >> Return to Diagnosis Procedure. Refer to EC-315, "DTC Description".
NO >> Repair complete.

Component Inspection

INFOID:0000000013062087

1.CHECK MASS AIR FLOW SENSOR

With CONSULT

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Start engine and warm it up to normal operating temperature.
4. Connect CONSULT and select “DATA MONITOR” mode.
5. Select “MASS AIR FLOW SENSOR” and check the indication.

Monitor item	Condition	Indication (V)
MASS AIR FLOW SENSOR	Ignition switch ON (Engine stopped.)	-2 lb/min(-120 lb/hr) to 2 lb/min(120 lb/hr)

Without CONSULT

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Start engine and warm it up to normal operating temperature.
4. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
F101	187	127	Ignition switch ON (Engine stopped.)	Less than 0.8V

Is the inspection result normal?

YES >> Inspection End.
NO >> Clean or replace malfunctioning mass air flow sensor. Refer to EM-216, "Removal and Installation".

P0103 MASS AIR FLOW SENSOR

DTC Description

INFOID:0000000013069557

The mass air flow sensor is a frequency based device. A constant voltage is applied to a heated wire. This wire is positioned in the air stream and is heated by the electrical current that the voltage produces. As air flows across it, it cools down. The heated wire or film is a positive temperature coefficient (PTC) resistor.This means that the resistance drops when the temperature drops. The drop in resistance allows more current to flow through it in order to maintain the programmed temperature. This current is changed to a frequency which is sent to the ECM and interpreted as air flow. Adjustments for air temperature and humidity are taken into consideration since they also affect the temperature of the heated wire or film. The mass air flow sensor receives a 12 volt power supply from the ECM.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the mass air flow sensor signal is shorted to battery for a period of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0103	MAF_SEN/CIRCUIT (Mass or Volume Air Flow “A” Circuit High Input)	Diagnosis condition	Engine is running.
		Signal (terminal)	Mass air flow sensor (187)
		Threshold	Mass air flow sensor value > 15,100 Hz (< 0 kg/min)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Mass air flow sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0103 being current on the CONSULT screen.

Is DTC P0103 current?

YES >> Go to EC-319, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069558

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0103 being past on the CONSULT screen.

Is DTC P0103 detected as past?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 2.

2.CHECK INTAKE AND EXHAUST SYSTEM FOR RESTRICTIONS

1. Turn ignition switch OFF.
2. Inspect the intake and exhaust systems for blockage or restrictions.:

- Inspect the air filter for excessive dirt, soiling or other problems that can cause restricted air flow.
- Corroded pins
- Inspect the charge air cooler hoses/tubes and connections.

- Inspect all air intake, crankcase vent and turbocharger related hoses/tubes and connections for damage, air leaks, or blockage.
- Check charge air cooler restriction.
- Inspect the exhaust system for damaged components that could cause exhaust flow blockage.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT MASS AIR FLOW SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor harness connector F104.
3. Inspect the engine harness and mass air flow sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the mass air flow sensor harness connector F104.
3. Turn ignition switch ON.
4. Measure the voltage between mass air flow sensor harness connector F104 terminals 2 and 3.

Mass air flow sensor			Voltage (Approx.)
Connector	Terminal	Terminal	
F104	2	3	Battery voltage

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 6.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor harness connector F104.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0102 become current and DTC P0103 become past?

YES >> Replace mass air flow sensor. Refer to EM-216, "Removal and Installation".
NO >> GO TO 8.

6. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals

- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between ECM harness connector F101 terminals 127 and 138.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	127	138	Battery voltage

Is the inspection result normal?

YES >> Repair or replace the engine harness for an open.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

8. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace error-detected parts.

9. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0102 become current and DTC P0103 become past?

YES >> Repair or replace the engine harness for an open or short to voltage.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P0106 MANIFOLD ABSOLUTE PRESSURE SENSOR

DTC Description

INFOID:0000000013073134

The charge air cooler pressure sensor is used to measure charge air pressure entering the intake manifold. This information is used by the ECM to control emissions. The charge air cooler pressure sensor provides a voltage signal to the ECM. This sensor voltage changes, based on the pressure exiting the charge air cooler. The ECM also estimates the charge air cooler pressure. If the measured pressure differs from the estimated pressure by a calibrated amount, an error is set.

DTC DETECTION LOGIC

The ECM detected the intake manifold pressure sensor was reading higher or lower than expected at ignition OFF or during normal engine operation.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0106	Manifold Absolute Pressure/Barometric Pressure Sensor Circuit Range/Performance (Engine charge air cooler outlet pressure - data erratic, intermittent or incorrect)	1	Diagnosis condition	• First part runs continuously when key is ON, or engine is running • Second part runs when key is OFF
			Signal (terminal)	—
			Threshold	Cumulative sum of error in 45 seconds is ever > 270,000 kPa, which is equivalent to ≥ 60 kPa
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	• First part runs continuously when key is ON, or engine is running • Second part runs when key is OFF
			Signal (terminal)	—
			Threshold	Maximum value of in range high error cumulative sum plus the maximum value of in range low error cumulative sum in 45 seconds is ≥ 501,000 kPa which is equivalent to ≥ 111.333 kPa
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		3	Diagnosis condition	• First part runs continuously when key is ON, or engine is running • Second part runs when key is OFF
			Signal (terminal)	—
			Threshold	Charge air pressure sensor reading < 18 kPa or charge air pressure sensor reading >144.31 kPa The tolerance of the remaining pressure sensors are: exhaust pressure sensor = 39.59 kPa and compressor inlet pressure sensor = 3.19 kPa
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Engine charge air cooler outlet pressure/temperature sensor
- Leaks in the charge air system plumbing
- Turbocharger
- Engine harness high resistance

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.

2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0106 being current on the CONSULT screen.

Is DTC P0106 current?

YES >> Go to EC-323, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073135

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTCs P0101, P0102, P0103, P0107, P0108, P0237, P0238, P1191, P1192, P1193, P2280 or P2579 being current or past (high counts) on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

Check for any turbocharger, compressor bypass valve, EGR valve or EGR bypass valve DTCs being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK DATA MONITOR

1. Check turbocharger compressor intake pressure Data Monitor item on the CONSULT screen.
2. Compare turbocharger compressor intake pressure to the local barometric pressure.

Is the reading within ± 2 kPa (0.3 psi) of local barometric pressure?

YES >> GO TO 4.
NO >> Replace the turbocharger compressor intake pressure sensor. Refer to EM-214, "Removal and Installation".

4.CHECK DATA MONITOR

Check charge air cooler outlet pressure Data Monitor item on the CONSULT screen.

Is the reading 0 ± 10.3 kPa (0 ± 1.5 psi)?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK CHARGE AIR COOLER

1. Start the engine.
2. Check the charge air cooler and connections for air leaks.

- Check for air leaks in connections and hoses between the turbocharger outlet and the charge air cooler inlet.

Are any air leaks present?

YES >> Repair or replace the leaking component.
NO >> GO TO 6.

6.CHECK DATA MONITOR

1. Turn ignition switch OFF.
2. Turn ignition switch ON.
3. Check intake and exhaust restriction Data Monitor items on the CONSULT screen.

Is the exhaust or intake restriction within specifications?

YES >> GO TO 14.
NO >> Repair or replace the restricted component.

7. INSPECT ENGINE CHARGE AIR COOLER OUTLET PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect engine charge air cooler outlet pressure/temperature sensor connector F140.
3. Inspect the harness and sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK DTC PRIORITY

1. Engine charge air cooler outlet pressure/temperature sensor connector F140 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0107 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 9.
NO >> GO TO 11.

9. CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect a jumper wire between terminals 1 and 2 of the engine charge air cooler outlet pressure/temperature sensor connector F140.
3. Turn ignition switch ON.
4. Check for DTC P0108 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 10.
NO >> GO TO 11.

10. CHECK ENGINE CHARGE AIR COOLER OUTLET PRESSURE/TEMPERATURE SENSOR

1. Turn ignition switch OFF.
2. Remove the engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".
3. Inspect the tip of the sensor for soot or carbon buildup.

Does the tip of the sensor display soot or carbon buildup?

YES >> Use compressed air to remove the soot or carbon buildup.
NO >> GO TO 14.

11. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals

- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 12.
NO >> Repair or replace error-detected parts.

12. CHECK DTC PRIORITY

1. ECM connector F101 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0107 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 13.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

13. CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect a jumper wire between terminals 106 and 194 of the ECM connector F101.
3. Turn ignition switch ON.
4. Check for DTC P0108 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> High resistance or a short circuit is detected in the engine harness. Repair or replace the harness.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

14. VERIFY THE VACUUM PUMP OUTPUT

1. Turn ignition switch OFF.
2. Install any previously removed components and connect any previously disconnected connectors.
3. Turn ignition switch ON.
4. Start the engine.
5. Connect a hand pump or vacuum gauge to the vacuum pump inlet.

Is the vacuum within specifications?

YES >> GO TO 15.
NO >> Replace the vacuum pump. Refer to EM-478, "Removal and Installation".

15. CHECK COMPRESSOR BYPASS VALVE ACTUATOR

1. Turn ignition switch OFF.
2. Using a hand pump, apply vacuum to the compressor bypass valve vacuum inlet. Verify that the valve moves from stop to stop.

Does the compressor bypass valve move from stop to stop?

YES >> GO TO 16.
NO >> Remove any obstructions preventing the valve from moving, or replace the compressor bypass valve. Refer to EM-414, "Exploded View".

16. CHECK DATA MONITOR

1. Turn ignition switch ON.
2. Monitor and record engine speed, charge air cooler outlet pressure and compressor bypass valve Data Monitor items on the CONSULT screen.
3. Start the engine.
4. Override the compressor bypass valve to OPEN.
5. Using the accelerator pedal, raise the engine speed to 2000 rpm and hold for 20 seconds.
6. Return the engine speed to idle.
7. Override the compressor bypass valve to CLOSED.
8. Using the accelerator pedal, raise the engine speed to 2000 rpm and hold for 20 seconds.
9. Return the engine speed to idle.

Did the charge air cooler outlet pressure increase by 50 kPa (7 psi) or more?

YES >> GO TO 17.

NO >> Replace the engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".

17. CHECK DATA MONITOR

1. Monitor and record engine speed, turbocharger speed and compressor bypass valve Data Monitor items on the CONSULT screen.
2. Start the engine.
3. Override the compressor bypass valve to OPEN.
4. Using the accelerator pedal, raise the engine speed to 2000 rpm and hold for 20 seconds.
5. Return the engine speed to idle.
6. Override the compressor bypass valve to CLOSED.
7. Using the accelerator pedal, raise the engine speed to 2000 rpm and hold for 20 seconds.
8. Return the engine speed to idle.

Was the turbocharger speed less than 130,000 rpm with the valve OPEN and between 140,000 and 160,000 rpm with the valve CLOSED?

YES >> GO TO 18.
NO >> Replace the turbocharger speed sensor. Refer to EM-399, "Removal and Installation".

18. CHECK DATA MONITOR

1. Monitor and record engine speed, low pressure turbocharger boost pressure, charge air cooler outlet pressure and compressor bypass valve Data Monitor items on the CONSULT screen.
2. Start the engine.
3. Override the compressor bypass valve to OPEN.
4. Using the accelerator pedal, raise the engine speed to 2000 rpm and hold for 20 seconds.
5. Return the engine speed to idle.
6. Override the compressor bypass valve to CLOSED.
7. Using the accelerator pedal, raise the engine speed to 2000 rpm and hold for 20 seconds.
8. Return the engine speed to idle.

Did the low pressure turbocharger boost pressure increase by 5 kPa (1 psi) or greater from the valve OPEN to the valve CLOSED at 2000 rpm?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Replace the low pressure turbocharger boost pressure sensor. Refer to EM-245, "Removal and Installation".

P0107 MAP SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013081430

The ECM provides a 5V supply to the charge air cooler outlet pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The charge air cooler outlet pressure sensor provides a signal to the ECM on the charge air cooler outlet pressure circuit. This sensor signal voltage changes based on the pressure exiting the charge air cooler.

DTC DETECTION LOGIC

The ECM detected the charge air cooler outlet pressure signal voltage was less than 0.2V for more than 5 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0107	Manifold Absolute Pressure/Barometric Pressure Sensor Circuit Low (Engine charge air cooler outlet pressure - voltage below normal or shorted to low source)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Charge pressure sensor value < 0.2 V (44.81 kPa)
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Intake manifold pressure sensor
- Engine harness short to ground

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0107 being current on the CONSULT screen.

Is DTC P0107 current?

YES >> Go to EC-327, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013081431

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for any sensor supply DTCs being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

Check for DTC P0107 being past on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 3.

3.INSPECT ENGINE CHARGE AIR COOLER OUTLET PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect engine charge air cooler outlet pressure/temperature sensor connector F140.

3. Inspect the harness and sensor connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK DTC PRIORITY

1. Engine charge air cooler outlet pressure/temperature sensor connector F140 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0108 being current and DTC P0107 being past on the CONSULT screen after 30 seconds.

Are applicable DTCs detected?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK SENSOR SUPPLY VOLTAGE

Check voltage between the terminals of the engine charge air cooler outlet pressure/temperature sensor connector F140.

Engine charge air cooler outlet pressure/temperature sensor connector F140		Condition	Voltage
Terminal	Terminal		
2	4	Ignition switch ON	4.75V – 5.25V

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect engine charge air cooler outlet pressure/temperature sensor connector F140.
3. Turn ignition switch ON.
4. Check for DTC P0107 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Replace the engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

7. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage

- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.CHECK DTC PRIORITY

1. ECM connector F101 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0108 being current and DTC P0107 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9.CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON.
4. Check for DTC P0107 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> A pin to pin short circuit has been detected on the signal circuit of the engine harness. Repair or replace the engine harness.

10.INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11.CHECK SENSOR SUPPLY VOLTAGE

1. ECM connector F101 remains disconnected.
2. Turn ignition switch ON.
3. Check voltage between the terminals of the engine charge air cooler outlet pressure/temperature sensor connector F140.

Engine charge air cooler outlet pressure/temperature sensor connector F140		Condition	Voltage
Terminal	Terminal		
2	4	Ignition switch ON	4.75V – 5.25V

Is the inspection result normal?

YES >> GO TO 12.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

12.CHECK DTC PRIORITY

1. Turn ignition switch OFF.

2. Connect all components.
3. Turn ignition switch ON.
4. Check for DTC P0107 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> An open has been detected on the return circuit of the engine harness. Repair or replace the engine harness.

P0108 MAP SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013081851

The ECM provides a 5V supply to the charge air cooler outlet pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The charge air cooler outlet pressure sensor provides a signal to the ECM on the charge air cooler outlet pressure circuit. This sensor signal voltage changes based on the pressure exiting the charge air cooler.

DTC DETECTION LOGIC

The ECM detected the charge air cooler outlet pressure signal voltage was greater than 4.8V for more than 5 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0108	Manifold Absolute Pressure/Barometric Pressure Sensor Circuit High (Engine charge air cooler outlet pressure - voltage above normal or shorted to high source)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Charge pressure sensor value > 4.8 V (350 kPa)
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Intake manifold pressure sensor
- Engine harness short to voltage

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0108 being current on the CONSULT screen.

Is DTC P0108 current?

YES >> Go to EC-331, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013081852

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for any sensor supply DTCs being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

Check for DTC P0108 being past on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 3.

3.INSPECT ENGINE CHARGE AIR COOLER OUTLET PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect engine charge air cooler outlet pressure/temperature sensor connector F140.

3. Inspect the harness and sensor connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK DTC PRIORITY

1. Engine charge air cooler outlet pressure/temperature sensor connector F140 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0107 being current and DTC P0108 being past on the CONSULT screen after 30 seconds.

Are applicable DTCs detected?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK SENSOR SUPPLY VOLTAGE

Check voltage between the terminals of the engine charge air cooler outlet pressure/temperature sensor connector F140.

Engine charge air cooler outlet pressure/temperature sensor connector F140		Condition	Voltage
Terminal	Terminal		
2	4	Ignition switch ON	4.75 – 5.25 V

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect engine charge air cooler outlet pressure/temperature sensor connector F140.
3. Turn ignition switch ON.
4. Check for DTC P0108 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Replace the engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

7. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken

- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.CHECK DTC PRIORITY

1. ECM connector F101 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0107 being current and DTC P0108 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9.CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON.
4. Check for DTC P0108 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> A pin to pin short circuit has been detected on the signal circuit of the engine harness. Repair or replace the engine harness.

10.INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11.CHECK SENSOR SUPPLY VOLTAGE

1. ECM connector F101 remains disconnected.
2. Turn ignition switch ON.
3. Check voltage between the terminals of the engine charge air cooler outlet pressure/temperature sensor connector F140.

Engine charge air cooler outlet pressure/temperature sensor connector F140		Condition	Voltage
Terminal	Terminal		
2	4	Ignition switch ON	4.75 – 5.25 V

Is the inspection result normal?

YES >> GO TO 12.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

12.CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON.
4. Check for DTC P0108 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> An open has been detected on the return circuit of the engine harness. Repair or replace the engine harness.

P0111 IAT SENSOR

DTC Description

INFOID:0000000013024807

The ECM provides 5V to the intake manifold temperature signal circuit, and monitors the change in voltage caused by changes in the resistance of the sensor to determine the intake manifold temperature. When the intake air is cold, the sensor (thermistor) resistance is high. The ECM signal voltage only pulls down a small amount through the sensor to a ground. Therefore, the ECM senses a high signal voltage or low temperature. When the intake air is warm, the sensor resistance is low. The signal voltage pulls down a large amount. Therefore, the ECM senses a low signal voltage, or high temperature.

DTC DETECTION LOGIC

The ECM detected the intake manifold temperature reading was higher or lower than other temperature sensors after 8 hours (engine OFF), or the sensor reading is erratic during engine running.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0111	Intake Air Temperature Sensor 1 Circuit Range/Performance Bank 1 (Intake manifold 1 temperature - Data erratic, intermittent, or incorrect)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	—
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Intake manifold temperature sensor
- Engine harness high resistance

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

NOTE:

If the DTC does not go past, it may be necessary to perform a 8 hour cold soak with the ignition switch OFF, then turn the ignition switch to the ON position so that the key ON portion of the diagnostic will run.

1. Turn ignition switch ON.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0111 being current on the CONSULT screen.

Is DTC P0111 current?

YES >> Go to EC-335, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024808

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0111 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for DTC P0112 or P0113 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. CHECK DATA MONITOR

1. Check intake manifold temperature Data Monitor item on the CONSULT screen.
2. Compare intake manifold temperature to the ambient air temperature.

Is the reading within 5.6°C (10°F) of each other?

YES >> GO TO 4.
NO >> Replace the intake manifold temperature sensor. Refer to EM-242, "Removal and Installation".

4. INSPECT INTAKE MANIFOLD TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect intake manifold temperature sensor connector F143.
3. Inspect the harness and sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK DTC PRIORITY

1. Intake manifold temperature sensor connector F143 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0113 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect a jumper wire between terminals 1 and 2 of the intake manifold temperature sensor connector F143.
3. Turn ignition switch ON.
4. Check for DTC P0112 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Replace the intake manifold temperature sensor. Refer to EM-242, "Removal and Installation".
NO >> GO TO 7.

7. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.CHECK DTC PRIORITY

1. ECM connector F101 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0113 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9.CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect a jumper wire between terminals 170 and 195 of the ECM connector F101.
3. Turn ignition switch ON.
4. Check for DTC P0112 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P0112 INTAKE AIR TEMPERATURE SENSOR

DTC Description

INFOID:0000000013024812

The Engine Control Module (ECM) provides 5V to the intake manifold temperature signal circuit, and monitors the change in voltage caused by changes in the resistance of the sensor to determine the intake manifold temperature. When the intake air is cold, the sensor (or thermistor) resistance is high. The signal voltage only pulls down a small amount through the sensor to a ground. Therefore, the ECM senses a high signal voltage or low temperature. When the intake air is warm, the sensor resistance is low. The signal voltage pulls down a large amount. Therefore, the ECM senses a low signal voltage, or a high temperature.

DTC DETECTION LOGIC

Charge temperature sensor reading less than specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0112	INTAKE MANIFOLD TEMP	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Intake manifold temperature sensor signal
		Threshold	• The intake manifold temperature sensor signal is not detected by the ECM for a period of 10 seconds. • The proper manifold temperature sensor signal is not sent to ECM while the engine is running. • The manifold temperature sensor signal is not in the normal pattern during engine running. • The manifold temperature sensor signal is < 0.067 volt (> 250°C)
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
- Sensor signal circuit is shorted to ground in the harness.
- Sensor signal circuit is shorted to ground in the sensor.
- Intake Manifold Temperature Sensor.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check 1st trip DTC.

Is 1st trip DTC P0112 detected?

YES >> Go to EC-338, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024813

1.CHECK FOR ACTIVE DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing ENGINE diagnostic trouble codes.
3. Check for DTC P0112 being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT INTAKE MANIFOLD TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.

2. Disconnect intake manifold temperature sensor from engine harness connector.
3. Inspect intake manifold temperature sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the intake manifold temperature sensor from the engine harness.
3. Turn key ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0113 DTC become current and P0112 DTC become past?

YES >> GO TO 4.
NO >> GO TO 5.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Reconnect the intake manifold temperature sensor connector.
3. Turn key ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0112 DTC become current?

YES >> Replace the intake manifold temperature sensor. Refer to EM-242, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

5. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101 from engine harness connector.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE ECM RESPONSE

1. Turn ignition switch ON and wait 30 seconds.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0113 DTC become current and P0112 DTC become past?

YES >> GO TO 7.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

7.CHECK INTAKE MANIFOLD TEMPERATURE SENSOR SIGNAL CIRCUIT CONNECTOR FOR SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM.
3. Check the continuity between intake manifold temperature sensor signal and all other circuits at ECM harness connector.

ECM			Continuity
Connector	Terminal	Terminal	
F101	195	All others	No

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair short circuit in harness connector.

8.CHECK INTAKE MANIFOLD TEMPERATURE SENSOR SIGNAL CIRCUIT FOR SHORT

Check the continuity between intake manifold temperature sensor harness connector and ground.

ECM		Ground	Continuity
Connector	Terminal		
F101	195	—	No

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair short circuit in harness or connectors.

9.CHECK FOR CURRENT DTC

1. Connect all disconnected harness connectors.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.

Is P0112 DTC CURRENT?

YES >> The troubleshooting procedure needs to be repeated. Refer to EC-338, "DTC Description".
NO >> The removal and installation of the connector corrected the issue.

P0113 INTAKE AIR TEMPERATURE SENSOR

DTC Description

INFOID:0000000013065572

The ECM provides 5V to the intake manifold temperature signal circuit, and monitors the change in voltage caused by changes in the resistance of the sensor to determine the intake manifold temperature. When the intake air is cold, the sensor (thermistor) resistance is high. The ECM signal voltage only pulls down a small amount through the sensor to a ground. Therefore, the ECM senses a high signal voltage or low temperature. When the intake air is warm, the sensor resistance is low. The signal voltage pulls down a large amount. Therefore, the ECM senses a low signal voltage, or high temperature.

DTC DETECTION LOGIC

The ECM detected the intake manifold temperature signal voltage was greater than 4.7V for more than 10 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0113	Intake Air Temperature Sensor 1 Circuit High Bank 1 (Intake manifold 1 temperature sensor circuit - voltage above normal or shorted to high source)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Charge temperature sensor value > 4.738 V (< 250°C)
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Open return circuit in harness, connectors, or sensor
- Open signal circuit or shorted to voltage source
- Intake manifold temperature sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0113 being current on the CONSULT screen.

Is DTC P0113 current?

YES >> Go to EC-341, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065573

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0113 being past on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 2.

2.INSPECT INTAKE MANIFOLD TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect intake manifold temperature sensor connector F143.
3. Inspect the harness and sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins

- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK DTC PRIORITY

1. Intake manifold temperature sensor connector F143 remains disconnected.
2. Connect a jumper wire between terminals 1 and 2 of the intake manifold temperature sensor connector F143.
3. Turn ignition switch ON.
4. Check for DTC P0112 being current and P0113 being past on the CONSULT screen after 30 seconds.

Are the applicable DTCs detected?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect the intake manifold temperature sensor connector F143.
3. Turn ignition switch ON.
4. Check for DTC P0113 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Replace the intake manifold temperature sensor. Refer to EM-242, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

5.INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK DTC PRIORITY

1. Connect a jumper wire between terminals 170 and 195 of the ECM connector F101.
2. Turn ignition switch ON.
3. Check for DTC P0112 being current and P0113 being past on the CONSULT screen after 30 seconds.

Are the applicable DTCs detected?

YES >> GO TO 7.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

7.CHECK FOR AN OPEN RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Remove the jumper wire between terminals 170 and 195 of the ECM connector F101.

3. Disconnect intake manifold temperature sensor connector F143.
4. Check resistance between ECM connector F101 and intake manifold temperature sensor connector F143.

ECM		Intake manifold temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	170	F143	1	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> An open return circuit has been detected in the engine harness. Repair or replace the engine harness.

8.CHECK FOR AN OPEN SIGNAL CIRCUIT

Check resistance between ECM connector F101 and intake manifold temperature sensor connector F143.

ECM		Intake manifold temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	195	F143	2	< 10 Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> An open signal circuit has been detected in the engine harness. Repair or replace the engine harness.

9.CHECK FOR A PIN TO PIN SHORT CIRCUIT

Check resistance between ECM connector F101 and intake manifold temperature sensor connector F143.

ECM		Intake manifold temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	All terminals	F143	2	> 100k Ω

Is the inspection result normal?

YES >> GO TO 10.
NO >> A pin to pin short circuit has been detected on the signal circuit in the engine harness. Repair or replace the engine harness.

10.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Check for DTC P0113 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 1.

P0116 ECT SENSOR

DTC Description

INFOID:0000000013062396

The coolant temperature sensor is a variable resistor sensor and is used to measure the temperature of the coolant of the engine. The Engine Control Module (ECM) supplies 5V to the coolant temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the coolant temperature.

DTC DETECTION LOGIC

- Coolant temperature sensor reading sent to ECM is erratic, intermittent or incorrect.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0116	ECT SENSOR (Engine coolant temperature sensor circuit)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Voltage signal transmitted from engine coolant temperature sensor to ECM
		Threshold	An excessively high voltage (> 4.95 volt) from the sensor is sent to ECM for more than 10 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

P0116
- Harness or connectors (The sensor circuit is open or shorted.)
- Engine coolant temperature sensor
- ECM

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF.
2. Allow the engine to stay OFF for 8 hours.
3. Start vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
4. Perform coast down event from 88 km/h (55 MPH) to 72 km/h (45 MPH) for 2 minutes.
5. Accelerate to 88 km/h (55 MPH) for 20 seconds.
6. Repeat steps 4 and 5 for 21 times.
7. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0116 being current on the CONSULT screen.

Is P0116 DTC current?

YES >> Go to EC-344, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013062397

1.CHECK FOR CURRENT RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following ″current″ ENGINE diagnostic trouble codes:

- P0117
- P0118

Are any of the above DTCs detected?

YES >> Perform diagnosis of applicable DTC first. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK THE THERMOSTAT

Check the thermostat for correct operation.

Does the thermostat operate correctly?

YES >> GO TO 3.
NO >> Replace the thermostat. Refer to CO-60, "Removal and Installation".

3.INSPECT COOLANT TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the coolant temperature sensor from engine harness connector.
3. Inspect the coolant temperature sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait for 30 seconds.
3. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P0118 DTC current?

YES >> GO TO 5.
NO >> GO TO 6.

5.CHECK THE ECM RESPONSE

1. Connect a jumper wire between the coolant temperature sensor two connector terminals 1 and 2.
2. Wait for 30 seconds.
3. With CONSULT check for current ENGINE diagnostic trouble codes.

Is P0117 DTC current?

YES >> Replace the coolant temperature sensor. Refer to CO-57, "Removal and Installation".
NO >> GO TO 6.

6.INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM engine harness connector F101.
3. Inspect the ECM connector F101 pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage

- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait for 30 seconds.
3. Using CONSULT, check for current ENGINE diagnostic trouble codes.

NOTE:
Other DTCs will be set during this step.

Is P0118 DTC current?

YES >> GO TO 8.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

8.CHECK THE ECM RESPONSE

CAUTION:
Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
- **Not to bend and damage pins and terminals.**
- **Not to probe or short unintended circuits and potentially damaging the control unit.**

1. Connect a jumper wire between ECM connector F101 pins 170 and 193.
2. Wait for 30 seconds.
3. With CONSULT check for current ENGINE diagnostic trouble codes.

Is P0117 DTC current?

YES >>
- High resistance or short circuit has been detected in the engine harness. Repair or replace the engine harness.
- GO TO 9.

NO >>
- Replace the ECM. Refer to EC-1254, "Removal and Installation".
- GO TO 9.

9.CHECK FOR CURRENT DTC

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect all harness connectors.
4. Turn ignition switch ON.
5. Using CONSULT, erase ENGINE diagnostic trouble codes.
6. Operate the engine within the ″Conditions for clearing the DTC″.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is P0116 DTC current?

YES >> Troubleshooting procedure need to be repeated. Go to EC-344, "DTC Description".
NO >> The removal and installation of the connector corrected the issue.

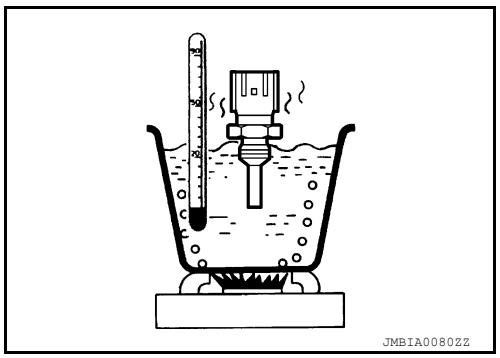
Component Inspection

INFOID:0000000013062398

1.CHECK ENGINE COOLANT TEMPERATURE SENSOR

1. Turn ignition switch OFF.
2. Disconnect engine coolant temperature sensor harness connector.
3. Remove engine coolant temperature sensor. Refer to EM-339, "Removal and Installation".

4. Check resistance between engine coolant temperature sensor terminals by heating with hot water as shown in the figure.



Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	20 (68)	2.10 - 2.90
		50 (122)	0.68 - 1.00
		90 (194)	0.236 - 0.260

Is the inspection result normal?

YES >> Inspection End.
NO >> Replace engine coolant temperature sensor. Refer to EM-339, "Removal and Installation".

P0117 COOLANT TEMPERATURE SENSOR

DTC Description

INFOID:0000000013024821

The coolant temperature sensor is a variable resistor sensor and is used to measure the temperature of the coolant of the engine. The Engine Control Module (ECM) supplies 5V to the coolant temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the coolant temperature.

DTC DETECTION LOGIC

- An excessively low voltage from the sensor is sent to ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0117	COOLANT TEMP (Engine coolant temperature sensor 1 circuit low)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Voltage signal transmitted from engine coolant temperature sensor to ECM
		Threshold	An excessively low voltage (< 0.108 volt) from the sensor is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

P0117
- Harness or connectors (The sensor circuit is open or shorted.)
- Engine coolant temperature sensor
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for existing ENGINE diagnostic trouble codes.
3. Check for DTC P0117 being current on the CONSULT screen.

Is DTC P0117 current?

YES >> Go to EC-348, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024823

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing ENGINE diagnostic trouble codes.
3. Check for DTC P0117 being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT COOLANT TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the coolant temperature sensor from engine harness connector.
3. Inspect the coolant temperature sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector

- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. With the sensor disconnected, connect CONSULT and wait 30 seconds.
3. Check for current ENGINE diagnostic trouble codes.

Is P0118 DTC current and P0117 DTC past?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Reconnect the coolant temperature sensor.
3. Turn ignition switch ON. Wait 30 seconds.
4. Recheck for current ENGINE diagnostic trouble codes.

Is P0117 DTC current and P0118 DTC past?

YES >> Replace the coolant temperature sensor. Refer to ACC-3, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

5.INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Inspect the ECM connector F101 pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

6.CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM engine harness side connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is P0118 DTC current and P0117 DTC past?

YES >> GO TO 6.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

7.CHECK COOLANT TEMPERATURE SENSOR SIGNAL FOR SHORT TO OTHER CIRCUITS

Check the continuity between the coolant temperature sensor signal and all other circuits at ECM harness connector.

ECM			Continuity
Connector	Terminal	Terminal	
F101	193	All others	No

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair short circuit in harness connector.

8.CHECK COOLANT TEMPERATURE SENSOR SIGNAL FOR SHORT TO GROUND

Check the continuity between ECM harness connector and ground.

ECM		Ground	Continuity
Connector	Terminal		
F101	195 (+)	Ground (-)	No

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair short circuit in harness or connectors.

9.CHECK FOR INACTIVE DTC

1. Connect all components in the correct positions.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.

Is P0117 DTC past?

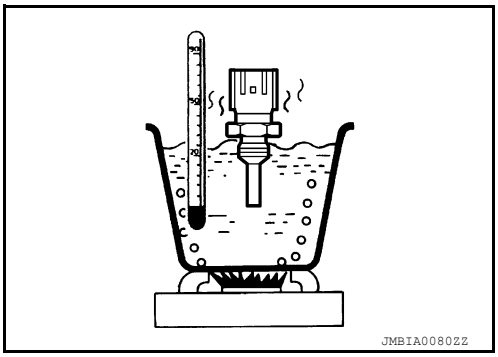
YES >> The removal and installation of the connector corrected the issue.
NO >> Troubleshooting procedure need to be repeated. Go to EC-348, "DTC Description".

Component Inspection

INFOID:0000000013057545

1.CHECK ENGINE COOLANT TEMPERATURE SENSOR

1. Turn ignition switch OFF.
2. Disconnect engine coolant temperature sensor harness connector.
3. Remove engine coolant temperature sensor. Refer to CO-57, "Removal and Installation".
4. Check resistance between engine coolant temperature sensor terminals by heating with hot water as shown in the figure.



Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	20 (68)	2.10 - 2.90
		50 (122)	0.68 - 1.00
		90 (194)	0.236 - 0.260

Is the inspection result normal?

YES >> Inspection End.
NO >> Replace engine coolant temperature sensor. Refer to CO-57, "Removal and Installation".

P0118 COOLANT TEMPERATURE SENSOR

DTC Description

INFOID:0000000013065564

The coolant temperature sensor is a variable resistor sensor and is used to measure the temperature of the coolant of the engine. The ECM supplies 5V to the coolant temperature sensor signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the coolant temperature.

DTC DETECTION LOGIC

The ECM detected the coolant temperature signal voltage was greater than 4.95V for more than 10 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0118	Engine Coolant Temperature Sensor 1 Circuit High (Engine coolant temperature 1 sensor circuit - voltage above normal or shorted to high source)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Coolant temperature sensor value > 4.966 V (< -40°C)
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Open return circuit in harness, connectors, or sensor
- Open signal circuit or shorted to voltage source
- Coolant temperature sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0118 being current on the CONSULT screen.

Is DTC P0118 current?

YES >> Go to EC-351, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065565

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0118 being past on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 2.

2.INSPECT COOLANT TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect coolant temperature sensor connector F127.
3. Inspect the harness and sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals

- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK COOLANT TEMPERATURE SENSOR RESISTANCE

1. Coolant temperature sensor connector F127 remains disconnected.
2. Check resistance between the terminals of coolant temperature sensor connector F127.

Coolant temperature sensor connector F127		Resistance
Terminal	Terminal	
1	2	180 – 160k Ω

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace the coolant temperature sensor. Refer to EM-339, "Removal and Installation".

4. CHECK DTC PRIORITY

1. Connect coolant temperature sensor connector F127.
2. Turn ignition switch ON.
3. Check for DTC P0118 being current and P0113 being past on the CONSULT screen after 30 seconds.

Are the applicable DTCs detected?

YES >> GO TO 5.
NO >> Refer to GI-43, "Intermittent Incident".

5. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK DTC PRIORITY

1. Connect a jumper wire between terminals 170 and 193 of the ECM connector F101.
2. Turn ignition switch ON.
3. Check for DTC P0117 being current and P0118 being past on the CONSULT screen after 30 seconds.

Are the applicable DTCs detected?

YES >> GO TO 7.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

7. CHECK FOR AN OPEN RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Remove the jumper wire between terminals 170 and 193 of the ECM connector F101.
3. Disconnect engine coolant temperature sensor connector F127.

4. Check resistance between ECM connector F101 and coolant temperature sensor connector F127.

ECM		Coolant temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	170	F127	1	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> An open return circuit has been detected in the engine harness. Repair or replace the engine harness.

8. CHECK FOR AN OPEN SIGNAL CIRCUIT

Check resistance between ECM connector F101 and engine coolant temperature sensor connector F127.

ECM		Coolant temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	193	F127	2	< 10 Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> An open signal circuit has been detected in the engine harness. Repair or replace the engine harness.

9. CHECK FOR A PIN TO PIN SHORT CIRCUIT

Check resistance between ECM connector F101 and coolant temperature sensor connector F127.

ECM		Coolant temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	All terminals	F127	2	> 100k Ω

Is the inspection result normal?

YES >> GO TO 10.
NO >> A pin to pin short circuit has been detected on the signal circuit in the engine harness. Repair or replace the engine harness.

10. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Check for DTC P0118 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 1.

P0127 IAT SENSOR

DTC Description

INFOID:0000000013024837

The ECM provides 5V to the intake manifold temperature signal circuit, and monitors the change in voltage caused by changes in the resistance of the sensor to determine the intake manifold temperature. When the intake air is cold, the sensor (thermistor) resistance is high. The ECM signal voltage only pulls down a small amount through the sensor to a ground. Therefore, the ECM senses a high signal voltage or low temperature. When the intake air is warm, the sensor resistance is low. The signal voltage pulls down a large amount. Therefore, the ECM senses a low signal voltage, or high temperature.

DTC DETECTION LOGIC

The ECM detected the intake manifold air temperature was greater than 132°C (270°F) for 5 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0127	Intake Air Temperature Too High - (Intake manifold 1 temperature - data valid but above normal operating range - most severe level)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Intake manifold temperature ≥ 132°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Restricted air flow through the charge-air cooler
- Undersized charge-air cooler
- High turbocharger compressor outlet temperature

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0127 being current on the CONSULT screen.

Is DTC P0127 current?

YES >> Go to EC-354, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024838

1.CHECK DATA MONITOR

1. Check intake manifold temperature “Data Monitor” item on the CONSULT screen.
2. Compare intake manifold temperature reading to a mechanical gauge or known value.

Does the reading correlate to a know value or a mechanical gauge?

YES >> Refer to Symptom Diagnosis EC-1246, "Symptom Table".
NO >> Replace the intake manifold temperature sensor. Refer to EM-242, "Removal and Installation".

P0128 THERMOSTAT FUNCTION

DTC Description

INFOID:0000000013024841

The coolant temperature sensor is a variable resistor sensor and is used to measure the temperature of the coolant of the engine. The ECM supplies 5V to the coolant temperature sensor signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the coolant temperature.

DTC DETECTION LOGIC

The ECM detected the engine coolant temperature did not reach 72°C (162°F) in a specified amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0128	Coolant Thermostat (Coolant Temperature Below Thermostat Regulating Temperature) (Engine cooling system monitor - data valid but below normal operating range - moderately severe level)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Coolant temperature < -71.094°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Low coolant level, or air in the cooling system
- Engine coolant temperature sensor
- Engine coolant thermostat

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Let the engine cold soak for the coolant temperature to reach 50°C (122°F) or less.
2. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
3. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
5. Check for DTC P0128 being current on the CONSULT screen.

Is DTC P0128 current?

YES >> Go to EC-355, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024842

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTCs P0116, P0117 or P0118 being past on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.PERFORM ACTIVE TEST

1. Start the engine and run at low idle.
2. Perform the Fan Override Test Active Test item on the CONSULT screen.

3. Verify that the fan operates correctly, is not stuck, and turns ON and OFF as commanded.

Is the fan clutch assembly operating correctly?

YES >> GO TO 3.
NO >> Troubleshoot and repair the cause of the malfunctioning engine fan operation. Inspect engine fan wiring for short or open circuits. Check engine fan switches for proper operation.

3. CHECK THERMOSTAT

1. Turn ignition switch OFF.
2. Check for a leaking or stuck open thermostat.

Is the thermostat operating correctly?

YES >> Replace the engine coolant temperature sensor. Refer to EM-339, "Removal and Installation".
NO >> Replace the thermostat. Refer to CO-60, "Removal and Installation".

P012B TC BOOST SENSOR

DTC Description

INFOID:0000000013073844

The combination turbocharger compressor intake pressure/temperature sensor is used to measure ambient air pressure.The pressure measuring portion of the sensor responds to pressure changes in the atmospheric pressure, which occur based on elevation at which the engine is presently operating. The turbocharger compressor intake pressure sensor has a 5V supply circuit, a pressure sensor signal voltage, and a return circuit.The ECM will detect a low signal voltage when the vehicle is operating at high altitudes. The ECM will detect a high signal voltage when the vehicle is operating at sea level altitudes.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the barometric pressure reading was higher or lower than the other pressure sensors at ignition off, or the sensor reading is erratic during engine running.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P012B	(Turbocharger/Supercharger Inlet Pressure Sensor Circuit Range/ Performance)	1	Diagnosis condition	Engine running.
			Signal (terminal)	(129)
			Threshold	Cumulative sum of error in 30 seconds is > 15 kPa, which is ≥ 0.1 kPa. Where tolerance is defined as 28.74 kPa.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	• 8 hour cold soak • Engine running.
			Signal (terminal)	(129)
			Threshold	Compressor inlet pressure sensor reading < 18 kPa OR Compressor inlet pressure sensor reading > 144.31 kPa OR Compressor inlet pressure to the most accurate remaining pressure sensor is > 3.19 kPa
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Turbocharger compressor intake pressure/temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
   - If the fault code does not go inactive, it may be necessary to perform a 8 hour cold soak with the ignition OFF, then turn the ignition switch to the ON position so that the key ON portion of the diagnostic will run.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P007B being current on the CONSULT screen.

Is DTC P007B current?

YES >> Go to EC-358, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073845

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen.

- P012C
- P012D

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.INSPECT TURBOCHARGER COMPRESSOR INTAKE PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Inspect the harness connector and turbocharger compressor intake pressure/temperature sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P012C current?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between turbocharger compressor intake pressure/temperature sensor harness connector F105 terminal 1 and 2.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P012D current?

YES >> Replace turbocharger compressor intake pressure/temperature sensor. Refer to EM-214, "Removal and Installation".
NO >> GO TO 5.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.

2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P012C current?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between ECM harness connector F101 terminal 106 and 129.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P012D current?

YES >> Repair or replace engine harness.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P012C TC COMPRESSOR INLET PRESSURE SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013104747

The combination turbocharger compressor intake pressure/temperature sensor is used to measure ambient air pressure.The pressure measuring portion of the sensor responds to pressure changes in the atmospheric pressure, which occur based on elevation at which the engine is presently operating. The turbocharger compressor intake pressure sensor has a 5V supply circuit, a pressure sensor signal voltage, and a return circuit.The ECM will detect a low signal voltage when the vehicle is operating at high altitudes. The ECM will detect a high signal voltage when the vehicle is operating at sea level altitudes.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the turbocharger compressor intake pressure sensor signal voltage was less than 0.25V for more than 10 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P012C	(Turbocharger/Supercharger Inlet Pressure Sensor Circuit Low)	Diagnosis condition	Ignition switch ON or engine running
		Signal (terminal)	(–)
		Threshold	Compressor inlet pressure sensor < 0.2V (44.82 kPa)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Turbocharger compressor intake pressure/temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P012C being current on the CONSULT screen.

Is DTC P012C current?

YES >> Go to EC-360, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013104748

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0652 or P0653 being current on the CONSULT screen.

Is applicable DTC detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P012C being current on the CONSULT screen.

Is DTC P012C detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT TURBOCHARGER COMPRESSOR INTAKE PRESSURE/TEMPERATURE SENSOR AND

CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Inspect the harness connector and turbocharger compressor intake pressure/temperature sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Turn ignition switch ON.
4. Measure the voltage between turbocharger compressor intake pressure/temperature sensor harness connector F105 terminals 2 and 4.

Turbocharger compressor intake pressure/temperature sensor			Voltage (Approx.)
Connector	Terminal	Terminal	
F105	2	4	4.75V - 5.25V

Is inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Connect a jumper wire between turbocharger compressor intake pressure/temperature sensor harness connector F105 terminal 1 and 2.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P012D DTC become current and P012C become past?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P012C become current?

YES >> Replace turbocharger compressor intake pressure/temperature sensor. Refer to EM-214, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between terminal 106 and 127 at the ECM connector F101.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	106	127	4.75V - 5.25V

Is inspection the result normal?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P012C being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace the harness for an open or shorted circuit.

10. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between ECM harness connector F101 terminal 106 and 129.

4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P012D become current and P012C become past?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

12. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P012C being past on the CONSULT screen.

Is DTC P012C detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open or pin-to-pin short.

P012D TC COMPRESSOR INLET PRESSURE SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013103138

The combination turbocharger compressor intake pressure/temperature sensor is used to measure ambient air pressure.The pressure measuring portion of the sensor responds to pressure changes in the atmospheric pressure, which occur based on elevation at which the engine is presently operating. The turbocharger compressor intake pressure sensor has a 5V supply circuit, a pressure sensor signal voltage, and a return circuit.The ECM will detect a low signal voltage when the vehicle is operating at high altitudes. The ECM will detect a high signal voltage when the vehicle is operating at sea level altitudes.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the turbocharger compressor intake pressure sensor signal voltage was greater than 4.75-VDC for more than 10 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P012D	(Turbocharger/Supercharger Inlet Pressure Sensor Circuit High)	Diagnosis condition	Ignition switch ON or engine running.
		Signal (terminal)	(-)
		Threshold	Compressor inlet pressure sensor value > 4.8V (110.32 kPa)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Turbocharger compressor intake pressure/temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P012D being current on the CONSULT screen.

Is DTC P012D current?

YES >> Go to EC-364, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013103139

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0652 or P0653 being current on the CONSULT screen.

Is applicable DTC detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P012D being current on the CONSULT screen.

Is DTC P012D detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT TURBOCHARGER COMPRESSOR INTAKE PRESSURE/TEMPERATURE SENSOR AND

CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Inspect the harness connector and turbocharger compressor intake pressure/temperature sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P012C DTC become current and P012D become past?

YES >> GO TO 5.
NO >> GO TO 10.

5. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Turn ignition switch ON.
4. Measure the voltage between turbocharger compressor intake pressure/temperature sensor harness connector F105 terminals 2 and 4.

Turbocharger compressor intake pressure/temperature sensor			Voltage (Approx.)
Connector	Terminal	Terminal	
F105	2	4	4.75-5.25

Is inspection result normal?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P012D become current?

YES >> Replace turbocharger compressor intake pressure/temperature sensor. Refer to EM-214, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins

- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P012C become current and P012D become past?

YES >> GO TO 9.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

9.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P012D being past on the CONSULT screen.

Is DTC P012D detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for a pin-to-pin short.

10.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11.CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between terminal 106 and 127 at the ECM connector F101.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	106	127	4.75-5.25

Is inspection the result normal?

YES >> GO TO 12.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

12.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P012D being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace the harness for an open circuit.

P0168 FUEL TEMPERATURE SENSOR

DTC Description

INFOID:0000000013296124

The fuel temperature sensor is a variable resistor sensor and is used to measure the temperature of the fuel entering the high pressure pump. The ECM supplies 5V to the fuel temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the fuel temperature. The fuel temperature is used by the ECM for the engine protection system, timing, and fueling control.

DTC DETECTION LOGIC

The ECM detected the fuel temperature exceeded 75°C.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0168	Fuel Temperature Too High (Engine fuel temperature - data valid but above normal operating range - most severe level)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	—
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel temperature sensor
- Operating the engine in a hot ambient environment with a low fuel tank level
- Wrong fuel grade/type

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Insure the fuel tank has more than 15% of fuel.
2. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
3. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
5. Check for DTC P0168 being current on the CONSULT screen.

Is DTC P0168 current?

YES >> Go to EC-368, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013296125

1.CHECK DATA MONITOR

1. Check fuel temperature “Data Monitor” item on the CONSULT screen.
2. Compare fuel temperature reading to a mechanical gauge or known value.

Does the reading correlate to a know value or a mechanical gauge?

YES >> Check for wrong fuel type/grade, fuel tank fuel level low, high fuel supply or return restriction, incorrect fuel tank installation, incorrectly routed fuel lines, high ambient air temperature or engine coolant overheating condition.
NO >> Replace the fuel temperature sensor. Refer to FL-54, "Removal and Installation".

P0169 INCORRECT FUEL COMPOSITION

DTC Description

INFOID:0000000013085662

The water-in-fuel sensor is in the fuel filter. The ECM provides a 5V reference signal to the water-in-fuel sensor. When the water collected in the fuel filter covers the sensor probes, the water-in-fuel sensor pulls the 5V reference voltage down, indicating high water accumulation in the fuel filter.

DTC DETECTION LOGIC

The ECM detected water in fuel for an extended period of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0169	Incorrect Fuel Composition (Water in fuel indicator - data valid but above normal operating range - moderately severe level)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Distance traveled with water in fuel detected ≥ 500.203 miles
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Water-in-fuel sensor
- Water in the fuel
- Water in the sensor connector

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0169 being current on the CONSULT screen.

Is DTC P0169 current?

YES >> Go to EC-369, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013085663

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0169 being current or past on the CONSULT screen.

Is applicable DTC detected?

YES >> Drain water from the fuel filter. Check sensor and sensor connector for water intrusion. Clean or replace connector or sensor as necessary.
NO >> Refer to GI-43, "Intermittent Incident".

P0181 FUEL TEMPERATURE SENSOR

DTC Description

INFOID:0000000013024885

The fuel temperature sensor is a variable resistor sensor and is used to measure the temperature of the fuel entering the high pressure pump. The ECM supplies 5V to the fuel temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the fuel temperature. The fuel temperature is used by the ECM for the engine protection system, timing, and fueling control.

DTC DETECTION LOGIC

The ECM detected the fuel temperature sensor was higher or lower than expected.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0181	Fuel Temperature Sensor “A” Circuit Range/Performance (Engine fuel temperature - Data erratic, intermittent, or incorrect)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Fuel temperature > 75°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Fuel temperature - ambient air temperature > 60°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		3	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Fuel temperature - ambient air temperature < -25°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel temperature sensor
- Engine harness high resistance
- Operating the engine in a hot ambient environment with a low fuel tank level

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Insure the fuel tank has more than 15% of fuel.
2. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
3. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
5. Check for DTC P0181 being current on the CONSULT screen.

Is DTC P0181 current?

YES >> Go to EC-371, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024886

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0181 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0182 or P0183 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK FUEL TEMPERATURE SENSOR

1. Turn ignition switch OFF.
2. Disconnect fuel temperature sensor connector F128.
3. Check resistance between the terminals of the fuel temperature sensor at room temperature (25°C [77°F]).

Fuel temperature sensor		Resistance
Terminal	Terminal	
1	2	9k – 11k Ω

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace the fuel temperature sensor. Refer to FL-54, "Removal and Installation".

4.INSPECT FUEL TEMPERATURE SENSOR AND CONNECTOR PINS

Inspect the harness and sensor connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK DTC PRIORITY

1. Fuel temperature sensor connector F128 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0183 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 6.
NO >> GO TO 7.

6.CHECK DTC PRIORITY

1. Fuel temperature sensor connector F128 remains disconnected.
2. Connect a jumper wire between terminals 1 and 2 of the fuel temperature sensor connector F128.
3. Turn ignition switch ON.
4. Check for DTC P0182 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Replace the fuel temperature sensor. Refer to FL-54, "Removal and Installation".
NO >> GO TO 7.

7. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK DTC PRIORITY

1. ECM connector F101 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0183 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9. CHECK DTC PRIORITY

1. ECM connector F101 remains disconnected.
2. Connect a jumper wire between terminals 170 and 174 of the ECM connector F101.
3. Turn ignition switch ON.
4. Check for DTC P0182 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> High resistance or a short circuit has been detected in the engine harness. Repair or replace the engine harness.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P0182 FUEL TEMPERATURE SENSOR

DTC Description

INFOID:0000000013024890

The fuel temperature sensor is a variable resistor sensor and is used to measure the temperature of the fuel entering the high pressure pump. The ECM supplies 5V to the fuel temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the fuel temperature. The fuel temperature is used by the ECM for the engine protection system, timing, and fueling control.

DTC DETECTION LOGIC

The ECM detected the fuel temperature sensor signal voltage was greater than 4.97V for more than 5 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0182	Fuel Temperature Sensor “A” Circuit Low (Engine fuel temperature sensor 1 circuit - voltage below normal or shorted to low source)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Fuel temperature sensor value < 0.089 V (> 150°C)
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel temperature sensor
- Open return circuit in harness, connectors or sensor
- Open signal circuit or shorted to a voltage source

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0182 being current on the CONSULT screen.

Is DTC P0182 current?

YES >> Go to EC-373, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024891

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0182 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel temperature sensor connector F128.
3. Inspect the harness and sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals

- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK DTC PRIORITY

1. Fuel temperature sensor connector F128 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0183 being current and DTC P0182 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect fuel temperature sensor connector F128.
3. Turn ignition switch ON.
4. Check for DTC P0182 being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Replace the fuel temperature sensor. Refer to FL-54, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

5.INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK DTC PRIORITY

1. ECM connector F101 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P0183 being current and DTC P0182 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 7.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

7.CHECK SENSOR SUPPLY VOLTAGE

1. Turn ignition switch OFF.
2. Check resistance between the terminals of the ECM connector F101.

ECM connector F101		Resistance
Terminal	Terminal	
174	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> A pin to pin short circuit on the signal circuit has been detected. Repair or replace the engine harness.

8.CHECK FUEL TEMPERATURE SENSOR

Check resistance between the terminals of the fuel temperature sensor at room temperature (25°C [77°F]).

ECM		Ground	Resistance
Connector	Terminal		
F101	174	—	> 100k Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> A short circuit to ground on the signal circuit has been detected. Repair or replace the engine harness.

9.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Check for DTC P0182 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 1.

P0183 FUEL TEMPERATURE SENSOR

DTC Description

INFOID:0000000013065652

The fuel temperature sensor is a variable resistor sensor and is used to measure the temperature of the fuel entering the high pressure pump. The ECM supplies 5V to the fuel temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the fuel temperature. The fuel temperature is used by the ECM for the engine protection system, timing, and fueling control.

DTC DETECTION LOGIC

The ECM detected the fuel temperature sensor signal voltage was greater than 4.97V for more than 5 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0183	Fuel Temperature Sensor “A” Circuit High (Engine fuel temperature sensor 1 circuit - voltage above normal or shorted to high source)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Fuel temperature sensor value > 4.979 V (< 40°C)
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel temperature sensor
- Open return circuit in harness, connectors or sensor
- Open signal circuit or shorted to a voltage source

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0183 being current on the CONSULT screen.

Is DTC P0183 current?

YES >> Go to EC-376, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065653

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0183 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel temperature sensor connector F128.
3. Inspect the harness and sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals

- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK DTC PRIORITY

1. Fuel temperature sensor connector F128 remains disconnected.
2. Connect a jumper wire between terminals 1 and 2 of the fuel temperature sensor connector F128.
3. Turn ignition switch ON.
4. Check for DTC P0182 being current and P0183 being past on the CONSULT screen.

Are the applicable DTCs detected?

YES >> GO TO 4.
NO >> Replace the fuel temperature sensor. Refer to FL-54, "Removal and Installation".

4. CHECK DTC PRIORITY

1. Turn ignition switch OFF.
2. Connect fuel temperature sensor connector F128.
3. Turn ignition switch ON.
4. Check for DTC P0183 being current on the CONSULT screen after 30 seconds.

Are the applicable DTCs detected?

YES >> GO TO 5.
NO >> Refer to GI-43, "Intermittent Incident".

5. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK DTC PRIORITY

1. Connect a jumper wire between terminals 170 and 174 of the ECM connector F101.
2. Turn ignition switch ON.
3. Check for DTC P0182 being current and P0183 being past on the CONSULT screen after 30 seconds.

Are the applicable DTCs detected?

YES >> GO TO 7.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

7. CHECK FOR AN OPEN RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Remove the jumper wire between terminals 170 and 174 of the ECM connector F101.
3. Disconnect fuel temperature sensor connector F128.
4. Check resistance between ECM connector F101 and fuel temperature sensor connector F128.

ECM		Fuel temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	170	F128	1	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> An open return circuit has been detected in the engine harness. Repair or replace the engine harness.

8.CHECK FOR AN OPEN SIGNAL CIRCUIT

Check resistance between ECM connector F101 and fuel temperature sensor connector F128.

ECM		Fuel temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	174	F128	2	< 10 Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> An open signal circuit has been detected in the engine harness. Repair or replace the engine harness.

9.CHECK FOR A PIN TO PIN SHORT CIRCUIT

Check resistance between the terminals of the ECM connector F101.

ECM connector F101		Resistance
Terminal	Terminal	
174	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 10.
NO >> A pin to pin short circuit has been detected on the signal circuit in the engine harness. Repair or replace the engine harness.

10.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Check for DTC P0183 being past on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 1.

P0184 FUEL TEMPERATURE SENSOR

DTC Description

INFOID:0000000013296308

The fuel temperature sensor is a variable resistor sensor and is used to measure the temperature of the fuel entering the high pressure pump. The ECM supplies 5V to the fuel temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the fuel temperature. The fuel temperature is used by the ECM for the engine protection system, timing, and fueling control.

DTC DETECTION LOGIC

The difference between fuel temperature and ambient temperature is greater than 15°C, while driving.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0184	Fuel Temperature Sensor “A” Circuit Intermittent (Engine fuel temperature - data valid but below normal operating range - moderately severe level)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	—
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel temperature sensor
- Operating the engine in a hot ambient environment with a low fuel tank level
- Wrong fuel grade/type

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Insure the fuel tank has more than 15% of fuel.
2. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
3. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
5. Check for DTC P0184 being current on the CONSULT screen.

Is DTC P0184 current?

YES >> Go to EC-379, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013296309

1.CHECK DATA MONITOR

1. Check fuel temperature “Data Monitor” item on the CONSULT screen.
2. Compare fuel temperature reading to a mechanical gauge or known value.

Does the reading correlate to a know value or a mechanical gauge?

YES >> Refer to Symptom Diagnosis EC-1246, "Symptom Table".
NO >> Replace the fuel temperature sensor. Refer to FL-54, "Removal and Installation".

P0191 FUEL RAIL PRESSURE SENSOR

DTC Description

INFOID:0000000013073131

The engine control module (ECM) monitors engine operating conditions, including the reading of fuel rail pressure, and changes the flow command to either increase (OPEN the fuel metering valve) or decrease (CLOSE the fuel metering valve) the fuel supply to the high-pressure pump.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fuel rail pressure was greater than 0.6V (key on) or less than 0.4V (key off)

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0191	FRP_SENSOR (Fuel Rail Pressure Sensor "A" Circuit Range/Performance)	1	Diagnosis condition	• Ignition is turned ON and before engine speed is detected. • Ignition OFF. The DTC will be active at the next ignition ON event.
			Signal (terminal)	Fuel rail pressure sensor (–)
			Threshold	Rail pressure sensor at ignition ON > 0.609V (59.965 bar absolute) Or The delay tome after all enable conditions are satisfied is greater than a calculated threshold at ignition OFF and Rail pressure sensor at ignition OFF > 0.609V (59.965 bar absolute)
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	• Ignition is turned ON and before engine speed is detected. • Ignition OFF. The DTC will be active at the next ignition ON event.
			Signal (terminal)	Fuel rail pressure sensor (171)
			Threshold	Rail pressure sensor at ignition ON < 0.424V (0 bar absolute) Or The delay tome after all enable conditions are satisfied is greater than a calculated threshold at ignition OFF and Rail pressure sensor at ignition OFF < 0.424V (0 bar absolute)
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel pressure sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Check that fuel temperature is above -7°C (19°F).
2. Turn ignition OFF for 1 minute, then turn ignition switch ON for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0191 being current on the CONSULT screen.

Is DTC P0191 current?

YES >> Go to EC-381, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073132

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have high past counts on the CONSULT screen:

- P008A
- P009C
- P009D
- P0192
- P0193
- P0252
- P0253
- P0254
- P2540

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.INSPECT FUEL RAIL PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel rail pressure sensor harness connector F139.
3. Inspect the harness connector and fuel rail pressure sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON and wait 30 seconds.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0193 DTC become current?

YES >> Replace fuel rail pressure sensor. Refer to EM-449, "Removal and Installation".
NO >> GO TO 4.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between fuel rail pressure sensor signal circuit and return circuit at the sensor harness connector F139.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0192 DTC become current?

YES >> • Replace fuel rail pressure sensor. Refer to EM-449, "Removal and Installation".
• GO TO 7.
NO >> GO TO 5.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.

3. Inspect the ECM connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0193 DTC become current?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between ECM harness connector F101 terminals 128 and 171.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0192 DTC become current?

YES >> Repair or replace harness for an open circuit.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P0192 FUEL RAIL PRESSURE SENSOR

DTC Description

INFOID:0000000013071809

The engine control module (ECM) provides a 5V supply to the fuel rail pressure sensor using a dedicated sensor supply circuit.The ECM also provides a ground on the sensor return circuit.The fuel rail pressure sensor provides a fuel pressure signal to the ECM on the fuel rail pressure sensor signal circuit. This sensor signal voltage changes based on the pressure in the fuel rail. The ECM will detect a high signal voltage at high rail pressure conditions. The ECM will detect a low signal voltage during low rail pressure conditions.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fuel rail pressure signal voltage is less than 0.2-VDC for more than 1 second.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0192	FRP_SEN/CIRC (Fuel Rail Pressure Sensor "A" Circuit Low)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	Fuel rail pressure sensor (171)
		Threshold	Fuel Rail pressure sensor < 189 mV (0 bar absolute)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel pressure sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0192 being current on the CONSULT screen.

Is DTC P0192 current?

YES >> Go to EC-383, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013071810

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for sensor supply DTCs PXXXX or P06D7 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0192 being past on the CONSULT screen.

Is DTC P0192 detected as past?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 3.

3.INSPECT FUEL RAIL PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.

2. Disconnect fuel rail pressure sensor harness connector F139.
3. Inspect the engine harness and fuel rail pressure sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the fuel rail pressure sensor harness connector F139.
3. Turn ignition switch ON.
4. Measure the voltage between fuel rail pressure sensor harness connector F139 terminals 1 and 3.

Fuel rail pressure sensor		Fuel rail pressure sensor		Voltage (Approx.)
Connector	Terminal	Connector	Terminal	
F139	1	F139	3	4.75V - 5.25V

Is inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fuel rail pressure sensor connector F139.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0193 become current and DTC P0192 become past?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect the fuel rail pressure sensor harness connector F139.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0192 become current?

YES >> Replace the fuel rail pressure sensor. Refer to EM-449, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between terminal 106 and 128 at the ECM connector F101.

ECM		ECM		Voltage (Approx.)
Connector	Terminal	Connector	Terminal	
F101	106	F101	128	4.75V - 5.25V

Is inspection the result normal?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0192 being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace the harness for an open or shorted circuit.

10.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11.CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON. Wait 30 seconds.
4. With CONSULT check for current ENGINE diagnostic trouble codes.

Did P0193 DTC become current and P0192 DTC become past?

YES >> GO TO 12.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

12.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0192 being past on the CONSULT screen.

Is DTC P0192 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open or pin-to-pin short.

P0193 FUEL RAIL PRESSURE SENSOR

DTC Description

INFOID:0000000013071807

The engine control module (ECM) provides a 5V supply to the fuel rail pressure sensor using a dedicated sensor supply circuit.The ECM also provides a ground on the sensor return circuit.The fuel rail pressure sensor provides a fuel pressure signal to the ECM on the fuel rail pressure sensor signal circuit. This sensor signal voltage changes based on the pressure in the fuel rail. The ECM will detect a high signal voltage at high rail pressure conditions. The ECM will detect a low signal voltage during low rail pressure conditions.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fuel rail pressure signal voltage is greater than 4.8-VDC for more than 1 second.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0193	FRP_SEN/CIRC (Fuel Rail Pressure Sensor "A" Circuit High)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	Fuel rail pressure sensor (171)
		Threshold	Fuel Rail pressure sensor > 4,810 mV (2,200 bar absolute)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Fuel pressure sensor
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0193 being current on the CONSULT screen.

Is DTC P0193 current?

YES >> Go to EC-387, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013071808

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for sensor supply DTCs P0653 or P06D8 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0193 being past on the CONSULT screen.

Is DTC P0193 detected as past?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 3.

3.INSPECT FUEL RAIL PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel rail pressure sensor harness connector F139.
3. Inspect the engine harness and fuel rail sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fuel rail pressure sensor harness connector F139.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0192 become current and DTC P0193 become past?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the fuel rail pressure sensor harness connector F139.
3. Turn ignition switch ON.
4. Measure the voltage between fuel rail pressure sensor harness connector F139 terminals 1 and 3.

Fuel rail pressure sensor		Fuel rail pressure sensor		Voltage (Approx.)
Connector	Terminal	Connector	Terminal	
F139	3	F139	1	4.75-5.25

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect the fuel rail pressure sensor harness connector F139.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0193 become current?

YES >> Replace the fuel rail pressure sensor. Refer to EM-296, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals

- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between terminal 106 and terminal 171 at the ECM engine connector F101.
4. Turn ignition switch ON. Wait 30 seconds.
5. With CONSULT check for current ENGINE diagnostic trouble codes.

Did P0192 DTC become current and P0193 DTC become past?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0193 being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for a short circuit.

10. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect harness connector F101 from the ECM.
3. Turn ignition switch ON.
4. Measure the voltage between terminals 106 and 128 at the ECM connector F101.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	128	106	4.75-5.25

Is the inspection result normal?

YES >> GO TO 12.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

12.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0193 being past on the CONSULT screen.

Is DTC P0193 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open.

P0201 FUEL INJECTOR (CYLINDER 1)

DTC Description

INFOID:0000000013065664

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected an open circuit in the engine wiring harness or injector actuator.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0201	CYL1 INJECTOR (Injector Circuit/Open – Cylinder 1)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 1 < 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge time for cylinder number 1 ≥ 35.2 μsecs • Actuator charge up voltage for cylinder number 1 ≤ injector charge voltage set point +80V • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or all of the following: • Actuator charging time for cylinder number 1 ≥ 5 μsecs • Actuator discharge time for cylinder number 1 ≤ 35.2 μsecs • Actuator charge up voltage for cylinder number 1 > injector charge voltage set point +80V • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.8A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Fuel injector
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0201 being current on the CONSULT screen.

Is DTC P0201 current?

YES >> Go to EC-392, "Diagnosis Procedure".

NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065665

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0201 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT HARNESS CONNECTIONS

1. Turn ignition switch OFF.
2. Check the following connections:

- ECM harness connector
- Injector harness connectors

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 1 harness connector F113.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK FOR OPEN CIRCUIT IN THE INJECTOR

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F113.
3. Measure the resistance between the injector 1 terminal 1 and 2.

Is resistance greater than 210 ohms?

YES >> Replace the injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".
NO >> GO TO 5.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F113.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 1 harness connector F113 terminal 2 and ECM harness connector F101 terminal 176.

Fuel injector no. 1		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F113	2	F101	176	< 10 Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the harness for a open.

7.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F113.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 1 harness connector F113 terminal 1 and ECM harness connector F101 terminal 155.

Fuel injector no. 1		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F113	1	F101	155	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the harness for a open.

8.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0201 DTC current?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair complete.

P0202 FUEL INJECTOR (CYLINDER 2)

DTC Description

INFOID:0000000013065666

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each Group of Injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel Injectors 2, 3, 5, and 8 make-up Group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected an open circuit in the engine wiring harness or injector actuator.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0202	CYL2 INJECTOR (Injector Circuit/Open – Cylinder 2)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 2 < 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge time for cylinder number 2 ≥ 35.2 μsecs • Actuator charge up voltage for cylinder number 2 ≤ injector charge voltage set point +80V • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or all of the following: • Actuator charging time for cylinder number 2 ≥ 5 μsecs • Actuator discharge time for cylinder number 2 ≤ 35.2 μsecs • Actuator charge up voltage for cylinder number 2 > injector charge voltage set point +80V • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.8A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Fuel injector
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0202 being current on the CONSULT screen.

Is DTC P0202 current?

YES >> Go to EC-395, "Diagnosis Procedure".

NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065667

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0202 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT HARNESS CONNECTIONS

1. Turn ignition switch OFF.
2. Check the following connections:

- ECM harness connector
- Injector harness connectors

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 2 harness connector F129.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK FOR OPEN CIRCUIT IN THE INJECTOR

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F129.
3. Measure the resistance between the injector 2 terminal 1 and 2.

Is resistance greater than 210 ohms?

YES >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".
NO >> GO TO 5.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F129.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 2 harness connector F129 terminal 2 and ECM harness connector F101 terminal 92.

Fuel injector no. 2		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F129	2	F101	92	< 10 Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the harness for a open.

7.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F129.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 2 harness connector F129 terminal 1 and ECM harness connector F101 terminal 113.

Fuel injector no. 2		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F129	1	F101	113	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the harness for a open.

8.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0202 DTC current?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair complete.

P0203 FUEL INJECTOR (CYLINDER 3)

DTC Description

INFOID:0000000013065668

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected an open circuit in the engine wiring harness or injector actuator.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0203	CYL3 INJECTOR (Injector Circuit/Open – Cylinder 3)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 3 < 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge time for cylinder number 3 ≥ 35.2 μsecs • Actuator charge up voltage for cylinder number 3 ≤ injector charge voltage set point +80V • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or all of the following: • Actuator charging time for cylinder number 3 ≥ 5 μsecs • Actuator discharge time for cylinder number 3 ≤ 35.2 μsecs • Actuator charge up voltage for cylinder number 3 > injector charge voltage set point +80V • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.8A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Fuel injector
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0203 being current on the CONSULT screen.

Is DTC P0203 current?

YES >> Go to EC-398, "Diagnosis Procedure".

NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065669

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0203 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT HARNESS CONNECTIONS

1. Turn ignition switch OFF.
2. Check the following connections:

- ECM harness connector
- Injector harness connectors

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 3 harness connector F115.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK FOR OPEN CIRCUIT IN THE INJECTOR

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F115.
3. Measure the resistance between the injector 3 terminal 1 and 2.

Is resistance greater than 210 ohms?

YES >> Replace the injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".
NO >> GO TO 5.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F115.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 3 harness connector F115 terminal 2 and ECM harness connector F101 terminal 95.

Fuel injector no. 3		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F115	2	F101	95	< 10 Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the harness for a open.

7.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F115.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 3 harness connector F115 terminal 1 and ECM harness connector F101 terminal 116.

Fuel injector no. 3		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F115	1	F101	116	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the harness for a open.

8.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0203 DTC current?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair complete.

P0204 FUEL INJECTOR (CYLINDER 4)

DTC Description

INFOID:0000000013065670

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of Injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected an open circuit in the engine wiring harness or injector actuator.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0204	CYL4 INJECTOR (Injector Circuit/Open – Cylinder 4)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 4 < 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge time for cylinder number 4 ≥ 35.2 μsecs • Actuator charge up voltage for cylinder number 4 ≤ injector charge voltage set point +80V • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or all of the following: • Actuator charging time for cylinder number 4 ≥ 5 μsecs • Actuator discharge time for cylinder number 4 ≤ 35.2 μsecs • Actuator charge up voltage for cylinder number 4 > injector charge voltage set point +80V • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.8A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Fuel injector
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0204 being current on the CONSULT screen.

Is DTC P0204 current?

YES >> Go to EC-401, "Diagnosis Procedure".

NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065671

1. CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0204 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2. INSPECT HARNESS CONNECTIONS

1. Turn ignition switch OFF.
2. Check the following connections:

- ECM harness connector
- Injector harness connectors

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 4 harness connector F131.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR OPEN CIRCUIT IN THE INJECTOR

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F131.
3. Measure the resistance between the injector 4 terminal 1 and 2.

Is resistance greater than 210 ohms?

YES >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".
NO >> GO TO 5.

5. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F131.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 4 harness connector F131 terminal 2 and ECM harness connector F101 terminal 178.

Fuel injector no. 4		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F131	2	F101	178	< 10 Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the harness for a open.

7.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F131.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 4 harness connector F131 terminal 1 and ECM harness connector F101 terminal 157.

Fuel injector no. 4		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F131	1	F101	157	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the harness for a open.

8.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0204 DTC current?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair complete.

P0205 FUEL INJECTOR (CYLINDER 5)

DTC Description

INFOID:0000000013197410

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected an open circuit in the engine wiring harness or injector actuator.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0205	CYL5 INJECTOR (Injector Circuit/Open – Cylinder 5)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 5 < 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge time for cylinder number 5 ≥ 35.2 μsecs • Actuator charge up voltage for cylinder number 5 ≤ injector charge voltage set point +80V • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or all of the following: • Actuator charging time for cylinder number 5 ≥ 5 μsecs • Actuator discharge time for cylinder number 5 ≤ 35.2 μsecs • Actuator charge up voltage for cylinder number 5 > injector charge voltage set point +80V • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.8A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Fuel injector
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0205 being current on the CONSULT screen.

Is DTC P0205 current?

YES >> Go to EC-404, "Diagnosis Procedure".

NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013197411

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0205 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT HARNESS CONNECTIONS

1. Turn ignition switch OFF.
2. Check the following connections:

- ECM harness connector
- Injector harness connectors

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 5 harness connector F117.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK FOR OPEN CIRCUIT IN THE INJECTOR

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F117.
3. Measure the resistance between the injector 5 terminal 1 and 2.

Is resistance greater than 210 ohms?

YES >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".
NO >> GO TO 5.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F117.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 5 harness connector F117 terminal 2 and ECM harness connector F101 terminal 94.

Fuel injector no. 5		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F117	2	F101	94	< 10 Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the harness for a open.

7.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F117.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 5 harness connector F117 terminal 1 and ECM harness connector F101 terminal 115.

Fuel injector no. 5		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F117	1	F101	115	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the harness for a open.

8.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0205 DTC current?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair complete.

P0206 FUEL INJECTOR (CYLINDER 6)

DTC Description

INFOID:0000000013197412

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected an open circuit in the engine wiring harness or injector actuator.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0206	CYL6 INJECTOR (Injector Circuit/Open – Cylinder 6)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 6 < 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge time for cylinder number 6 ≥ 35.2 μsecs • Actuator charge up voltage for cylinder number 6 ≤ injector charge voltage set point +80V • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or all of the following: • Actuator charging time for cylinder number 6 ≥ 5 μsecs • Actuator discharge time for cylinder number 6 ≤ 35.2 μsecs • Actuator charge up voltage for cylinder number 6 > injector charge voltage set point +80V • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.8A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Fuel injector
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0206 being current on the CONSULT screen.

Is DTC P0206 current?

YES >> Go to EC-407, "Diagnosis Procedure".

NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013197413

1. CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0206 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2. INSPECT HARNESS CONNECTIONS

1. Turn ignition switch OFF.
2. Check the following connections:

- ECM harness connector
- Injector harness connectors

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 6 harness connector F133.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR OPEN CIRCUIT IN THE INJECTOR

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F133.
3. Measure the resistance between the injector 6 terminal 1 and 2.

Is resistance greater than 210 ohms?

YES >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 5.

5. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F133.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 6 harness connector F133 terminal 2 and ECM harness connector F101 terminal 179.

Fuel injector no. 6		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F133	2	F101	179	< 10 Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the harness for a open.

7.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F133.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 6 harness connector F133 terminal 1 and ECM harness connector F101 terminal 158.

Fuel injector no. 6		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F133	1	F101	158	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the harness for a open.

8.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0206 DTC current?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair complete.

P0207 FUEL INJECTOR (CYLINDER 7)

DTC Description

INFOID:0000000013104072

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected an open circuit in the engine wiring harness or injector actuator.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0207	CYL7 INJECTOR (Injector Circuit/Open – Cylinder 7)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 7 < 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge time for cylinder number 7 ≥ 35.2 μsecs • Actuator charge up voltage for cylinder number 7 ≤ injector charge voltage set point +80V • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or all of the following: • Actuator charging time for cylinder number 7 ≥ 5 μsecs • Actuator discharge time for cylinder number 7 ≤ 35.2 μsecs • Actuator charge up voltage for cylinder number 7 > injector charge voltage set point +80V • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.8A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Fuel injector
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0207 being current on the CONSULT screen.

Is DTC P0207 current?

YES >> Go to EC-410, "Diagnosis Procedure".

NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013104073

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0207 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT HARNESS CONNECTIONS

1. Turn ignition switch OFF.
2. Check the following connections:

- ECM harness connector
- Injector harness connectors

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 7 harness connector F119.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK FOR OPEN CIRCUIT IN THE INJECTOR

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F119.
3. Measure the resistance between the injector 7 terminal 1 and 2.

Is resistance greater than 210 ohms?

YES >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".
NO >> GO TO 5.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F119.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 7 harness connector F119 terminal 2 and ECM harness connector F101 terminal 177.

Fuel injector no. 7		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F119	2	F101	177	< 10 Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the harness for a open.

7.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F119.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 7 harness connector F119 terminal 1 and ECM harness connector F101 terminal 156.

Fuel injector no. 7		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F119	1	F101	156	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the harness for a open.

8.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0207 DTC current?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair complete.

P0208 FUEL INJECTOR (CYLINDER 8)

DTC Description

INFOID:0000000013104284

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected an open circuit in the engine wiring harness or injector actuator.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0208	CYL8 INJECTOR (Injector Circuit/Open – Cylinder 8)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 8 < 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge time for cylinder number 8 ≥ 35.2 μsecs • Actuator charge up voltage for cylinder number 8 ≤ injector charge voltage set point +80V • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or all of the following: • Actuator charging time for cylinder number 8 ≥ 5 μsecs • Actuator discharge time for cylinder number 8 ≤ 35.2 μsecs • Actuator charge up voltage for cylinder number 8 > injector charge voltage set point +80V • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.8A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Fuel injector
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0208 being current on the CONSULT screen.

Is DTC P0208 current?

YES >> Go to EC-413, "Diagnosis Procedure".

NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013104285

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0208 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT HARNESS CONNECTIONS

1. Turn ignition switch OFF.
2. Check the following connections:

- ECM harness connector
- Injector harness connectors

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 8 harness connector F135.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK FOR OPEN CIRCUIT IN THE INJECTOR

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F135.
3. Measure the resistance between the injector 8 terminal 1 and 2.

Is resistance greater than 210 ohms?

YES >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 5.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F135.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 8 harness connector F135 terminal 2 and ECM harness connector F101 terminal 93.

Fuel injector no. 8		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F135	2	F101	93	< 10 Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the harness for a open.

7.CHECK FOR OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector harness connector F135.
3. Disconnect the ECM harness connector F101.
4. Measure the resistance between the injector 8 harness connector F135 terminal 1 and ECM harness connector F101 terminal 114.

Fuel injector no. 8		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F135	1	F101	114	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the harness for a open.

8.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0208 DTC current?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair complete.

P020A FUEL INJECTOR CYLINDER 1 TIMING

DTC Description

INFOID:0000000013074791

The Engine Control Module (ECM) can detect when inaccurate fuel injection occurs by monitoring fuel rail pressure and engine speed. During certain engine conditions, the ECM looks at injection on time and engine speed to determine if the injector is meeting the proper fuel quantity. If the fuel quantity is outside the set limits, a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a fueling timing or quantity error for the specified injector.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P020A	(Cylinder 1 Injection Timing)	1	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 1 > reftable38
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle
		2	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 1 < reftable39
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

Fuel injector

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Bring the vehicle to a complete stop.
6. Repeat all of the above steps one more time.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
8. Check for DTC P020A being current on the CONSULT screen.

Is DTC P020A current?

YES >> Go to EC-415, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013074792

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0335, P0016 or P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:
The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3.PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 1.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

4.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P020A DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P020B FUEL INJECTOR CYLINDER 2 TIMING

DTC Description

INFOID:0000000013074793

The Engine Control Module (ECM) can detect when inaccurate fuel injection occurs by monitoring fuel rail pressure and engine speed. During certain engine conditions, the ECM looks at injection on time and engine speed to determine if the injector is meeting the proper fuel quantity. If the fuel quantity is outside the set limits, a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a fueling timing or quantity error for the specified injector.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P020B	(Cylinder 2 Injection Timing)	1	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 2 > reftable38
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle
		2	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 2 < reftable39
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

Fuel injector

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Bring the vehicle to a complete stop.
6. Repeat all of the above steps one more time.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
8. Check for DTC P020B being current on the CONSULT screen.

Is DTC P020B current?

YES >> Go to EC-417, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013074794

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen.

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0335, P0016 or P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:
The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3.PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 2.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

4.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P020A DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P020C FUEL INJECTOR CYLINDER 3 TIMING

DTC Description

INFOID:0000000013074795

The Engine Control Module (ECM) can detect when inaccurate fuel injection occurs by monitoring fuel rail pressure and engine speed. During certain engine conditions, the ECM looks at injection on time and engine speed to determine if the injector is meeting the proper fuel quantity. If the fuel quantity is outside the set limits, a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a fueling timing or quantity error for the specified injector.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P020C	(Cylinder 3 Injection Timing)	1	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 3 > reftable38
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle
		2	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 3 < reftable39
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

Fuel injector

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Bring the vehicle to a complete stop.
6. Repeat all of the above steps one more time.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
8. Check for DTC P020C being current on the CONSULT screen.

Is DTC P020C current?

YES >> Go to EC-419, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013074796

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0335, P0016 or P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:
The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3.PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 3.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

4.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P020A DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P020D FUEL INJECTOR CYLINDER 4 TIMING

DTC Description

INFOID:0000000013074912

The Engine Control Module (ECM) can detect when inaccurate fuel injection occurs by monitoring fuel rail pressure and engine speed. During certain engine conditions, the ECM looks at injection on time and engine speed to determine if the injector is meeting the proper fuel quantity. If the fuel quantity is outside the set limits, a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a fueling timing or quantity error for the specified injector.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P020D	(Cylinder 4 Injection Timing)	1	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 4 > reftable38
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle
		2	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 4 < reftable39
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

Fuel injector

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Bring the vehicle to a complete stop.
6. Repeat all of the above steps one more time.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
8. Check for DTC P020D being current on the CONSULT screen.

Is DTC P020D current?

YES >> Go to EC-421, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013074913

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen.

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0335, P0016 or P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:
The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3.PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 4.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

4.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P020A DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P020E FUEL INJECTOR CYLINDER 5 TIMING

DTC Description

INFOID:0000000013074914

The Engine Control Module (ECM) can detect when inaccurate fuel injection occurs by monitoring fuel rail pressure and engine speed. During certain engine conditions, the ECM looks at injection on time and engine speed to determine if the injector is meeting the proper fuel quantity. If the fuel quantity is outside the set limits, a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a fueling timing or quantity error for the specified injector.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P020E	(Cylinder 5 Injection Timing)	1	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 5 > reftable38
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle
		2	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 5 < reftable39
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

Fuel injector

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Bring the vehicle to a complete stop.
6. Repeat all of the above steps one more time.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
8. Check for DTC P020E being current on the CONSULT screen.

Is DTC P020E current?

YES >> Go to EC-423, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013074915

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0335, P0016 or P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:
The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3.PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 5.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

4.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P020A DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P020F FUEL INJECTOR CYLINDER 6 TIMING

DTC Description

INFOID:0000000013074916

The Engine Control Module (ECM) can detect when inaccurate fuel injection occurs by monitoring fuel rail pressure and engine speed. During certain engine conditions, the ECM looks at injection on time and engine speed to determine if the injector is meeting the proper fuel quantity. If the fuel quantity is outside the set limits, a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a fueling timing or quantity error for the specified injector.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P020F	(Cylinder 6 Injection Timing)	1	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 6 > reftable38
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle
		2	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 6 < reftable39
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

Fuel injector

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Bring the vehicle to a complete stop.
6. Repeat all of the above steps one more time.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
8. Check for DTC P020F being current on the CONSULT screen.

Is DTC P020F current?

YES >> Go to EC-425, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013074917

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0335, P0016 or P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:
The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3.PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 6.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

4.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P020A DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P0217 ENGINE OVER TEMPERATURE

DTC Description

INFOID:0000000013065624

The coolant temperature sensor is a variable resistor sensor and is used to measure the temperature of the coolant of the engine. The ECM supplies 5V to the coolant temperature sensor signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the coolant temperature.

DTC DETECTION LOGIC

The ECM detected the engine coolant temperature was above a threshold and closed the EGR valve to reduce the engine coolant temperature.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0217	Engine Coolant Over Temperature Condition (Engine coolant temperature - condition exists)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Coolant temperature sensor ≥ 120°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

—

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0217 being current on the CONSULT screen.

Is DTC P0217 current?

YES >> Go to EC-427, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065625

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0217 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> The EGR and EGR bypass valves were closed to reduce engine coolant temperature. No repair is necessary. Inspection End.
NO >> Refer to GI-43, "Intermittent Incident".

P0219 ENGINE OVER SPEED

DTC Description

INFOID:0000000013065608

The crankshaft position and camshaft position sensors are hall effect type sensors. The ECM provides a 5V supply to the position sensor and a return circuit. As the teeth on the crankshaft speed ring or the dimples in the back of the camshaft gear move past the position sensor, a signal is generated on the sensor signal circuit. The ECM interprets this signal and converts it to an engine speed. A missing tooth on the crankshaft gear is used by the ECM to determine the position of the engine.

DTC DETECTION LOGIC

The ECM detected the engine had exceeded 4600 rpm.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0219	Engine Overspeed Condition (Engine crankshaft speed/position - most severe level)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Engine speed > 4,650 rpm
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- External fuel sources drawn into the intake air passage
- Reverse powering (motoring) of the engine
- Tampering of the engine speed/position sensors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0219 being current on the CONSULT screen.

Is DTC P0219 current?

YES >> Go to EC-428, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065609

1.CHECK FOR PROPER OPERATING CONDITIONS

1. Turn ignition switch OFF.
2. Check for proper operating conditions.
3. Check if the engine was motoring downhill when the fault was logged.

Was the vehicle motoring downhill?

YES >> GO TO 2.
NO >> Check the base engine for damage due to overspeed condition.

2.CHECK FOR AN ALTERNATE FUEL SOURCE

1. Turn ignition switch OFF.
2. Check for an alternate fuel source.
3. Check if the driver reported a fuel-controlled event where the engine rapidly accelerated to or past 3400 rpm, followed by moderate deceleration to 3400 rpm.

Is there an alternate fuel source?

YES >> Locate any alternate fuel sources, such as operating the engine near flammable vapors, blown turbocharger seals, etc.
NO >> GO TO 3.

3.CHECK THE ENGINE RPM

1. Connect CONSULT.
2. Start engine.
3. Check engine rpm Data Monitor item on the CONSULT screen.
4. Compare the Data Monitor reading to a mechanical tachometer or the combination meter tachometer.

Is the rpm reading correct?

YES >> GO TO 4.
NO >> Refer to EC-566, "DTC Description" and EC-571, "DTC Description".

4.CHECK DTC PRIORITY

1. Check for ENGINE diagnostic trouble codes.
2. Check for DTC P0219 being current on the CONSULT screen when the engine is operating above 3200 rpm.

Is DTC P0219 current at low rpm?

YES >> GO TO 5.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

5.ROAD TEST

1. Road test the vehicle.
2. Check for DTC P0219 being past on the CONSULT screen.

.

Test the vehicle in a road test or the vessel in a sea trail to determine if the overspeed condition is still present.

Is DTC P0219 past?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 1.

P021A FUEL INJECTOR CYLINDER 7 TIMING

DTC Description

INFOID:0000000013069278

The Engine Control Module (ECM) can detect when inaccurate fuel injection occurs by monitoring fuel rail pressure and engine speed. During certain engine conditions, the ECM looks at injection on time and engine speed to determine if the injector is meeting the proper fuel quantity. If the fuel quantity is outside the set limits, a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a fueling timing or quantity error for the specified injector.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P021A	(Cylinder 7 Injection Timing)	1	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 7 > reftable38
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle
		2	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 7 < reftable39
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

Fuel injector

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Bring the vehicle to a complete stop.
6. Repeat all of the above steps one more time.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
8. Check for DTC P021A being current on the CONSULT screen.

Is DTC P021A current?

YES >> Go to EC-430, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069279

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0335, P0016 or P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:
The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3.PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 7.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

4.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P020A DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P021B FUEL INJECTOR CYLINDER 8 TIMING

DTC Description

INFOID:0000000013069375

The Engine Control Module (ECM) can detect when inaccurate fuel injection occurs by monitoring fuel rail pressure and engine speed. During certain engine conditions, the ECM looks at injection on time and engine speed to determine if the injector is meeting the proper fuel quantity. If the fuel quantity is outside the set limits, a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a fueling timing or quantity error for the specified injector.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P021B	(Cylinder 8 Injection Timing)	1	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 8 > reftable38
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle
		2	Diagnosis condition	Engine running at idle
			Signal (terminal)	(–)
			Threshold	Corrected energizing time of injector number 8 < reftable39
			Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

Fuel injector

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Bring the vehicle to a complete stop.
6. Repeat all of the above steps one more time.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
8. Check for DTC P021B being current on the CONSULT screen.

Is DTC P021B current?

YES >> Go to EC-432, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069376

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen.

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0335, P0016 or P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:
The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3.PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 8.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

4.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P020A DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P0237 BOOST PRESSURE SENSOR

DTC Description

INFOID:0000000013085190

The engine control module (ECM) provides a 5V supply and ground to the low pressure turbocharger boost pressure sensor.This sensor monitors the pressure of the compressed air exiting low pressure compressor turbocharger. The ECM interprets the signal voltage into a pressure reading. If the signal voltage is greater or less than a threshold, a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module detected the low pressure turbocharger boost pressure signal voltage is less than 0.2V for a period of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0237	TC_BOOST_SENSOR (Turbocharger/Supercharger Boost Sensor "A" Circuit Low)	Diagnosis condition	Ignition switch ON or engine running
		Signal (terminal)	(196)
		Threshold	Compressor interstage pressure sensor < 0.2V (44.81 kPa)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Low pressure Turbocharger boost pressure sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0237 being current on the CONSULT screen.

Is DTC P0237 current?

YES >> Go to EC-434, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013085191

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0652 or P0653 being current on the CONSULT screen.

Is applicable DTC detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0237 being current on the CONSULT screen.

Is DTC P0237 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT LOW PRESSURE TURBOCHARGER BOOST PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect low pressure turbocharger boost pressure sensor harness connector F105.

3. Inspect the harness connector and low pressure turbocharger boost pressure sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the low pressure turbocharger boost pressure sensor harness connector F198.
3. Turn ignition switch ON.
4. Measure the voltage between low pressure turbocharger boost pressure sensor harness connector F198 terminals 1 and 2.

Low pressure turbocharger boost pressure sensor			Voltage (Approx.)
Connector	Terminal	Terminal	
F198	1	2	4.75-5.25

Is inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect low pressure turbocharger boost pressure sensor harness connector F198.
3. Connect a jumper wire between low pressure turbocharger boost pressure sensor harness connector F198 terminal 1 and 3.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0238 DTC become current and P0237 become past?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK DTCS AND SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect low pressure turbocharger boost pressure sensor harness connector F198.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0237 become current?

YES >> Replace low pressure turbocharger boost pressure sensor. Refer to EM-245, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins

- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between terminal 106 and 127 at the ECM connector F101.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	106	127	4.75-5.25

Is inspection the result normal?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0237 being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace the harness for an open or shorted circuit.

10.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11.CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between ECM harness connector F101 terminal 106 and 196.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0238 become current and P0237 become past?

YES >> GO TO 12.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

12. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0237 being past on the CONSULT screen.

Is DTC P0237 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open or pin-to-pin short.

P0238 BOOST PRESSURE SENSOR

DTC Description

INFOID:0000000013084614

The engine control module (ECM) provides a 5V supply and ground to the low pressure turbocharger boost pressure sensor.This sensor monitors the pressure of the compressed air exiting low pressure compressor turbocharger. The ECM interprets the signal voltage into a pressure reading. If the signal voltage is greater or less than a threshold, a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module detected the low pressure turbocharger boost pressure signal voltage is greater than 4.8V for a period of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0238	TC_BOOST_SENSOR (Turbocharger/Supercharger Boost Sensor "A" Circuit High)	Diagnosis condition	Ignition switch ON or engine running.
		Signal (terminal)	(196)
		Threshold	Compressor interstage pressure sensor value > 4.8V (620.53 kPa)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Low pressure Turbocharger boost pressure sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0238 being current on the CONSULT screen.

Is DTC P0238 current?

YES >> Go to EC-438, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084615

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0652 or P0653 being current on the CONSULT screen.

Is applicable DTC detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0238 being current on the CONSULT screen.

Is DTC P0238 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT LOW PRESSURE TURBOCHARGER BOOST PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.

2. Disconnect low pressure turbocharger boost pressure sensor harness connector F105.
3. Inspect the harness connector and low pressure turbocharger boost pressure sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect low pressure turbocharger boost pressure sensor harness connector F105.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0237 DTC become current and P0238 become past?

YES >> GO TO 5.
NO >> GO TO 10.

5. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the low pressure turbocharger boost pressure sensor harness connector F105.
3. Turn ignition switch ON.
4. Measure the voltage between low pressure turbocharger boost pressure sensor harness connector F105 terminals 1 and 2.

Low pressure turbocharger boost pressure sensor			Voltage (Approx.)
Connector	Terminal	Terminal	
F105	1	2	4.75-5.25

Is inspection result normal?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK DTCS AND SENSOR CONDITION

1. Turn ignition switch OFF.
2. Disconnect low pressure turbocharger boost pressure sensor harness connector F105.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0238 become current?

YES >> Replace low pressure turbocharger boost pressure sensor. Refer to EM-245, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins

- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0237 become current and P0238 become past?

YES >> GO TO 9.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

9. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0238 being past on the CONSULT screen.

Is DTC P0238 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for a pin-to-pin short.

10. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between terminal 106 and 196 at the ECM connector F101.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	106	196	4.75-5.25

Is inspection the result normal?

YES >> GO TO 12.

NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

12. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0238 being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace the harness for an open circuit.

P0252 FUEL PUMP METERING CONTROL RANGE/PERFORMANCE

DTC Description

INFOID:0000000013065658

The circuit is a pulse-width modulation (PWM) driver in the engine control module (ECM) that controls the fuel pump actuator.The actuator is grounded in the ECM. The actuator is normally open. The PWM duty cycle to the fuel pump actuator depends on the difference between desired rail pressure and sensed rail pressure.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Fuel Pump Actuator driver has overheated

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0252	[Injection Pump Fuel Metering Control "A" Range/Performance (Cam/Rotor/Injector)]	Diagnosis condition	Ignition switch is ON
		Signal (terminal)	(–)
		Threshold	Volume control valve (VCV) driver ASIC temperature ≥ 165°C
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON

POSSIBLE CAUSE

- Fuel pump actuator
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0252 being current on the CONSULT screen.

Is DTC P0252 current?

YES >> Go to EC-442, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065659

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have high past counts on the CONSULT screen:

- P0253
- P0254
- P0667

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0252 being current on the CONSULT screen.

Is DTC P0252 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT FUEL PUMP ACTUATOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel pump actuator harness connector F123.
3. Inspect the harness connector and fuel pump actuator pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fuel pump actuator harness connector F123.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0254 DTC become current and P0252 become past?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK DTCS AND SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect fuel pump actuator harness connector F123.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0252 become current?

YES >> GO TO 6.
NO >> The removal and installation of the connector corrected the malfunction.

6. CHECK FUEL PUMP ACTUATOR

1. Turn ignition switch ON.
2. Using CONSULT, perform High Fuel Pressure Actuator Test.

Is the inspection result normal?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Replace the fuel pump actuator. Refer to EM-476, "Removal and Installation".

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0254 become current and P0252 become past?

YES >> Repair or replace harness for a short circuit.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P0253 FUEL PUMP METERING CONTROL LOW

DTC Description

INFOID:0000000013065660

The circuit is a pulse-width modulation (PWM) driver in the engine control module (ECM) that controls the fuel pump pressurizing assembly. The actuator is grounded in the ECM. The actuator is normally open. The PWM duty cycle to the fuel pump pressurizing assembly depends on the difference between desired rail pressure and sensed rail pressure.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fuel pump actuator signal voltage is less than 2.7V for 1 second commanded off.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0253	[Injection Pump Fuel Metering Control "A" Low (Cam/Rotor/Injector)]	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Volume control valve (VCV) driver voltage < 2.7V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- Fuel pump actuator
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0253 being current on the CONSULT screen.

Is DTC P0253 current?

YES >> Go to EC-445, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065661

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0253 being current on the CONSULT screen.

Is DTC P0253 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL PUMP ACTUATOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel pump actuator harness connector F123.
3. Inspect the harness connector and fuel pump actuator pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fuel pump actuator harness connector F123.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0254 DTC become current and P0253 become past?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK DTCS AND SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect fuel pump actuator harness connector F123.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0253 become current?

YES >> Replace fuel pump actuator. Refer to EM-476, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0254 become current and P0253 become past?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7.CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the fuel pump actuator harness connector F123.
4. Measure the resistance between the ECM harness connector terminal 118 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	118	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 8.
NO >> Repair or replace the engine harness for a short.

8. CHECK FOR A PIN-TO-GROUND SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the fuel pump actuator harness connector F123.
4. Measure the resistance between the ECM harness connector F101 terminal 118 and ground.

ECM		Ground	Resistance
Connector	Terminal		
F101	118	—	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for a short to ground.

9. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0253 become past?

YES >> The removal and installation of the connector corrected the fault.
NO >> Troubleshooting procedures need to be repeated from the beginning. A failure mode should have been be detected.

P0254 FUEL PUMP METERING CONTROL HIGH

DTC Description

INFOID:0000000013065656

The circuit is a pulse-width modulation (PWM) driver in the engine control module (ECM) that controls the fuel pump pressurizing assembly. The actuator is grounded in the ECM. The actuator is normally open. The PWM duty cycle to the fuel pump pressurizing assembly depends on the difference between desired rail pressure and sensed rail pressure.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a short to battery, short pin-to-pin, or open circuit in the fuel pump actuator circuit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0254	[Injection Pump Fuel Metering Control "A" High (Cam/Rotor/Injector)]	1	Diagnosis condition	Ignition switch is ON or engine is running
			Signal (terminal)	(–)
			Threshold	Volume control valve (VCV) driver voltage < 245V
			Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running
		2	Diagnosis condition	Ignition switch is ON or engine is running
			Signal (terminal)	(–)
			Threshold	Volume control valve (VCV) driver voltage > 600mV
			Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0254 being current on the CONSULT screen.

Is DTC P0254 current?

YES >> Go to EC-448, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065657

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0254 being current on the CONSULT screen.

Is DTC P0254 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL PUMP ACTUATOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel pump actuator harness connector F123.
3. Inspect the harness connector and fuel pump actuator pins for the following:

- Loose connector
- Corroded pins

- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fuel pump actuator harness connector F123.
3. Connect a jumper wire between fuel pump actuator harness connector F123 terminal 1 and 2.
4. Turn ignition switch ON and wait seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0253 become current and P0254 become past?

YES >> GO TO 4.
NO >> GO TO 5.

4. CHECK DTCS AND FUEL PUMP ACTUATOR CONDITION

1. Turn ignition switch OFF.
2. Connect fuel pump actuator harness connector F123.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0254 become current?

YES >> Replace fuel pump actuator. Refer to EM-476, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

5. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between the fuel pump actuator signal circuit pin 118 and battery voltage at the ECM harness connector F101.
4. Turn ignition switch ON and wait 30 seconds.

Did P0253 DTC become current and P0254 become past?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7. CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Measure the resistance between the ECM harness connector F101 terminal 118 and the fuel pressure relief valve harness connector F123 terminal 2.

ECM		Fuel pump actuator		Resistance
Connector	Terminal	Connector	Terminal	
F101	118	F123	2	< 10 Ω

Is resistance less than 10 ohms?

YES >> GO TO 8.
NO >> Repair or replace the engine harness for an open.

8. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the fuel pump actuator harness connector F123.
4. Measure the resistance between the ECM harness connector terminal 118 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	118	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for a short.

9. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0254 become past?

YES >> The removal and installation of the connector corrected the fault.
NO >> Troubleshooting procedures need to be repeated from the beginning. A failure mode should have been be detected. Refer to EC-448, "DTC Description".

P0257 FUEL PUMP METERING CONTROL RANGE/PERFORMANCE

DTC Description

INFOID:0000000013065662

The circuit is a pulse-width modulation (PWM) driver in the engine control module (ECM) that controls the high pressure common rail fuel pressure relief valve. The high pressure common rail fuel pressure relief valve is grounded in the ECM. The high pressure common rail fuel pressure relief valve is normally open. The PWM duty cycle to the high pressure common rail fuel pressure relief valve depends on the difference between desired rail pressure and sensed rail pressure.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the internal temperature of the pressure relief valve driver has exceeded 160°C.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0257	[Injection Pump Fuel Metering Control "B" Range/Performance (Cam/Rotor/Injector)]	Diagnosis condition	Ignition switch is ON or engine is running
		Signal (terminal)	(–)
		Threshold	Fuel pressure relief valve driver has exceeded > 160°C
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- Fuel pressure relief valve
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0257 being current on the CONSULT screen.

Is DTC P0257 current?

YES >> Go to EC-451, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065663

1.CHECK DTC PRIORITY

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have high past counts on the CONSULT screen:

- P009C
- P009D
- P0667

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0257 being current on the CONSULT screen.

Is DTC P0257 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT FUEL PRESSURE RELIEF VALVE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel pressure relief valve harness connector F122.
3. Inspect the harness connector and fuel pressure relief valve pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fuel pressure relief valve harness connector F122.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P009D become current and P0257 become past?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK DTCS AND SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect fuel pressure relief valve harness connector F122.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0257 become current?

YES >> GO TO 6.
NO >> The removal and installation of the connector corrected the malfunction.

6. CHECK FUEL PRESSURE RELIEF VALVE

1. Turn ignition switch ON.
2. Using CONSULT, perform High Fuel Pressure Actuator Test.

Is the inspection result normal?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Replace the fuel pressure relief valve. Refer to EM-474, "Removal and Installation".

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage

- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P009D become current and P0257 become past?

YES >> Repair or replace the engine harness for a short.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P0261 FUEL INJECTOR (CYLINDER 1)

DTC Description

INFOID:0000000013070711

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector low side driver is shorted to another injector or a high side driver.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0261	CYL1 INJECTOR (Cylinder 1 Injector Circuit Low)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 1 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or • Actuator charging time ≤ 100 secs • Actuator charging time for cylinder number 1 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge voltage < injector charge voltage set-point 0.55V • Actuator charge up voltage for cylinder number 1 < injector charge voltage set point +80V • Actuator charge up voltage for cylinder number 1 < injector charge voltage set point 0.7V • Actuator charge up voltage for cylinder number 1 < injector charge voltage set point 0.55V • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0261 being current on the CONSULT screen.

Is DTC P0261 current?

YES >> Go to EC-455, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070712

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0261 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 1 harness connector F113.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

- Measure the resistance between the injector 1 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector.
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 176 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	176	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace harness for a short.

6. CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 155 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	155	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace harness for a short.

7. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0261 DTC past?

YES >> GO TO 8.
NO >> Replace the injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

8. ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0261 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-454, "DTC Description".
NO >> Repair complete.

P0262 FUEL INJECTOR (CYLINDER 1)

DTC Description

INFOID:0000000013065672

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0262	CYL1 INJECTOR (Cylinder 1 Injector Circuit High)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time > 100 secs • Actuator charging time for cylinder number 1 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0262 being current on the CONSULT screen.

Is DTC P0262 current?

YES >> Go to EC-457, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065673

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0262 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 1 harness connector F113.

3. Inspect the harness and connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

• Measure the resistance between the injector 1 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Disconnect ECM from engine harness connector F101.
2. Inspect the ECM connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

• Measure the resistance between ECM harness connector F101 terminal 176 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	176	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace harness for a short.

6.CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 155 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	155	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace harness for a short.

7. CHECK THE INJECTOR DRAIN LINE

1. Turn ignition switch ON.
2. Connect CONSULT and perform Fuel Injector Line Restriction Test on the bank of this injector.

Injector drain flow meets specifications?

YES >> GO TO 8.
NO >> Replace the injector drain line. Refer to EM-467, "Removal and Installation".

8. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Start engine.
4. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0262 DTC past?

YES >> GO TO 9.
NO >> Replace the injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

9. ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0262 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-457, "DTC Description".
NO >> Repair complete.

P0263 CYLINDER 1 COMBUSTION DISORDER

DTC Description

INFOID:0000000013068222

Fuel Balancing is intended to decrease variances in fuel quantity from cylinder to cylinder. The change in engine speed due to a single cylinder combustion is calculated. The ECM will correct the fuel injected into each cylinder to reduce the variance in engine speed from cylinder to cylinder. If the variance is too large, this DTC will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fueling correction for this cylinder exceeded its allowable limit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0263	(Cylinder 1 Contribution/Balance)	Diagnosis condition	Engine running at idle
		Signal (terminal)	(–)
		Threshold	Cylinder number 1 fuel balance control correction quantity > reftable27
		Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

- Fuel injector
- High blow-by when engine is loaded
- Turbocharger

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 5 minutes.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0263 being current on the CONSULT screen.

Is DTC P0263 current?

YES >> Go to EC-460, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068223

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0016
- P0300
- P0301
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:

The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3. PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 1.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

4. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0263 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P0264 FUEL INJECTOR (CYLINDER 2)

DTC Description

INFOID:0000000013070731

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector low side driver is shorted to another injector or a high side driver.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0264	CYL2 INJECTOR (Cylinder 2 Injector Circuit Low)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 2 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or • Actuator charging time ≤ 100 secs • Actuator charging time for cylinder number 2 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge voltage < injector charge voltage set-point 0.55V • Actuator charge up voltage for cylinder number 2 < injector charge voltage set point +80V • Actuator charge up voltage for cylinder number 2 < injector charge voltage set point 0.7V • Actuator charge up voltage for cylinder number 2 < injector charge voltage set point 0.55V • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0264 being current on the CONSULT screen.

Is DTC P0264 current?

YES >> Go to EC-463, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070732

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0264 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 2 harness connector F129.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

- Measure the resistance between the injector 2 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

- Measure the resistance between ECM harness connector F101 terminal 92 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	92	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6. CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

- Measure the resistance between ECM harness connector F101 terminal 133 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	113	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace harness for a short.

7. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0264 DTC past?

YES >> GO TO 8.
NO >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

8. ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0264 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-462, "DTC Description".
NO >> Repair complete.

P0265 FUEL INJECTOR (CYLINDER 2)

DTC Description

INFOID:0000000013065680

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0265	CYL2 INJECTOR (Cylinder 2 Injector Circuit High)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time > 100 secs • Actuator charging time for cylinder number 2 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0265 being current on the CONSULT screen.

Is DTC P0265 current?

YES >> Go to EC-465, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065681

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0265 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 2 harness connector F129.

3. Inspect the harness and connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

• Measure the resistance between the injector 2 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 92 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	92	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6.CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

• Measure the resistance between ECM harness connector F101 terminal 133 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	113	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7. CHECK THE INJECTOR DRAIN LINE

1. Turn ignition switch ON.
2. Connect CONSULT and perform Fuel Injector Line Restriction Test on the bank of this injector.

Injector drain flow meets specifications?

YES >> GO TO 8.
NO >> Replace the injector drain line.

8. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Start engine.
4. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0265 DTC past?

YES >> GO TO 9.
NO >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

9. ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0265 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-465, "DTC Description".
NO >> Repair complete.

P0266 CYLINDER 2 COMBUSTION DISORDER

DTC Description

INFOID:0000000013068224

Fuel Balancing is intended to decrease variances in fuel quantity from cylinder to cylinder. The change in engine speed due to a single cylinder combustion is calculated. The ECM will correct the fuel injected into each cylinder to reduce the variance in engine speed from cylinder to cylinder. If the variance is too large, this DTC will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fueling correction for this cylinder exceeded its allowable limit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0266	(Cylinder 2 Contribution/Balance)	Diagnosis condition	Engine running at idle
		Signal (terminal)	(–)
		Threshold	Cylinder number 2 fuel balance control correction quantity > reftable27
		Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

- Fuel injector
- High blow-by when engine is loaded
- Turbocharger

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 5 minutes.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0266 being current on the CONSULT screen.

Is DTC P0266 current?

YES >> Go to EC-468, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068225

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0016
- P0300
- P0301
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:

The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3. PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 2.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

4. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0266 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P0267 FUEL INJECTOR (CYLINDER 3)

DTC Description

INFOID:0000000013072911

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector low side driver is shorted to another injector or a high side driver.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0267	CYL3 INJECTOR (Cylinder 3 Injector Circuit Low)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 3 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or • Actuator charging time ≤ 100 secs • Actuator charging time for cylinder number 3 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge voltage < injector charge voltage set-point 0.55V • Actuator charge up voltage for cylinder number 3 < injector charge voltage set point +80V • Actuator charge up voltage for cylinder number 3 < injector charge voltage set point 0.7V • Actuator charge up voltage for cylinder number 3 < injector charge voltage set point 0.55V • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0267 being current on the CONSULT screen.

Is DTC P0267 current?

YES >> Go to EC-471, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072912

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0267 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 3 harness connector F115.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

- Measure the resistance between the injector 3 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 95 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	95	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6.CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

- Measure the resistance between ECM harness connector F101 terminal 116 and all other terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	116	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7.CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0267 DTC past?

YES >> GO TO 8.
NO >> Replace the injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

8.ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0267 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-470, "DTC Description".
NO >> Repair complete.

P0268 FUEL INJECTOR (CYLINDER 3)

DTC Description

INFOID:0000000013065676

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0268	CYL3 INJECTOR (Cylinder 3 Injector Circuit High)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time > 100 secs • Actuator charging time for cylinder number 3 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0268 being current on the CONSULT screen.

Is DTC P0268 current?

YES >> Go to EC-473, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065677

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0268 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 3 harness connector F115.

3. Inspect the harness and connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

• Measure the resistance between the injector 3 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT HARNESS

• Measure the resistance between ECM harness connector F101 terminal 95 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	95	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6.CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

• Measure the resistance between ECM harness connector F101 terminal 116 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	116	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7. CHECK THE INJECTOR DRAIN LINE

1. Turn ignition switch ON.
2. Connect CONSULT and perform Fuel Injector Line Restriction Test on the bank of this injector.

Injector drain flow meets specifications?

YES >> GO TO 8.
NO >> Replace the injector drain line.

8. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Start engine.
4. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0268 DTC past?

YES >> GO TO 9.
NO >> Replace the injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

9. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0268 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-473, "DTC Description".
NO >> Repair complete.

P0269 CYLINDER 3 COMBUSTION DISORDER

DTC Description

INFOID:0000000013068292

Fuel Balancing is intended to decrease variances in fuel quantity from cylinder to cylinder. The change in engine speed due to a single cylinder combustion is calculated. The ECM will correct the fuel injected into each cylinder to reduce the variance in engine speed from cylinder to cylinder. If the variance is too large, this DTC will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fueling correction for this cylinder exceeded its allowable limit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0269	(Cylinder 3 Contribution/Balance)	Diagnosis condition	Engine running at idle
		Signal (terminal)	(–)
		Threshold	Cylinder number 3 fuel balance control correction quantity > reftable27
		Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

- Fuel injector
- High blowby when engine is loaded
- Turbocharger

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 5 minutes.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0269 being current on the CONSULT screen.

Is DTC P0269 current?

YES >> Go to EC-476, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068293

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0016
- P0300
- P0301
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:

The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3. PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 3.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

4. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0269 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P026A CHARGE AIR COOLER EFFICIENCY BELOW NORMAL

DTC Description

INFOID:0000000013073212

The ECM supplies 5V to the Charge Air Cooler outlet temperature signal circuit, and monitors the change in voltage caused by changes in the resistance of the sensor to determine the Charge Air Cooler outlet temperature. When the intake air is cold, the sensor (or thermistor) resistance is high. The ECM signal voltage only pulls down a small amount through the sensor to a ground. Therefore, the ECM senses a high signal voltage or low temperature. When the intake air is warm, the sensor resistance is low. The signal voltage pulls down a large amount. Therefore, the ECM senses a low signal voltage, or a high temperature.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Charge Air Cooler Temperature was higher than estimated.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P026A	(Charge Air Cooler Efficiency Below Threshold)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Cumulative sum of error in 50 seconds is > 600°C, which is ≥ 12°C. Where tolerance is defined as 0°C.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Intake manifold temperature sensor
- Charge-air cooler.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P026A being current on the CONSULT screen.

Is DTC P026A current?

YES >> Go to EC-478, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073213

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- P007B
- P007C
- P007D

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".

NO >> GO TO 2.

2. CHECK CHARGE AIR COOLER OUTLET TEMPERATURE SENSOR

1. Turn ignition switch ON.
2. Connect CONSULT and select “Data Monitor” mode.
3. Select “CHARGE AIR COOLER OUTLET TEMPERATURE SENSOR” and check the indication.
4. Compare charge air cooler outlet temperature sensor reading to a mechanical gauge or a known value.

Monitor item	Condition	Indication
CHARGE AIR COOLER OUTLET TEMPERATURE SENSOR	Ignition switch ON (Engine stopped.)	Varies

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Replace engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".

P026B INJECTION TIMING PERFORMANCE

DTC Description

INFOID:0000000013065709

Fuel Balancing is intended to decrease variances in fuel quantity from cylinder to cylinder. The change in engine speed due to a single cylinder combustion is calculated. The ECM will correct the fuel injected into each cylinder to reduce the variance in engine speed from cylinder to cylinder. If the variance is too large, this fault code will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a fueling timing or quantity error for all injectors.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P026B	(Engine Fuel Injection Quantity Error for Multiple Cylinders Exists)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	Fuel quantity balancing control is not in closed loop mode.
		Diagnosis delay time	Diagnostic runs periodically when engine is running

POSSIBLE CAUSE

- Corrupted engine calibration
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 5 minutes.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P026B being current on the CONSULT screen.

Is DTC P026B current?

YES >> Go to EC-480, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065710

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P026B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

P0270 FUEL INJECTOR (CYLINDER 4)

DTC Description

INFOID:0000000013072942

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector low side driver is shorted to another injector or a high side driver.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0270	CYL4 INJECTOR (Cylinder 4 Injector Circuit Low)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 4 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or • Actuator charging time ≤ 100 secs • Actuator charging time for cylinder number 4 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge voltage < injector charge voltage set-point 0.55V • Actuator charge up voltage for cylinder number 4 < injector charge voltage set point +80V • Actuator charge up voltage for cylinder number 4 < injector charge voltage set point 0.7V • Actuator charge up voltage for cylinder number 4 < injector charge voltage set point 0.55V • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0270 being current on the CONSULT screen.

Is DTC P0270 current?

YES >> Go to EC-482, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072943

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0270 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 4 harness connector F131.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

- Measure the resistance between the injector 4 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 178 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	178	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6. CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 157 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	157	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0270 DTC past?

YES >> GO TO 8.
NO >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

8. ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0270 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-481, "DTC Description".
NO >> Repair complete.

P0271 FUEL INJECTOR (CYLINDER 4)

DTC Description

INFOID:0000000013065682

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up Group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0271	CYL4 INJECTOR (Cylinder 4 Injector Circuit High)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time > 100 secs • Actuator charging time for cylinder number 4 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0271 being current on the CONSULT screen.

Is DTC P0271 current?

YES >> Go to EC-484, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065683

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0271 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 4 harness connector F131.

3. Inspect the harness and connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

• Measure the resistance between the injector 4 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 178 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	178	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6.CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 157 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	157	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7. CHECK THE INJECTOR DRAIN LINE

1. Turn ignition switch ON.
2. Connect CONSULT and perform Fuel Injector Line Restriction Test on the bank of this injector.

Injector drain flow meets specifications?

YES >> GO TO 8.
NO >> Replace the injector drain line.

8. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Start engine.
4. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0271 DTC past?

YES >> GO TO 9.
NO >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

9. ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0271 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-484, "DTC Description".
NO >> Repair complete.

P0272 CYLINDER 4 COMBUSTION DISORDER

DTC Description

INFOID:0000000013068299

Fuel Balancing is intended to decrease variances in fuel quantity from cylinder to cylinder. The change in engine speed due to a single cylinder combustion is calculated. The ECM will correct the fuel injected into each cylinder to reduce the variance in engine speed from cylinder to cylinder. If the variance is too large, this DTC will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fueling correction for this cylinder exceeded its allowable limit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0272	(Cylinder 4 Contribution/Balance)	Diagnosis condition	Engine running at idle
		Signal (terminal)	(–)
		Threshold	Cylinder number 4 fuel balance control correction quantity > reftable27
		Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

- Fuel injector
- High blow-by when engine is loaded
- Turbocharger

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 5 minutes.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0272 being current on the CONSULT screen.

Is DTC P0272 current?

YES >> Go to EC-487, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068300

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0016
- P0300
- P0301
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:

The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3. PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 4.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

4. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0272 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P0273 FUEL INJECTOR (CYLINDER 5)

DTC Description

INFOID:0000000013072944

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector low side driver is shorted to another injector or a high side driver.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0273	CYL5 INJECTOR (Cylinder 5 Injector Circuit Low)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 5 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or • Actuator charging time ≤ 100 secs • Actuator charging time for cylinder number 5 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge voltage < injector charge voltage set-point 0.55V • Actuator charge up voltage for cylinder number 5 < injector charge voltage set point +80V • Actuator charge up voltage for cylinder number 5 < injector charge voltage set point 0.7V • Actuator charge up voltage for cylinder number 5 < injector charge voltage set point 0.55V • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0273 being current on the CONSULT screen.

Is DTC P0273 current?

YES >> Go to EC-490, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072945

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0273 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 5 harness connector F117.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

- Measure the resistance between the injector 5 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 94 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	94	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6.CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 115 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	115	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7.CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0273 DTC past?

YES >> GO TO 8.
NO >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

8.ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0273 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-489, "DTC Description".
NO >> Repair complete.

P0274 FUEL INJECTOR (CYLINDER 5)

DTC Description

INFOID:0000000013065674

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up Group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0274	CYL5 INJECTOR (Cylinder 5 Injector Circuit High)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time > 100 secs • Actuator charging time for cylinder number 5 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0274 being current on the CONSULT screen.

Is DTC P0274 current?

YES >> Go to EC-492, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065675

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0274 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 5 harness connector F117.

3. Inspect the harness and connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

• Measure the resistance between the injector 5 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 94 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	94	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6.CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 115 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	115	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7. CHECK THE INJECTOR DRAIN LINE

1. Turn ignition switch ON.
2. Connect CONSULT and perform Fuel Injector Line Restriction Test on the bank of this injector.

Injector drain flow meets specifications?

YES >> GO TO 8.
NO >> Replace the injector drain line. Refer to EM-467, "Removal and Installation".

8. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Start engine.
4. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0274 DTC past?

YES >> GO TO 9.
NO >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

9. ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0274 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-492, "DTC Description".
NO >> Repair complete.

P0275 CYLINDER 5 COMBUSTION DISORDER

DTC Description

INFOID:0000000013068304

Fuel Balancing is intended to decrease variances in fuel quantity from cylinder to cylinder. The change in engine speed due to a single cylinder combustion is calculated. The ECM will correct the fuel injected into each cylinder to reduce the variance in engine speed from cylinder to cylinder. If the variance is too large, this DTC will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fueling correction for this cylinder exceeded its allowable limit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0275	(Cylinder 5 Contribution/Balance)	Diagnosis condition	Engine running at idle
		Signal (terminal)	(–)
		Threshold	Cylinder number 5 fuel balance control correction quantity > reftable27
		Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

- Fuel injector
- High blow-by when engine is loaded
- Turbocharger

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 5 minutes.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0275 being current on the CONSULT screen.

Is DTC P0275 current?

YES >> Go to EC-495, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068305

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0016
- P0300
- P0301
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:

The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3. PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 5.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

4. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0275 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P0276 FUEL INJECTOR (CYLINDER 6)

DTC Description

INFOID:0000000013072962

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Injector low side driver is shorted to another injector or a high side driver.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0276	CYL6 INJECTOR (Cylinder 6 Injector Circuit Low)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 6 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or • Actuator charging time ≤ 100 secs • Actuator charging time for cylinder number 6 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge voltage < injector charge voltage set-point 0.55V • Actuator charge up voltage for cylinder number 6 < injector charge voltage set point +80V • Actuator charge up voltage for cylinder number 6 < injector charge voltage set point 0.7V • Actuator charge up voltage for cylinder number 6 < injector charge voltage set point 0.55V • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0276 being current on the CONSULT screen.

Is DTC P0276 current?

YES >> Go to EC-498, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072963

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0276 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 6 harness connector F133.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

- Measure the resistance between the injector 6 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 4.

4.INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 179 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	179	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6.CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 158 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	158	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7.CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0276 DTC past?

YES >> GO TO 8.
NO >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

8.ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0276 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-497, "DTC Description".
NO >> Repair complete.

P0277 FUEL INJECTOR (CYLINDER 6)

DTC Description

INFOID:0000000013065678

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0277	CYL6 INJECTOR (Cylinder 6 Injector Circuit High)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time > 100 secs • Actuator charging time for cylinder number 6 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0277 being current on the CONSULT screen.

Is DTC P0277 current?

YES >> Go to EC-500, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065679

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0277 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 6 harness connector F133.

3. Inspect the harness and connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK FOR SHORT CIRCUIT IN THE INJECTOR

• Measure the resistance between the injector 6 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 4.

4. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 179 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	179	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6. CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 158 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	158	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7. CHECK THE INJECTOR DRAIN LINE

1. Turn ignition switch ON.
2. Connect CONSULT and perform Fuel Injector Line Restriction Test on the bank of this injector.

Injector drain flow meets specifications?

YES >> GO TO 8.
NO >> Replace the injector drain line. Refer to EM-467, "Removal and Installation".

8. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Start engine.
4. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0277 DTC past?

YES >> GO TO 9.
NO >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

9. ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0277 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-500, "DTC Description".
NO >> Repair complete.

P0278 CYLINDER 6 COMBUSTION DISORDER

DTC Description

INFOID:0000000013068511

Fuel Balancing is intended to decrease variances in fuel quantity from cylinder to cylinder. The change in engine speed due to a single cylinder combustion is calculated. The ECM will correct the fuel injected into each cylinder to reduce the variance in engine speed from cylinder to cylinder. If the variance is too large, this DTC will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fueling correction for this cylinder exceeded its allowable limit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0278	(Cylinder 6 Contribution/Balance)	Diagnosis condition	Engine running at idle
		Signal (terminal)	(–)
		Threshold	Cylinder number 6 fuel balance control correction quantity > reftable27
		Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

- Fuel injector
- High blow-by when engine is loaded
- Turbocharger

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 5 minutes.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0278 being current on the CONSULT screen.

Is DTC P0278 current?

YES >> Go to EC-503, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068512

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0016
- P0300
- P0301
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:

The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3. PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 6.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

4. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0278 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P0279 FUEL INJECTOR (CYLINDER 7)

DTC Description

INFOID:0000000013072964

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Injector low side driver is shorted to another injector or a high side driver.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0279	CYL7 INJECTOR (Cylinder 7 Injector Circuit Low)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 7 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or • Actuator charging time ≤ 100 secs • Actuator charging time for cylinder number 7 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge voltage < injector charge voltage set-point 0.55V • Actuator charge up voltage for cylinder number 7 < injector charge voltage set point +80V • Actuator charge up voltage for cylinder number 7 < injector charge voltage set point 0.7V • Actuator charge up voltage for cylinder number 7 < injector charge voltage set point 0.55V • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0279 being current on the CONSULT screen.

Is DTC P0279 current?

YES >> Go to EC-506, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072965

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0279 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 7 harness connector F119.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

- Measure the resistance between the injector 7 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 177 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	177	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6. CHECK FOR SHORT CIRCUIT IN HARNESS

1. Measure the resistance between ECM harness connector F101 terminal 156 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	156	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0279 DTC past?

YES >> GO TO 8.
NO >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

8. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0279 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-505, "DTC Description".
NO >> Repair complete.

P0280 FUEL INJECTOR (CYLINDER 7)

DTC Description

INFOID:0000000013084166

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0280	CYL7 INJECTOR (Cylinder 7 Injector Circuit High)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time > 100 secs • Actuator charging time for cylinder number 7 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0280 being current on the CONSULT screen.

Is DTC P0280 current?

YES >> Go to EC-508, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084167

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0280 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 7 harness connector F119.

3. Inspect the harness and connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

• Measure the resistance between the injector 7 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 177 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	177	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6.CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 156 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	156	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7. CHECK THE INJECTOR DRAIN LINE

1. Turn ignition switch ON.
2. Connect CONSULT and perform Fuel Injector Line Restriction Test on the bank of this injector.

Injector drain flow meets specifications?

YES >> GO TO 8.
NO >> Replace the injector drain line. Refer to EM-467, "Removal and Installation".

8. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Start engine.
4. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0280 DTC past?

YES >> GO TO 9.
NO >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

9. ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0280 DTC current?

YES >> Return to the diagnosis procedure. Refer to EC-508, "DTC Description".
NO >> Repair complete.

P0281 CYLINDER 7 COMBUSTION DISORDER

DTC Description

INFOID:0000000013068517

Fuel Balancing is intended to decrease variances in fuel quantity from cylinder to cylinder. The change in engine speed due to a single cylinder combustion is calculated. The ECM will correct the fuel injected into each cylinder to reduce the variance in engine speed from cylinder to cylinder. If the variance is too large, this DTC will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fueling correction for this cylinder exceeded its allowable limit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0281	(Cylinder 7 Contribution/Balance)	Diagnosis condition	Engine running at idle
		Signal (terminal)	(–)
		Threshold	Cylinder number 7 fuel balance control correction quantity > reftable27
		Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

- Fuel injector
- High blow-by when engine is loaded
- Turbocharger

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 5 minutes.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0281 being current on the CONSULT screen.

Is DTC P0281 current?

YES >> Go to EC-511, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068518

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0016
- P0300
- P0301
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:

The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3. PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 7.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

4. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0281 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P0282 FUEL INJECTOR (CYLINDER 8)

DTC Description

INFOID:0000000013072969

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector low side driver is shorted to another injector or a high side driver.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0282	CYL8 INJECTOR (Cylinder 8 Injector Circuit Low)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 8 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A Or • Actuator charging time ≤ 100 secs • Actuator charging time for cylinder number 8 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Actuator discharge voltage < injector charge voltage set-point 0.55V • Actuator charge up voltage for cylinder number 8 < injector charge voltage set point +80V • Actuator charge up voltage for cylinder number 8 < injector charge voltage set point 0.7V • Actuator charge up voltage for cylinder number 8 < injector charge voltage set point 0.55V • Maximum injector current ≤ 32A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0282 being current on the CONSULT screen.

Is DTC P0282 current?

YES >> Go to EC-514, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072970

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0282 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF
2. Disconnect injector 8 harness connector F135.
3. Inspect the harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

- Measure the resistance between the injector 8 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 4.

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 93 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	93	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6.CHECK FOR SHORT CIRCUIT IN HARNESS

- Measure the resistance between ECM harness connector F101 terminal 114 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	114	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7.CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0282 DTC past?

YES >> GO TO 8.
NO >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

8.ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0282 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-513, "DTC Description".
NO >> Repair complete.

P0283 FUEL INJECTOR (CYLINDER 8)

DTC Description

INFOID:0000000013083923

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0283	CYL8 INJECTOR (Cylinder 8 Injector Circuit High)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time > 100 secs • Actuator charging time for cylinder number 8 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≤ 9.8A • Differential current in the injector buffer shunt for current measurement and difference analysis ≤ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0283 being current on the CONSULT screen.

Is DTC P0283 current?

YES >> Go to EC-516, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013083924

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0283 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 8 harness connector F113.

3. Inspect the harness and connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR SHORT CIRCUIT IN THE INJECTOR

• Measure the resistance between the injector 8 terminal 1 and 2.

Is resistance less than 150K ohms?

YES >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 4.

4.INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Disconnect ECM harness connector F101.
2. Inspect the ECM connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 93 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	93	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6.CHECK FOR SHORT CIRCUIT IN HARNESS

• Measure the resistance between ECM harness connector F101 terminal 114 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	114	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7. CHECK THE INJECTOR DRAIN LINE

1. Turn ignition switch ON.
2. Connect CONSULT and perform Fuel Injector Line Restriction Test on the bank of this injector.

Injector drain flow meets specifications?

YES >> GO TO 8.
NO >> Replace the injector drain line. Refer to EM-467, "Removal and Installation".

8. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Start engine.
4. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P0283 DTC past?

YES >> GO TO 9.
NO >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

9. ERASE DTC

1. Using CONSULT erase ENGINE diagnostic trouble codes.
2. Perform DTC CONFIRMATION PROCEDURE.

Is P0283 DTC current?

YES >> Return to the Diagnosis Procedure. Refer to EC-516, "DTC Description".
NO >> Repair complete.

P0284 CYLINDER 8 COMBUSTION DISORDER

DTC Description

INFOID:0000000013069217

Fuel Balancing is intended to decrease variances in fuel quantity from cylinder to cylinder. The change in engine speed due to a single cylinder combustion is calculated. The ECM will correct the fuel injected into each cylinder to reduce the variance in engine speed from cylinder to cylinder. If the variance is too large, this DTC will set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fueling correction for this cylinder exceeded its allowable limit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0284	(Cylinder 8 Contribution/Balance)	Diagnosis condition	Engine running at idle
		Signal (terminal)	(–)
		Threshold	Cylinder number 8 fuel balance control correction quantity > reftable27
		Diagnosis delay time	Diagnostic runs continuously when the engine is running at idle

POSSIBLE CAUSE

- Fuel injector
- High blow-by when engine is loaded
- Turbocharger

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 5 minutes.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0284 being current on the CONSULT screen.

Is DTC P0284 current?

YES >> Go to EC-519, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069218

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed on the CONSULT screen:

- Any injector or rail pressure sensor DTCs current or with accumulated past counts.
- Any turbocharger, intake air throttle or EGR DTCs
- P0016
- P0300
- P0301
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK INJECTOR TRIM CODE.

1. Turn ignition switch ON.
2. Using CONSULT, verify injector trim codes.

NOTE:

The factory installed injector bar code values can be found in website Online by entering the correct engine serial number (ESN), selecting Service, and then Engine Data Plate. The correct injector bar code values for that ESN are contained in the engine data plate section. If the engine has had a previous repair involving the replacement of injectors, the injector bar code values can be read directly off the top of each injector without the need of removing any additional parts.

Injector trim code missing or incorrect?

YES >> Using CONSULT correctly enter the injector bar code parameters into the ECM.
NO >> GO TO 3.

3. PERFORM THE HIGH PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 8.

Injectors meet specifications?

YES >> GO TO 4.
NO >> Replace malfunctioning fuel injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

4. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is P0284 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P0299 BOOST PRESSURE

DTC Description

INFOID:0000000013073227

The engine control module (ECM) provides a 5V supply to the Charge Air Cooler outlet pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The Charge Air Cooler outlet pressure sensor provides a signal to the ECM on the Charge Air Cooler outlet pressure sensor signal circuit. This sensor signal voltage changes based on the pressure exiting the Charge Air Cooler.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the intake manifold pressure reading was below the expected level for the engine operating conditions.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0299	TC_SYSTEM (Turbocharger/Supercharger Underboost)	Diagnosis condition	Ignition switch ON or engine running.
		Signal (terminal)	(–)
		Threshold	Cumulative sum of error in 120 seconds is > 1400 kg/min, which is ≥ 1.167 kg/min. Where tolerance is defined as 0 kg/min.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Air intake system leak between turbocharger and intake manifold
- Charge air cooler temperature sensor
- Turbocharger

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0299 being current on the CONSULT screen.

Is DTC P0299 current?

YES >> Go to EC-521, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073228

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P007B being current on the CONSULT screen.

Is DTC P007B detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have high past counts on the CONSULT screen:

- P0101
- P0102
- P0103
- P0107
- P0108
- P012B
- P012C
- P012D
- P0471
- P2280
- P2580
- Any turbocharger, EGR bypass valve or EGR valve DTCs

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. CHECK CHARGE AIR COOLER OUTLET PRESSURE SENSOR

1. Turn ignition switch ON.
2. Connect a mechanical gauge to the engine, as close to the charge-air cooler outlet pressure sensor as possible
3. Connect CONSULT and select “Data Monitor” mode.
4. Select “CHARGE AIR COOLER OUTLET PRESSURE SENSOR” and check the indication.
5. Compare charge air cooler outlet pressure sensor reading to mechanical gauge reading.

Monitor item	Condition	Indication
CHARGE AIR COOLER OUTLET PRESSURE SENSOR	Ignition switch ON (Engine stopped)	Within 17 kPa (2.5 psi) of mechanical gauge reading

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".

4. INSPECT CHARGE AIR COOLER

1. Operate the engine.
2. Inspect the charge-air cooler for the following:

- Leaks between the turbocharger compressor outlet and the charge-air cooler
- Connections between the charge-air cooler and the intake manifold
- intake manifold gasket for leaks
- Hoses for leaks or loose connections
- Clamps to make sure they are tight
- Charge-air plumbing for cracks

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. INSPECT CHARGE AIR COOLER FOR RESTRICTION

1. Turn ignition switch OFF.
2. Inspect the charge-air cooler and piping for damages or obstructions to airflow.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. INSPECT EGR SYSTEM FOR LEAKS AND RESTRICTIONS

1. Turn ignition switch OFF.

2. Inspect the EGR system plumbing for leaks and restrictions:
- Check the exhaust transfer tubes for leaks and restrictions.
- Check the exhaust bypass tubes for leaks and restrictions.
- Leaks can be easily noted by traces of soot.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. INSPECT AIR INTAKE FOR RESTRICTION

1. Connect all components.
2. Connect CONSULT and check for air intake restriction.

Is the inspection result normal?

YES >> Inspection End.
NO >> Repair or replace error-detected parts.

P02EE FUEL INJECTOR (CYLINDER 1)

DTC Description

INFOID:0000000013069539

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each Group of Injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up Group 1. Fuel Injectors 2, 3, 5, and 8 make-up Group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Injector Low side driver is shorted to battery or a voltage source.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P02EE	(Cylinder 1 Injector Circuit Range/ Performance)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 1 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≥ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P02EE being current on the CONSULT screen.

Is DTC P02EE current?

YES >> Go to EC-524, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069540

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P02EE being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 1 from engine harness connector F113.
3. Inspect the harness and connector pins for the following:

- Loose connector

- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector from the engine harness connector F113.
3. Disconnect the engine harness from the ECM connector F101.
4. Measure the resistance between the injector 1 RETURN terminal 176 and all other pins in the engine harness ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	176	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 5.
NO >> Repair or replace the engine harness for a short.

5. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P02EE DTC past?

YES >> GO TO 6.
NO >> Replace the injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

6. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.

Is P02EE DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P02EF FUEL INJECTOR (CYLINDER 2)

DTC Description

INFOID:0000000013069658

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each Group of Injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up Group 1. Fuel Injectors 2, 3, 5, and 8 make-up Group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Injector Low side driver is shorted to battery or a voltage source.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P02EF	(Cylinder 2 Injector Circuit Range/ Performance)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 2 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≥ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P02EF being current on the CONSULT screen.

Is DTC P02EF current?

YES >> Go to EC-527, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069659

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P02EF being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 2 from engine harness connector F129.
3. Inspect the harness and connector pins for the following:

- Loose connector

- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector from the engine harness connector F129.
3. Disconnect the engine harness from the ECM connector F101.
4. Measure the resistance between the injector 2 RETURN terminal 92 and all other pins in the engine harness ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	92	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 5.
NO >> Repair or replace the engine harness for a short.

5. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P02EF DTC past?

YES >> GO TO 6.
NO >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

6. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.

Is P02EF DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P02F0 FUEL INJECTOR (CYLINDER 3)

DTC Description

INFOID:0000000013069939

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each Group of Injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up Group 1. Fuel Injectors 2, 3, 5, and 8 make-up Group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Injector Low side driver is shorted to battery or a voltage source.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P02F0	(Cylinder 3 Injector Circuit Range/ Performance)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 3 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≥ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P02F0 being current on the CONSULT screen.

Is DTC P02F0 current?

YES >> Go to EC-530, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069940

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P02F0 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 3 from engine harness connector F115.
3. Inspect the harness and connector pins for the following:

- Loose connector

- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector from the engine harness connector F115.
3. Disconnect the engine harness from the ECM connector F101.
4. Measure the resistance between the injector 3 RETURN terminal 95 and all other pins in the engine harness ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	95	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 5.
NO >> Repair or replace the engine harness for a short.

5. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P02F0 DTC past?

YES >> GO TO 6.
NO >> Replace the injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

6. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.

Is P02F0 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P02F1 FUEL INJECTOR (CYLINDER 4)

DTC Description

INFOID:0000000013069972

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each Group of Injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up Group 1. Fuel Injectors 2, 3, 5, and 8 make-up Group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Injector Low side driver is shorted to battery or a voltage source.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P02F1	(Cylinder 4 Injector Circuit Range/ Performance)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 4 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≥ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P02F1 being current on the CONSULT screen.

Is DTC P02F1 current?

YES >> Go to EC-533, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069973

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P02F1 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 4 from engine harness connector F131.
3. Inspect the harness and connector pins for the following:

- Loose connector

- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector from the engine harness connector F131.
3. Disconnect the engine harness from the ECM connector F101.
4. Measure the resistance between the injector 4 RETURN terminal 178 and all other pins in the engine harness ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	178	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 5.
NO >> Repair or replace the engine harness for a short.

5. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P02F1 DTC past?

YES >> GO TO 6.
NO >> Replace the injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

6. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.

Is P02F1 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P02F2 FUEL INJECTOR (CYLINDER 5)

DTC Description

INFOID:0000000013070109

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each Group of Injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up Group 1. Fuel Injectors 2, 3, 5, and 8 make-up Group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Injector Low side driver is shorted to battery or a voltage source.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P02F2	(Cylinder 5 Injector Circuit Range/ Performance)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 5 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≥ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P02F2 being current on the CONSULT screen.

Is DTC P02F2 current?

YES >> Go to EC-536, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070110

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P02F2 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 5 from engine harness connector F117.
3. Inspect the harness and connector pins for the following:

- Loose connector

- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector 5 from the engine harness connector F117.
3. Disconnect the engine harness from the ECM connector F101.
4. Measure the resistance between the injector 1 RETURN terminal 94 and all other pins in the engine harness ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	94	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 5.
NO >> Repair or replace the engine harness for a short.

5. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P02F2 DTC past?

YES >> GO TO ^.
NO >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

6. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.

Is P02F2 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P02F3 FUEL INJECTOR (CYLINDER 6)

DTC Description

INFOID:0000000013070158

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each Group of Injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up Group 1. Fuel Injectors 2, 3, 5, and 8 make-up Group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Injector Low side driver is shorted to battery or a voltage source.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P02F3	(Cylinder 6 Injector Circuit Range/ Performance)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 6 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≥ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P02F3 being current on the CONSULT screen.

Is DTC P02F3 current?

YES >> Go to EC-539, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070159

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P02F3 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 6 from engine harness connector F133.
3. Inspect the harness and connector pins for the following:

- Loose connector

- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector from the engine harness connector F133.
3. Disconnect the engine harness from the ECM connector F101.
4. Measure the resistance between the injector 6 RETURN terminal 179 and all other pins in the engine harness ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	179	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 5.
NO >> Repair or replace the engine harness for a short.

5. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P02F3 DTC past?

YES >> GO TO 6.
NO >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

6. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.

Is P02F3 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P02F4 FUEL INJECTOR (CYLINDER 7)

DTC Description

INFOID:0000000013070282

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each Group of Injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up Group 1. Fuel Injectors 2, 3, 5, and 8 make-up Group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Injector Low side driver is shorted to battery or a voltage source.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P02F4	(Cylinder 7 Injector Circuit Range/ Performance)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 7 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≥ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P02F4 being current on the CONSULT screen.

Is DTC P02F4 current?

YES >> Go to EC-542, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070283

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P02F4 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 7 from engine harness connector F119.
3. Inspect the harness and connector pins for the following:

- Loose connector

- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector 7 from the engine harness connector F119.
3. Disconnect the engine harness from the ECM connector F101.
4. Measure the resistance between the injector 1 RETURN terminal 177 and all other pins in the engine harness ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	177	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 5.
NO >> Repair or replace the engine harness for a short.

5. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P02F4 DTC past?

YES >> GO TO 6.
NO >> Replace the injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

6. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.

Is P02F4 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P02F5 FUEL INJECTOR (CYLINDER 8)

DTC Description

INFOID:0000000013070703

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each Group of Injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up Group 1. Fuel Injectors 2, 3, 5, and 8 make-up Group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Injector Low side driver is shorted to battery or a voltage source.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P02F5	(Cylinder 8 Injector Circuit Range/ Performance)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Actuator charging time ≤ 100 μsecs • Actuator charging time for cylinder number 8 ≥ 5 μsecs • Differential current in the injector shunt for current measurement and difference analysis ≥ 9.8A • Injector buffer current during voltage discharging ≤ 9.6A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P02F5 being current on the CONSULT screen.

Is DTC P02F5 current?

YES >> Go to EC-545, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070704

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P02F5 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect injector 8 from engine harness connector F135.
3. Inspect the harness and connector pins for the following:

- Loose connector

- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the injector 8 from the engine harness connector F135.
3. Disconnect the engine harness from the ECM connector F101.
4. Measure the resistance between the injector 1 RETURN terminal 93 and all other pins in the engine harness ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	93	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 5.
NO >> Repair or replace the engine harness for a short.

5. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for past ENGINE diagnostic trouble codes.

Is P02F5 DTC past?

YES >> GO TO 6.
NO >> Replace the injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

6. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.

Is P02F5 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P0300 MISFIRE

DTC Description

INFOID:0000000013024899

An algorithm in the ECM calibration monitors engine speed as each injector fires. If a cylinder(s) has high or low contribution to engine speed, the fault will become active. The intention of the fault is to assist in trouble-shooting performance complaints such as engine misfire and low power.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a misfire of two or more cylinders.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0300	MULTI_CYL_MISFIRE (Random/Multiple Cylinder Misfire Detected)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	• At least 120 misfires on each of at least two cylinders were detected during 440 crankshaft revs • The angular acceleration of the crankshaft after the injection of each of at least two cylinders is below minimum threshold that is dynamically calculated from current injection quantity and engine speed
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- High blowby when the engine is loaded
- Valve train malfunction
- Injector malfunctions

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for up to 5 minutes.
   NOTE:
   The engine coolant temperature must be greater than 30°C [86°F] before this diagnostic will run.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0300 being current on the CONSULT screen.

Is DTC P0300 current?

YES >> Go to EC-548, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024900

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have accumulated past counts on the CONSULT screen:

- Any fuel system, injector or rail pressure sensor DTCs
- Any turbocharger, crankcase or EGR related DTCs
- P0016
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0300 being current on the CONSULT screen.

Is DTC P0300 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. PERFORM CYLINDER CUTOUT TEST

1. Turn ignition switch ON.
2. Operate the engine under the conditions in which the complaint occurs.
3. Connect CONSULT and perform the Cylinder Cutout Test to disable individual injectors.

Is the symptom attributed to injectors?

YES >> Replace malfunctioning injectors. Refer to EM-427, "Exploded View".
NO >> GO TO 4.

4. PERFORM HIGH-PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on each bank.

Injectors meet specifications?

YES >> Refer to Engine Runs Rough or Misfires troubleshooting symptom.
NO >> Replace malfunctioning injectors. Refer to EM-427, "Exploded View".

P0301 CYLINDER 1 MISFIRE

DTC Description

INFOID:0000000013084453

An algorithm in the ECM calibration monitors engine speed as each injector fires. If a cylinder(s) has high or low contribution to engine speed, the fault will become active. The intention of the fault is to assist in trouble-shooting performance complaints such as engine misfire and low power.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a cylinder 1 misfire.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0301	CYL_1_MISFIRE (Cylinder 1 Misfire Detected)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	• At least 120 misfires on cylinder number 1 were detected during 440 crankshaft revs • The angular acceleration of the crankshaft after cylinder number 1 injection is below minimum threshold that is dynamically calculated from current injection quantity and engine speed
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- High blow-by when the engine is loaded
- Valve train malfunction
- Extra, missing, or damaged sealing washer under an injector
- Injector malfunctions

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for up to 5 minutes.
   NOTE:
   The engine coolant temperature must be greater than 30°C [86°F] before this diagnostic will run.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0301 being current on the CONSULT screen.

Is DTC P0301 current?

YES >> Go to EC-550, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084454

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have accumulated past counts on the CONSULT screen:

- Any fuel system, injector or rail pressure sensor DTCs
- Any turbocharger, crankcase or EGR related DTCs
- P0016
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0301 being current on the CONSULT screen.

Is DTC P0301 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.PERFORM CYLINDER CUTOUT TEST

1. Turn ignition switch ON.
2. Operate the engine under the conditions in which the complaint occurs.
3. Connect CONSULT and perform the Cylinder Cutout Test to disable individual injectors.

Is the symptom attributed to number 1 cylinder?

YES >> Replace cylinder 1 injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".
NO >> GO TO 4.

4.PERFORM HIGH-PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 1.

Is the symptom attributed to number 1 cylinder?

YES >> Refer to Engine Runs Rough or Misfires troubleshooting symptom.
NO >> Replace malfunctioning injectors. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

P0302 CYLINDER 2 MISFIRE

DTC Description

INFOID:0000000013084525

An algorithm in the ECM calibration monitors engine speed as each injector fires. If a cylinder(s) has high or low contribution to engine speed, the fault will become active. The intention of the fault is to assist in trouble-shooting performance complaints such as engine misfire and low power.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a cylinder 2 misfire.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0302	CYL_2_MISFIRE (Cylinder 2 Misfire Detected)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	• At least 120 misfires on cylinder number 2 were detected during 440 crankshaft revs • The angular acceleration of the crankshaft after cylinder number 2 injection is below minimum threshold that is dynamically calculated from current injection quantity and engine speed
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- High blow-by when the engine is loaded
- Valve train malfunction
- Extra, missing, or damaged sealing washer under an injector
- Injector malfunctions

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for up to 5 minutes.
   NOTE:
   The engine coolant temperature must be greater than 30°C [86°F] before this diagnostic will run.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0302 being current on the CONSULT screen.

Is DTC P0302 current?

YES >> Go to EC-552, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084526

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have accumulated past counts on the CONSULT screen:

- Any fuel system, injector or rail pressure sensor DTCs
- Any turbocharger, crankcase or EGR related DTCs
- P0016
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0302 being current on the CONSULT screen.

Is DTC P0302 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.PERFORM CYLINDER CUTOUT TEST

1. Turn ignition switch ON.
2. Operate the engine under the conditions in which the complaint occurs.
3. Connect CONSULT and perform the Cylinder Cutout Test to disable individual injectors.

Is the symptom attributed to number 2 cylinder?

YES >> Replace cylinder 2 injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".
NO >> GO TO 4.

4.PERFORM HIGH-PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 2.

Is the symptom attributed to number 2 cylinder?

YES >> Refer to Engine Runs Rough or Misfires troubleshooting symptom.
NO >> Replace malfunctioning injectors. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

P0303 CYLINDER 3 MISFIRE

DTC Description

INFOID:0000000013084545

An algorithm in the ECM calibration monitors engine speed as each injector fires. If a cylinder(s) has high or low contribution to engine speed, the fault will become active. The intention of the fault is to assist in trouble-shooting performance complaints such as engine misfire and low power.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a cylinder 3 misfire.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0303	CYL_3_MISFIRE (Cylinder 3 Misfire Detected)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	• At least 120 misfires on cylinder number 3 were detected during 440 crankshaft revs • The angular acceleration of the crankshaft after cylinder number 3 injection is below minimum threshold that is dynamically calculated from current injection quantity and engine speed
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- High blow-by when the engine is loaded
- Valve train malfunction
- Extra, missing, or damaged sealing washer under an injector
- Injector malfunctions

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for up to 5 minutes.
   NOTE:
   The engine coolant temperature must be greater than 30°C [86°F] before this diagnostic will run.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0303 being current on the CONSULT screen.

Is DTC P0303 current?

YES >> Go to EC-554, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084546

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have accumulated past counts on the CONSULT screen:

- Any fuel system, injector or rail pressure sensor DTCs
- Any turbocharger, crankcase or EGR related DTCs
- P0016
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0303 being current on the CONSULT screen.

Is DTC P0303 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.PERFORM CYLINDER CUTOUT TEST

1. Turn ignition switch ON.
2. Operate the engine under the conditions in which the complaint occurs.
3. Connect CONSULT and perform the Cylinder Cutout Test to disable individual injectors.

Is the symptom attributed to number 3 cylinder?

YES >> Replace cylinder 3 injector. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".
NO >> GO TO 4.

4.PERFORM HIGH-PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 3.

Is the symptom attributed to number 3 cylinder?

YES >> Refer to Engine Runs Rough or Misfires troubleshooting symptom.
NO >> Replace malfunctioning injectors. Refer to EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)".

P0304 CYLINDER 4 MISFIRE

DTC Description

INFOID:0000000013084562

An algorithm in the ECM calibration monitors engine speed as each injector fires. If a cylinder(s) has high or low contribution to engine speed, the fault will become active. The intention of the fault is to assist in trouble-shooting performance complaints such as engine misfire and low power.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a cylinder 4 misfire.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0304	CYL_4_MISFIRE (Cylinder 4 Misfire Detected)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	• At least 120 misfires on cylinder number 4 were detected during 440 crankshaft revs • The angular acceleration of the crankshaft after cylinder number 4 injection is below minimum threshold that is dynamically calculated from current injection quantity and engine speed
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- High blow-by when the engine is loaded
- Valve train malfunction
- Extra, missing, or damaged sealing washer under an injector
- Injector malfunctions

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for up to 5 minutes.
   NOTE:
   The engine coolant temperature must be greater than 30°C [86°F] before this diagnostic will run.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0304 being current on the CONSULT screen.

Is DTC P0304 current?

YES >> Go to EC-556, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084563

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have accumulated past counts on the CONSULT screen:

- Any fuel system, injector or rail pressure sensor DTCs
- Any turbocharger, crankcase or EGR related DTCs
- P0016
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0304 being current on the CONSULT screen.

Is DTC P0304 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.PERFORM CYLINDER CUTOUT TEST

1. Turn ignition switch ON.
2. Operate the engine under the conditions in which the complaint occurs.
3. Connect CONSULT and perform the Cylinder Cutout Test to disable individual injectors.

Is the symptom attributed to number 4 cylinder?

YES >> Replace cylinder 4 injector. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".
NO >> GO TO 4.

4.PERFORM HIGH-PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 4.

Is the symptom attributed to number 4 cylinder?

YES >> Refer to Engine Runs Rough or Misfires troubleshooting symptom.
NO >> Replace malfunctioning injectors. Refer to EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)".

P0305 CYLINDER 5 MISFIRE

DTC Description

INFOID:0000000013084569

An algorithm in the ECM calibration monitors engine speed as each injector fires. If a cylinder(s) has high or low contribution to engine speed, the fault will become active. The intention of the fault is to assist in trouble-shooting performance complaints such as engine misfire and low power.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a cylinder 5 misfire.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0305	CYL_5_MISFIRE (Cylinder 5 Misfire Detected)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	• At least 120 misfires on cylinder number 5 were detected during 440 crankshaft revs • The angular acceleration of the crankshaft after cylinder number 5 injection is below minimum threshold that is dynamically calculated from current injection quantity and engine speed
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- High blow by when the engine is loaded
- Valve train malfunction
- Extra, missing, or damaged sealing washer under an injector
- Injector malfunctions

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for up to 5 minutes.
   NOTE:
   The engine coolant temperature must be greater than 30°C [86°F] before this diagnostic will run.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0305 being current on the CONSULT screen.

Is DTC P0305 current?

YES >> Go to EC-558, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084570

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have accumulated past counts on the CONSULT screen:

- Any fuel system, injector or rail pressure sensor DTCs
- Any turbocharger, crankcase or EGR related DTCs
- P0016
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0305 being current on the CONSULT screen.

Is DTC P0305 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.PERFORM CYLINDER CUTOUT TEST

1. Turn ignition switch ON.
2. Operate the engine under the conditions in which the complaint occurs.
3. Connect CONSULT and perform the Cylinder Cutout Test to disable individual injectors.

Is the symptom attributed to number 5 cylinder?

YES >> Replace cylinder 5 injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".
NO >> GO TO 4.

4.PERFORM HIGH-PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 5.

Is the symptom attributed to number 5 cylinder?

YES >> Refer to Engine Runs Rough or Misfires troubleshooting symptom.
NO >> Replace malfunctioning injectors. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

P0306 CYLINDER 6 MISFIRE

DTC Description

INFOID:0000000013084576

An algorithm in the ECM calibration monitors engine speed as each injector fires. If a cylinder(s) has high or low contribution to engine speed, the fault will become active. The intention of the fault is to assist in trouble-shooting performance complaints such as engine misfire and low power.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a cylinder 6 misfire.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0306	CYL_6_MISFIRE (Cylinder 6 Misfire Detected)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	• At least 120 misfires on cylinder number 6 were detected during 440 crankshaft revs • The angular acceleration of the crankshaft after cylinder number 6 injection is below minimum threshold that is dynamically calculated from current injection quantity and engine speed
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- High blow-by when the engine is loaded
- Valve train malfunction
- Extra, missing, or damaged sealing washer under an injector
- Injector malfunctions

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for up to 5 minutes.
   NOTE:
   The engine coolant temperature must be greater than 30°C [86°F] before this diagnostic will run.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0306 being current on the CONSULT screen.

Is DTC P0306 current?

YES >> Go to EC-560, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084577

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have accumulated past counts on the CONSULT screen:

- Any fuel system, injector or rail pressure sensor DTCs
- Any turbocharger, crankcase or EGR related DTCs
- P0016
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0306 being current on the CONSULT screen.

Is DTC P0306 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.PERFORM CYLINDER CUTOUT TEST

1. Turn ignition switch ON.
2. Operate the engine under the conditions in which the complaint occurs.
3. Connect CONSULT and perform the Cylinder Cutout Test to disable individual injectors.

Is the symptom attributed to number 6 cylinder?

YES >> Replace cylinder 6 injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 4.

4.PERFORM HIGH-PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 6.

Is the symptom attributed to number 6 cylinder?

YES >> Refer to Engine Runs Rough or Misfires troubleshooting symptom.
NO >> Replace malfunctioning injectors. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

P0307 CYLINDER 7 MISFIRE

DTC Description

INFOID:0000000013084583

An algorithm in the ECM calibration monitors engine speed as each injector fires. If a cylinder(s) has high or low contribution to engine speed, the fault will become active. The intention of the fault is to assist in trouble-shooting performance complaints such as engine misfire and low power.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a cylinder 7 misfire.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0307	CYL_1_MISFIRE (Cylinder 7 Misfire Detected)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	• At least 120 misfires on cylinder number 7 were detected during 440 crankshaft revs • The angular acceleration of the crankshaft after cylinder number 7 injection is below minimum threshold that is dynamically calculated from current injection quantity and engine speed
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- High blow-by when the engine is loaded
- Valve train malfunction
- Extra, missing, or damaged sealing washer under an injector
- Injector malfunctions

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for up to 5 minutes.
   NOTE:
   The engine coolant temperature must be greater than 30°C [86°F] before this diagnostic will run.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0307 being current on the CONSULT screen.

Is DTC P0307 current?

YES >> Go to EC-562, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084584

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have accumulated past counts on the CONSULT screen:

- Any fuel system, injector or rail pressure sensor DTCs
- Any turbocharger, crankcase or EGR related DTCs
- P0016
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0307 being current on the CONSULT screen.

Is DTC P0307 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.PERFORM CYLINDER CUTOUT TEST

1. Turn ignition switch ON.
2. Operate the engine under the conditions in which the complaint occurs.
3. Connect CONSULT and perform the Cylinder Cutout Test to disable individual injectors.

Is the symptom attributed to number 7 cylinder?

YES >> Replace cylinder 7 injector. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".
NO >> GO TO 4.

4.PERFORM HIGH-PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 7.

Is the symptom attributed to number 7 cylinder?

YES >> Refer to Engine Runs Rough or Misfires troubleshooting symptom.
NO >> Replace malfunctioning injectors. Refer to EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)".

P0308 CYLINDER 8 MISFIRE

DTC Description

INFOID:0000000013084588

An algorithm in the ECM calibration monitors engine speed as each injector fires. If a cylinder(s) has high or low contribution to engine speed, the fault will become active. The intention of the fault is to assist in trouble-shooting performance complaints such as engine misfire and low power.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a cylinder 8 misfire.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0308	CYL_8_MISFIRE (Cylinder 8 Misfire Detected)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	• At least 120 misfires on cylinder number 8 were detected during 440 crankshaft revs • The angular acceleration of the crankshaft after cylinder number 8 injection is below minimum threshold that is dynamically calculated from current injection quantity and engine speed
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- High blow-by when the engine is loaded
- Valve train malfunction
- Extra, missing, or damaged sealing washer under an injector
- Injector malfunctions

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for up to 5 minutes.
   NOTE:
   The engine coolant temperature must be greater than 30°C [86°F] before this diagnostic will run.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0308 being current on the CONSULT screen.

Is DTC P0308 current?

YES >> Go to EC-564, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084589

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current or have accumulated past counts on the CONSULT screen:

- Any fuel system, injector or rail pressure sensor DTCs
- Any turbocharger, crankcase or EGR related DTCs
- P0016
- P0335
- P0340

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0308 being current on the CONSULT screen.

Is DTC P0308 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.PERFORM CYLINDER CUTOUT TEST

1. Turn ignition switch ON.
2. Operate the engine under the conditions in which the complaint occurs.
3. Connect CONSULT and perform the Cylinder Cutout Test to disable individual injectors.

Is the symptom attributed to number 8 cylinder?

YES >> Replace cylinder 8 injector. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 4.

4.PERFORM HIGH-PRESSURE FUEL INJECTOR DRAIN FLOW TEST

1. Turn ignition switch ON.
2. Perform the Fuel Injector Drain Flow Test on the bank of cylinder number 8.

Is the symptom attributed to number 8 cylinder?

YES >> Refer to Engine Runs Rough or Misfires troubleshooting symptom.
NO >> Replace malfunctioning injectors. Refer to EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

P0335 CKP SENSOR (POS)

DTC Description

INFOID:0000000013024908

The crankshaft position sensor is a hall effect type sensor. The Engine Control Module (ECM) provides a 5V supply to the position sensor and a return circuit. As the teeth on the crankshaft speed ring move past the position sensor, a signal is generated on the position sensor signal circuit. The ECM interprets this signal and converts it to an engine speed. A missing tooth on the crankshaft gear is used by the ECM to determine the position of the engine.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0335	CKP SEN/CIRCUIT (Crankshaft position sensor “A” circuit)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Crankshaft position sensor (POS) signal
		Threshold	• The crankshaft position sensor (POS) signal is not detected by the ECM during the first few seconds of engine cranking. • The proper pulse signal from the crankshaft position sensor (POS) is not sent to ECM while the engine is running. • The crankshaft position sensor (POS) signal is not in the normal pattern during engine running.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
- CKP sensor 5V supply circuit is open or shorted.
- CKP sensor return circuit is open or shorted.
- CKP sensor signal circuit is open or shorted.
- Crankshaft position sensor (POS)
- Damaged tone wheel
- CKP air gap that is too small or too large

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 10.5V with ignition switch ON.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for at least 5 seconds.
   If engine does not start, crank engine for at least 2 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-567, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024909

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing ENGINE diagnostic trouble codes.

If DTC P0698 or P0699 is present, perform the confirmation procedure (trouble diagnosis) for these other DTCs first.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR ACTIVE CKP DTC

Check for DTC P0335 being active on the CONSULT screen.

Is applicable DTC active?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT CRANKSHAFT POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect crankshaft position sensor from engine harness connector.
3. Inspect the crankshaft position sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.INSPECT MASS AIR FLOW SENSOR AND CONNECTOR PINS

1. Remove the crankshaft position sensor from the gear housing.
2. Inspect the crankshaft position sensor for the following:

- Metal debris on the end of the sensor
- Damage to the end of the sensor caused by camshaft gear
- Oil leakage or insulation problems such as swelling
- Damaged electrical potting in sensing end of sensor

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK CRANKSHAFT POSITION SENSOR (CKP) POWER SUPPLY CIRCUIT

1. Turn ignition switch ON.
2. Check the voltage between crankshaft position sensor harness connector terminals.

CKP sensor			Voltage (V)
Connector	Terminal (+)	Terminal (-)	
F110	190	169	Approx. 5V

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 11.

6.INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7.CHECK CKP SENSOR INPUT SIGNAL CIRCUIT FOR OPEN

Check the continuity between CKP sensor harness connector and ECM harness connector.

CKP sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F110	3	F101	189	Yes

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair open circuit in harness or connectors.

8.CHECK CKP SENSOR INPUT SIGNAL CIRCUIT FOR SHORT

Check the continuity between CKP sensor harness connector and ECM harness connector.

ECM			Continuity
Connector	Terminal	Terminal	
F101	189	All others	No

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair short circuit in harness connector.

9.INSPECT THE AIR GAP AND TARGET WHEEL

1. Inspect the air gap and target wheel.
2. With the crankshaft position sensor removed from the engine block, measure the air gap and runout at several points in the crankshaft's revolution.

Air gap		Runout
Minimum	Maximum	Maximum target
0.25 mm [0.009 in]	2.25 mm [0.089 in]	0.5 mm [0.02 in]

Is the inspection result normal?

YES >> GO TO 10.
NO >> Add shims or repair as necessary.

10.CHECK THE DTC AND VERIFY CKP SENSOR CONDITION

1. Connect all components in the correct positions.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF. Key ON.

4. Connect CONSULT and check for active ENGINE diagnostic trouble codes.

Is P0335 DTC active?

YES >> Replace the crankshaft position sensor. Refer to EM-336, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue

11. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 12.
NO >> Repair or replace error-detected parts.

12. CHECK CKP SENSOR CIRCUITS FOR OPEN

Check the continuity between CKP sensor (POS) harness connector and ECM harness connector.

CKP sensor (POS)		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F110	1	F101	190	Yes
	2		169	

Is the inspection result normal?

YES >> GO TO 13.
NO >> Repair open circuit in harness or connectors.

13. CHECK CKP SENSOR CIRCUITS FOR SHORT

Check the continuity between CKP sensor (POS) harness connector and ground.

CKP sensor (POS)		Ground	Continuity
Connector	Terminal		
F110	1(+)	(-)	No
	2(+)	(-)	

Is the inspection result normal?

YES >> GO TO 14.
NO >> Repair short circuit in harness or connectors.

14. CHECK THE DTC AND VERIFY CKP SENSOR CONDITION

1. Connect all components in the correct positions.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF. Key ON.
4. Connect CONSULT and check for active ENGINE diagnostic trouble codes.

Is P0335 DTC active?

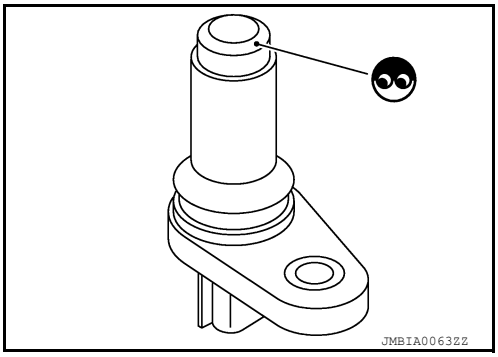
YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

Component Inspection

INFOID:0000000013055694

1. CHECK CRANKSHAFT POSITION SENSOR (POS)

1. Turn ignition switch OFF.
2. Loosen the fixing bolt of the sensor.
3. Disconnect crankshaft position sensor (POS) harness connector.
4. Remove the sensor. Refer to EM-336, "Removal and Installation".
5. Visually check the sensor for chipping.



Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace crankshaft position sensor (POS). Refer to EM-336, "Removal and Installation".

2. CHECK CRANKSHAFT POSITION SENSOR (POS)

Check resistance between crankshaft position sensor (POS) terminals as follows.

Terminals (Polarity)	Resistance (Ω)
1 (+) - 2 (-)	Except 0 or ∞ [at 25°C (77°F)]
1 (+) - 3 (-)	
2 (+) - 3 (-)	

Is the inspection result normal?

YES >> Inspection End.
NO >> Replace crankshaft position sensor (POS). Refer to EM-336, "Removal and Installation".

P0340 CMP SENSOR (PHASE)

DTC Description

INFOID:0000000013024913

The engine control module (ECM) provides a 5V supply to the engine camshaft speed/position sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The camshaft speed/position sensor provides a signal to the ECM on the camshaft speed/position sensor signal circuit. This sensor generates a signal to the ECM as the camshaft speed indicator lobe moves past the sensor. The ECM interprets this signal into an engine speed reading and determines engine position. This sensor is used as a backup sensor if the primary engine crankshaft speed/position signal is lost.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a loss of the camshaft speed/position sensor while the engine was running.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0340	CMP_SEN/CIRCUIT (Camshaft Position Sensor “A” Circuit)	Diagnosis condition	Engine running
		Signal (terminal)	Camshaft position (168)
		Threshold	Detected when no camshaft signal is present and crankshaft signal is valid over calibrated threshold.
		Diagnosis delay time	Diagnostic runs continuously when engine is running

POSSIBLE CAUSE

- Camshaft position sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0340 being current on the CONSULT screen.

Is DTC P0340 current?

YES >> Go to EC-571, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024914

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- P0652
- P0653

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0340 being current on the CONSULT screen.

Is DTC P0340 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT CAMSHAFT POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect camshaft position sensor harness connector F109.
3. Inspect the harness connector and camshaft position sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. INSPECT CAMSHAFT POSITION SENSOR

1. Turn ignition switch OFF.
2. Disconnect camshaft position sensor harness connector F109.
3. Remove camshaft position sensor.
4. Inspect camshaft position sensor for the following:

- Metal debris on the end of the sensor
- Damage to the end of the sensor caused by camshaft gear
- Oil leakage or insulation problems such as swelling
- Damaged electrical potting in sensing end of sensor

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace camshaft position sensor. Refer to EM-315, "Removal and Installation".

5. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the camshaft position sensor harness connector F109.
3. Turn ignition switch ON.
4. Measure the voltage between camshaft position sensor harness connector F109 terminals 1 and 2.

Camshaft position sensor			Voltage (Approx.)
Connector	Terminal	Terminal	
F109	1	2	4.75V - 5.25V

Is inspection result normal?

YES >> GO TO 6.
NO >> GO TO 11.

6. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK FOR AN OPEN CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the camshaft position sensor harness connector F109.
4. Measure the resistance between the ECM harness connector F101 terminal 168 and the camshaft position sensor harness connector F109 terminal 3.

ECM		Camshaft position sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	168	F109	3	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the harness for an open.

8. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the camshaft position sensor harness connector F109.
4. Measure the resistance between the ECM harness connector F101 terminal 168 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	168	F101	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace the harness for a short.

9. VERIFY CAMSHAFT POSITION SENSOR AIR GAP

1. Turn ignition switch OFF.
2. Disconnect camshaft position sensor harness connector F109.
3. Remove camshaft position sensor.
4. Measure camshaft position sensor air gap at several points in the camshaft's revolution.

- Minimum Air Gap: 0.25 mm (0.009 in)
- Maximum Air Gap: 2.00 mm (0.078 in)

Is the inspection result normal?

YES >> GO TO 10.
NO >> Replace or shim the sensor if the air gap is out of specification. If the target runout is excessive, replace the target.

10. CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect all components.
3. Start engine and let idle for 1 minute.
4. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.

Is DTC P0340 current?

YES >> Replace the camshaft position sensor. Refer to EM-315, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

11. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 12.
NO >> Repair or replace error-detected parts.

12. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between ECM harness connector F101 terminals 106 and 127.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	106	127	4.75V - 5.25V

Is inspection result normal?

YES >> GO TO 13.
NO >> Repair or replace the harness.

13. CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect all components.
3. Start engine and let idle for 1 minute.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0340 current?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Inspection End.

P0383 GLOW PLUG CONTROL MODULE CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013066199

The Glow Plug Control Module controls the timing and intensity of the glow plug outputs on the engine using data provided by the ECM through the CAN2 communication lines. The Glow Plug Control Module will not activate the glow plugs if the glow plug module reads a temperature greater than a calibrated amount. The Glow Plug Control Module receives fused power directly from the battery, and switched power through the smart power relay.

DTC DETECTION LOGIC

The glow plug control module supply voltage was less than 6V.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0383	GLOW PLUG CONTROL MODULE 1 CONTROL CIRCUIT LOW (Glow Plug Control Module Control Circuit Low)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Glow plug control module supply voltage < 6V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- Glow plug control module
- Harness and connectors
- Charging system

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0383 being current on the CONSULT screen.

Is DTC P0383 current?

YES >> Go to EC-575, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013066200

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0383 being current on the CONSULT screen.

Is DTC P0383 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- P0562
- P0563
- P0686
- P0687
- P2503
- P2504

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug control module harness connector F102.
3. Inspect the harness connector and glow plug control module pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect the glow plug control module harness connector E69.
3. Turn ignition switch ON.
4. Measure the voltage between glow plug control module harness connector E69 terminal 1 and ground.

Glow plug control module		–	Voltage (Approx.)
Connector	Terminal		
E69	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 6.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect the glow plug control module connectors.
3. Turn ignition switch ON.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0383 current?

YES >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> The removal and installation of the connector corrected the fault.

6. CHECK THE BATTERY CONECTIONS

1. Turn ignition switch OFF.
2. Check battery terminal connections.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK FUSE

Check if the following fuse is blown.

Component	Capacity	Fuse No.
Fusible link box LH battery	60A	G

Is the inspection result normal?

YES >> GO TO 8.

NO >> Replace the blown fuse after repairing the affected circuit.

8. INSPECT THE CHARGING SYSTEM

Inspect charging system. Refer to CHG-23, "Work Flow (With EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)" or CHG-29, "Work Flow (Without EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)".

Is the inspection result normal?

YES >> Repair or replace the harness for an open.
NO >> Repair or replace error-detected parts.

P0384 GLOW PLUG CONTROL MODULE CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013065754

The Glow Plug Control Module controls the timing and intensity of the glow plug outputs on the engine using data provided by the ECM through the CAN2 communication lines. The Glow Plug Control Module will not activate the glow plugs if the glow plug module reads a temperature greater than a calibrated amount. The Glow Plug Control Module receives fused power directly from the battery, and switched power through the smart power relay.

DTC DETECTION LOGIC

The glow plug control module supply voltage was greater than 16V.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0384	GLOW PLUG CONTROL MODULE 1 CONTROL CIRCUIT HIGH (Glow Plug Control Module Control Circuit High)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Glow plug control module supply voltage > 16V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- Glow plug control module
- Harness and connectors
- Charging system

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0384 being current on the CONSULT screen.

Is DTC P0384 current?

YES >> Go to EC-578, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065755

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0384 being current on the CONSULT screen.

Is DTC P0384 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- P0562
- P0563
- P0686
- P0687
- P2503
- P2504

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug control module harness connector F102.
3. Inspect the harness connector and glow plug control module pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect the glow plug control module harness connector E69.
3. Turn ignition switch ON.
4. Measure the voltage between glow plug control module harness connector E69 terminal 1 and ground.

Glow plug control module		–	Voltage (Approx.)
Connector	Terminal		
E69	1	Ground	> 16.5V

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect the glow plug control module connectors.
3. Turn ignition switch ON.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0384 current?

YES >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> The removal and installation of the connector corrected the fault.

6. CHECK THE BATTERY VOLTAGE

1. Turn ignition switch OFF.
2. Measure the voltage of the battery.

Is the battery voltage > 16.5V?

YES >> Troubleshoot the cause of the overcharging condition. Refer to CHG-23, "Work Flow (With EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)" or CHG-29, "Work Flow (Without EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)".
NO >> Inspection End.

P0401 FLOW IN THE EXHAUST GAS RECIRCULATION

DTC Description

INFOID:0000000013073593

The Engine Control Module (ECM) check for Exhaust Gas Recirculation (EGR) flow conditions that are outside of a calibrated amount by calculating an error based on the commanded and actual EGR flow. If the error is outside of the calibrated amount for a period of time, the diagnostic fails.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the actual EGR flow was less than what was being commanded based on the current engine operating conditions.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0401	EGR_SYSTEM (Exhaust Gas Recirculation Flow Insufficient Detected)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Cumulative sum of error (estimated flow - measured flow) over a 120 second period is ever > 3000 kg/min, which is equivalent to (average of error - tolerance) > 2.5 kg/min, where tolerance is defined as 0 kg/min
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- EGR valve
- Leaks or restrictions in the EGR flow plumbing

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
7. Check for DTC P0401 being current on the CONSULT screen.

Is DTC P0401 current?

YES >> Go to EC-580, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073594

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current or do they have high past counts on the CONSULT screen:

- P012B
- P012C
- P012D
- P0101
- P0102
- P0103
- P0107
- P0108

- P0299
- P0471
- P2280
- P2580
- Any turbocharger DTCs
- Any EGR bypass DTCs
- Any EGR valve DTCs

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK EGR SYSTEM FOR LEAKS AND RESTRICTION

1. Turn ignition switch OFF.
2. Check the EGR system plumbing for leaks and restrictions:
   NOTE:
   Leaks can be easily noted by traces of soot.
- Check the exhaust transfer tubes for leaks and restrictions.
- Check the exhaust bypass tubes for leaks and restrictions.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK EGR VALVE FOR RESTRICTION

Check the EGR valve for restrictions.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace the EGR valve. Refer to EM-279, "Removal and Installation".

4.CHECK EGR COOLER FOR RESTRICTION

Check the EGR cooler for restrictions.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace the EGR cooler. Refer to EM-268, "Removal and Installation".

5.CHECK CHARGE-AIR COOLER AND CHARGE-AIR PLUMBING FOR LEAKS

1. Start the engine.
2. Check the charge-air cooler and charge-air plumbing for leaks.
- Check the charge-air cooler connections for leaks between the turbocharger compressor outlet and the charge-air cooler.
- Check the charge-air cooler connections between the charge-air cooler and the intake manifold.
- Inspect the intake manifold gasket for leaks.
- Inspect the charge-air cooler hoses for leaks or loose connections. Check the Exhaust bypass tubes for leaks and restrictions.
- Inspect the charge-air cooler clamps to make sure they are tight.
- Inspect the charge-air plumbing for cracks.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FOR AIR INTAKE RESTRICTION

Check for air intake restriction.

Is the inspection result normal?

YES >> Inspection End.
NO >> Repair or replace error-detected parts.

P0402 FLOW IN THE EXHAUST GAS RECIRCULATION

DTC Description

INFOID:0000000013073679

The Engine Control Module (ECM) check for Exhaust Gas Recirculation (EGR) flow conditions that are outside a calibrated amount by calculating an error based on the commanded and actual EGR flow. If the error is outside the calibrated amount for a period of time, the diagnostic fails.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the measured EGR flow was greater than what was being commanded based on the present engine.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0402	EGR_SYSTEM (Exhaust Gas Recirculation Flow Excessive Detected)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Cumulative sum of error (estimated flow - measured flow) in a 200 second period is ever > 800 kg/min, which is equivalent to (average of error - tolerance) ≥ 0.4 kg/min, where tolerance is defined as reftable23 kg/min
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

EGR valve

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0402 being current on the CONSULT screen.

Is DTC P0402 current?

YES >> Go to EC-582, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073680

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current or do they have high past counts on the CONSULT screen:

- P012B
- P012C
- P012D
- P0101
- P0102
- P0103
- P0107
- P0108
- P0299
- P0471
- P0472
- P0473
- P2280
- P2580
- Any turbocharger DTCs

- Any EGR bypass DTCs
- Any EGR valve DTCs

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK EGR VALVE

1. Turn ignition switch OFF.
2. Remove the EGR valve from the engine.
3. Inspect the EGR valve,

- Check for a stuck open EGR valve.
- Check for a damaged EGR valve that allows flow when closed.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Replace EGR valve. Refer to EM-279, "Removal and Installation".

3.CHECK EXHAUST GAS PRESSURE SENSOR TUBE

1. Turn ignition switch ON.
2. Remove the exhaust gas pressure sensor tube.
3. Inspect the exhaust gas pressure sensor tube.

- Inspect the inside of the tube. If clogged, use compressed air to remove debris or soot buildup.
- Check the tube for cracks and thread damage.

Is the inspection result normal?

YES >> Inspection End.
NO >> Replace or repair the exhaust gas pressure sensor tube. Refer to EM-293, "Removal and Installation".

P0405 EGR SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013083381

The engine control module (ECM) uses the EGR valve position sensor to determine whether or not the valve is meeting the commanded position. The ECM supplies 5V to the EGR valve position signal circuit, and the EGR valve position sensor outputs a voltage signal to the ECM, based on the valve position.The ECM converts this signal into a percentage value, 0 to 100, indicating valve position. A fully-opened valve is equivalent to 100%.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the EGR Valve position signal voltage was less than 0.3V for more than 3 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0405	EGR_SENSOR (Exhaust Gas Recirculation Sensor "A" Circuit Low)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	EGR position sensor (152)
		Threshold	Measure EGR H-bridge valve position < 0.259V (-8.448%)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- EGR valve position sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch to ON for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0405 being current on the CONSULT screen.

Is DTC P0405 current?

YES >> Go to EC-584, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013083382

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for sensor supply DTC P0652 or P0653 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0405 being current on the CONSULT screen.

Is DTC P0405 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT EGR VALVE POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect EGR valve position sensor harness connector F144.
3. Inspect the engine harness and EGR valve connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect EGR valve harness connector F144.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0406 become current and DTC P0405 become past?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the EGR valve harness connector F144.
3. Turn ignition switch ON.
4. Measure the voltage between EGR valve position sensor harness connector F144 terminals 2 and 3.

EGR valve			Voltage (Approx.)
Connector	Terminal	Terminal	
F144	2	3	4.75V - 5.25V

Is inspection result normal?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect the EGR valve harness connector F144.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0405 current?

YES >> Replace the EGR valve. Refer to EM-279, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals

- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0406 become current and DTC P0405 become past?

YES >> GO TO 9.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

9. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0405 being current on the CONSULT screen.

Is DTC P0405 detected as current?

YES >> Repair or replace harness for an open.
NO >> The removal and installation of the connector corrected the issue.

10. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

11. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between EGR valve harness connector F144 terminals 2 and 3.

EGR valve			Voltage (Approx.)
Connector	Terminal	Terminal	
F144	2	3	4.75-5.25

Is inspection result normal?

YES >> GO TO 12.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

12.CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0405 being past on the CONSULT screen.

Is DTC P0405 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open.

P0406 EGR SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013083735

The engine control module (ECM) uses the EGR valve position sensor to determine whether or not the valve is meeting the commanded position. The ECM supplies 5V to the EGR valve position signal circuit, and the EGR valve position sensor outputs a voltage signal to the ECM, based on the valve position.The ECM converts this signal into a percentage value, 0 to 100, indicating valve position. A fully-opened valve is equivalent to 100%.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the EGR Valve position signal voltage was greater than 4.7V for more than 3 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0406	EGR_SENSOR (Exhaust Gas Recirculation Sensor "A" Circuit High)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	EGR valve position (152)
		Threshold	Measured EGR H-bridge valve position > 4.737V (101.02%)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- EGR valve
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0406 being current on the CONSULT screen.

Is DTC P0406 current?

YES >> Go to EC-588, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013083736

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for sensor supply DTCs P0652 or P0653 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0406 being current on the CONSULT screen.

Is DTC P0406 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT EGR VALVE POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect EGR valve harness connector F144.
3. Inspect the engine harness and EGR valve connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect EGR valve harness connector F144.
3. Connect a jumper wire between EGR valve harness connector F144 terminals 3 and 4.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0405 become current and DTC P0406 become past?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the EGR valve harness connector F144.
3. Turn ignition switch ON.
4. Measure the voltage between EGR valve harness connector F144 terminals 2 and 3.

EGR valve			Voltage (Approx.)
Connector	Terminal	Terminal	
F144	2	3	4.75V - 5.25V

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect the EGR valve harness connector F144
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0406 current?

YES >> Replace the EGR valve. Refer to EM-279, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector

- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between ECM harness connector F101 terminals 127 and 152.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0405 become current and DTC P0406 become past?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9. CHECK PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0406 being current on the CONSULT screen.

Is the inspection result normal?

YES >> Repair or replace the engine harness.
NO >> The removal and installation of the connector corrected the issue.

10. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between ECM harness connector F101 terminals 106 and 127.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	106	127	4.75V - 5.25V

Is the inspection result normal?

YES >> GO TO 12.

NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

12. CHECK PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0406 being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace the engine harness.

P040B EXHAUST GAS RECIRCULATION TEMPERATURE SENSOR

DTC Description

INFOID:0000000013084606

The exhaust gas recirculation (EGR) temperature sensor is a variable resistor sensor and is used to measure the temperature of the EGR gas flow after it exits the EGR cooler. The engine control module (ECM) supplies 5V to the EGR temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the EGR flow temperature.The EGR temperature value is used by the ECM for the engine protection system and engine emissions control.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the EGR temperature reading was too high or too low for the operating conditions, or the EGR temperature reading did not raise 0.5 degree Celsius at start-up.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P040B	(EGR temperature sensor “A” circuit range/performance)	1	Diagnosis condition	Engine running for 2 minutes or more (2 Trips).
			Signal (terminal)	Exhaust gas temperature (–)
			Threshold	Cumulative sum of error in 60 seconds is > 6,000 Deg C.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Engine running for 2 minutes or more (2 Trips).
			Signal (terminal)	Exhaust gas temperature (–)
			Threshold	Maximum sensor value to minimum sensor value after 60 seconds is < 0.3° C.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		3	Diagnosis condition	• Engine off time is 480 minutes or more. • The temperature drop detected on coolant temperature sensor is 1°C or less for 30 seconds after the engine is started up.
			Signal (terminal)	Exhaust gas temperature (–)
			Threshold	> 25 deg C of the second most accurate of the remaining temperature sensors
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- EGR temperature sensor
- Harness and connectors
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

NOTE:

Allow the engine to rest for 8 hour cold soak with the ignition switch OFF, then turn the ignition switch to the ON position so that the key ON portion of the diagnostic will run.

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 eleven more times.

6. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
7. Check for DTC P040B being current on the CONSULT screen.

Is DTC P040B current?

YES >> Go to EC-593, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084607

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P040C and P040D being current on the CONSULT screen.

Is applicable DTC detected?

YES >> DTC P040C and P040D. Refer to EC-595, "Diagnosis Procedure" or EC-598, "Diagnosis Procedure".
NO >> GO TO 2.

2.INSPECT EGR TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect EGR temperature sensor connector F142 from engine harness connector.
3. Inspect the engine harness and EGR temperature sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the EGR temperature sensor connector F142 from the engine harness.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P040D become current?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between EGR temperature sensor connector F142 return terminal 2 and signal circuit terminal 1.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P040C become current?

YES >> Replace the EGR temperature sensor. Refer to EM-228, "Removal and Installation".
NO >> GO TO 5.

5.INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the engine harness connector F101 from the ECM.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P040D become current?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect EGR temperature sensor connector F142 from the engine harness.
3. Connect a jumper wire between EGR temperature return terminal 1 and signal circuit terminal 2 at the ECM connector F101.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P040C become current?

YES >> Repair or replace the engine harness for an open or short.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P040C EXHAUST GAS RECIRCULATION TEMPERATURE SENSOR

DTC Description

INFOID:0000000013065576

The exhaust gas recirculation (EGR) temperature sensor is a variable resistor sensor and is used to measure the temperature of the EGR gas flow after it exits the EGR cooler. The engine control module (ECM) supplies 5V to the EGR temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the EGR flow temperature.The EGR temperature value is used by the ECM for the engine protection system and engine emissions control.

DTC DETECTION LOGIC

The EGR orifice temperature sensor reading is less than the specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P040C	(EGR temperature sensor “A” circuit low)	Diagnosis condition	Engine running for 1 minute or more
		Signal (terminal)	Exhaust gas temperature sensor (–)
		Threshold	EGR orifice temperature sensor value > 500 Deg C (< 0.067V)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- EGR temperature sensor
- Harness and connectors
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P040C being current on the CONSULT screen.

Is DTC P040C current?

YES >> Go to EC-595, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065577

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P040C being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT EGR TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect EGR temperature sensor from engine harness connector F142.
3. Inspect the engine harness and EGR temperature sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector

- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the EGR temperature sensor from the engine harness connector F142.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P040D become current and DTC P040C become past?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect EGR temperature sensor to the engine harness connector F142.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P040C become current?

YES >> Replace the EGR temperature sensor. Refer to EM-228, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

5.INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the engine harness connector F101 from the ECM.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P040D become current and DTC P040C become past?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7.CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the engine harness from the ECM connector F101.
3. Disconnect the EGR temperature sensor from the engine harness connector F142.

4. Measure the resistance between the EGR temperature sensor SIGNAL terminal 174 in the engine harness ECM connector and all other terminals in the engine harness ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	174	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> Repair or replace the engine harness for an open.
NO >> GO TO 8.

8. CHECK FOR A PIN-TO-GROUND SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the engine harness from the ECM connector F101.
3. Disconnect the EGR temperature sensor from the engine harness connector F142.
4. Measure the resistance between the EGR temperature sensor SIGNAL terminal 174 in the engine harness ECM connector F101 and ground.

ECM		Ground	Resistance
Connector	Terminal		
F101	174	—	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for an short to ground.

9. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P040C being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> GO TO 2.

P040D EXHAUST GAS RECIRCULATION TEMPERATURE SENSOR

DTC Description

INFOID:0000000013065568

The exhaust gas recirculation (EGR) temperature sensor is a variable resistor sensor and is used to measure the temperature of the EGR gas flow after it exits the EGR cooler. The engine control module (ECM) supplies 5V to the EGR temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the EGR flow temperature.The EGR temperature value is used by the ECM for the engine protection system and engine emissions control.

DTC DETECTION LOGIC

The EGR orifice temperature sensor reading is greater than the specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P040D	(EGR temperature sensor “A” circuit high)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Exhaust gas temperature sensor (–)
		Threshold	EGR temperature signal voltage was greater than 4.9-VDC for more than 8seconds
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- EGR temperature sensor
- Harness and connectors
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P040D being current on the CONSULT screen.

Is DTC P0102 current?

YES >> Go to EC-598, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065569

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P040D being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT EGR TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect EGR temperature sensor from engine harness connector F142.
3. Inspect the engine harness and EGR temperature sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector

- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the EGR temperature sensor from the engine harness F142.
3. Connect a jumper wire between EGR temperature sensor return terminal 1 and signal circuit terminal 2 at EGR temperature sensor connector F142.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P040C become current and DTC P040D become past?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect the EGR temperature sensor to the engine harness connector F142.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for ENGINE diagnostic trouble codes.
5. Check for DTC P040D being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Replace the EGR temperature sensor. Refer to EM-228, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

5.INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the engine harness from the ECM.
3. Connect a jumper wire between EGR temperature sensor return terminal 170 and signal circuit terminal 154 at the ECM connector F101.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P040C become current and DTC P040D become past?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7. CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the engine harness from the ECM connector F101.
3. Disconnect the EGR temperature sensor from the engine harness connector F142.
4. Measure the resistance between the ECM connector F101 EGR temperature sensor terminal 170 and the engine harness EGR temperature sensor connector F142 terminal 1.

ECM		EGR temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	170	F142	1	< 10 Ω

Is resistance less than 10 ohms?

YES >> GO TO 8.
NO >> Repair or replace the engine harness for an open.

8. CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the engine harness from the ECM connector F101.
3. Disconnect the EGR temperature sensor from the engine harness connector F142.
4. Measure the resistance between the ECM connector F101 EGR temperature sensor SIGNAL terminal 154 and the engine harness EGR temperature sensor connector F142 terminal 2.

ECM		EGR temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	154	F142	2	< 10 Ω

Is resistance less than 10 ohms?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for an open.

9. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the engine harness from the ECM connector F101.
3. Disconnect the EGR temperature sensor from the engine harness connector F142.
4. Measure the resistance between the EGR temperature sensor SIGNAL terminal 154 in the engine harness ECM connector F101 and all other pins in the engine harness ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	154	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> Repair or replace the engine harness for an open.
NO >> GO TO 10.

10. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P040D being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> GO TO 2.

P0420 EFFICIENCY OF THE CATALYTIC CONVERTER

DTC Description

INFOID:0000000013024917

The aftertreatment diesel particulate filter temperature sensor module is a smart device that communicates with the engine control module via the CAN 2 communication lines. The aftertreatment diesel particulate filter temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using the CAN 2 communication lines. The aftertreatment diesel particulate filter temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature, and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the aftertreatment diesel particulate filter temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The Engine Control Module (ECM) calculated the DOC efficiency was less than required to successfully complete a regeneration.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0420	CATALYST (Catalyst System Efficiency Below Threshold)	1	Diagnosis condition	Engine is running and active regeneration of the aftertreatment diesel particulate filter is occurring.
			Signal (terminal)	(–)
			Threshold	Filtered value of hydrocarbon efficiency < 55% where hydrocarbon dosing efficiency is defined as DOC heat/DOC dosing heat
			Diagnosis delay time	Diagnostic runs continuously when the engine is running and active regeneration of the aftertreatment diesel particulate filter is occurring.
		2	Diagnosis condition	Engine is running and active regeneration of the aftertreatment diesel particulate filter is occurring.
			Signal (terminal)	(–)
			Threshold	DPF intake temperature - DOC intake temperature < 10°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running and active regeneration of the aftertreatment diesel particulate filter is occurring.

POSSIBLE CAUSE

Diesel oxidation catalyst

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0420 being current on the CONSULT screen.

Is DTC P0420 current?

YES >> Go to EC-601, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024919

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0420 being current on the CONSULT screen.

Is DTC P0420 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- Any aftertreatment DOC temperature sensor or aftertreatment DPF temperature sensor DTCs
- Any turbocharger DTCs
- Any EGR valve DTCs
- Any fuel system DTCs

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK EXHAUST SYSTEM FOR LEAKS

1. Turn ignition switch OFF.
2. Inspect the exhaust system between the turbocharger outlet and the aftertreatment system:

- Inspect for loose connections.
- Inspect for leaking connections and broken exhaust system components.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.INSPECT AFTERTREATMENT DOC

1. Remove the aftertreatment DOC from the vehicle. Refer to EX-42, "Removal and Installation".
2. Inspect the aftertreatment DOC for:

- Plugging from soot or oil contamination
- Cracks or damage of any cells in the catalyst
- Soot plugging the front face of the catalyst

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace the aftertreatment DOC.

5.INSPECT TURBOCHARGER EXHAUST OUTLET

1. Remove the exhaust plumbing from the turbocharger outlet.
2. Inspect the turbocharger exhaust outlet for signs of oil, coolant, or fuel being introduced into the aftertreatment system.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Locate the cause of possible diesel fuel, coolant, or engine oil being carried from the engine into the aftertreatment system.

6.INSPECT EXHAUST FOR EXCESSIVE BLACK SMOKE

1. Disconnect exhaust pipe from turbocharger outlet.
2. Start the engine.
3. Perform the Snap Acceleration - Aftertreatment Disconnected procedure to check for excessive black smoke. Refer to EC-189, "Work Procedure".

Is the inspection result normal?

YES >> Inspection End.
NO >> Refer to appropriate engine performance symptom table.

P0421 CATALYST EFFICIENCY BELOW THRESHOLD

DTC Description

INFOID:0000000013312692

The aftertreatment diesel particulate filter temperature sensor module is a smart device that communicates with the engine control module via the CAN 2 communication lines. The aftertreatment diesel particulate filter temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using the CAN 2 communication lines. The aftertreatment diesel particulate filter temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature, and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the aftertreatment diesel particulate filter temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The Engine Control Module (ECM) calculated the DOC efficiency was less than required to successfully complete a regeneration.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0421	CATALYST (Warm Up Catalyst Efficiency Below Threshold)	Diagnosis condition	Engine is running and active regeneration of the aftertreatment diesel particulate filter is occurring.
		Signal (terminal)	(–)
		Threshold	Aftertreatment Diesel Oxidation Catalyst Conversion Efficiency - Data Valid But Below Normal Operating Range
		Diagnosis delay time	Diagnostic runs continuously when the engine is running and active regeneration of the aftertreatment diesel particulate filter is occurring.

POSSIBLE CAUSE

- Diesel oxidation catalyst
- Aftertreatment diesel particulate filter temperature sensor module
- Excessive engine oil or diesel fuel being introduced into the exhaust system from the engine

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Using CONSULT, check for current “ENGINE“ diagnostic trouble codes.
3. Check for DTC P0421 being current on the CONSULT screen.

Is DTC P0421 current?

YES >> Go to EC-603, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013312693

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0421 being current on the CONSULT screen.

Is DTC P0421 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.

3. Are any of the following displayed as current on the CONSULT screen:
- Any aftertreatment DOC temperature sensor or aftertreatment DPF temperature sensor DTCs
- Any turbocharger DTCs
- Any EGR valve DTCs
- Any fuel system DTCs

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. CHECK EXHAUST SYSTEM FOR LEAKS

1. Turn ignition switch OFF.
2. Inspect the exhaust system between the turbocharger outlet and the aftertreatment system:
- Inspect for loose connections.
- Inspect for leaking connections and broken exhaust system component.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. INSPECT AFTERTREATMENT DOC

1. Remove the aftertreatment DOC from the vehicle. Refer to EX-42, "Removal and Installation".
2. Inspect the aftertreatment DOC:
- Plugging from soot or oil contamination
- Soot plugging the front face of the catalyst

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace the aftertreatment DOC.

5. INSPECT TURBOCHARGER EXHAUST OUTLET

1. Remove the exhaust plumbing from the turbocharger outlet.
2. Inspect the turbocharger exhaust outlet for signs of oil, coolant, or fuel being introduced into the aftertreatment system

Is the inspection result normal?

YES >> GO TO 6.
NO >> Locate the cause of possible diesel fuel, coolant, or engine oil being carried from the engine into the aftertreatment system.

6. INSPECT EXHAUST FOR EXCESSIVE BLACK SMOKE

1. Disconnect exhaust pipe from turbocharger outlet.
2. Start the engine.
3. Perform the Snap Acceleration - Aftertreatment Disconnected procedure to check for excessive black smoke. Refer to EC-189, "Work Procedure".

Is the inspection result normal?

YES >> Inspection End.
NO >> Refer to appropriate engine performance symptom table.

P0461 FUEL LEVEL SENSOR

DTC Description

INFOID:0000000013024980

The fuel level sensor measures the amount of fuel in the tank.The fuel level and circuit errors are diagnose internally by the instrument cluster and transmitted to the Engine Control Module (ECM) via the CAN line.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the vehicle has traveled over 500 miles with the fuel level at less than 15%

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0461	FUEL_LEVEL_SENSOR (Fuel Level Sensor “A” Circuit Range/Performance)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	(-)
		Threshold	Vehicle has traveled at least 192.625 miles while fuel level < 14.898%
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel level sensor
- VECU

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P0461 being current on the CONSULT screen.

Is DTC P0461 current?

YES >> Go to EC-605, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024981

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0461 being current on the CONSULT screen.

Is DTC P0461 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for CAN DTCs being current on the CONSULT screen.

Is applicable DTC detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0462 or P0463 being current on the CONSULT screen.

Is applicable DTC detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4.CHECK FUEL LEVEL

1. Turn ignition switch ON engine OFF.
2. Check for adequate fuel supply; verify there is fuel in the tank.
   NOTE:
   Do not rely on the vehicle’s fuel gauge.

Is the inspection result normal?

YES >> Replace the fuel level sensor. Refer to FL-36, "Removal and Installation".
NO >> Add fuel to the fuel tank.

P0462 FUEL LEVEL SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013024984

The fuel level input voltage received from the CAN message is greater than the calibrated maximum value allowed by the corresponding sensor. The fuel level message is received from the fuel level sensor through the CAN data link. The message is scaled to voltage and then checked for the out of range.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fuel level sensor signal voltage was out of range low.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0462	FUEL_LEVL_SEN/CIRC (Fuel Level Sensor “A” Circuit Low)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	(-)
		Threshold	Fuel sensor voltage < 0.122V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel level sensor
- Harness or connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0462 being current on the CONSULT screen.

Is DTC P0462 current?

YES >> Go to EC-607, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024985

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for CAN DTCs being current on the CONSULT screen.

Is applicable DTC detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0462 being current on the CONSULT screen.

Is DTC P0462 detected as current?

YES >> Check the following:
- Vehicle electronic control unit-to-data link connection
- Voltage to the vehicle electronic control unit
- Fuel level sensor/unit
- Harness or connectors

NO >> Refer to GI-43, "Intermittent Incident".

P0463 FUEL LEVEL SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013084586

The fuel level input voltage received from the CAN message is greater than the calibrated maximum value allowed by the corresponding sensor. The fuel level message is received from the fuel level sensor through the CAN data link. The message is scaled to voltage and then checked for the out of range.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fuel level sensor signal voltage was out of range high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0463	FUEL_LEVL_SEN/CIRC (Fuel Level Sensor “A” Circuit High)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	(-)
		Threshold	Fuel level sensor voltage is > 4.302V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel level sensor
- Harness or connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0463 being current on the CONSULT screen.

Is DTC P0463 current?

YES >> Go to EC-608, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084587

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for CAN DTCs being current on the CONSULT screen.

Is applicable DTC detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0463 being current on the CONSULT screen.

Is DTC P0463 detected as current?

YES >> Check the following:
- Vehicle electronic control unit-to-data link connection
- Voltage to the vehicle electronic control unit
- Fuel level sensor/unit
- Harness or connectors

NO >> Refer to GI-43, "Intermittent Incident".

P046C EGR VOLUME CONTROL VALVE POSITION SENSOR

DTC Description

INFOID:0000000013083383

The engine control module (ECM) uses the EGR valve position sensor to determine whether or not the valve is meeting the commanded position. The ECM supplies 5V to the EGR valve position signal circuit, and the EGR valve position sensor outputs a voltage signal to the ECM, based on the valve position.The ECM converts this signal into a percentage value, 0 to 100, indicating valve position. A fully-opened valve is equivalent to 100%

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the EGR valve was unable to reach the commanded position.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P046C	EGR_SENSOR (Exhaust Gas Recirculation Sensor "A" Circuit Range/Performance)	1	Diagnosis condition	Engine is running.
			Signal (terminal)	EGR position sensor (152)
			Threshold	Cumulative sum of error (commanded value - measured value) over a 30 second period is ever > 30,000%, which is equivalent to (average of in range low error - tolerance) > 20%, where tolerance is defined as 0%
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Engine is running.
			Signal (terminal)	EGR position sensor (152)
			Threshold	(Maximum value of in range high error cumulative sum plus maximum value of in range low error cumulative sum within a 30 second period is ever > 40,000%, which is equivalent to (average of in range high error - tolerance + average of in range low error - tolerance) > 26.667%, where in range high error is defined as (measured value - commanded value), In range low error is defined as (commanded value - measured value), and tolerance is defined as 0%
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- EGR valve position sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
7. Check for DTC P046C being current on the CONSULT screen.

Is DTC P046C current?

YES >> Go to EC-610, "Diagnosis Procedure".

NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013083384

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- P0405
- P0406
- P0489
- P0490
- P0652
- P0653

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.INSPECT EGR VALVE POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect EGR valve position sensor harness connector F144.
3. Inspect the engine harness and EGR valve connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect EGR valve harness connector F144.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0406 become current?

YES >> GO TO 4.
NO >> GO TO 6.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect EGR valve harness connector F144.
3. Connect a jumper wire between EGR valve harness connector F144 terminals 3 and 4.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0405 become current?

YES >> GO TO 5.
NO >> GO TO 6.

5.CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the EGR valve harness connector F144.
3. Turn ignition switch ON.

4. Measure the voltage between EGR valve position sensor harness connector F144 terminals 2 and 3.

EGR valve			Voltage (Approx.)
Connector	Terminal	Terminal	
F144	2	3	4.75V - 5.25V

Is inspection result normal?

YES >> Replace the EGR valve. Refer to EM-279, "Removal and Installation".
NO >> GO TO 6.

6. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0406 become current?

YES >> GO TO 8.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

8. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between ECM harness connector F101 terminals 127 and 152.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0405 become current?

YES >> GO TO 9.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

9. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between ECM harness connector F101 terminals 106 and 127.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	106	127	4.75V - 5.25V

Is inspection result normal?

YES >> Repair or replace harness.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P0471 EXHAUST PRESSURE SENSOR

DTC Description

INFOID:0000000013065600

The exhaust gas pressure sensor is used to measure exhaust gas pressure in the exhaust manifold. This information is used by the engine control module (ECM) to control emissions and exhaust gas recirculation (EGR) valve operation. The ECM provides a 5V supply to the exhaust gas pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The exhaust gas pressure sensor provides a signal to the ECM on the exhaust gas pressure sensor signal circuit. This sensor signal voltage changes, based on the pressure in the exhaust manifold.

DTC DETECTION LOGIC

- The Engine Control Module (ECM) detected the exhaust pressure reading was higher or lower than the other absolute pressure sensors when the ignition switch is OFF and the engine is not running.
- The Engine Control Module (ECM) detected the exhaust pressure was higher or lower than expected during normal engine operation.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0471	DIFF_EX_PRESS_SEN (Exhaust pressure sensor “A” circuit range/performance)	1	Diagnosis condition	Engine is running
			Signal (terminal)	Exhaust gas pressure sensor (–)
			Threshold	Exhaust pressure sensor reading < 18 kPa
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Engine is running
			Signal (terminal)	Exhaust gas pressure sensor (–)
			Threshold	Exhaust pressure sensor reading > 144.3 kPa
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		3	Diagnosis condition	• Ignition switch is OFF 30 seconds or more. • Engine coolant temperature is above 70°C (158°F).
			Signal (terminal)	Exhaust gas pressure sensor (–)
			Threshold	• Exhaust pressure sensor reading < 18 kPa • Exhaust pressure sensor reading > 144.3 kPa
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Exhaust gas sensor pressure tube
- Harness and connectors
- Turbocharger turbine actuator linkage
- Exhaust gas pressure sensor
- Turbocharger

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Check that engine coolant temperature is above 70°C (158°F).
2. Turn ignition ON for 30 seconds, then turn ignition switch OFF and wait 30 seconds.
3. Start the engine and let it idle for 1 minute.
4. Accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
5. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

6. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
7. Check for DTC P0471 being current on the CONSULT screen.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again, even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is DTC P0471 current?

YES >> Go to EC-614, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065601

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- P0101
- P0472
- P0473
- P2280
- Any turbocharger DTCs
- Any EGR or EGR bypass DTCs

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK THE EXHAUST GAS PRESSURE SENSOR TUBE

1. Turn ignition switch OFF.
2. Remove the exhaust gas pressure sensor tube.

- Inspect the inside of the tube. If clogged, use compressed air to remove debris or soot buildup.
- Check the tube for cracks and thread damage.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Clean or replace the exhaust gas sensor pressure tube.

3.INSPECT EXHAUST GAS PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect exhaust gas pressure sensor harness connector F199.
3. Inspect the harness connector and exhaust gas pressure sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON and wait 30 seconds.
2. With the exhaust gas temperature sensor harness connector F199 disconnected. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0472 DTC become current?

YES >> GO TO 5.
NO >> GO TO 6.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between exhaust gas pressure sensor harness connector F199 terminals 1 and 3.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P0473 DTC become current?

YES >> GO TO 7.
NO >> GO TO 6.

6. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Check continuity between ECM harness connector F101 and exhaust gas pressure sensor harness connector F199.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	106	F199	1	< 10 Ω
	127		2	
	132		3	

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace harness for an open circuit.

8. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

Measure the resistance between the ECM harness connector F101 terminal 132 and all other F101 terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	132	F101	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace harness for a short circuit.

9. CHECK FOR A PIN-TO-GROUND SHORT CIRCUIT IN THE ENGINE HARNESS

Measure the resistance between ECM harness connector F101 terminal 132 and ground.

ECM		Ground	Resistance
Connector	Terminal		
F101	132	—	> 100k Ω

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair or replace the engine harness for a short to ground.

10. INSPECT THE ROTARY TURBINE CONTROL VALVE ACTUATOR

1. Disconnect the rotary turbine control valve actuator harness connector F146.
2. Inspect the rotary turbine control valve actuator and harness connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11. INSPECT THE TURBOCHARGER TURBINE ACTUATOR LINKAGE

Inspect the turbocharger turbine actuator linkage for damage.

Is the inspection result normal?

YES >> GO TO 12.
NO >> Replace the turbocharger turbine actuator linkage.

12. INSPECT THE TURBOCHARGER TURBINE ACTUATOR LINKAGE MOVEMENT

Rotate (by hand) the turbocharger turbine actuator linkage from stop to stop.

- Check for smooth movement between the stops.
- There will be an initial friction force that must be overcome before the linkage will move. Once movement is started, the actuator linkage must move to the other stop position by hand.

Is the inspection result normal?

YES >> Replace the exhaust gas pressure sensor. Refer to EM-296, "Removal and Installation".
NO >> Inspect the base engine components for damage. Replace the turbocharger assembly.

P0472 EXHAUST PRESSURE SENSOR

DTC Description

INFOID:0000000013065560

The exhaust gas pressure sensor is used to measure exhaust gas pressure in the exhaust manifold. This information is used by the engine control module (ECM) to control emissions and exhaust gas recirculation (EGR) valve operation. The ECM provides a 5V supply to the exhaust gas pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The exhaust gas pressure sensor provides a signal to the ECM on the exhaust gas pressure sensor signal circuit. This sensor signal voltage changes, based on the pressure in the exhaust manifold.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the exhaust gas pressure signal voltage was less than 0.25V for more than 8 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0472	DFF_PRESS_SEN/CIRC (Exhaust pressure sensor “A” circuit low)	Diagnosis condition	Engine running for 1 minute or more.
		Signal (terminal)	Exhaust gas pressure (–)
		Threshold	Exhaust gas pressure signal voltage was less than 0.25V for more than 8 seconds
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Exhaust gas pressure sensor
- Harness and connectors
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0472 being current on the CONSULT screen.

Is DTC P0472 current?

YES >> Go to EC-617, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065561

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for sensor supply DTCs being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0472 being past on the CONSULT screen.

Is DTC P0472 detected as past?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 3.

3.INSPECT EXHAUST GAS PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect exhaust gas pressure sensor harness connector F199.
3. Inspect the engine harness and exhaust gas pressure sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the exhaust gas pressure sensor harness connector F199.
3. Turn ignition switch ON.
4. Measure the voltage between exhaust gas pressure sensor harness connector F199 terminals 1 and 3.

Exhaust gas pressure sensor		Exhaust gas pressure sensor		Voltage (Approx.)
Connector	Terminal	Connector	Terminal	
F199	1	F199	3	4.75V - 5.25V

Is inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect exhaust gas pressure sensor from the engine harness connector F199.
3. Connect a jumper wire between terminal 1 and 2 of exhaust gas pressure sensor harness connector F199.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0473 become current and DTC P0472 become past?

YES >> GO TO 6.
NO >> GO TO 10.

6.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect the exhaust gas pressure sensor harness connector F199.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0472 become current?

YES >> Replace the exhaust gas pressure sensor. Refer to EM-296, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins

- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Turn ignition switch ON.
4. Measure the voltage between terminal 106 and 127 at the ECM connector F101.

ECM		ECM		Voltage (Approx.)
Connector	Terminal	Connector	Terminal	
F101	106	F101	127	4.75V - 5.25V

Is inspection the result normal?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0472 being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace the harness for an open or shorted circuit.

10. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between the exhaust gas pressure sensor SUPPLY terminal 106 and the exhaust gas pressure sensor SIGNAL terminal 132 at the ECM engine connector F101.
4. Turn ignition switch ON. Wait 30 seconds.

5. With CONSULT check for current ENGINE diagnostic trouble codes.

Did P0473 DTC become current and P0472 DTC become past?

YES >> GO TO 12.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

12. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0472 being past on the CONSULT screen.

Is DTC P0472 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open or pin-to-pin short.

P0473 EXHAUST PRESSURE SENSOR

DTC Description

INFOID:0000000013065554

The exhaust gas pressure sensor is used to measure exhaust gas pressure in the exhaust manifold. This information is used by the engine control module (ECM) to control emissions and exhaust gas recirculation (EGR) valve operation. The ECM provides a 5V supply to the exhaust gas pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The exhaust gas pressure sensor provides a signal to the ECM on the exhaust gas pressure sensor signal circuit. This sensor signal voltage changes, based on the pressure in the exhaust manifold.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the exhaust gas pressure signal voltage was greater than 4.75V for more than 8 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0473	DFF_PRESS_SEN/CIRC1 (Exhaust pressure sensor “A” circuit high)	Diagnosis condition	Engine running for 2 minutes or more.
		Signal (terminal)	Exhaust gas pressure (–)
		Threshold	Exhaust gas pressure signal voltage was greater than 4.75V for more than 8 seconds.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Exhaust gas pressure sensor
- Harness and connectors
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0473 being current on the CONSULT screen.

Is DTC P0473 current?

YES >> Go to EC-621, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065555

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for sensor supply DTCs being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0473 being past on the CONSULT screen.

Is DTC P0473 detected as past?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 3.

3. INSPECT EXHAUST GAS PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect exhaust gas pressure sensor harness connector F199.
3. Inspect the engine harness and exhaust gas pressure sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect exhaust gas pressure sensor harness connector F199.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0472 become current and DTC P0473 become past?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the exhaust gas pressure sensor from the engine harness connector F199.
3. Turn ignition switch ON.
4. Measure the voltage between exhaust gas pressure sensor harness connector F199 terminals 2 and 3.

Exhaust gas pressure sensor		Exhaust gas pressure sensor		Voltage (Approx.)
Connector	Terminal	Connector	Terminal	
F199	3	F199	2	4.75-5.25

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect the exhaust gas pressure sensor harness connector F199.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0473 become current?

YES >> Replace the exhaust gas pressure sensor. Refer to EM-296, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins

- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON. Wait 30 seconds.
4. With CONSULT check for current ENGINE diagnostic trouble codes.

Did P0472 DTC become current and P0473 DTC become past?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0473 being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open or shorted SUPPLY circuit.

10.INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11.CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect harness connector F101 from the ECM.
3. Turn ignition switch ON.
4. Measure the voltage between terminals 106 and 127 at the ECM connector F101.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	127	106	4.75-5.25

Is the inspection result normal?

YES >> GO TO 12.

NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

12. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P0473 being past on the CONSULT screen.

Is DTC P0473 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open or pin-to-pin short.

P0489 EGR CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013083033

The EGR valve device driver in the ECM provides power to the EGR valve motor. The EGR valve motor is used to move the EGR valve to the correct position, as commanded by the ECM.The engine control module (ECM) uses the EGR valve position sensor to determine whether or not the valve is meeting the commanded position. The ECM supplies 5V to the EGR valve position signal circuit, and the EGR valve position sensor outputs a voltage signal to the ECM, based on the valve position. The ECM converts this signal into a percentage value, 0 to100, indicating valve position. A fully-opened valve is equivalent to 100%.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected low voltage on the EGR valve actuator.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0489	(Exhaust Gas Recirculation Control Circuit Low)	Diagnosis condition	Ignition is turned ON after 30 seconds with ignition OFF.
		Signal (terminal)	(-)
		Threshold	The current rises above the high-side shutdown threshold of 12.6A when a high-side switch is turned ON
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- EGR valve
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
   NOTE:
   Ignition switch must be turned OFF for more than 30 seconds before this diagnostic will run at initial key ON
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0489 being current on the CONSULT screen.

Is DTC P0489 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013083034

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0489 being current on the CONSULT screen.

Is DTC P0489 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT EGR VALVE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect EGR valve harness connector F144.
3. Inspect the engine harness and EGR valve connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK FOR A SHORT CIRCUIT TO GROUND IN THE EGR VALVE MOTOR

1. Turn ignition switch OFF.
2. Disconnect the EGR valve harness connector F144.
3. Measure the resistance between the ECM harness connector F101 terminals 134, 135 and ground.

ECM		Ground	Resistance
Connector	Terminal		
F101	134	—	> 100k Ω
	135		

Is resistance greater than 100k ohms?

YES >> GO TO 4.
NO >> Replace the EGR valve. Refer to EM-282, "Removal and Installation".

4. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK FOR A SHORT CIRCUIT TO GROUND IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the EGR valve harness connector F144.
4. Measure the resistance between the ECM harness connector F101 terminals 134, 135 and ground.

ECM		Ground	Resistance
Connector	Terminal		
F101	134	—	> 100k Ω
	135		

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the EGR valve harness connector F144.
4. Measure the resistance between the ECM harness connector F101 terminals 134, 135 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	134	F101	All	> 100k Ω
	135			

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P0489 being past on the CONSULT screen.

Is DTC P0489 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P0490 EGR CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013082770

The EGR valve device driver in the ECM provides power to the EGR valve motor. The EGR valve motor is used to move the EGR valve to the correct position, as commanded by the ECM.The engine control module (ECM) uses the EGR valve position sensor to determine whether or not the valve is meeting the commanded position. The ECM supplies 5V to the EGR valve position signal circuit, and the EGR valve position sensor outputs a voltage signal to the ECM, based on the valve position. The ECM converts this signal into a percentage value, 0 to100, indicating valve position. A fully-opened valve is equivalent to 100%.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected high voltage on the EGR Valve actuator.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0490	(Exhaust Gas Recirculation Control Circuit High)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	(-)
		Threshold	The current through the low side transistor is lower than the referenced current (1.5 mA to 1.0 mA) during PWM off-state.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- EGR valve
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0490 being current on the CONSULT screen.

Is DTC P0490 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013082771

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0490 being current on the CONSULT screen.

Is DTC P0490 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT EGR VALVE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect EGR valve harness connector F144.
3. Inspect the engine harness and EGR valve connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins

- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK FOR AN OPEN CIRCUIT IN THE EGR VALVE MOTOR CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Connect the EGR valve harness connector F144.
4. Measure the resistance between the ECM harness connector F101 terminals 134 and 135.

ECM			Resistance
Connector	Terminal	Terminal	
F101	134	135	< 15 Ω

Is resistance less than 15 ohms?

YES >> GO TO 6.
NO >> GO TO 4.

4. CHECK FOR AN OPEN CIRCUIT IN THE EGR VALVE MOTOR

1. Turn ignition switch OFF.
2. Disconnect the EGR valve harness connector F144.
3. Measure the resistance between the EGR connector F144 terminals 1 and 5.

EGR valve			Resistance
Connector	Terminal	Terminal	
F144	1	5	< 15 Ω

Is resistance less than 15 ohms?

YES >> GO TO 5.
NO >> Replace EGR valve assembly. Refer to EM-279, "Removal and Installation".

5. CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the EGR valve harness connector F144.
4. Measure the resistance between the ECM harness connector F101 and EGR harness connector F144.

ECM		EGR valve		Resistance
Connector	Terminal	Connector	Terminal	
F101	134	F144	1	< 10 Ω
	135		5	

Is resistance less than 10 ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for an open.

6. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins

- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7.CHECK FOR A SHORT CIRCUIT TO VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the EGR valve harness connector F144.
4. Measure the voltage between the ECM harness connector F101 terminals 134, 135 and ground.

ECM		Ground	Voltage (V) (Approx.)
Connector	Terminal		
F101	134	(—)	< 1.5
	135		

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the engine harness for a short.

8.CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the EGR valve harness connector F144.
4. Measure the resistance between the ECM harness connector F144 terminals 134, 135 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	134	F101	All	> 100k Ω
	135			

Is resistance greater than 100k ohms?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for a short.

9.CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P0490 being past on the CONSULT screen.

Is DTC P0490 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P0501 VEHICLE SPEED SIGNAL

DTC Description

INFOID:0000000013065632

The vehicle speed sensor senses the speed of the tail shaft gear on the vehicle's transmission. This speed signal is then transmitted to the Engine Control Module (ECM) and converted into a vehicle speed.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a loss of vehicle speed when other engine operating conditions indicated that the vehicle should be in motion. This fault code can also become active if the calculated gear ratio and actual gear ratio do not agree while the vehicle is in motion

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0501	VEHICLE_SPEED (Vehicle Speed Sensor "A" Range/ Performance)	1	Diagnosis condition	Vehicle is in motion
			Signal (terminal)	(–)
			Threshold	At ignition OFF vehicle speed is > 158.449 mph
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Vehicle is in motion
			Signal (terminal)	(–)
			Threshold	Actual gear ratio < 0.504
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		3	Diagnosis condition	Vehicle is in motion
			Signal (terminal)	(–)
			Threshold	Difference between min and max vehicle speeds attained within a time window is less than 0.621 mph, while pedal position has changed by 20% at least 50 times in the time window
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		4	Diagnosis condition	Vehicle is in motion
			Signal (terminal)	(–)
			Threshold	• Vehicle speed = 0 and idle validation counter is ≥ 10 and boost transition counter ≥ 60 where idle validation counter is incremented on idle transitions from idle to non-idle, and boost transition counter is incremented when boost goes above 20 kPa for 5 seconds. • After engine has been running for at least 5 minutes, then at any instant of time when engine torque is > 116 Nm and unfiltered vehicle speed = 0 and filtered vehicle speed is > 9.942 mph
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Output shaft speed sensor
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch ON.

2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0501 being current on the CONSULT screen.

Is DTC detected?

YES >> Proceed to EC-632, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065633

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen.

- Any CAN DTCs
- Any accelerator pedal DTCs
- Any TCM DTCs

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0501 being current on the CONSULT screen.

Is DTC P0501 detected as current?

YES >> Repair or replace output shaft sensor. Refer to TM-231, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

P0506 ISC SYSTEM

DTC Description

INFOID:0000000013024989

The Engine Control Module (ECM) continuously monitors the engine speed at idle and adjusts fueling to maintain governed idle speed. The ECM checks if engine speed is within nominal idle speed for an accumulated amount of time. When the accumulated amount of time exceeds the limit, the engine speed is checked once again. If the engine speed is higher or lower than the acceptable boundary, an error is set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the engine speed was 50 rpm below governed idle speed for 30 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0506	ISC SYSTEM (Idle Air Control System RPM Lower Than Expected)	Diagnosis condition	Engine running at idle.
		Signal (terminal)	(-)
		Threshold	Idle reference speed - Engine speed > 50 RPM, when the amount of time that engine speed is outside the idle reference speed band, by more than 50 RPM, is equal to 15 seconds
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel system malfunction
- Crankshaft position sensor
- Camshaft position sensor
- Increased engine accessory load

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0506 being current on the CONSULT screen.

Is DTC P0506 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024992

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0506 being current on the CONSULT screen.

Is DTC P0506 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0501 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for current or past DTCs related to the fuel system, crankshaft position sensor or camshaft position sensor on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4.CHECK ENGINE RPM

1. Start the engine.
2. Connect CONSULT and compare engine RPM in “Data Monitor” to mechanical tachometer or to the instrument cluster tachometer.

Is RPM reading correct?

YES >> GO TO 5.
NO >> Refer to EC-567, "Diagnosis Procedure" and EC-571, "Diagnosis Procedure".

5.CHECK ACCESSORY LOAD

1. Turn ignition switch OFF.
2. Check the accessory load on the engine:

- Inspect the engine for damaged or marginal accessories such as generator, refrigerant pumps, hydraulic pumps, air compressors, etc.
- Inspect for additional engine accessories that could increase the load on the engine.

Damaged or additional accessories found on the engine?

YES >> Repair or replace error-detected parts.
NO >> Refer to appropriate engine performance troubleshooting tree.

P0507 ISC SYSTEM

DTC Description

INFOID:0000000013024993

The Engine Control Module (ECM) continuously monitors the engine speed at idle and adjusts fueling to maintain governed idle speed. The ECM checks if engine speed is within nominal idle speed for an accumulated amount of time. When the accumulated amount of time exceeds the limit, the engine speed is checked once again. If the engine speed is higher or lower than the acceptable boundary, an error is set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the engine speed was 50 rpm above governed idle speed for 30 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0507	ISC SYSTEM (Idle Air Control System RPM Higher Than Expected)	Diagnosis condition	Engine running at idle.
		Signal (terminal)	(-)
		Threshold	Engine speed - idle reference speed > 50 RPM, when the amount of time that engine speed is outside the idle reference speed band, by more than 50 RPM, is equal to 15 seconds
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel system
- Crankshaft position sensor
- Camshaft position sensor
- Alternate fuel source entering intake system

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0507 being current on the CONSULT screen.

Is DTC P0507 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013024996

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0507 being current on the CONSULT screen.

Is DTC P0507 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0501 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for current or past DTCs related to the fuel system, crankshaft position sensor or camshaft position sensor on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4.CHECK ENGINE RPM

1. Start the engine.
2. Connect CONSULT and compare engine RPM in Data Monitor to mechanical tachometer or to the instrument cluster tachometer.

Is RPM reading correct?

YES >> GO TO 5.
NO >> Refer to EC-567, "Diagnosis Procedure" and EC-571, "Diagnosis Procedure".

5.CHECK FOR ALTERNATE FUEL SOURCE

1. Turn ignition switch OFF.
2. Check for alternate fuel source:

- Check the oil contamination in the intake piping.
- Check for malfunctioning cold weather starting aids.
- Check for malfunctioning aftermarket devices.

Alternate fuel source found?

YES >> Repair or replace error-detected parts.
NO >> Refer to appropriate engine performance troubleshooting tree.

P0513 INCORRECT IMMOBILIZER KEY

DTC Description

INFOID:0000000013065654

The immobilizer anti-theft device communicates to the primary engine electronic control module (ECM) through the CAN data link. Messages sent from the immobilizer anti-theft device are received by the ECM and are used to control the anti-theft features.

DTC DETECTION LOGIC

The Engine Control Module (ECM) received an invalid key message from the immobilizer anti-theft system.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0513	(Incorrect Immobilizer Key)	Diagnosis condition	Ignition switch is ON
		Signal (terminal)	(–)
		Threshold	Driver used incorrect key
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Invalid key
- Antitheft device

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let it idle for 1 minute.
2. Check DTC.

Is DTC detected?

YES >> Proceed to EC-632, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065655

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0513 being current on the CONSULT screen.

Is DTC P0513 detected as current?

YES >> Immobilizer anti-theft device has not been deactivated. Refer to SEC-12, "NISSAN VEHICLE IMMOBILIZER SYSTEM-NATS : System Description".
NO >> Refer to GI-43, "Intermittent Incident".

P051B CRANKCASE PRESSURE SENSOR RANGE/PERFORMANCE

DTC Description

INFOID:0000000013084567

The crankcase pressure sensor is used to monitor the pressure inside the crankcase. The engine control module (ECM) supplies the crankcase pressure sensor a 5V reference voltage. When the crankcase pressure is low, the sensor signal voltage is low. When the crankcase pressure is high, the sensor signal voltage is near the 5V reference voltage. The ECM monitors the crankcase pressure signal circuit voltage to calculate the pressure of the air within the crankcase.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the crankcase pressure was greater than 0.5kPa or less than -0.5kPa at key on; or not changing during engine running.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P051B	(Crankcase Pressure Sensor Circuit Range/Performance)	Diagnosis condition	• Ignition switch ON. • Engine running.
		Signal (terminal)	Crankcase pressure sensor (111)
		Threshold	Crankcase pressure sensor > 0.5 kPa Or Crankcase pressure sensor < -0.5 kPa
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Crankcase pressure sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Bring the vehicle to a complete stop, and turn ignition switch OFF for 1 minute.
4. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
5. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
6. Accelerate to 88 km/h (55 MPH) for 20 seconds.
7. Repeat steps 5 and 6 for 21 times.
8. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
9. Check for DTC P051B being current on the CONSULT screen.

Is DTC P051B current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084568

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.

3. Are any of the following displayed as current on the CONSULT screen.
- P051C
- P051D

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK OIL FILL CAP

Check the oil fill cap for proper installation.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Install oil fill cap.

3.INSPECT CRANKCASE PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect crankcase pressure sensor harness connector F151.
3. Inspect the harness connector and crankcase pressure sensor pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect crankcase pressure sensor harness connector F151.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P051C DTC become current?

YES >> GO TO 5.
NO >> GO TO 6.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect crankcase pressure sensor harness connector F151.
3. Connect a jumper wire between crankcase harness connector F151 terminals 1 and 3.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P051D DTC become current?

YES >> Replace crankcase pressure sensor. Refer to EM-326, "Removal and Installation".
NO >> GO TO 6.

6.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector

- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P051C current?

YES >> GO TO 8.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

8. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between ECM harness connector F101 terminals 106 and 111.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P051D current?

YES >> Repair or replace harness for an open or short circuit.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P051C CRANKCASE PRESSURE SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013085993

The crankcase pressure sensor is used to monitor the pressure inside the crankcase. The engine control module (ECM) supplies the crankcase pressure sensor a 5V reference voltage. When the crankcase pressure is low, the sensor signal voltage is low. When the crankcase pressure is high, the sensor signal voltage is near the 5V reference voltage. The ECM monitors the crankcase pressure signal circuit voltage to calculate the pressure of the air within the crankcase.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the crankcase pressure signal voltage was Less than 0.25V for more than 8seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P051C	(Crankcase Pressure Sensor Circuit Low)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	Crankcase pressure sensor (111)
		Threshold	Crankcase pressure sensor value < 0.254V (-2.49 kPa)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Crankcase pressure sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P051C being current on the CONSULT screen.

Is DTC P051C current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013085994

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for sensor supply DTCs being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P051C being past on the CONSULT screen.

Is DTC P051C detected as past?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 3.

3.INSPECT CRANKCASE PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect crankcase pressure sensor harness connector F151.
3. Inspect the engine harness and crankcase pressure sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the crankcase pressure sensor harness connector F151.
3. Turn ignition switch ON.
4. Measure the voltage between crankcase pressure sensor harness connector F151 terminals 1 and 2.

Crankcase pressure sensor			Voltage (V) (Approx.)
Connector	Terminal	Terminal	
F151	1	2	4.75-5.25

Is inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect crankcase pressure sensor connector F151.
3. Connect a jumper wire between crankcase pressure sensor harness connector F151 terminals 1 and 3.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P051D become current and DTC P051C become past?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect the crankcase pressure sensor harness connector F151.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0051C current?

YES >> Replace the crankcase pressure sensor. Refer to EM-326, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector

- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect harness connector F101 from the ECM.
3. Turn ignition switch ON.
4. Measure the voltage between terminals 106 and 127 at the ECM connector F101.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	127	106	4.75-5.25

Is the inspection result normal?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P051C being past on the CONSULT screen.

Is DTC P051C detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open.

10. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between crankcase pressure sensor harness connector F101 terminals 106 and 111.
4. Turn ignition switch ON. Wait 30 seconds.
5. With CONSULT check for current ENGINE diagnostic trouble codes.

Did P0051D DTC become current and P051C DTC become past?

YES >> GO TO 12.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

12. CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P051C being current on the CONSULT screen.

Is DTC P051C detected as current?

YES >> Repair or replace harness for an open or pin-to-pin short.
NO >> The removal and installation of the connector corrected the issue.

P051D CRANKCASE PRESSURE SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013086369

The crankcase pressure sensor is used to monitor the pressure inside the crankcase. The engine control module (ECM) supplies the crankcase pressure sensor a 5V reference voltage. When the crankcase pressure is low, the sensor signal voltage is low. When the crankcase pressure is high, the sensor signal voltage is near the 5V reference voltage. The ECM monitors the crankcase pressure signal circuit voltage to calculate the pressure of the air within the crankcase.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the crankcase pressure signal voltage was greater than 4.7V for more than8 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P051D	(Crankcase Pressure Sensor Circuit High)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	Crankcase pressure sensor (111)
		Threshold	Crankcase pressure sensor > 4.746V (6.89 kPa)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Crankcase pressure sensor
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P051D being current on the CONSULT screen.

Is DTC P051D current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013086370

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for sensor supply DTCs P0653 or P06D8 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P051D being past on the CONSULT screen.

Is DTC P051D detected as past?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 3.

3.INSPECT CRANKCASE PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.

2. Disconnect crankcase pressure sensor harness connector F139.
3. Inspect the engine harness and crankcase pressure sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect crankcase pressure sensor harness connector F151.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P051C become current and DTC P051D become past?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the crankcase pressure sensor harness connector F151.
3. Turn ignition switch ON.
4. Measure the voltage between crankcase pressure sensor harness connector F151 terminals 1 and 2.

Crankcase pressure sensor			Voltage (V) (Approx.)
Connector	Terminal	Terminal	
F151	1	2	4.75-5.25

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect the crankcase pressure sensor harness connector F151.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0051D current?

YES >> Replace the crankcase pressure sensor. Refer to EM-326, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between terminal 106 and terminal 111 at the ECM engine connector F101.
4. Turn ignition switch ON. Wait 30 seconds.
5. With CONSULT check for current ENGINE diagnostic trouble codes.

Did P051C DTC become current and P051D DTC become past?

YES >> GO TO 9.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

9.CHECK PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ENGINE diagnostic trouble codes.
4. Check for DTC P051D being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for a short circuit.

10.INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11.CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect harness connector F101 from the ECM.
3. Turn ignition switch ON.
4. Measure the voltage between terminals 106 and 127 at the ECM connector F101.

ECM			Voltage (Approx.)
Connector	Terminal	Terminal	
F101	127	106	4.75-5.25

Is the inspection result normal?

YES >> GO TO 12.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

12.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE diagnostic” trouble codes.
4. Check for DTC P051D being past on the CONSULT screen.

Is DTC P051D detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open.

P0521 ENGINE OIL PRESSURE

DTC Description

INFOID:0000000013070727

An engine oil pressure switch or oil pressure sensor is used by the Engine Control Module (ECM) to monitor the lubricating oil pressure. For engines with an oil pressure switch, the switch is normally closed when the engine is not running and open when oil pressure is present. For engines with an oil pressure sensor, the ECM will detect a low signal voltage at operating conditions when the oil pressure is low. The ECM will detect a high signal voltage at operating conditions when the oil pressure is high.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the engine oil pressure reading was higher or lower than the other absolute pressure sensors on the engine after the key switch has been turned OFF and the engine has stopped running.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0521	(Engine Oil Pressure Sensor/Switch Range/Performance)	Diagnosis condition	1. Ignition switch ON. 2. Ignition switch OFF
		Signal (terminal)	Oil pressure switch (143)
		Threshold	• Oil pressure > 0 kPa at ignition ON and engine OFF • Number of times the oil pressure switch indicates positive oil pressure before engine start ≥ 5 counts
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Oil pressure switch
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P0521 being current on the CONSULT screen.

Is DTC P0521 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070728

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0521 being current on the CONSULT screen.

Is DTC P0521 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2. INSPECT OIL PRESSURE SWITCH AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect oil pressure switch harness connector F111.
3. Inspect the engine harness and oil pressure switch connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK OIL PRESSURE SWITCH RESISTANCE

1. Turn ignition switch OFF.
2. Disconnect the oil pressure switch harness connector F111.
3. Measure the resistance between the oil pressure switch terminal 1 and ground.

Oil pressure switch Terminal	Ground	Resistance
1	—	< 10 Ω

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace oil pressure switch. Refer to LU-58, "Removal and Installation".

4. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the oil pressure switch harness connector F111.
4. Measure the resistance between the ECM harness connector F101 terminal 143 and the oil pressure switch harness connector F111 terminal 1.

ECM		Oil pressure switch		Resistance
Connector	Terminal	Connector	Terminal	
F101	143	F111	1	< 10 Ω

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for an open.

6. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the refrigerant pressure sensor harness connector F111.
4. Measure the resistance between the ECM harness connector F101 terminal 143 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	143	F101	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P0521 being past on the CONSULT screen.

Is DTC P0521 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open.

P0524 ENGINE OIL PRESSURE

DTC Description

INFOID:0000000013065556

An engine oil pressure switch or oil pressure sensor is used by the Engine Control Module (ECM) to monitor the lubricating oil pressure. For engines with an oil pressure switch, the switch is normally closed when the engine is not running and open when oil pressure is present. For engines with an oil pressure sensor, the ECM will detect a low signal voltage at operating conditions when the oil pressure is low. The ECM will detect a high signal voltage at operating conditions when the oil pressure is high.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the engine oil pressure was less than 60 kPa for more than 5 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0524	ENGINE OIL PRESSURE (Engine Oil Pressure Too Low)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	Oil pressure switch (143)
		Threshold	Oil pressure sensor value < reftable50
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Oil pressure

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0524 being current on the CONSULT screen.

Is DTC P0524 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065557

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0524 being current or past on the CONSULT screen.

Is DTC P0524 detected?

YES >> Refer to Lubricating Oil Pressure Low or Lubricating Oil Pressure High.
NO >> GO TO 2.

2.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Perform “DTC CONFIRMATION PROCEDURE”.

Is P0524 DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again.
NO >> Repair complete.

P0532 A/C REFRIGERANT PRESSURE SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013084602

The engine control module (ECM) provides a 5V supply and ground to the AC pressure sensor circuit. The AC pressure sensor provides a signal to the ECM. The ECM monitors the AC pressure signal voltage to diagnose the condition of the sensor circuit.

DTC DETECTION LOGIC

The Engine control module (ECM) detected the AC pressure sensor circuit is less than 0.3V for more than 5 seconds

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0532	(A/C Refrigerant Pressure Sensor “A” Circuit Low)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	Refrigerant pressure sensor (26)
		Threshold	A/C pressure sensor value < 0.25V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Refrigerant pressure sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0532 being current on the CONSULT screen.

Is DTC P0532 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084603

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for sensor supply DTC P06D3 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0532 being current on the CONSULT screen.

Is DTC P0532 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT REFRIGERANT PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect refrigerant pressure sensor harness connector E88.
3. Inspect the engine harness and refrigerant pressure sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the refrigerant pressure sensor harness connector E88.
3. Turn ignition switch ON.
4. Measure the voltage between refrigerant pressure sensor harness connector F88 terminals 1 and 2.

Refrigerant pressure sensor			Voltage (V) (Approx.)
Connector	Terminal	Terminal	
E88	1	2	4.75-5.25

Is inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect refrigerant pressure sensor connector E88.
3. Connect a jumper wire between refrigerant pressure sensor harness connector E88 terminals 2 and 3.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0533 become current and DTC P0532 become past?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect the refrigerant pressure sensor harness connector E88.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0532 current?

YES >> Replace the refrigerant pressure sensor. Refer to HAC-123, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken

- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the refrigerant pressure sensor harness connector E88.
4. Measure the resistance between the ECM harness connector E93 terminal 64 and the refrigerant pressure sensor harness connector E88 terminal 1.

ECM		Refrigerant pressure sensor		Resistance
Connector	Terminal	Connector	Terminal	
E93	64	E88	1	< 10 Ω

Is resistance less than 10 ohms?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for an open.

9. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the refrigerant pressure sensor harness connector E88.
4. Measure the resistance between the ECM harness connector E93 terminal 26 and all other terminals in the ECM harness connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	26	E93	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 10.
NO >> Repair or replace the engine harness for a short.

10. CHECK FOR A PIN-TO-GROUND SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the refrigerant pressure sensor harness connector E88.
4. Measure the resistance between the ECM harness connector E93 terminal 26 and ground.

ECM		Ground	Resistance
Connector	Terminal		
E93	26	—	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 11.
NO >> Repair or replace the engine harness for a short to ground.

11. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P0532 being past on the CONSULT screen.

Is DTC P0532 detected as past?

YES >> The removal and installation of the connector corrected the issue.
NO >> Repair or replace harness for an open.

P0533 A/C REFRIGERANT PRESSURE SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013084590

The engine control module (ECM) provides a 5V supply and ground to the AC pressure sensor circuit. The AC pressure sensor provides a signal to the ECM. The ECM monitors the AC pressure signal voltage to diagnose the condition of the sensor circuit.

DTC DETECTION LOGIC

The Engine control module (ECM) detected the AC pressure sensor circuit is greater than 4.7V for more than 5 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0533	(A/C Refrigerant Pressure Sensor “A” Circuit High)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	Refrigerant pressure sensor (26)
		Threshold	A/C pressure sensor value > 0.4.75V (3,138 kPa)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Refrigerant pressure sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0533 being current on the CONSULT screen.

Is DTC P0533 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084591

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for sensor supply DTCs P06D4 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0533 being past on the CONSULT screen.

Is DTC P0533 detected as past?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 3.

3.INSPECT REFRIGERANT PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect refrigerant pressure sensor harness connector E88.
3. Inspect the engine harness and refrigerant pressure sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect refrigerant pressure sensor harness connector E88.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0532 become current and DTC P0533 become past?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the refrigerant pressure sensor harness connector E88.
3. Turn ignition switch ON.
4. Measure the voltage between refrigerant pressure sensor harness connector E88 terminals 1 and 2.

Refrigerant pressure sensor			Voltage (V) (Approx.)
Connector	Terminal	Terminal	
E88	1	3	4.75-5.25

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect the refrigerant pressure sensor harness connector E88.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0533 current?

YES >> Replace the refrigerant pressure sensor. Refer to HAC-123, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage

- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the refrigerant pressure sensor harness connector E88.
4. Measure the resistance between the ECM harness connector E93 terminal 64 and the refrigerant pressure sensor harness connector E88 terminal 1.

ECM		Refrigerant pressure sensor		Resistance
Connector	Terminal	Connector	Terminal	
E93	64	E88	1	< 10 Ω

Is resistance less than 10 ohms?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for an open.

9. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the refrigerant pressure sensor harness connector E88.
4. Measure the resistance between the ECM harness connector E93 terminal 26 and all other terminals in the ECM harness connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	26	E93	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 10.
NO >> Repair or replace the engine harness for a short.

10. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the refrigerant pressure sensor harness connector E88.
4. Disconnect all components connected to sensor supply 5.
5. Measure the resistance between the ECM harness connector E93 terminal 81 and all other terminals in the ECM harness connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	81	E93	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 10.
NO >> Repair or replace the engine harness for a short.

11. CHECK PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P0533 being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.

NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P053E CRANKCASE PRESSURE TOO HIGH

DTC Description

INFOID:0000000013310375

The crankcase pressure sensor is used to monitor the pressure inside the crankcase. The engine control module (ECM) supplies the crankcase pressure sensor a 5V reference voltage. When the crankcase pressure is low, the sensor signal voltage is low. When the crankcase pressure is high, the sensor signal voltage is near the 5V reference voltage. The ECM monitors the crankcase pressure signal circuit voltage to calculate the pressure of the air within the crankcase.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the crankcase pressure was greater than 3.7 kPa

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P053E	(Crankcase Pressure - Data Valid but Above Normal Operational Range)	Diagnosis condition	Engine running.
		Signal (terminal)	Crankcase pressure sensor (111)
		Threshold	Crankcase pressure sensor > 3.7 kPa
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Crankcase pressure sensor
- Plugged or restricted crankcase breather draft tube

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P053E being current on the CONSULT screen.

Is DTC P053E current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013310376

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P053E being current or multiple past counts on the CONSULT screen.

Is DTC P053E detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK CRANKCASE PRESSURE SENSOR

1. Turn ignition switch ON.
2. Connect CONSULT and select “Data Monitor” mode.
3. Select “CRANKCASE PRESSURE SENSOR” and check the indication.

Monitor item	Condition	Indication
CRANKCASE PRESSURE SENSOR	Ignition switch ON (Engine stopped.)	0 ± 0.28 kPa (0 ± 1.13 psi)

Is the inspection result normal?

YES >> GO TO 3.
NO >> Replace crankcase pressure sensor. Refer to EM-326, "Removal and Installation".

3. CHECK CRANKCASE FILTER TUBE

Check that the breather tube is properly connected and that kinks or other restrictions are not present.

Is the inspection result normal?

YES >> Troubleshoot the possible causes for excessive crankcase gases.
NO >> Replace or properly connect the crankcase breather hose. Refer to EM-324, "Removal and Installation".

P0544 EXHAUST GAS TEMPERATURE SENSOR

DTC Description

INFOID:0000000013073081

The aftertreatment diesel particulate filter temperature sensor module is a smart device that communicates with the engine control module via the CAN2 communication link. The aftertreatment diesel particulate filter temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using the CAN2 communication link. The aftertreatment diesel particulate filter temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature, and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the aftertreatment diesel particulate filter temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the difference between the aftertreatment diesel oxidation catalyst intake temperature sensor data and diesel particulate filter intake temperature sensor data did not match the expected value for the present engine operating conditions.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0544	ECM RESERVATION (Exhaust gas temperature sensor circuit bank 1 sensor1)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	• Average temperature drop across DOC > 85 deg C or average temperature across DOC < -85 deg C • -85 deg C < average temperature drop across DPF < 85 deg C
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- aftertreatment diesel particulate filter intake temperature sensor
- aftertreatment diesel oxidation catalyst intake temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
6. Check for DTC P021A being current on the CONSULT screen.

Is DTC P0544 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073082

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U1611, P1614, P1615, P1616 or P1623 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> Replace the aftertreatment DPF temperature sensor module. Refer to EX-52, "Removal and Installation".

P0545 EXHAUST GAS TEMPERATURE SENSOR

DTC Description

INFOID:0000000013073012

The aftertreatment diesel particulate filter temperature sensor module is a smart device that communicates with the engine control module via the CAN2 communication link. The aftertreatment diesel particulate filter temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using the CAN2 communication link. The aftertreatment diesel particulate filter temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature, and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the aftertreatment diesel particulate filter temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The aftertreatment Temperature Sensor Module has detected a sensor short to ground condition that causes a low input voltage.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0545	(Exhaust gas temperature sensor circuit low bank 1 sensor1)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Aftertreatment intake DOC gas temperature sensor input voltage < 1V (-40 Deg C).
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Aftertreatment diesel oxidation catalyst intake temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P0545 being current on the CONSULT screen.

Is DTC P0545 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073013

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U1611, P1614, P1615, P1616 or P1623 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> Replace the aftertreatment diesel particulate filter (DPF) temperature sensor module. Refer to EX-52, "Removal and Installation".

P0546 EXHAUST GAS TEMPERATURE SENSOR

DTC Description

INFOID:0000000013073062

The aftertreatment diesel particulate filter temperature sensor module is a smart device that communicates with the engine control module via the CAN2 communication link. The aftertreatment diesel particulate filter temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using the CAN2 communication link. The aftertreatment diesel particulate filter temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature, and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the aftertreatment diesel particulate filter temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The aftertreatment Temperature Sensor Module has detected a sensor short to battery or open circuit condition that causes a high input voltage.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0546	(Exhaust gas temperature sensor circuit high bank 1 sensor1)	Diagnosis condition	Engine running.
		Signal (terminal)	(–)
		Threshold	Aftertreatment intake DOC gas temperature sensor input voltage > 5V (240 Deg C) or intake DOC gas temperature thermocouple impedance > 10 ohms.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Aftertreatment diesel oxidation catalyst intake temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0546 being current on the CONSULT screen.

Is DTC P0546 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073063

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U1611, P1614, P1615, P1616 or P1623 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> Replace the aftertreatment DPF temperature sensor module. Refer to EX-52, "Removal and Installation".

P054E IDLE FUEL QUANTITY LOWER THAN EXPECTED

DTC Description

INFOID:0000000013073110

The ECM uses diagnostic software to verify injector operation. During selected conditions, each injector is fired. The fueling quantity and timing are then compared to a specified threshold.

DTC DETECTION LOGIC

The ECM detected the fueling is lower than nominal at idle.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P054E	Idle Control System - Fuel Quantity Lower Than Expected (Engine idle fuel quantity - data valid but below normal operating range - moderately severe level)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Idle fuel < 2 mg/stroke
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Engine calibration issue
- Malfunctioning fuel injectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P054E being current on the CONSULT screen.

Is DTC P054E current?

YES >> Go to EC-666, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073111

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P054E being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for DTCs P0501, P2121, P2122, P2123, P2127 or P2128 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK DTC PRIORITY

Check for current DTCs related to any injector or rail pressure sensor circuit on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4.CHECK DTC PRIORITY

1. Start the engine and operate at low idle.
2. Check for current DTCs related to turbocharger, intake air throttle or EGR on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 5.

5.CHECK DTC PRIORITY

1. Continue operating engine at low idle.
2. Check for DTCs P0016, P0335 or P0340 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 6.

6.CHECK DTC PRIORITY

1. Continue operating engine at low idle.
2. Check for current DTCs related to misfire or high count past DTCs related to misfire on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 7.

7.PERFORM ACTIVE TEST

1. Turn ignition switch OFF.
2. Turn ignition switch ON.
3. Perform the high-pressure fuel injector return flow “Active Test” using CONSULT.

Does the Active Test meet specifications?

YES >> Refer to Symptom Diagnosis. Refer to EC-1246, "Symptom Table".
NO >> Replace the malfunctioning fuel injector(s). Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

P054F IDLE FUEL QUANTITY HIGHER THAN EXPECTED

DTC Description

INFOID:0000000013073106

The ECM uses diagnostic software to verify injector operation. During selected conditions, each injector is fired. The fueling quantity and timing are then compared to a specified threshold.

DTC DETECTION LOGIC

The ECM detected the fueling is higher than nominal at idle.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P054F	Idle Control System - Fuel Quantity Higher Than Expected (Engine idle fuel quantity - data valid but above normal operating range - moderately severe level)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Idle fuel > 35 mg/stroke
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Engine calibration issue
- Malfunctioning fuel injectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
7. Check for DTC P054F being current on the CONSULT screen.

Is DTC P054F current?

YES >> Go to EC-668, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073107

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P054F being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for DTCs P0501, P2121, P2122, P2123, P2127 or P2128 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK DTC PRIORITY

Check for current DTCs related to any injector or rail pressure sensor circuit on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4. CHECK DTC PRIORITY

1. Start the engine and operate at low idle.
2. Check for current DTCs related to turbocharger or EGR on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 5.

5. CHECK DTC PRIORITY

1. Continue operating engine at low idle.
2. Check for DTCs P0016, P0335 or P0340 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 6.

6. CHECK DTC PRIORITY

1. Continue operating engine at low idle.
2. Check for current DTCs related to misfire or high count past DTCs related to misfire on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 7.

7. PERFORM ACTIVE TEST

1. Turn ignition switch OFF.
2. Turn ignition switch ON.
3. Perform the high-pressure fuel injector drain flow Active Test using CONSULT.

Does the Active Test meet specifications?

YES >> Refer to Symptom Diagnosis EC-1246, "Symptom Table".
NO >> Replace the malfunctioning fuel injector(s). Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

P0562 SYSTEM VOLTAGE LOW

DTC Description

INFOID:0000000013070733

The ECM is the brains for the engine operation. It interprets signals from sensors to determine actuator positions and fueling control. The ECM gathers and maintains data in it's internal memory. The ECM receives constant voltage from the batteries through unswitched battery connections. It also receives switched battery input through the ignition circuit when the vehicle is turned ON.

DTC DETECTION LOGIC

The ECM detected the main battery supply voltage was less than 8.2V.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0562	System Voltage Low (Battery 1 voltage - data valid but below normal operating range - moderately severe level)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	Battery voltage < 8.128 V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

—

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P0562 being current on the CONSULT screen.

Is DTC P0562 current?

YES >> Go to EC-670, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070734

1.CHECK BATTERY TERMINALS

1. Turn ignition switch OFF.
2. Check the battery terminal connections.

Are the battery terminal connections tight and corrosion free?

YES >> GO TO 2.
NO >> Tighten and clean the terminals.

2.CHECK BATTERY VOLTAGE

1. Turn ignition switch ON.
2. Measure the voltage from the positive battery terminal to the negative battery terminal while trying to start the engine.

- Normal condition: above 12 V
- Cranking condition: above 6.2 V

Is the battery voltage within specified range?

YES >> GO TO 3.
NO >> Charge or test battery(s). Refer to CHG-23, "Work Flow (With EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)" or CHG-29, "Work Flow (Without EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)".

3.CHECK FUSE

1. Turn ignition switch OFF.

2. Verify that fuse 68 (5A) is installed correctly and that the fuse is not blown.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace the fuse.

4. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM connector E93.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK FOR AN OPEN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM connector E93.
3. Check resistance between ECM connector E93 and battery positive terminal.

ECM			Resistance
Connector	Terminal	Battery terminal	
E93	83	(+)	< 10 Ω

4. Check resistance between ECM connector E93 and battery negative terminal.

ECM			Resistance
Connector	Terminal	Battery terminal	
E93	1	(–)	< 10 Ω
	2		
	4		

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace the harness.

6. CHECK FOR A SHORT CIRCUIT

1. Disconnect the battery.
2. Check resistance between ECM connector terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	83	E93	1	> 100k Ω
			2	
			4	

Is the inspection result normal?

YES >> GO TO 7.

NO >> Repair or replace the harness.

7.CHECK FOR A SHORT CIRCUIT TO GROUND

Check resistance between ECM connector E93 and ground.

ECM		Ground	Resistance
Connector	Terminal		
E93	83	(–)	> 100k Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the harness.

8.CHECK FOR A PIN TO PIN SHORT CIRCUIT

Check resistance between ECM connector terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminals	
E93	83	E93	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace the harness.

9.CHECK ADD ON ACCESSORIES

Check for any add on accessory wiring connected to the battery positive terminal.
- Check for damaged insulation or an installation error that could cause a short to ground.

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace damaged wiring.

P0563 SYSTEM VOLTAGE HIGH

DTC Description

INFOID:0000000013071191

The ECM is the brains for the engine operation. It interprets signals from sensors to determine actuator positions and fueling control. The ECM gathers and maintains data in it's internal memory. The ECM receives constant voltage from the batteries through unswitched battery connections. It also receives switched battery input through the ignition circuit when the vehicle is turned ON.

DTC DETECTION LOGIC

The ECM detected the main battery supply voltage was greater than 17V.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0563	System Voltage High (Battery 1 voltage - data valid but above normal operating range - moderately severe level)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	Battery voltage > 17.766 V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Malfunctioning generator or regulator overcharging system
- Batteries connected in series instead of parallel
- Incorrect jump-starting procedure

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P0563 being current on the CONSULT screen.

Is DTC P0563 current?

YES >> Go to EC-673, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013071192

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT.
3. Start the engine and let it idle for 1 minute.
4. Check for DTC P0563 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK BATTERY

1. Turn ignition switch OFF.
2. Check the battery terminal connections.

Are the battery terminal connected properly for the system voltage required?

YES >> GO TO 3.
NO >> Tighten and clean the terminals.

3.CHECK CHARGING SYSTEM

Test the charging system. Refer to CHG-23, "Work Flow (With EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)" or CHG-29, "Work Flow (Without EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)".

Is the generator charging within specifications?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Repair the charging system.

P0579 CRUISE CONTROL CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013080972

The ASCD steering switch contains a signal and ground which are input to the ECM. When a switch is pressed, a voltage signal is sent to the ECM. The ECM monitors the voltage to determine if the switch is stuck, or the signal circuit is shorted.

DTC DETECTION LOGIC

The ECM detected cruise control switch input is not in the required voltage boundary.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0579	Cruise Control Multi-Function Input “A” Circuit Range/Performance (Cruise control enable switch - data erratic, intermittent or incorrect)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	—
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

ASCD steering switch

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and drive vehicle in cruise control mode.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P0579 being current on the CONSULT screen.

Is DTC P0579 current?

YES >> Go to EC-675, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013080973

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0581 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

Check for DTC P0579 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector E93.
3. Disconnect ASCD steering switch connector M30.
4. Inspect the harnesses and module and switch connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins

- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

P057E BRAKE PEDAL POSITION SENSOR

DTC Description

INFOID:0000000013065638

The stop lamp switch (with LED rear combination lamps) or stop lamp relay (without LED rear combination lamps) and ASCD cancel switch each input a signal to the ECM. The ECM monitors both signals. If the stop lamp switch/relay is ON, the ASCD cancel switch will be ON. If both inputs are not equal for a period of time, the DTC will set.

DTC DETECTION LOGIC

The ECM detected the stop lamp switch/relay and ASCD cancel switch signals do not match.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P057E	Brake Pedal Position Sensor “A” Circuit Intermittent/Erratic (Brake pedal position - data erratic, intermittent, or incorrect)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Stop lamp switch/relay is ON and ASCD cancel switch is OFF or Stop lamp switch/relay is OFF and ASCD cancel switch is ON for 4 seconds
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Stop lamp switch (with LED rear combination lamps) or stop lamp relay (without LED rear combination lamps)
- ASCD cancel switch
- Engine harness short to ground
- Engine harness open

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P057E being current on the CONSULT screen.

Is DTC P057E current?

YES >> Go to EC-677, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065639

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P057E being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FUSE

1. Turn ignition switch OFF.
2. Verify that fuse 10 (10A) is installed correctly and that the fuse is not blown.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Replace the fuse.

3.INSPECT STOP LAMP SWITCH/RELAY AND ASCD CANCEL SWITCH AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect stop lamp switch connector E38 (with LED rear combination lamps).
3. Disconnect stop lamp relay connector E12 (without LED rear combination lamps).
4. Disconnect ASCD cancel switch connector E89.
5. Inspect the harness and switches/relay connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector E93.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK STOP LAMP SWITCH/RELAY FOR AN OPEN CIRCUIT

1. Check resistance between ECM connector E93 and stop lamp switch connector E38 (with LED rear combination lamps).

With LED Rear Combination Lamps

ECM		Stop lamp switch		Resistance
Connector	Terminal	Connector	Terminal	
E93	53	E38	2	< 10 Ω

2. Check resistance between ECM connector E93 and stop lamp relay connector E12 (without LED rear combination lamps).

Without LED Rear Combination Lamps

ECM		Stop lamp switch		Resistance
Connector	Terminal	Connector	Terminal	
E93	53	E12	3	< 10 Ω

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace the harness.

6. CHECK ASCD CANCEL SWITCH FOR AN OPEN CIRCUIT

1. Check resistance between ECM connector E93 and ASCD cancel switch connector E89.

ECM		Stop lamp switch		Resistance
Connector	Terminal	Connector	Terminal	
E93	54	E89	1	< 10 Ω
	41		2	

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the harness.

7. CHECK FOR A PIN TO PIN SHORT CIRCUIT

Check resistance between ECM connector terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminals	
E93	53	E93	All	> 100k Ω
	54			
	41			

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the harness.

8. CHECK SWITCH/RELAY

Perform the component inspection. Refer to EC-679, "Component Inspection".

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Replace the applicable switch/relay.

Component Inspection

INFOID:0000000013348383

STOP LAMP SWITCH (WITH LED REAR COMBINATION LAMPS)

1. CHECK STOP LAMP SWITCH

1. Turn the ignition switch OFF.
2. Disconnect stop lamp switch connector E38.
3. Check the continuity of stop lamp switch.

Stop lamp switch terminals	Condition	Continuity
1 – 2	Stop lamp switch ON (Brake pedal depressed)	Yes
	Stop lamp switch OFF (Brake pedal released)	No

Is the inspection result normal?

YES >> Inspection End.
NO >> Replace the stop lamp switch. Refer to BR-20, "Exploded View".

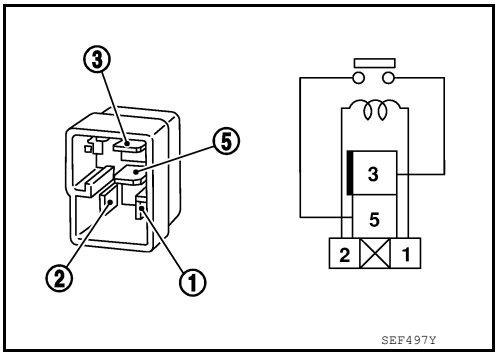
STOP LAMP RELAY (WITHOUT LED REAR COMBINATION LAMPS)

1. CHECK STOP LAMP RELAY

1. Turn the ignition switch OFF.
2. Disconnect stop lamp relay connector E12.

3. Check stop lamp relay.

Rear window defogger relay terminals		Condition	Continuity
3	5	12V direct current supply between terminals 1 and 2.	Yes
		No current supply	No



Is the inspection result normal?

YES >> Inspection End.
NO >> Replace stop lamp relay.

ASCD CANCEL SWITCH

1.CHECK ASCD CANCEL SWITCH

1. Turn the ignition switch OFF.
2. Disconnect ASCD cancel switch connector E89.
3. Check the continuity of ASCD cancel switch.

ASCD cancel switch terminals	Condition	Continuity
1 – 2	ASCD cancel switch ON (Brake pedal depressed)	Yes
	ASCD cancel switch OFF (Brake pedal released)	No

Is the inspection result normal?

YES >> Inspection End.
NO >> Replace the ASCD cancel switch. Refer to AV-289, "Removal and Installation".

P0581 CRUISE CONTROL SIGNAL CIRCUIT HIGH

DTC Description

INFOID:0000000013065578

The ASCD steering switch contains a signal and ground which are input to the ECM. When a switch is pressed, a voltage signal is sent to the ECM. The ECM monitors the voltage to determine if the switch is stuck or the signal circuit is shorted.

DTC DETECTION LOGIC

The ECM detected cruise control switch input voltage is greater than 4.88V for 20 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0581	Cruise Control Multi-Function Input “A” Circuit High (Cruise control (resistive) signal circuit - voltage above normal or shorted to high source)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	Cruise control switch value > 4.888 V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- ASCD steering switch
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and drive vehicle in cruise control mode.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P0581 being current on the CONSULT screen.

Is DTC P0581 current?

YES >> Go to EC-681, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065579

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0581 being current on the CONSULT screen.

Is DTC P0581 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage

- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK FOR AN OPEN CIRCUIT

1. Disconnect ASCD steering switch connector M30.
2. Check resistance between ECM connector E93 and ASCD steering switch connector M30.

With Heated Steering Wheel

ECM		ASCD steering switch		Resistance
Connector	Terminal	Connector	Terminal	
E93	59	M30	10	< 10 Ω

Without Heated Steering Wheel

ECM		ASCD steering switch		Resistance
Connector	Terminal	Connector	Terminal	
E93	59	M30	9	< 10 Ω

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace the harness.

4.CHECK FOR A PIN-TO-PIN SHORT CIRCUIT

Check resistance between ECM connector terminals.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	59	E93	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace the harness.

5.CHECK DTC PRIORITY

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P0581 being past on the CONSULT screen.

Is DTC P0581 detected as past?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Replace the ASCD steering switch. Refer to AV-289, "Removal and Installation".

P0591 CRUISE CONTROL SYSTEM RANGE/PERFORMANCE

DTC Description

INFOID:0000000013072991

The ASCD steering switch contains a signal and ground which are input to the ECM. When a switch is pressed, a voltage signal is sent to the ECM. The ECM monitors the voltage to determine if the switch is stuck, or the signal circuit is shorted.

DTC DETECTION LOGIC

The ECM detected cruise control switch has been stuck for longer than 60 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0591	Cruise Control Multi-Function Input “B” Circuit Range/Performance (Cruise control system command state - mechanical system not responding or out of adjustment)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	When the cruise switch input is sending an active signal continuously longer than 120 seconds
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

ASCD steering switch

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and drive vehicle in cruise control mode.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P0591 being current on the CONSULT screen.

Is DTC P0591 current?

YES >> Go to EC-683, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072992

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0581 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

Check for DTC P0591 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector E93.
3. Disconnect ASCD steering switch connector M30.
4. Inspect the harnesses and module and switch connector pins for the following:

- Loose connector
- Corroded pins

- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

P0601 ECM

DTC Description

INFOID:0000000013065586

The Engine Control Module (ECM) calculates a calibration memory check sum based on the values of certain parameters in the ECM. This check sum is compared to an expected value in the ECM to detect tampering.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the calibration memory check sum did not match the expected value or it did not complete before ECM shutdown.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0601	ECM (Internal Control Module Memory Check Sum Error)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	(-)
		Threshold	CRC on calibrations and unchanging trims, code block or other calibrations does not equal the expected values.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Malfunctioning software

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0601 being current on the CONSULT screen.

Is DTC P0601 current?

YES >> Go to EC-685, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065587

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0601 being current on the CONSULT screen.

Is DTC P0601 detected as current?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Inspection End.

P0604 ECM

DTC Description

INFOID:0000000013025007

The Engine Control Module (ECM) contains microprocessors that calculates, interprets, and store data from connected inputs and output devices. The ECM runs diagnostics to check its internal memory and software. If the memory or software becomes corrupted, a fault will be set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a software or calibration error.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0604	ECM (Internal Control Module Random Access Memory (RAM) Error)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	(-)
		Threshold	The value read from each location of RAM by the main ECM microprocessor does not match the value previously written to it.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Incorrect software
- Corrupted engine calibration

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P0604 being current on the CONSULT screen.

Is DTC P0604 current?

YES >> Go to EC-686, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013025008

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- P0562
- P0563
- P06B8
- P0601
- P0606
- P0607
- P2509

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P0605 ECM

DTC Description

INFOID:0000000013025009

The Engine Control Module (ECM) contains microprocessors that calculates, interprets, and stores data from connected inputs and output devices. The ECM runs diagnostics to check its internal memory and software. If the memory or software becomes corrupted, a DTC will be set.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0605	ECM (Internal Control Module Read Only Memory (ROM) Error]	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	The Engine Control Module (ECM) detected a software or calibration error.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Corrupted engine calibration
- Incorrect ECM software

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0605 being current on the CONSULT screen.

Is DTC P0605 current?

YES >> Proceed to EC-689, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013042434

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC confirmation procedure. Refer to EC-688, "DTC Description".
4. Check the DTC.

Is the DTC displayed again?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Inspection End.

P0606 ECM

DTC Description

INFOID:0000000013025011

The Engine Control Module (ECM) is the brain for engine operation. It intercepts signals from sensors to determine actuator positions and fueling control. The ECM gathers and maintains data in its internal memory. The ECM receives constant voltage from the batteries through unswitched battery connections. It also receives switched battery input through the vehicle key switch wire when the vehicle is turned ON.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0606	ECM [Internal control module read only memory (ROM) error]	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	Malfunction in the internal ROM of ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

- ECM internal memory error

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn engine OFF.
2. Turn ignition switch ON.
3. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-689, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013025012

1.INSPECTION START

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC CONFIRMATION PROCEDURE. Refer to EC-689, "DTC Description".

Is the 1st trip DTC P0606 displayed again?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Inspection End.

P0607 ECM

DTC Description

INFOID:0000000013025013

The Engine Control Module (ECM) receives battery voltage through the battery supply circuit. The ECM receives ignition voltage through the ignition supply circuit when the ignition switch is in the ON or START position.
At ignition OFF, the ECM remains powered for a short period of time. During this period of time, the ECM saves important data to memory. If the ECM battery and ignition circuitry are malfunctioning, maintenance and DTC data could be corrupted or inaccurate.

DTC DETECTION LOGIC

The ECM detected a read or write error internal to the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0607	Control Module Performance (Engine control module warning internal hardware failure - bad intelligent device or component)	1	Diagnosis condition	Ignition is ON or engine is running
			Signal (terminal)	—
			Threshold	The ECM stays powered on after the ignition is turned off
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Ignition is ON or engine is running
			Signal (terminal)	—
			Threshold	The monitoring microprocessor commands the torque actuator circuits (typically injector drivers) to shut down, but the torque actuator circuit feedbacks indicate the circuit is still active
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		3	Diagnosis condition	Ignition is ON or engine is running
			Signal (terminal)	—
			Threshold	The check sum of the ECM sub-processor memory does not equal the expected check-sum or the independent internal watchdog timer updated in conjunction with the sub-processors intended instructions indicates operation processing is lost > 500 microseconds or the register value of the sub-processor is not equal to the expected value in normal operation
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Harness or connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0607 being current on the CONSULT screen.

Is DTC P0607 current?

YES >> Go to EC-691, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013025014

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0607 being current or past for more than 3 counts on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK BATTERY

1. Turn ignition switch OFF.
2. Check the battery terminal connections.

Are the battery terminal connections tight and corrosion free?

YES >> GO TO 3.
NO >> Tighten and clean the terminals.

3.CHECK BATTERY VOLTAGE

1. Turn ignition switch ON.
2. Measure the voltage from the positive battery terminal to the negative battery terminal while trying to start the engine.

- Normal condition: above 12 V
- Cranking condition: above 6.2 V

Is the battery voltage within specified range?

YES >> GO TO 4.
NO >> Charge or test battery(s). Refer to CHG-23, "Work Flow (With EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)" or CHG-29, "Work Flow (Without EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)".

4.INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM connector E93.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR AN OPEN

Measure the voltage between ECM connector E93 and ground.

ECM		Ground	Voltage (V) (Approx.)
Connector	Terminal		
E93	83	(–)	≥ 10 V

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 6.

6.CHECK FUSE

1. Turn ignition switch OFF.
2. Verify that fuse 68 (5A) is installed correctly and that the fuse is not blown.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Replace the fuse.

7.CHECK ADD ON ACCESSORIES

Check for any add on accessory wiring connected to the battery positive terminal.
- Check for damaged insulation or an installation error that could cause a short to ground.

Is the inspection result normal?

YES >> Repair or replace engine harness.
NO >> Repair or replace damaged wiring.

8.CHECK FOR AN OPEN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect positive terminal from the battery.
3. Check resistance between ECM connector E93 and battery positive terminal.

ECM			Resistance
Connector	Terminal	Battery terminal	
E93	83	(+)	< 1.0 Ω

4. Check resistance between ECM connector E93 and battery negative terminal.

ECM			Resistance
Connector	Terminal	Battery terminal	
E93	1	(–)	< 1.0 Ω
	2		
	4		

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace the harness.

9.CHECK IGNITION CIRCUIT

Check resistance between ECM connector E93 and push button ignition switch connector M46.

ECM		Push button ignition switch		Resistance
Connector	Terminal	Connector	Terminal	
E93	65	M46	8	< 5.0 Ω

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace the harness.

P060A ECM

DTC Description

INFOID:0000000013025015

The Engine Control Module (ECM) contains microprocessors that calculates, interprets, and stores data from connected inputs and output devices. The ECM runs diagnostics to check its internal memory and software. If the memory or software becomes corrupted, a fault will be set.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P060A	ECM (Internal Control Module Read Only Memory (ROM) Error]	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	The Engine Control Module (ECM) detected a software or calibration error.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Corrupted engine calibration
- Incorrect ECM software

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P060A being current on the CONSULT screen.

Is DTC P060A current?

YES >> Proceed to EC-689, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013025016

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0606 being current DTC on the CONSULT screen.

Is DTC P0606 detected as current?

YES >> Replace the ECM.
NO >> GO TO 2.

2.RECALIBRATE THE ECM

1. Turn ignition switch ON.
2. Connect CONSULT and recalibrate the ECM with the latest engine calibration.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P060A being current DTC on the CONSULT screen.

Is DTC P060A current?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Inspection End.

P060B ECM

DTC Description

INFOID:0000000013025017

The Engine Control Module (ECM) contains microprocessors that calculates, interprets, and stores data from connected inputs and output devices. The ECM runs diagnostics to check its internal memory and software. If the memory or software becomes corrupted, a fault will be set.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P060B	INTERNAL CONTROL MODULE A/D PROCESSOR PERFORMANCE (Internal Control Module A/D Processing Performance]	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	The Engine Control Module (ECM) detected a software or calibration error.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Corrupted engine calibration
- Incorrect ECM software

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P060B being current on the CONSULT screen.

Is DTC P060B current?

YES >> Proceed to EC-689, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013025018

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0606 being current DTC on the CONSULT screen.

Is DTC P0606 detected as current?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> GO TO 2.

2.RECALIBRATE THE ECM

1. Turn ignition switch ON.
2. Connect CONSULT and recalibrate the ECM with the latest engine calibration.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P060B being current DTC on the CONSULT screen.

Is DTC P060B current?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Inspection End.

P060C ECM

DTC Description

INFOID:0000000013073026

The Engine Control Module (ECM) controls engine operation. It interprets signals from sensors to determine outputs for actuators and fueling control. The ECM gathers and maintains data in it's internal memory. The ECM receives battery voltage through the battery supply circuit. The ECM receives ignition voltage through the ignition supply circuit when the ignition switch is in the ON or START position.

DTC DETECTION LOGIC

The ECM detected that the power supply was removed before power-down parameters could be saved.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P060C	Internal Control Module Main Processor Performance (Number of ECM resets - data valid but above normal operating range - moderately severe level)	1	Diagnosis condition	Ignition is ON or engine is running
			Signal (terminal)	—
			Threshold	The monitoring microprocessor reset has been commanded 7 times with the ignition input ON
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Ignition is ON or engine is running
			Signal (terminal)	—
			Threshold	First reported engine speed after ECM initialization > 300 rpm and time since ECM power up is < 2 seconds or engine speed > 50 rpm and ECM reset occurs
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		3	Diagnosis condition	Ignition is ON or engine is running
			Signal (terminal)	—
			Threshold	The run-time response indicates an incorrect process sequence or the monitor micro new question update is ≤ 40 msec or the instruction path test fails consecutively for ≥ 0.5 seconds, or, the run-time response indicates an incorrect process sequence or the monitor micro new question update is ≤ 40 msec or the instruction path test fails for a cumulatively of time ≥ 4.8 seconds
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Battery(s)
- Harness or connectors
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.

- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P060C being current on the CONSULT screen.

Is DTC P060C current?

YES >> Go to EC-696, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073027

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P060C being current or past for multiple counts on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK BATTERY

1. Turn ignition switch OFF.
2. Check the battery terminal connections.

Are the battery terminal connections tight and corrosion free?

YES >> GO TO 3.
NO >> Tighten and clean the terminals.

3.CHECK BATTERY VOLTAGE

1. Turn ignition switch ON.
2. Measure the voltage from the positive battery terminal to the negative battery terminal while trying to start the engine.

- Normal condition: above 12 V
- Cranking condition: above 6.2 V

Is the battery voltage within specified range?

YES >> GO TO 4.
NO >> Charge test battery(s). Refer to CHG-23, "Work Flow (With EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)" or CHG-29, "Work Flow (Without EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)".

4.INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM connector E93.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR AN OPEN

Measure the voltage between ECM connector E93 and ground.

ECM		Ground	Voltage (Approx.)
Connector	Terminal		
E93	83	(–)	≥ 10 V

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 6.

6.CHECK FUSE

1. Turn ignition switch OFF.
2. Verify that fuse 68 (5A) is installed correctly and that the fuse is not blown.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Replace the fuse.

7.CHECK ADD ON ACCESSORIES

Check for any add on accessory wiring connected to the battery positive terminal.
- Check for damaged insulation or an installation error that could cause a short to ground.

Is the inspection result normal?

YES >> Repair or replace engine harness.
NO >> Repair or replace damaged wiring.

8.CHECK FOR AN OPEN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect positive terminal from the battery.
3. Check resistance between ECM connector E93 and battery positive terminal.

ECM			Resistance
Connector	Terminal	Battery terminal	
E93	83	(+)	< 1.0 Ω

4. Check resistance between ECM connector E93 and battery negative terminal.

ECM			Resistance
Connector	Terminal	Battery terminal	
E93	1	(–)	< 1.0 Ω
	2		
	4		

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace the harness.

9.CHECK IGNITION CIRCUIT

Check resistance between ECM connector E93 and push button ignition switch connector M46.

ECM		Push button ignition switch		Resistance
Connector	Terminal	Connector	Terminal	
E93	65	M46	8	< 5.0 Ω

Is the inspection result normal?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace the harness.

P0611 ECM

DTC Description

INFOID:0000000013069100

The fuel injector timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator in the fuel injector. Energizing the actuator causes the needle valve to rise, allowing fuel to flow into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6 and 7 make up group 1 and fuel injectors 2, 3, 5 and 8 make up group 2.

DTC DETECTION LOGIC

The ECM detected a significant difference between main and calculated fueling.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0611	Fuel Injector Control Module Performance (Injector power supply - bad intelligent device or component)	1	Diagnosis condition	Ignition is ON or engine is running
			Signal (terminal)	—
			Threshold	Absolute value of the difference of engine speed calculated at a 10 ms interval and engine speed calculated at a 40 ms interval > 400 RPM
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- ECM
- Fuel system

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Bring the engine to a complete stop and let it idle for 1 minute.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
5. Check for DTC P0611 being current on the CONSULT screen.

Is DTC P0611 current?

YES >> Go to EC-698, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069101

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0611 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for any fuel injector DTCs being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK FOR INTERMITTENT CONDITION

Interview the customer on driving conditions.

Was the vehicle stalled at a recent key-off event?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 4.

4.CHECK ENGINE

Inspect the vehicle for signs of performance enhancement equipment.

Has the vehicle been modified with performance enhancement equipment?

YES >> Inspection End.
NO >> Refer to GI-43, "Intermittent Incident".

P061A ECM

DTC Description

INFOID:0000000013065644

The fuel injector timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator in the fuel injector. Energizing the actuator causes the needle valve to rise, allowing fuel to flow into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6 and 7 make up group 1 and fuel injectors 2, 3, 5 and 8 make up group 2.

DTC DETECTION LOGIC

Fueling commands were not consistent with engine running conditions.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P061A	Internal Control Module Torque Performance (Governor fueling error - condition exists)	1	Diagnosis condition	Ignition is ON or engine is running
			Signal (terminal)	—
			Threshold	Engine speed is > 1200 RPM and observed fueling value exceeds 4mg/stroke
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Stop lamp switch/relay
- Crankshaft position sensor
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P061A being current on the CONSULT screen.

Is DTC P061A current?

YES >> Go to EC-700, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065645

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for multiple DTCs being current on the CONSULT screen.

Are DTCs other than P061A detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FREEZE FRAME DATA

Read the DTC freeze frame data for DTC P061A.

Is the coolant temperature abnormally low for the operating conditions?

YES >> Replace the coolant temperature sensor. Refer to EM-339, "Removal and Installation".
NO >> GO TO 3.

3.CHECK DATA MONITOR

Monitor the accelerator position sensor 1 and 2 data monitor items while depressing the accelerator pedal.

Are the voltage transition readings smooth?

YES >> GO TO 4.
NO >> Refer to GI-43, "Intermittent Incident".

4.CHECK FREEZE FRAME DATA

Read the DTC freeze frame data for DTC P061A.

Is the exhaust gas pressure sensor reading higher than the boost pressure reading?

YES >> Replace the exhaust gas pressure sensor. Refer to EM-296, "Removal and Installation".
NO >> GO TO 5.

5.CHECK FREEZE FRAME DATA

Read the DTC freeze frame data for DTC P061A.

Is the boost pressure reading higher than the exhaust gas pressure sensor reading?

YES >> Replace the engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".
NO >> GO TO 6.

6.CHECK DATA MONITOR

Monitor the brake switch data monitor item while depressing the brake pedal.

Does the brake switch status change accordingly?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 7.

7.INSPECT STOP LAMP SWITCH/RELAY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the stop lamp switch connector E38 (with LED rear combination lamps).
3. Disconnect the stop lamp relay connector E12 (without LED rear combination lamps).
4. Inspect the harness and sensor/relay connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> Replace the stop lamp switch BR-20, "Exploded View".
NO >> Repair or replace harness or connectors.

P061B ECM

DTC Description

INFOID:0000000013073129

The fuel injector timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator in the fuel injector. Energizing the actuator causes the needle valve to rise, allowing fuel to flow into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6 and 7 make up group 1 and fuel injectors 2, 3, 5 and 8 make up group 2.

DTC DETECTION LOGIC

Fueling commands were not consistent with engine running conditions.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P061B	Internal Control Module Torque Calculation Performance (Torque fueling performance beyond design limits - condition exists)	1	Diagnosis condition	Ignition is ON or engine is running
			Signal (terminal)	—
			Threshold	Commanded fueling is > 100mg/stroke and engine speed is ≤ 4900 RPM
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- Stop lamp switch/relay
- Crankshaft position sensor
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P061B being current on the CONSULT screen.

Is DTC P061B current?

YES >> Go to EC-702, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073130

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for multiple DTCs being current on the CONSULT screen.

Are DTCs other than P061B detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FREEZE FRAME DATA

Read the DTC freeze frame data for DTC P061B.

Is the coolant temperature abnormally low for the operating conditions?

YES >> Replace the coolant temperature sensor. Refer to EM-339, "Removal and Installation".
NO >> GO TO 3.

3.CHECK DATA MONITOR

Monitor the accelerator position sensor 1 and 2 data monitor items while depressing the accelerator pedal.

Are the voltage transition readings smooth?

YES >> GO TO 4.
NO >> Refer to GI-43, "Intermittent Incident".

4.CHECK FREEZE FRAME DATA

Read the DTC freeze frame data for DTC P061B.

Is the exhaust gas pressure sensor reading higher than the boost pressure reading?

YES >> Replace the exhaust gas pressure sensor. Refer to EM-296, "Removal and Installation".
NO >> GO TO 5.

5.CHECK FREEZE FRAME DATA

Read the DTC freeze frame data for DTC P061B.

Is the boost pressure reading higher than the exhaust gas pressure sensor reading?

YES >> Replace the engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".
NO >> GO TO 6.

6.CHECK DATA MONITOR

Monitor the brake switch data monitor item while depressing the brake pedal.

Does the brake switch status change accordingly?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 7.

7.INSPECT STOP LAMP SWITCH/RELAY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the stop lamp switch connector E38 (with LED rear combination lamps).
3. Disconnect the stop lamp relay connector E12 (without LED rear combination lamps).
4. Inspect the harness and sensor/relay connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> Replace the stop lamp switch BR-20, "Exploded View".
NO >> Repair or replace harness or connectors.

P061C ECM

DTC Description

INFOID:0000000013065630

The crankshaft position and camshaft position sensors are Hall effect type sensors. The engine control module (ECM) provides a 5V supply and a return circuit to the position sensors. As holes drilled in the flywheel or slots in the front of the camshaft gear move past the position sensor, a signal is generated on the position sensor signal circuit. The ECM uses this signal to determine engine speed. Offset spacing of the drillings or slots indicate to the ECM the position of the engine.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P061C	ECM (Internal Control Module Engine RPM Performance]	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	Absolute value of difference between Engine RPM and an independently calculated engine speed is greater than 500 RPM
		Diagnosis delay time	—

POSSIBLE CAUSE

- Crankshaft position sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P061C being current on the CONSULT screen.

Is DTC P061C current?

YES >> Proceed to EC-689, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065631

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P061C being only current DTC on the CONSULT screen.

Is P061C only current DTC detected?

YES >> Replace the crankshaft position sensor. Refer to EM-336, "Removal and Installation". GO TO 2.
NO >> Refer to EC-135, "DTC Index".

2.ERASE DTC.

1. Connect all components.
2. With CONSULT, erase all DTCs.
3. Operate the engine within the conditions for setting DTC found in the DTC description.
4. Check for existing ENGINE diagnostic trouble codes.

Is DTC P061C current?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

P061E ECM

DTC Description

INFOID:0000000013065650

The Engine Control Module (ECM) monitors brake switches and vehicle speed. The ECM will set a fault when it has detected the vehicle speed is above a threshold for a period of time and has stopped twice without brake activity and cycling of the key switch.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P061E	ECM (Internal Control Module Brake Signal Performance]	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	The Engine Control Module has detected the vehicle speed has been above 28 MPH for 5 minutes and has decreased to less than 2 MPH twice without brake activity.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Brake pedal position switch
- Vehicle speed sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P061E being current on the CONSULT screen.

Is DTC P061E current?

YES >> Proceed to EC-689, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065651

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for current DTCs on the CONSULT screen.

ABS and/or ESC warning lamp/s on or vehicle speed DTCs current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.INTERVIEW CUSTOMER.

1. The diagnostic is designed to detect a faulty brake switch.
2. Diagnostic runs when vehicle speed is above 48 km/h (30 mph) for more than five minutes.
3. Fault code will set when vehicle speed is detected at 3 km/h (2 mph) or less without brake activity.

Does customer coast to a near stop without using the service brake?

YES >> Explain the diagnostic operation to the customer. Repair Complete.
NO >> GO TO 3.

3. CHECK THE BRAKE SWITCH

1. Turn ignition switch ON.
2. Select “BRAKE SW1” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
3. Check “BRAKE SW1” indication as per the following conditions.

Monitor item	Condition		Indication
BRAKE SW1	Brake pedal	Slightly depressed	OFF
		Fully released	ON

Brake switch status changing correctly?

YES >> Inspection End.
NO >> GO TO 4.

4. INSPECT BRAKE SWITCH AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the brake switch from the harness.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> Replace the brake switch. Refer to BR-20, "Exploded View".
NO >> Repair or replace error-detected parts.

P0628 FUEL PUMP CONTROL

DTC Description

INFOID:0000000013083936

The lift pump is powered by the battery using a relay. The ECM will commands the lift pump on (at ignition on) by grounding the coil of the lift pump relay. The lift pump draws fuel from the fuel tank through the stage 1 fuel filter. It supplies fuel to the high pressure fuel pump. The lift pump fuel pressure is regulated to 101PSI (7 bar) maximum.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the lift pump voltage was less than 5V when commanded off.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0628	FUEL_PUMP/CIRC (Fuel Pump “A” Control Circuit Low)	Diagnosis condition	Ignition switch is turned ON.
		Signal (terminal)	(-)
		Threshold	Fuel lift pump driver current > 4A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel lift pump
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0628 being current on the CONSULT screen.

Is DTC P0628 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013083937

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0628 being current on the CONSULT screen.

Is DTC P628 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT LIFT PIMP RELAY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector E122.
3. Inspect the engine harness and IPDM E/R connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken

- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the IPDM E/R harness connector E122.
4. Measure the resistance between the ECM harness connector E93 terminal 40 and ground.

ECM		Ground	Resistance
Connector	Terminal		
E93	40	—	> 100k Ω

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace the harness for a short.

5. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the IPDM E/R harness connector E122.
4. Measure the resistance between the ECM harness connector E93 terminal 40 and all other terminals in the ECM harness connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	40	E93	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace the harness for a short.

6. CHECK PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P0628 being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P0629 FUEL PUMP CONTROL

DTC Description

INFOID:0000000013084523

The lift pump is powered by the battery using a relay. The ECM will commands the lift pump on (at key on) by grounding the coil of the lift pump relay. The lift pump draws fuel from the fuel tank through the stage 1 fuel filter. It supplies fuel to the high pressure fuel pump. The lift pump fuel pressure is regulated to 101PSI (7 bar) maximum.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the lift pump driver circuit is shorted high or open when commanded on.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0629	FUEL_PUMP/CIRC (Fuel Pump “A” Control Circuit High)	Diagnosis condition	Ignition switch is turned ON.
		Signal (terminal)	(-)
		Threshold	Fuel lift pump driver voltage < 5V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel lift pump
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0629 being current on the CONSULT screen.

Is DTC P0629 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084524

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0629 being current on the CONSULT screen.

Is DTC P0629 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT LIFT PUMP RELAY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector E122.
3. Inspect the engine harness and IPDM E/R connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins

- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK FOR AN OPEN CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the IPDM E/R harness connector E122.
4. Measure the resistance between the ECM harness connector E93 terminal 40 and the IPDM E/R harness connector E122 terminal 45.

ECM		IPDM E/R		Resistance
Connector	Terminal	Connector	Terminal	
E93	40	E122	45	< 10 Ω

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace the engine harness for an open.

5. CHECK FOR A SHORT CIRCUIT TO VOLTAGE IN THE HARNESS

Measure the resistance between ECM harness connector E93 terminal 40 and battery positive terminal.

ECM		Battery positive	Resistance
Connector	Terminal		
E93	40	+	> 100k Ω

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace the harness for a short to voltage

6. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the IPDM E/R harness connector E122.
4. Measure the resistance between the ECM harness connector E93 terminal 40 and all other terminals in the ECM harness connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	40	E93	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the harness for a short.

7. CHECK PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P0629 being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P062B ECM

DTC Description

INFOID:0000000013065636

The fuel injector timing and quantity are controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator in the fuel injector. Energizing the actuator causes the needle valve to rise, allowing fuel to flow into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6 and 7 make up group 1 and fuel injectors 2, 3, 5 and 8 make up group 2.

DTC DETECTION LOGIC

The ECM detected a significant difference between main and calculated fueling.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P062B	Internal Control Module Fuel Injector Control Performance (Fuel system shutdown failure - condition exists)	1	Diagnosis condition	Ignition is ON or engine is running
			Signal (terminal)	—
			Threshold	Absolute difference between actual and calculated injection correction components for main injection 1, pilot injection 1, post injection 2 or post injection 3 ≥ 9.5 mg
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Fuel injector
- ECM
- Fuel system

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P062B being current on the CONSULT screen.

Is DTC P062B current?

YES >> Go to EC-714, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065637

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P062B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for any fuel injector DTCs being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK FOR INTERMITTENT CONDITION

Interview the customer about driving conditions.

Was the vehicle stalled at a recent key-off event?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 4.

4.CHECK ENGINE

Inspect the vehicle for signs of performance enhancement equipment.

Has the vehicle been modified with performance enhancement equipment?

YES >> Inspection End.
NO >> Refer to GI-43, "Intermittent Incident".

P062C ECM

DTC Description

INFOID:0000000013065642

While in cruise control, this monitor verifies vehicle speed stays within the cruise control set-point. This diagnostic detects a condition when the vehicle is traveling downhill, which could cause an increase in overall speed. The monitor will disable as engine speed decreases by a certain threshold, or if the brake or accelerator pedal is depressed. Cruise control will be disabled for the rest of the drive cycle (until ignition is OFF).

DTC DETECTION LOGIC

The ECM detected vehicle speed is more than 5 mph (8 km/h) over targeted cruise control speed.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P062C	Internal Control Module Vehicle Speed Performance (Cruise control set speed - out of calibration)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	Independently calculated road speed exceeds independently calculated cruise set speed by 6.214 mph and DTC P061A is current
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

—

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and drive vehicle in cruise control mode.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P062C being current on the CONSULT screen.

Is DTC P062C current?

YES >> Go to EC-716, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065643

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P062C being current on the CONSULT screen.

Is DTC P062C the only DTC detected?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Refer to EC-135, "DTC Index".

P0630 VIN NOT PROGRAMMED OR INCOMPATIBLE - ECM

DTC Description

INFOID:0000000013065622

The Engine Control Module (ECM) stores the Vehicle Identification Number (VIN) in it's internal memory. If the VIN is not entered at power up, the ECM will set the DTC.

DTC DETECTION LOGIC

The ECM detected the VIN was not programmed in the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0630	VIN Not Programmed or Incompatible - ECM/PCM (Vehicle identification number - out of calibration)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	—
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
3. Check for DTC P0630 being current on the CONSULT screen.

Is DTC P0630 current?

YES >> Go to EC-717, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065623

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for "ENGINE" diagnostic trouble codes.
3. Check for DTC P0630 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

P064C GLOW OUTPUT STAGE

DTC Description

INFOID:0000000013070729

The Glow Plug Control Module controls the timing and intensity of the glow plug output using data provided by the ECM through the CAN 2 communication lines. The Glow Plug Control Module will not activate the glow plugs if the glow plug module reads a temperature greater than the calibrated amount. The Glow Plug Control Module receives fused power from the battery supply circuit and ignition power from the ECM relay.

DTC DETECTION LOGIC

The glow plug module reported an internal error.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P064C	Glow Plug Control Module 1 (Glow plug control module - bad intelligent device or component)	Diagnosis condition	Initial Key ON
		Signal (terminal)	—
		Threshold	The glow plug control module has not updated the status signal to indicate “No after-run delay requested”
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Glow Plug Control Module

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P064C being current on the CONSULT screen.

Is DTC P064C current?

YES >> Go to EC-718, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070730

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U0106, P0383 or P2509 being current or history on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch OFF and wait 5 seconds.
2. Start engine and let idle for 1 minute.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P064C being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the glow plug control module from engine harness connector.

3. Inspect the glow plug control module connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace error-detected parts.
• GO TO 7.

4. CHECK THE VOLTAGE TO THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch ON.
2. Check the voltage between the glow plug control module battery voltage supply circuit and engine block.
NOTE:
Check the voltage while cranking the engine, and with the engine at idle.

Glow plug control module			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
E69	1	Engine block	>6

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 6.

5. CHECK FOR DTCS

1. Turn ignition switch OFF.
2. Reconnect the glow plug control module connector.
3. Turn ignition switch ON.
4. Turn ignition switch OFF, and wait 5 seconds.
5. Start the engine and let it idle for 1 minute.
6. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P064C DTC become ″Current″?

YES >> • A malfunctioning glow plug control module has been detected. Replace the glow plug control module. Refer to EC-1256, "Removal and Installation".
• GO TO 7.
NO >> GO TO 7.

6. CHECK THE BATTERY AND THE POWER CONNECTOR

1. Turn ignition switch OFF.
2. Inspect the battery connections for the following:
- Loose connector
- Corroded terminals

Are the connections tight and corrosion-free?

YES >> GO TO 7.
NO >> • Tighten the connections and clean the terminals.
• GO TO 7.

7. ERASE DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, select “ENGINE” and erase DTCs.
5. Operate the engine within the "Conditions for Clearing the DTC".

Is P064C DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-718, "DTC Description".
NO >> Repair complete.

P0652 SENSOR REFERENCE VOLTAGE B CIRCUIT LOW

DTC Description

INFOID:0000000013069533

The engine control module (ECM) provides a dedicated 5V supply to various engine sensors. The following sensors make-up sensor supply 1: rail fuel pressure, fuel pressure, exhaust gas pressure, Turbocharger Compressor Inlet Pressure, Camshaft Position, Charge-Air Cooler Outlet Pressure and Temperature, Turbocharger Compressor Intake Pressure and Temperature, Crankcase pressure, turbo speed, EGR bypass position and EGR position sensors.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the sensor supply 1 signal voltage was less than 4.64V for more than one second.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0652	(Sensor Reference Voltage “B” Circuit Low)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Sensor supply 1 voltage < 4.644V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- Fuel rail pressure sensor
- Fuel pressure sensor
- Exhaust gas pressure sensor
- Low pressure turbocharger boost pressure sensor
- Camshaft position sensor
- Engine charge air cooler outlet pressure/temperature sensor
- Turbocharger compressor intake pressure/temperature sensor
- Crankcase pressure sensor
- Turbocharger speed sensor
- EGR bypass valve
- EGR valve
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0652 being current on the CONSULT screen.

Is DTC P0652 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069534

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0652 being current on the CONSULT screen.

Is DTC P0652 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT CAMSHAFT POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect camshaft position sensor harness connector F109.
3. Inspect the harness connector and camshaft position sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect camshaft position sensor harness connector F109.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 4.
NO >> Replace camshaft position sensor. Refer to EM-315, "Removal and Installation".

4.INSPECT FUEL RAIL PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel rail pressure sensor harness connector F139.
3. Inspect the harness connector and fuel rail pressure sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fuel rail pressure sensor harness connector F139.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 6.
NO >> Replace fuel rail pressure sensor. Refer to EM-449, "Removal and Installation".

6.INSPECT CHARGE AIR COOLER OUTLET PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect charge air cooler outlet pressure/temperature sensor harness connector F140.

3. Inspect the harness connector and charge air cooler outlet pressure/temperature sensor pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect charge air cooler outlet pressure/temperature sensor harness connector F140.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 8.
NO >> Replace charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".

8. INSPECT TURBOCHARGER COMPRESSOR INTAKE PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Inspect the harness connector and turbocharger compressor intake pressure/temperature sensor pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace error-detected parts.

9. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 10.
NO >> Replace turbocharger compressor intake pressure/temperature sensor. Refer to EM-214, "Removal and Installation".

10. INSPECT FUEL PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel pressure sensor harness connector F197.

3. Inspect the harness connector and fuel pressure sensor pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fuel pressure sensor harness connector F197.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 12.
NO >> Replace fuel pressure sensor. Refer to EM-449, "Removal and Installation".

12. INSPECT EXHAUST GAS PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect exhaust gas pressure sensor harness connector F199.
3. Inspect the harness connector and exhaust gas pressure sensor pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 13.
NO >> Repair or replace error-detected parts.

13. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect exhaust gas pressure sensor harness connector F199.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 14.
NO >> Replace exhaust gas pressure sensor. Refer to EM-296, "Removal and Installation".

14. INSPECT LOW PRESSURE TURBOCHARGER BOOST PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect low pressure turbocharger boost pressure sensor harness connector F198.
3. Inspect the harness connector and low pressure turbocharger boost pressure sensor pins for the following:
- Loose connector
- Corroded pins

- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 15.
NO >> Repair or replace error-detected parts.

15. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect low pressure turbocharger boost pressure sensor harness connector F198.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 16.
NO >> Replace low pressure turbocharger boost pressure sensor. Refer to EM-245, "Removal and Installation".

16. INSPECT EGR VALVE POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect EGR valve position sensor harness connector F144.
3. Inspect the harness connector and EGR valve position sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 17.
NO >> Repair or replace error-detected parts.

17. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect EGR valve position sensor harness connector F144.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 18.
NO >> Replace EGR valve position sensor. Refer to EM-296, "Removal and Installation".

18. INSPECT TURBOCHARGER SPPED SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect turbocharger speed sensor harness connector F126.
3. Inspect the harness connector and turbocharger speed sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals

- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 19.
NO >> Repair or replace error-detected parts.

19. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect turbocharger speed sensor harness connector F126.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 20.
NO >> Replace turbocharger speed sensor. Refer to EM-399, "Removal and Installation".

20. INSPECT CRANKCASE PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect crankcase pressure sensor harness connector F151.
3. Inspect the harness connector and crankcase pressure sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 21.
NO >> Repair or replace error-detected parts.

21. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect crankcase pressure sensor harness connector F151.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 22.
NO >> Replace crankcase pressure sensor. Refer to EM-326, "Removal and Installation".

22. INSPECT EGR BYPASS VALVE POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect EGR bypass valve position sensor harness connector F145.
3. Inspect the harness connector and EGR bypass valve position sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 23.
NO >> Repair or replace error-detected parts.

23. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect EGR bypass valve position sensor harness connector F145.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 24.
NO >> Replace EGR bypass valve position sensor. Refer to EM-282, "Removal and Installation".

24. INSPECT FAN CLUTCH ASSEMBLY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fan clutch assembly harness connector F106.
3. Inspect the harness connector and fan clutch assembly pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 25.
NO >> Repair or replace error-detected parts.

25. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fan clutch assembly harness connector F106.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 26.
NO >> Replace fan clutch assembly. Refer to CO-70, "Exploded View".

26. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 27.
NO >> Repair or replace error-detected parts.

27. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.

2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0652 current?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair or replace the engine harness.

P0653 SENSOR REFERENCE VOLTAGE B CIRCUIT HIGH

DTC Description

INFOID:0000000013070287

The engine control module (ECM) provides a dedicated 5V supply to various engine sensors. The following sensors make-up sensor supply 1: rail fuel pressure, fuel pressure, exhaust gas pressure, Turbocharger Compressor Inlet Pressure, Camshaft Position, Charge-Air Cooler Outlet Pressure and Temperature, Turbocharger Compressor Intake Pressure and Temperature, Crankcase pressure, turbo speed, EGR bypass position and EGR position sensors.

DTC DETECTION LOGIC

The ECM detects that the sensor supply 1 signal voltage is greater than 5.3V for more than 1 second.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0653	(Sensor Reference Voltage “B” Circuit High)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Sensor supply 1 voltage > 5.356V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0653 being current on the CONSULT screen.

Is DTC P0653 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070288

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0653 being current on the CONSULT screen.

Is DTC P0653 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken

- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0653 current?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair or replace the engine harness for a short

P0667 CONTROL MODULE INTERNAL TEMPERATURE SENSOR

DTC Description

INFOID:0000000013082965

The Engine Control Module (ECM) has an internal temperature sensor that is used to measure the temperature inside the ECM. If the internal temperature exceeds a threshold, a DTC will be set.

DTC DETECTION LOGIC

The ECM detected the internal temperature sensor circuit was irrational.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0667	Control Module Internal Temperature Sensor “A”/Performance (Engine ECU temperature - data erratic, intermittent, or incorrect)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	ECM internal temperature sensor > 35°C plus the tolerance of the most accurate remaining temperature sensor
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Allow the engine to to cold soak for 8 hours with the ignition OFF.
2. Start the engine.
3. Connect CONSULT, select “ENGINE” and perform the ″Stationary Regeneration″ Active Test.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.
5. Check for DTC P0667 being current on the CONSULT screen.

Is DTC P0667 current?

YES >> Go to EC-731, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013082966

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0667 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

P066A CYLINDER 1 GLOW PLUG CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013066351

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to ground.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P066A	(Cylinder 1 Glow Plug Control Circuit Low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current > 41 A or > 90A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P066A being current on the CONSULT screen.

Is DTC P066A current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013066352

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P066A being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0671 become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F114.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F114.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0671 become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for a short to ground.

P066B CYLINDER 1 GLOW PLUG CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013067130

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to battery.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P066B	(Cylinder 1 Glow Plug Control Circuit High)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Voltage is > 0.6 and MOFSET is commanded OFF or voltage is < 0.6 and MOFSET is commanded ON
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P066B being current on the CONSULT screen.

Is DTC P066B current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013067131

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P066B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0671 become current and P066B become past?

YES >> Repair or replace the glow plug harness for a short to voltage. GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".GO TO 5.

5. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Connect the glow plug to the harness connector F114.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P066B become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

P066C CYLINDER 2 GLOW PLUG CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013067261

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to ground.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P066C	(Cylinder 2 Glow Plug Control Circuit Low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current > 41 A or > 90A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P066C being current on the CONSULT screen.

Is DTC P066C current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013067262

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P066C being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0672 become current?

YES >> GO TO 5.
NO >> Replace glow plug control module.

5. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F130.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F130.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0672 become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for a short to ground.

P066D CYLINDER 2 GLOW PLUG CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013067399

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to battery.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P066D	(Cylinder 2 Glow Plug Control Circuit High)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Voltage is > 0.6 and MOFSET is commanded OFF or voltage is < 0.6 and MOFSET is commanded ON
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P066D being current on the CONSULT screen.

Is DTC P066D current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013067400

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P066D being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0672 become current and P066D become past?

YES >> Repair or replace the glow plug harness for a short to voltage. GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".GO TO 5.

5.CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Connect the glow plug to the harness connector F130.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE”” diagnostic trouble codes.

Did DTC P066D become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

P066E CYLINDER 3 GLOW PLUG CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013067538

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to ground.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P066E	(Cylinder 3 Glow Plug Control Circuit Low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current > 41 A or > 90A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P066E being current on the CONSULT screen.

Is DTC P066E current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013067539

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P066E being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0673 become current?

YES >> GO TO 5.
NO >> Replace glow plug control module.

5. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F116.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F116.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0673 become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for a short to ground.

P066F CYLINDER 3 GLOW PLUG CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013067746

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to battery.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P066F	(Cylinder 3 Glow Plug Control Circuit High)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Voltage is > 0.6 and MOFSET is commanded OFF or voltage is < 0.6 and MOFSET is commanded ON
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P066F being current on the CONSULT screen.

Is DTC P066F current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013067747

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P066F being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connectr F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0673 become current and P066F become past?

YES >> Repair or replace the glow plug harness for a short to voltage. GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".GO TO 5.

5. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Connect the glow plug from the harness connector F116.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P066F become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

P0671 GLOW PLUG (CYLINDER 1)

DTC Description

INFOID:0000000013068218

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the Glow Plug Control Module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected an open circuit on this glow plug.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0671	CYLINDER 1 GLOW PLUG CIRCUIT (Glow plug heater circuit 1 low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current < 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0671 being current on the CONSULT screen.

Is DTC P0671 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068219

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U0106, U0307, P0383, P0384, P064C, P066A or P066B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0671 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Connect a jumper wire between glow plug heater terminal 18 at the glow plug control module connector F103 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did DTC P066A become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK DTC PRIORITY AND VERIFY GLOW PLUG HEATER CONDITION

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect the glow plug control module to the harness connector F103.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for ENGINE diagnostic trouble codes.
6. Check for DTC P0671 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 6.
NO >> The removal and installation of the connector corrected the malfunction.

6. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F114.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.

NO >> Repair or replace error-detected parts.

7.CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F114.
3. Connect a jumper wire between glow plug heater terminal 1 at the glow plug heater connector F114 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P066A become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for an open.

P0672 GLOW PLUG (CYLINDER 2)

DTC Description

INFOID:0000000013068220

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the Glow Plug Control Module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected an open circuit on this glow plug.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0672	CYLINDER 2 GLOW PLUG CIRCUIT (Glow plug heater circuit 2 low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current < 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0672 being current on the CONSULT screen.

Is DTC P0672 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068221

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U0106, U0307, P0383, P0384, P064C, P066A or P066B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0672 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Connect a jumper wire between glow plug heater terminal 19 at the glow plug control module connector F103 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did DTC P066C become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK DTC PRIORITY AND VERIFY GLOW PLUG HEATER CONDITION

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect the glow plug control module to the harness connector F103.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for ENGINE diagnostic trouble codes.
6. Check for DTC P0672 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 6.
NO >> The removal and installation of the connector corrected the malfunction.

6. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F130.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.

NO >> Repair or replace error-detected parts.

7. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F130.
3. Connect a jumper wire between glow plug heater terminal 1 at the glow plug heater connector F130 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P066C become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for an open.

P0673 GLOW PLUG (CYLINDER 3)

DTC Description

INFOID:0000000013068296

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the Glow Plug Control Module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected an open circuit on this glow plug.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0673	CYLINDER 3 GLOW PLUG CIRCUIT (Glow plug heater circuit 3 low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current < 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0673 being current on the CONSULT screen.

Is DTC P0673 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068297

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U0106, U0307, P0383, P0384, P064C, P066A or P066B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0673 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Connect a jumper wire between glow plug heater terminal 22 at the glow plug control module connector F103 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P066E become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK DTC PRIORITY AND VERIFY GLOW PLUG HEATER CONDITION

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect the glow plug control module to the harness connector F103.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
6. Check for DTC P0673 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 6.
NO >> The removal and installation of the connector corrected the malfunction.

6. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F116.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.

NO >> Repair or replace error-detected parts.

7.CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F116.
3. Connect a jumper wire between glow plug heater terminal 1 at the glow plug heater connector F116 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P066E become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for an open.

P0674 GLOW PLUG (CYLINDER 4)

DTC Description

INFOID:0000000013068306

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the Glow Plug Control Module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected an open circuit on this glow plug.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0674	CYLINDER 4 GLOW PLUG CIRCUIT (Glow plug heater circuit 4 low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current < 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0674 being current on the CONSULT screen.

Is DTC P0674 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068307

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U0106, U0307, P0383, P0384, P064C, P066A or P066B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0674 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Connect a jumper wire between glow plug heater terminal 23 at the glow plug control module connector F103 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did DTC P067A become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK DTC PRIORITY AND VERIFY GLOW PLUG HEATER CONDITION

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect the glow plug control module to the harness connector F103.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for ENGINE diagnostic trouble codes.
6. Check for DTC P0674 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 6.
NO >> The removal and installation of the connector corrected the malfunction.

6. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F132.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.

NO >> Repair or replace error-detected parts.

7. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F132.
3. Connect a jumper wire between glow plug heater terminal 1 at the glow plug heater connector F132 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P067A become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for an open.

P0675 GLOW PLUG (CYLINDER 5)

DTC Description

INFOID:0000000013068506

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the Glow Plug Control Module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected an open circuit on this glow plug.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0675	CYLINDER 5 GLOW PLUG CIRCUIT (Glow plug heater circuit 5 low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current < 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0675 being current on the CONSULT screen.

Is DTC P0675 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068507

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U0106, U0307, P0383, P0384, P064C, P066A or P066B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0675 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Connect a jumper wire between glow plug heater terminal 24 at the glow plug control module connector F103 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did DTC P067C become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK DTC PRIORITY AND VERIFY GLOW PLUG HEATER CONDITION

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect the glow plug control module to the harness connector F103.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for ENGINE diagnostic trouble codes.
6. Check for DTC P0675 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 6.
NO >> The removal and installation of the connector corrected the malfunction.

6. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F118.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 7.

NO >> Repair or replace error-detected parts.

7.CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F118.
3. Connect a jumper wire between glow plug heater terminal 1 at the glow plug heater connector F118 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P067C become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for an open.

P0676 GLOW PLUG (CYLINDER 6)

DTC Description

INFOID:0000000013068519

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected an open circuit on this glow plug.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0676	CYLINDER 6 GLOW PLUG CIRCUIT (Glow plug heater circuit 6 low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current < 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P0676 being current on the CONSULT screen.

Is DTC P0676 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068520

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U0106, U0307, P0383, P0384, P064C, P066A or P066B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0676 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Connect a jumper wire between glow plug heater terminal 25 at the glow plug control module connector F103 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did DTC P067E become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK DTC PRIORITY AND VERIFY GLOW PLUG HEATER CONDITION

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect the glow plug control module to the harness connector F103.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
6. Check for DTC P0676 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 6.
NO >> The removal and installation of the connector corrected the malfunction.

6. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F134.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.

NO >> Repair or replace error-detected parts.

7. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F134.
3. Connect a jumper wire between glow plug heater terminal 1 at the glow plug heater connector F134 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P067E become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for an open.

P0677 GLOW PLUG (CYLINDER 7)

DTC Description

INFOID:0000000013068528

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the Glow Plug Control Module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected an open circuit on this glow plug.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0677	CYLINDER 7 GLOW PLUG CIRCUIT (Glow plug heater circuit 7 low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current < 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P0677 being current on the CONSULT screen.

Is DTC P0677 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068529

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U0106, U0307, P0383, P0384, P064C, P066A or P066B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0677 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Connect a jumper wire between glow plug heater terminal 28 at the glow plug control module connector F103 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did DTC P068C become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK DTC PRIORITY AND VERIFY GLOW PLUG HEATER CONDITION

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect the glow plug control module to the harness connector F103.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for ENGINE diagnostic trouble codes.
6. Check for DTC P0677 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 6.
NO >> The removal and installation of the connector corrected the malfunction.

6. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F120.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 7.

NO >> Repair or replace error-detected parts.

7.CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F120.
3. Connect a jumper wire between glow plug heater terminal 1 at the glow plug heater connector F120 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P068C become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for an open.

P0678 GLOW PLUG (CYLINDER 8)

DTC Description

INFOID:0000000013068534

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the Glow Plug Control Module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected an open circuit on this glow plug.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0678	CYLINDER 8 GLOW PLUG CIRCUIT (Glow plug heater circuit 8 low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current < 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P0678 being current on the CONSULT screen.

Is DTC P0678 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068535

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC U0106, U0307, P0383, P0384, P064C, P066A or P066B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0678 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Connect a jumper wire between glow plug heater terminal 29 at the glow plug control module connector F103 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did DTC P068E become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK DTC PRIORITY AND VERIFY GLOW PLUG HEATER CONDITION

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect the glow plug control module to the harness connector F103.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
6. Check for DTC P0678 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 6.
NO >> The removal and installation of the connector corrected the malfunction.

6. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F136.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 7.

NO >> Repair or replace error-detected parts.

7. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F136.
3. Connect a jumper wire between glow plug heater terminal 1 at the glow plug heater connector F136 and ground.
4. Turn ignition switch ON.
5. Connect CONSULT.
6. Wait 30 seconds.
7. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P068E become current?

YES >> Replace the glow plug. Refedr to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for an open.

P067A CYLINDER 4 GLOW PLUG CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013068597

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the Glow Plug Control Module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to ground.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P067A	(Cylinder 4 Glow Plug Control Circuit Low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current > 41 A or > 90A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P067A being current on the CONSULT screen.

Is DTC P067A current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068598

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P067A being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0674 become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F132.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F132.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0674 become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for a short to ground.

P067B CYLINDER 4 GLOW PLUG CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013068730

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the Glow Plug Control Module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to battery.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P067B	(Cylinder 4 Glow Plug Control Circuit High)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Voltage is > 0.6 and MOFSET is commanded OFF or voltage is < 0.6 and MOFSET is commanded ON
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P067B being current on the CONSULT screen.

Is DTC P067B current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068731

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P067B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0674 become current and P067B become past?

YES >> Repair or replace the glow plug harness for a short to voltage. GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Connect the glow plug to the harness connector F132.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P067B become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

P067C CYLINDER 5 GLOW PLUG CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013068880

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the Glow Plug Control Module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to ground.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P067C	(Cylinder 5 Glow Plug Control Circuit Low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current > 41 A or > 90A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P067C being current on the CONSULT screen.

Is DTC P067C current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013068881

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P067C being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0675 become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F118.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F118.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0675 become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for a short to ground.

P067D CYLINDER 5 GLOW PLUG CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013069102

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the Glow Plug Control Module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to battery.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P067D	(Cylinder 5 Glow Plug Control Circuit High)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Voltage is > 0.6 and MOFSET is commanded OFF or voltage is < 0.6 and MOFSET is commanded ON
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P067D being current on the CONSULT screen.

Is DTC P067D current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069103

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P067D being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0675 become current and P067D become past?

YES >> Repair or replace the glow plug harness for a short to voltage. GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Connect the glow plug to the harness connector F118.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P067D become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

P067E CYLINDER 6 GLOW PLUG CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013069312

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to ground.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P067E	(Cylinder 6 Glow Plug Control Circuit Low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current > 41 A or > 90A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P067E being current on the CONSULT screen.

Is DTC P067E current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069313

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P067E being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0676 become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F134.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F134.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0676 become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for a short to ground.

P067F CYLINDER 6 GLOW PLUG CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013069537

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to battery.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P067F	(Cylinder 6 Glow Plug Control Circuit High)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Voltage is > 0.6 and MOFSET is commanded OFF or voltage is < 0.6 and MOFSET is commanded ON
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P067F being current on the CONSULT screen.

Is DTC P067F current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069538

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P067F being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P0676 become current and P067F become past?

YES >> Repair or replace the glow plug harness for a short to voltage. GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Connect the glow plug to the harness connector F134.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P067F become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

P0687 ECM POWER RELAY CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013073108

The ECM relay provides battery voltage to the smart power sensors and actuators. The Engine Control Module (ECM) controls the grounds the coil of the relay at key ON. This will switch on power to the Aftertreatment Temperature sensor modules, aftertreatment DEF controller, aftertreatment DEF quality sensor, inlet and outlet NOx sensors, rotary turbine control valve actuator, fuel pump actuator, fuel pressure relief valve and glow plug module. A DTC is set when the ground wire is shorted to battery.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a short to battery on the ECM relay ground signal.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0687	(ECM/PCM Power Relay Control Circuit High)	Diagnosis condition	Ignition switch is turned ON or engine is running
		Signal (terminal)	(-)
		Threshold	Power supply to a device is > 16V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- IPDM E/R
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0687 being current on the CONSULT screen.

Is DTC P0687 current?

YES >> Go to EC-780, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073109

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0562 being current on the CONSULT screen.

Is DTC P0562 detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0687 being current on the CONSULT screen.

Is DTC P0687 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT ECM RELAY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector E121.
3. Inspect the engine harness and IPDM E/R connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the IPDM E/R harness connector E121.
4. Measure the resistance between the ECM harness connector E93 terminal 37 and all other terminals in the ECM harness connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	37	E93	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace the harness for a short.

6. CHECK FOR A SHORT CIRCUIT TO VOLTAGE IN THE HARNESS

Measure the resistance between ECM harness connector E93 terminal 37 and battery positive terminal.

ECM		Battery positive	Resistance
Connector	Terminal		
E93	37	+	> 100k Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the harness for a short to voltage

7. CHECK PAST DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P0687 being past on the CONSULT screen.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the issue.
NO >> Replace the IPDM E/R. Refer to PCS-43, "Removal and Installation of IPDM E/R".

P068C CYLINDER 7 GLOW PLUG CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013069548

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the Glow Plug Control Module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to ground.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P068C	(Cylinder7 Glow Plug Control Circuit Low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current > 41 A or > 90A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P068C being current on the CONSULT screen.

Is DTC P068C current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069549

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P068C being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0677 become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F120.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F120.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0677 become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for a short to ground.

P068D CYLINDER 7 GLOW PLUG CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013069681

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to battery.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P068D	(Cylinder 7 Glow Plug Control Circuit High)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Voltage is > 0.6 and MOFSET is commanded OFF or voltage is < 0.6 and MOFSET is commanded ON
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P068D being current on the CONSULT screen.

Is DTC P068D current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069682

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P068D being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0677 become current and P068D become past?

YES >> Repair or replace the glow plug harness for a short to voltage. GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Connect the glow plug to the harness connector F120.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P068D become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

P068E CYLINDER 8 GLOW PLUG CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013069970

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to ground.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P068E	(Cylinder 8 Glow Plug Control Circuit Low)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Current > 41 A or > 90A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P068E being current on the CONSULT screen.

Is DTC P068E current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069971

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P068E being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0678 become current?

YES >> GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. INSPECT GLOW PLUG AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug from the harness connector F136.
3. Inspect the glow plug connections and harness for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Disconnect the glow plug from the harness connector F136.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0678 become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> Repair or replace the glow plug harness for a short to ground.

P068F CYLINDER 8 GLOW PLUG CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013070284

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

The Glow Plug Control Module detected that the glow plug circuit was shorted to battery.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P068F	(Cylinder 8 Glow Plug Control Circuit High)	Diagnosis condition	Initial key ON
		Signal (terminal)	(–)
		Threshold	Voltage is > 0.6 and MOFSET is commanded OFF or voltage is < 0.6 and MOFSET is commanded ON
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON for 2 minutes.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P068F being current on the CONSULT screen.

Is DTC P068F current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070285

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0383 or P0384 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE diagnostic trouble codes.
3. Check for DTC P068F being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug harness connector F103 from the glow plug control module.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch OFF.
2. Disconnect the glow plug harness connector F103 from the glow plug control module.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P0678 become current and P068F become past?

YES >> Repair or replace the glow plug harness for a short to voltage. GO TO 5.
NO >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".

5. CHECK THE GLOW PLUG

1. Turn ignition switch OFF.
2. Connect the glow plug to the harness connector F136.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P068F become current?

YES >> Replace the glow plug. Refer to EM-252, "Removal and Installation".
NO >> The removal and installation of the connector corrected the malfunction.

P0691 COOLING FAN

DTC Description

INFOID:0000000013065640

The fan control circuit is a device used by the engine to control the fan operation. When the Engine Control Module (ECM) energizes the fan control circuit, the engine fan is engaged. The fan control circuit utilizes a Pulse Width Modulated (PWM) signal. A PWM signal is a pulsed voltage signal between 0V and system voltage. The frequency of the pulsed voltage signal is dependent on the application requirement.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fan control circuit Pulse Width Modulated (PWM) signal was not at system voltage when the Pulse Width Modulated (PWM) signal was commanded ON.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0691	RAD. FAN relay1 Short to GND (Fan 1 Control Circuit Low)	Diagnosis condition	Ignition switch is ON
		Signal (terminal)	(–)
		Threshold	Resistance between fan clutch driver and ground < 2 Ω
		Diagnosis delay time	Diagnostic runs when the ignition is ON and when the pulse width modulated (PWM) device is getting energized or de-energized. In some cases, the diagnostics can also run at some fixed intervals.

POSSIBLE CAUSE

- Fan clutch assembly
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0691 being current on the CONSULT screen.

Is DTC P0691 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065641

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0691 being current on the CONSULT screen.

Is DTC P0691 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FAN CLUTCH ASSEMBLY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fan clutch assembly harness connector F106.
3. Inspect the harness connector and fan clutch assembly pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins

- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE FAN CLUTCH VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect the fan clutch assembly harness connector F106.
3. Turn ignition switch ON.
4. Measure the voltage between fan clutch assembly harness connector F106 terminal 1 and ground.

Fan clutch assembly		(—)	Voltage (V) (Approx.)
Connector	Terminal		
F106	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace the engine harness for an open circuit.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fan clutch assembly harness connector F106.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0692 current?

YES >> Replace fan clutch assembly. Refer to CO-70, "Exploded View".
NO >> GO TO 5.

5. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK FOR A PIN-TO-GROUND SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the fan clutch assembly harness connector F106.
4. Measure the resistance between the ECM harness connector F101 terminal 181 and ground.

ECM		Ground	Resistance
Connector	Terminal		
F101	181	—	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short to ground.

7. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the fan clutch assembly harness connector F106.
4. Measure the resistance between the ECM harness connector terminal 80 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	181	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 8.
NO >> Repair or replace the engine harness for a short.

8. CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0691 past?

YES >> The removal and installation of the connector corrected the fault.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P0692 COOLING FAN

DTC Description

INFOID:0000000013065580

The fan control circuit is a device used by the engine to control the fan operation. When the Engine Control Module (ECM) energizes the fan control circuit, the engine fan is engaged.The fan control circuit utilizes a Pulse Width Modulated (PWM) signal. A PWM signal is a pulsed voltage signal between 0Vand system voltage. The frequency of the pulsed voltage signal is dependent on the application requirement.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fan control circuit Pulse Width Modulated (PWM) signal voltage was greater then 0V when the PWM signal was commanded OFF.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0692	RAD. FAN relay1 Short to BATT (Fan 1 Control Circuit High)	Diagnosis condition	Ignition switch is ON
		Signal (terminal)	(–)
		Threshold	Resistance between fan clutch driver and ground > 500k Ω
		Diagnosis delay time	Diagnostic runs when the ignition is ON and when the pulse width modulated (PWM) device is getting energized or de-energized. In some cases, the diagnostics can also run at some fixed intervals.

POSSIBLE CAUSE

- Fan clutch assembly
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0692 being current on the CONSULT screen.

Is DTC P0692 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065581

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0692 being current on the CONSULT screen.

Is DTC P0692 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FAN CLUTCH ASSEMBLY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fan clutch assembly harness connector F106.
3. Inspect the harness connector and fan clutch assembly pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins

- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fan clutch assembly harness connector F106.
3. Connect a jumper wire between fan clutch assembly harness connector F106 terminal 1 and 6.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P0691 current?

YES >> Replace fan clutch assembly. Refer to CO-70, "Exploded View".
NO >> GO TO 4.

4. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the fan clutch assembly harness connector F106.
4. Measure the resistance between the ECM harness connector F101 terminal 181 and the fan clutch assembly harness connector F106 terminal 6.

ECM		Fan clutch assembly		Resistance
Connector	Terminal	Connector	Terminal	
F101	181	F106	6	< 10 Ω

Is resistance less than 10 ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for an open.

6. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the fan clutch assembly harness connector F106.
4. Measure the resistance between the ECM harness connector terminal 181 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	181	F101	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short.

7.CHECK FOR PAST DTC

1. Connect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0692 past?

YES >> The removal and installation of the connector corrected the fault.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P0698 SENSOR REFERENCE VOLTAGE C CIRCUIT LOW

DTC Description

INFOID:0000000013065618

The Engine Control Module (ECM) provides a dedicated 5 volt supply and ground to the crankshaft position sensor. The ECM monitors the voltage level on the Crankshaft position sensor +5V supply circuit. If the voltage falls below a calibrated limit, this DTC is recorded.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the sensor supply 3 signal voltage was less than a 4.8V for more than 1 second.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0698	(Sensor Reference Voltage “C” Circuit Low)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Sensor supply 3 voltage < 4.644V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- Crankshaft position sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0698 being current on the CONSULT screen.

Is DTC P0698 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065619

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0698 being current on the CONSULT screen.

Is DTC P0698 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT CRANKSHAFT POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect crankshaft position sensor harness connector F110.
3. Inspect the harness connector and crankshaft position sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken

- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect crankshaft position sensor harness connector F110.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0698 current?

YES >> GO TO 4.
NO >> Replace crankshaft position sensor. Refer to EM-336, "Removal and Installation".

4. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0698 current?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair or replace the engine harness.

P0699 SENSOR REFERENCE VOLTAGE C CIRCUIT HIGH

DTC Description

INFOID:0000000013065626

The Engine Control Module (ECM) provides a dedicated 5 volt supply and ground to the Crankshaft position sensor. The ECM monitors the voltage level on the Crankshaft position sensor +5V supply circuit. If the voltage falls below a calibrated limit, this fault is recorded.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the sensor supply 3 signal voltage was greater than a 5.4-VDC for more than 1second.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0699	(Sensor Reference Voltage “C” Circuit High)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Sensor supply 3 voltage > 5.356V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0699 being current on the CONSULT screen.

Is DTC P0699 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065627

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0699 being current on the CONSULT screen.

Is DTC P0699 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage

- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0699 current?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair or replace the engine harness for a short

P06A4 SENSOR REFERENCE VOLTAGE D CIRCUIT LOW

DTC Description

INFOID:0000000013084580

The Engine Control Module (ECM) provides a dedicated 5V supply and ground to the primary pedal position sensor. The ECM monitors the voltage level on the sensor +5V supply circuit.If the voltage falls below or above a calibrated limit, this fault is recorded.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected this sensor supply voltage was less than 4.7V for 1 second.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06A4	(Sensor Reference Voltage “D” Circuit Low)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Sensor supply 4 voltage < 4.644V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- Accelerator pedal position sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P06A4 being current on the CONSULT screen.

Is DTC P06A4 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084581

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06A4 being current on the CONSULT screen.

Is DTC P06A4 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT ACCELERATOR PEDAL POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect accelerator pedal position sensor harness connector E20.
3. Inspect the harness connector and accelerator pedal position sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage

- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect accelerator pedal position sensor harness connector E20.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P06A4 DTC current?

YES >> GO TO 4.
NO >> Replace accelerator pedal position sensor. Refer to ACC-3, "Removal and Installation".

4. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the accelerator pedal position sensor harness connector E20.
4. Measure the resistance between the ECM harness connector terminal 80 and all other terminals in the ECM harness connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	80	E93	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6. CHECK FOR A PIN-TO-GROUND SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the accelerator pedal position sensor harness connector E20.
4. Measure the resistance between the ECM harness connector E93 terminal 80 and ground.

ECM		Ground	Resistance
Connector	Terminal		
E93	80	—	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the engine harness for a short to ground.

7. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the accelerator pedal position sensor harness connector E20.
3. Turn ignition switch ON.
4. Measure the voltage between accelerator pedal position sensor harness connector E20 terminals 2 and 4.

Accelerator pedal position sensor			Voltage (V) (Approx.)
Connector	Terminal	Terminal	
E20	2	4	4.6

Is voltage below 4.6V?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Inspection End.

P06A5 SENSOR REFERENCE VOLTAGE D CIRCUIT HIGH

DTC Description

INFOID:0000000013084573

The engine control module (ECM) provides a dedicated 5V supply and ground to the primary pedal position sensor. The ECM monitors the voltage level on the sensor +5V supply circuit.If the voltage falls below or above a calibrated limit, this fault is recorded.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected this sensor supply voltage was greater than 5.3V for 1 second.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06A5	(Sensor Reference Voltage “D” Circuit Low)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Sensor supply 4 voltage > 5.356V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P06A5 being current on the CONSULT screen.

Is DTC P06A5 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084574

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06A5 being current on the CONSULT screen.

Is DTC P06A5 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connectors E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93 and F101.
3. Disconnect the all components connected to sensor supply 4.
4. Measure the resistance between the ECM harness connector terminal 80 and all other terminals in the ECM harness connector E93 and F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	80	E93	All	> 100k Ω
		F101		

Is resistance greater than 100k ohms?

YES >> GO TO 4.
NO >> Repair or replace the engine harness for a short.

4. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the accelerator pedal position sensor harness connector E20.
3. Turn ignition switch ON.
4. Measure the voltage between accelerator pedal position sensor harness connector E20 terminals 2 and 4.

Accelerator pedal position sensor			Voltage (V) (Approx.)
Connector	Terminal	Terminal	
E20	2	4	5.63

Is voltage greater than 5.63V?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Inspection End.

P06B8 ECM

DTC Description

INFOID:0000000013081428

The Engine Control Module (ECM) is the brains for engine operation. It interprets signals from sensors to determine actuator positions and fueling control. The ECM gather and maintain data in its internal memory. The ECM receives constant voltage from the batteries through unswitched battery connections. It also receives switched battery input through the vehicle key switch wire when the vehicle is turned ON.
The ECM has internal diagnostics that continuously run and check the internal memory.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a software or calibration error.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06B8	EEPROM DIAGNOSIS STORAGE AREA DATA ABNORMALITY (Internal Control Module Non-Volatile Random Access Memory (NVRAM) Error)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	(-)
		Threshold	Data in flash memory does not match its image in RAM on 10 separate occurrences
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

ECM software

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P06B8 being current on the CONSULT screen.

Is DTC P06B8 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013081429

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0606 being current on the CONSULT screen.

Is DTC P0606 detected as current?

YES >> Refer to EC-135, "DTC Index".
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P06B9 CYLINDER 1 GLOW PLUG CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013065751

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

This fault code sets when the glow plug is outside of the acceptable range of resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06B9	Cylinder 1 Glow Plug Circuit Range/ Performance (Engine Glow Plug 1 - Data Erratic, Intermittent or Incorrect)	Diagnosis condition	Initial Key ON
		Signal (terminal)	Glow plug 1 signal (18)
		Threshold	Current > 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow Plug Control Module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Bring the vehicle to a complete stop.
7. Repeat all of the above steps three more times.
8. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
9. Check for DTC P06B9 being current on the CONSULT screen.

Is DTC P06B9 current?

YES >> Go to EC-807, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065752

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P066A, P066B or P0671 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.

2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06B9 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK GLOW PLUG NO. 1

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Check resistance between glow plug control module connector F103 and ground.

Glow plug control module		Ground	Resistance
Connector	Terminal		
F103	18	—	< 1.5 Ω

Is the inspection result normal?

YES >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> GO TO 5.

5. CHECK GLOW PLUG NO. 1 CIRCUIT

1. Disconnect glow plug no. 1 connector F114.
2. Check resistance between glow plug no. 1 terminal 1 and ground.

Glow plug no. 1 terminal	Ground	Resistance
1	—	< 1.0 Ω

Is the inspection result normal?

YES >> Repair or replace the glow plug harness for an open.
NO >> Replace glow plug no. 1. Refer to EM-252, "Removal and Installation".

P06BA CYLINDER 2 GLOW PLUG CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013066194

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

This fault code sets when the glow plug is outside of the acceptable range of resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06BA	Cylinder 2 Glow Plug Circuit Range/ Performance (Engine Glow Plug 2 - Data Erratic, Intermittent or Incorrect)	Diagnosis condition	Initial Key ON
		Signal (terminal)	Glow plug 2 signal (19)
		Threshold	Current > 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow Plug Control Module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Bring the vehicle to a complete stop.
7. Repeat all of the above steps three more times.
8. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
9. Check for DTC P06BA being current on the CONSULT screen.

Is DTC P06BA current?

YES >> Go to EC-809, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013066195

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P066C, P066D or P0672 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.

2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06BA being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK GLOW PLUG NO. 2

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Check resistance between glow plug control module connector F103 and ground.

Glow plug control module		Ground	Resistance
Connector	Terminal		
F103	19	—	< 1.5 Ω

Is the inspection result normal?

YES >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> GO TO 5.

5. CHECK GLOW PLUG NO. 2 CIRCUIT

1. Disconnect glow plug no. 2 connector F130.
2. Check resistance between glow plug no. 2 terminal 1 and ground.

Glow plug no. 2 terminal	Ground	Resistance
1	—	< 1.0 Ω

Is the inspection result normal?

YES >> Repair or replace the glow plug harness for an open.
NO >> Replace glow plug no. 2. Refer to EM-252, "Removal and Installation".

P06BB CYLINDER 3 GLOW PLUG CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013066196

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

This fault code sets when the glow plug is outside of the acceptable range of resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06BB	Cylinder 3 Glow Plug Circuit Range/ Performance (Engine Glow Plug 3 - Data Erratic, Intermittent or Incorrect)	Diagnosis condition	Initial Key ON
		Signal (terminal)	Glow plug 3 signal (22)
		Threshold	Current > 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow Plug Control Module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Bring the vehicle to a complete stop.
7. Repeat all of the above steps three more times.
8. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
9. Check for DTC P06BB being current on the CONSULT screen.

Is DTC P06BB current?

YES >> Go to EC-811, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013066197

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P066E, P066F or P0673 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.

2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06BB being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK GLOW PLUG NO. 3

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Check resistance between glow plug control module connector F103 and ground.

Glow plug control module		Ground	Resistance
Connector	Terminal		
F103	22	—	< 1.5 Ω

Is the inspection result normal?

YES >> • A malfunctioning glow plug control module has been detected. Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
• GO TO 6.
NO >> GO TO 5.

5. CHECK GLOW PLUG NO. 3 CIRCUIT

1. Disconnect glow plug no. 3 connector F116.
2. Check resistance between glow plug no. 3 terminal 1 and engine block.

Glow plug no. 3 terminal	Ground	Resistance
1	—	< 1.0 Ω

Is the inspection result normal?

YES >> • Repair or replace the glow plug harness for an open.
• GO TO 6.
NO >> • Replace glow plug no. 3. Refer to EM-252, "Removal and Installation".
• GO TO 6.

6. ERASE DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, select “ENGINE” and erase DTCs.
5. Operate the engine within the "Conditions for Clearing the DTC".

Is P06BB DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-811, "DTC Description".
NO >> Repair complete.

P06BC CYLINDER 4 GLOW PLUG CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013066214

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

This fault code sets when the glow plug is outside of the acceptable range of resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06BC	Cylinder 4 Glow Plug Circuit Range/ Performance (Engine Glow Plug 4 - Data Erratic, Intermittent or Incorrect)	Diagnosis condition	Initial Key ON
		Signal (terminal)	Glow plug 4 signal (23)
		Threshold	Current > 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow Plug Control Module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Bring the vehicle to a complete stop.
7. Repeat all of the above steps three more times.
8. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
9. Check for DTC P06BC being current on the CONSULT screen.

Is DTC P06BC current?

YES >> Go to EC-814, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013066215

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P0674, P067A or P067B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.

2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P06BC being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK GLOW PLUG NO. 4

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Check resistance between glow plug control module connector F103 and ground.

Glow plug control module		Ground	Resistance
Connector	Terminal		
F103	23	—	< 1.5 Ω

Is the inspection result normal?

YES >> • A malfunctioning glow plug control module has been detected. Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
• GO TO 6.
NO >> GO TO 5.

5. CHECK GLOW PLUG NO. 4 CIRCUIT

1. Disconnect glow plug no. 4 connector F132.
2. Check resistance between glow plug no. 4 terminal 1 and ground.

Glow plug no. 4 terminal	Ground	Resistance
1	—	< 1.0 Ω

Is the inspection result normal?

YES >> • Repair or replace the glow plug harness for an open.
• GO TO 6.
NO >> • Replace glow plug no. 4. Refer to EM-252, "Removal and Installation".
• GO TO 6.

6. ERASE DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, select “ENGINE” and erase DTCs.
5. Operate the engine within the "Conditions for Clearing the DTC".

Is P06BC DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-814, "DTC Description".
NO >> Repair complete.

P06BD CYLINDER 5 GLOW PLUG CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013066256

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

This fault code sets when the glow plug is outside of the acceptable range of resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06BD	Cylinder 5 Glow Plug Circuit Range/ Performance (Engine Glow Plug 5 - Data Erratic, Intermittent or Incorrect)	Diagnosis condition	Initial Key ON
		Signal (terminal)	Glow plug 5 signal (24)
		Threshold	Current > 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow Plug Control Module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Bring the vehicle to a complete stop.
7. Repeat all of the above steps three more times.
8. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
9. Check for DTC P06BD being current on the CONSULT screen.

Is DTC P06BD current?

YES >> Go to EC-817, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013066257

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0675, P067C or P067D being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.

2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06BD being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK GLOW PLUG NO. 5

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Check resistance between glow plug control module connector F103 and ground.

Glow plug control module		Ground	Resistance
Connector	Terminal		
F103	24	—	< 1.5 Ω

Is the inspection result normal?

YES >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> GO TO 5.

5. CHECK GLOW PLUG NO. 5 CIRCUIT

1. Disconnect glow plug no. 5 connector F118.
2. Check resistance between glow plug no. 5 terminal 1 and ground.

Glow plug no. 5 terminal	Ground	Resistance
1	—	< 1.0 Ω

Is the inspection result normal?

YES >> Repair or replace the glow plug harness for an open.
NO >> Replace glow plug no. 5. Refer to EM-252, "Removal and Installation".

P06BE CYLINDER 6 GLOW PLUG CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013066455

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

This fault code sets when the glow plug is outside of the acceptable range of resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06BE	Cylinder 6 Glow Plug Circuit Range/ Performance (Engine Glow Plug 6 - Data Erratic, Intermittent or Incorrect)	Diagnosis condition	Initial Key ON
		Signal (terminal)	Glow plug 6 signal (25)
		Threshold	Current > 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow Plug Control Module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Bring the vehicle to a complete stop.
7. Repeat all of the above steps three more times.
8. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
9. Check for DTC P06BE being current on the CONSULT screen.

Is DTC P06BE current?

YES >> Go to EC-819, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013066456

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0676, P067E or P067F being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.

2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06BE being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK GLOW PLUG NO. 6

1. Turn ignition switch OFF.
2. Disconnect glow plug .
3. Check resistance between glow plug control module connector F103 and ground.

Glow plug control module		Ground	Resistance
Connector	Terminal		
F103	25	—	< 1.5 Ω

Is the inspection result normal?

YES >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> GO TO 5.

5. CHECK GLOW PLUG NO. 6 CIRCUIT

1. Disconnect glow plug no. 6 connector F134.
2. Check resistance between glow plug no. 6 terminal 1 and ground.

Glow plug no. 6 terminal	Ground	Resistance
1	—	< 1.0 Ω

Is the inspection result normal?

YES >> Repair or replace the glow plug harness for an open.
NO >> Replace glow plug no. 6. Refer to EM-252, "Removal and Installation".

P06BF CYLINDER 7 GLOW PLUG CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013067536

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

This fault code sets when the glow plug is outside of the acceptable range of resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06BF	Cylinder 7 Glow Plug Circuit Range/ Performance (Engine Glow Plug 7 - Data Erratic, Intermittent or Incorrect)	Diagnosis condition	Initial Key ON
		Signal (terminal)	Glow plug 7 signal (28)
		Threshold	Current > 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow Plug Control Module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Bring the vehicle to a complete stop.
7. Repeat all of the above steps three more times.
8. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
9. Check for DTC P06BF being current on the CONSULT screen.

Is DTC P06BF current?

YES >> Go to EC-821, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013067537

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0677, P068C or P068D being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.

2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06BF being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK GLOW PLUG NO. 7

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Check resistance between glow plug control module connector F103 and ground.

Glow plug control module		Ground	Resistance
Connector	Terminal		
F103	28	—	< 1.5 Ω

Is the inspection result normal?

YES >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> GO TO 5.

5. CHECK GLOW PLUG NO. 7 CIRCUIT

1. Disconnect glow plug no. 7 connector F120.
2. Check resistance between glow plug no. 7 terminal 1 and ground.

Glow plug no. 7 terminal	Ground	Resistance
1	—	< 1.0 Ω

Is the inspection result normal?

YES >> Repair or replace the glow plug harness for an open.
NO >> Replace glow plug no. 7. Reefer to EM-252, "Removal and Installation".

P06C0 CYLINDER 8 GLOW PLUG CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013067744

Glow plugs provide rapid heating of the air inside the cylinder to aid in starting the engine during cold ambient conditions. The ceramic glow plug heating element extends into the combustion chamber area where the fuel will be injected. The voltage supplied through the glow plug control module is grounded through the cylinder head. When the glow plug control module commands the glow plugs to activate, the Wait to Start Lamp will be commanded by the ECM to turn ON. Allowing the Wait to Start Lamp to shut off before cranking the engine will ensure that the optimum conditions for starting are present in the cylinder.

DTC DETECTION LOGIC

This fault code sets when the glow plug is outside of the acceptable range of resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06C0	Cylinder 8 Glow Plug Circuit Range/ Performance (Engine Glow Plug 8 - Data Erratic, Intermittent or Incorrect)	Diagnosis condition	Initial Key ON
		Signal (terminal)	Glow plug 8 signal (29)
		Threshold	Current > 1.374 A
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow Plug Control Module
- Glow plug
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Bring the vehicle to a complete stop.
7. Repeat all of the above steps three more times.
8. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
9. Check for DTC P06C0 being current on the CONSULT screen.

Is DTC P06C0 current?

YES >> Go to EC-823, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013067745

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0678, P068E or P068F being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.

2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06C0 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK GLOW PLUG NO. 8

1. Turn ignition switch OFF.
2. Disconnect glow plug control module connector F103.
3. Check resistance between glow plug control module connector F103 and ground.

Glow plug control module		Ground	Resistance
Connector	Terminal		
F103	29	—	< 1.5 Ω

Is the inspection result normal?

YES >> Replace glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> GO TO 5.

5. CHECK GLOW PLUG NO. 8 CIRCUIT

1. Disconnect glow plug no. 8 connector F136.
2. Check resistance between glow plug no. 8 terminal 1 and ground.

Glow plug no. 8 terminal	Ground	Resistance
1	—	< 1.0 Ω

Is the inspection result normal?

YES >> Repair or replace the glow plug harness for an open.
NO >> Replace glow plug no. 8. Refer to EM-252, "Removal and Installation".

P06D3 SENSOR REFERENCE VOLTAGE E CIRCUIT LOW

DTC Description

INFOID:0000000013086071

The Engine Control Module (ECM) provides a dedicated 5 volt supply and ground to the secondary pedal position sensor, refrigerant pressure sensor, and the Fan control assembly. The ECM monitors the voltage level on the sensor +5V supply circuit. If the voltage falls below or above a calibrated limit, this fault is recorded.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected this sensor supply voltage was less than 4.7V for 1 second.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06D3	(Sensor Reference Voltage “E” Circuit Low)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Sensor supply 5 voltage < 4.644V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- Accelerator pedal position sensor
- Fan clutch assembly
- Refrigerant pressure sensor
- Coolant level sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P06D3 being current on the CONSULT screen.

Is DTC P06D3 current?

YES >> Go to EC-825, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013086072

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06D3 being current on the CONSULT screen.

Is DTC P06D3 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect accelerator pedal position sensor harness connector E20.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P06D3 current?

YES >> GO TO 3.
NO >> Replace accelerator pedal position sensor. Refer to ACC-3, "Removal and Installation".

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect fan clutch assembly harness connector F106.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P0652 current?

YES >> GO TO 4.
NO >> Replace fan clutch assembly. Refer to CO-43, "Exploded View".

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect refrigerant pressure sensor harness connector E88.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P06D3 current?

YES >> GO TO 5.
NO >> Replace refrigerant pressure sensor. Refer to HAC-123, "Removal and Installation".

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect coolant level sensor harness connector E91.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P06D3 current?

YES >> GO TO 6.
NO >> Replace coolant level sensor. Refer to CO-46, "Exploded View".

6.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7.CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the accelerator pedal position sensor harness connector E20.
4. Disconnect the refrigerant pressure sensor harness connector E88.
5. Disconnect the fan clutch assembly harness connector F106.
6. Measure the resistance between the ECM harness connector terminal 81 and all other terminals in the ECM harness connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	81	E93	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 8.
NO >> Repair or replace the engine harness for a short.

8. CHECK FOR A PIN-TO-GROUND SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the accelerator pedal position sensor harness connector E20.
4. Disconnect the refrigerant pressure sensor harness connector E88.
5. Disconnect the fan clutch assembly harness connector F106.
6. Measure the resistance between the ECM harness connector E93 terminal 81 and ground.

ECM		Ground	Resistance
Connector	Terminal		
E93	81	—	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 9.
NO >> Repair or replace the harness for a short to ground.

9. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase “ENGINE” diagnostic trouble codes.
4. Perform “DTC CONFIRMATION PROCEDURE”.

Is DTC P06D3 current?

YES >> GO TO 2.
NO >> Repair complete.

P06D4 SENSOR REFERENCE VOLTAGE E CIRCUIT HIGH

DTC Description

INFOID:0000000013085709

The engine control module (ECM) provides a dedicated 5V supply and ground to the secondary pedal position sensor, refrigerant pressure sensor, and the Fan control assembly. The ECM monitors the voltage level on the sensor +5V supply circuit. If the voltage falls below or above a calibrated limit, this fault is recorded.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected this sensor supply voltage was greater than 5.3V for 1 second

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06D4	(Sensor Reference Voltage “E” Circuit High)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Sensor supply 5 voltage > 5.356V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P06D4 being current on the CONSULT screen.

Is DTC P06D4 current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013085710

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06D4 being current on the CONSULT screen.

Is DTC P06D4 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the accelerator pedal position sensor harness connector E20.
4. Disconnect the coolant level sensor harness connector E91.
5. Disconnect the refrigerant pressure sensor harness connector E88.
6. Disconnect the fan clutch assembly harness connector F106.
7. Measure the resistance between the ECM harness connector terminal 81 and all other terminals in the ECM harness connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	81	E93	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 4.
NO >> Repair or replace the engine harness for a short.

4. CHECK FOR A PIN-TO-VOLTAGE SHORT CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the accelerator pedal position sensor harness connector E20.
4. Disconnect the coolant level sensor harness connector E91.
5. Disconnect the refrigerant pressure sensor harness connector E88.
6. Disconnect the fan clutch assembly harness connector F106.
7. Measure the resistance between the ECM harness connector E93 terminal 81 and terminals 3, 5, 6, 65 and 83.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	81	E93	3	> 100k Ω
			5	
			6	
			65	
			83	

Is resistance greater than 100k ohms?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair or replace the engine harness for a short to voltage.

P06D7 SENSOR REFERENCE VOLTAGE F CIRCUIT LOW

DTC Description

INFOID:0000000013071871

The engine control module (ECM) provides a dedicated 5V supply and ground to the Diesel Particulate Filter Differential Pressure sensor. The ECM monitors the voltage level on the DPF Differential (or Delta) Pressure sensor +5V supply circuit. If the voltage falls below or above a calibrated limit, a fault is recorded.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected this sensor supply voltage was less than 4.7V for 1 second.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06D7	(Sensor Reference Voltage “F” Circuit Low)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Sensor supply 6 voltage < 4.644V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- DPF differential pressure sensor
- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P06D7 being current on the CONSULT screen.

Is DTC P06D7 current?

YES >> Go to EC-830, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013071872

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06D7 being current on the CONSULT screen.

Is DTC P06D7 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT DPF DIFFERENTIAL PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect DPF differential pressure sensor harness connector C28.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage

- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect DPF differential pressure sensor harness connector C28.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is DTC P06D7 current?

YES >> GO TO 4.
NO >> Replace DPF differential pressure sensor. Refer to EX-58, "Removal and Installation".

4.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Measure the resistance between the ECM harness connector terminal 32 and all other terminals in the ECM harness connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	32	E93	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 6.
NO >> Repair or replace the engine harness for a short.

6.CHECK FOR A PIN-TO-GROUND SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Measure the resistance between the ECM harness connector E93 terminal 32 and ground.

ECM		Ground	Resistance
Connector	Terminal		
E93	32	—	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 7.
NO >> Repair or replace the harness for a short to ground.

7.ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase “ENGINE” diagnostic trouble codes.
4. Perform DTC CONFIRMATION PROCEDURE.

Is DTC P06D7 current?

YES >> GO TO 2.
NO >> Inspection End.

P06D8 SENSOR REFERENCE VOLTAGE F CIRCUIT HIGH

DTC Description

INFOID:0000000013071811

The engine control module (ECM) provides a dedicated 5V supply and ground to the secondary pedal position sensor, refrigerant pressure sensor, and the Fan control assembly. The ECM monitors the voltage level on the sensor +5V supply circuit. If the voltage falls below or above a calibrated limit, this fault is recorded.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected this sensor supply voltage was greater than 5.3V for 1 second

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06D8	(Sensor Reference Voltage “F” Circuit High)	Diagnosis condition	Ignition switch is ON or engine running
		Signal (terminal)	(–)
		Threshold	Sensor supply 6 voltage > 5.356V
		Diagnosis delay time	Diagnostic runs continuously when the ignition is ON or engine is running

POSSIBLE CAUSE

- ECM
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P06D8 being current on the CONSULT screen.

Is DTC P06D8 current?

YES >> Go to EC-833, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013071812

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06D8 being current on the CONSULT screen.

Is DTC P06D8 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the DPF differential pressure sensor harness connector C28.
4. Measure the resistance between the ECM harness connector E93 terminal 32 and all other terminals in the ECM harness connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	32	E93	All	> 100k Ω

Is resistance greater than 100k ohms?

YES >> GO TO 4.
NO >> Repair or replace the engine harness for a short.

4. CHECK FOR A PIN-TO-VOLTAGE SHORT CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector E93.
3. Disconnect the DPF differential pressure sensor harness connector C28.
4. Measure the resistance between the ECM harness connector E93 terminal 32 and terminals 3, 5, 6, 65 and 83.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	32	E93	3	> 100k Ω
			5	
			6	
			65	
			83	

Is resistance greater than 100k ohms?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair or replace the engine harness for a short to voltage.

P06E5 GLOW PLUG CONTROL MODULE PERFORMANCE

DTC Description

INFOID:0000000013065749

The glow plug control module controls the timing and intensity of the glow plug outputs on the engine using data provided by the ECM through the CAN 2 communication lines. The glow plug control module will not activate the glow plugs if the glow plug module reads a temperature greater than a calibrated amount. The glow plug control module receives fused power directly from the battery, and switched power through the smart power relay.

DTC DETECTION LOGIC

The glow plug control module reported an internal error.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P06E5	(Glow Plug Control Module - Root Cause Not Known)	Diagnosis condition	Ignition is ON or engine is running.
		Signal (terminal)	(-)
		Threshold	The glow plug control modules diagnostics on glow plug 1 circuit detect the following: • Voltage out of range low, shorted to ground resulting in too high of a current • Voltage out of range high, shorted to battery, or an internal GPCM MOFSET error • Current out of range low resulting from an open circuit that has not completed
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Glow plug control module not receiving power from battery supply circuit
- Open in harness, fuse, connector, or low voltage supplied by the battery
- Glow plug control module malfunction

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P06E5 being current on the CONSULT screen.

Is DTC P06E5 current?

YES >> Go to EC-835, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065750

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for sensor supply DTC U0106 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-211, "DTC Description".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P06E5 being current on the CONSULT screen.

Is DTC P06E5 detected as current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT GLOW PLUG CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the glow plug control module from engine harness connector.
3. Inspect the glow plug control module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace error-detected parts.
• GO TO 7.

4. CHECK THE VOLTAGE TO THE GLOW PLUG CONTROL MODULE

1. Turn ignition switch ON.
2. Check the voltage between the glow plug control module ignition voltage supply circuit and ground circuit.
NOTE:
Check the voltage while cranking the engine, and with the engine at idle.

Glow plug control module			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
F102	7	6	Battery voltage

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5. CHECK THE VOLTAGE TO THE GLOW PLUG CONTROL MODULE

Check the voltage between the glow plug control module ignition voltage supply circuit and engine block.
NOTE:
Check the voltage while cranking the engine, and with the engine at idle.

Glow plug control module			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
F102	7	Engine block	Battery voltage

Is the inspection result normal?

YES >> • A malfunction has been detected in the ground supply circuit. Repair or replace engine harness as necessary.
• GO TO 7.
NO >> • A malfunction has been detected in the ignition supply circuit. Repair or replace engine harness as necessary.
• GO TO 7.

6. CHECK FOR DTCS

1. Turn ignition switch OFF.
2. Reconnect the glow plug control module connector.
3. Turn ignition switch ON.
4. Turn ignition switch OFF, and wait 5 seconds.

5. Start the engine and let it idle for 1 minute.
6. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P064C DTC become ″Current″?

YES >> • A malfunctioning glow plug control module has been detected. Replace the glow plug control module. Refer to EC-1256, "Removal and Installation".
• GO TO 7.

NO >> • The removal and installation of the connector corrected the malfunction.
• GO TO 7.

7. ERASE DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, select “ENGINE” and erase DTCs.
5. Operate the engine within the "Conditions for Clearing the DTC".

Is P06E5 DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-835, "DTC Description".

NO >> Repair complete.

P0700 TRANSMISSION CONTROL SYSTEM (MIL REQUEST)

DTC Description

INFOID:0000000013065646

The Transmission Control Module (TCM) communicates to the engine Electronic Control Module (ECM) through the CAN data link. Messages sent from the Transmission Control Module are received and monitored by the ECM. If there is a transmission fault, the TCM will notify the to illuminate the MIL.

DTC DETECTION LOGIC

The Transmission Control Module (TCM) detected an issue and reported to the Engine Control Module.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0700	TCM [Transmission Control System (MIL Request)]	Diagnosis condition	Ignition is ON or engine is running
		Signal (terminal)	(-)
		Threshold	OBD MIL requested
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Transmission control module

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0700 being current on the CONSULT screen.

Is DTC P0700 current?

YES >> Go to EC-838, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065647

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P0700 being current on the CONSULT screen.

Is DTC P0700 detected as current?

YES >> Refer to TM-87, "Work Flow".
NO >> Refer to GI-43, "Intermittent Incident".

P0A0F THE ENGINE DOES NOT START

DTC Description

INFOID:0000000013069937

The crankshaft position and camshaft position sensors are Hall effect type sensors. The Engine Control Module (ECM) provides a 5V supply to the position sensor and a return circuit. As the teeth on the crankshaft speed ring or the dimples in the back of the camshaft gear move past the position sensor, a signal is generated on the position sensor signal circuit. The ECM interprets this signal and converts it to an engine speed. A missing tooth on the crankshaft gear is used by the ECM to determine the position of the engine.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the crankshaft position does not match the camshaft position signal input to the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0A0F	ENGINE FAILED TO START (Engine Failed to Start)	Diagnosis condition	Engine cranking
		Signal (terminal)	(–)
		Threshold	Engine synchronization time > 5 seconds
		Diagnosis delay time	Diagnostic runs continuously when engine is running

POSSIBLE CAUSE

- Camshaft position sensor
- Crankshaft position sensor
- Tone wheel
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P0A0F being current on the CONSULT screen.

Is DTC P0A0F current?

YES >> Go to EC-839, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013069938

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any other DTCs displayed as current on the CONSULT screen.

Is DTC P0A0F only current DTC detected?

YES >> GO TO 2.
NO >> Refer to EC-135, "DTC Index".

2.INSPECT CAMSHAFT POSITION SENSOR

1. Turn ignition switch OFF.
2. Inspect camshaft position sensor for damage or misalignment.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Realign or replace camshaft position sensor. Refer to EM-315, "Removal and Installation".

3.INSPECT CRANKSHAFT POSITION SENSOR

1. Turn ignition switch OFF.
2. Inspect crankshaft position sensor for damage or misalignment.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Realign or replace crankshaft position sensor. Refer to EM-336, "Removal and Installation".

4. INSPECT CRANKSHAFT TONE WHEEL

1. Turn ignition switch OFF.
2. Inspect crankshaft tone wheel for damage.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace crankshaft tone wheel. Refer to EM-380, "Removal and Installation".

5. CHECK THE CRANKSHAFT SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the crankshaft position sensor harness connector F110.
3. Turn ignition switch ON.
4. Measure the voltage between crankshaft position sensor harness connector F110 terminals 1 and 2.

Crankshaft position sensor			Voltage (V) (Approx.)
Connector	Terminal	Terminal	
F110	1	2	4.75-5.25

Is inspection result normal?

YES >> GO TO 10.
NO >> GO TO 6.

6. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts

7. CHECK FOR AN OPEN CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the crankshaft position sensor harness connector F110.
4. Measure the resistance between the ECM harness connector F101 terminal 189 and the crankshaft position sensor harness connector F110 terminal 3.

ECM		Camshaft position sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	189	F110	3	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.

NO >> Repair or replace the harness for an open.

8. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the crankshaft position sensor harness connector F110.
4. Measure the resistance between the ECM harness connector F101 terminal 189 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	189	F101	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace the harness for a short.

9. VERIFY CRANKSHAFT POSITION SENSOR AIR GAP

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect crankshaft position sensor harness connector F110.
4. Remove crankshaft position sensor.
5. Measure crankshaft position sensor air gap at several points in the crankshaft's revolution. Refer to EC-570, "Component Inspection".

Is the inspection result normal?

YES >> Replace the crankshaft position sensor. Refer to EM-336, "Removal and Installation".
NO >> Replace or shim the sensor if the air gap is out of specification.

10. CHECK THE CAMSHAFT SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the camshaft position sensor harness connector F109.
3. Turn ignition switch ON.
4. Measure the voltage between camshaft position sensor harness connector F109 terminals 1 and 2.

Camshaft position sensor			Voltage (V) (Approx.)
Connector	Terminal	Terminal	
F109	1	2	4.75-5.25

Is inspection result normal?

YES >> GO TO 15.
NO >> GO TO 11.

11. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 12.

NO >> Repair or replace error-detected parts.

12. CHECK FOR AN OPEN CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the camshaft position sensor harness connector F109.
4. Measure the resistance between the ECM harness connector F101 terminal 168 and the camshaft position sensor harness connector F109 terminal 3.

ECM		Camshaft position sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	168	F109	3	< 10 Ω

Is the inspection result normal?

YES >> GO TO 13.
NO >> Repair or replace the harness for an open.

13. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the camshaft position sensor harness connector F109.
4. Measure the resistance between the ECM harness connector F101 terminal 168 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	168	F101	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 14.
NO >> Repair or replace the harness for a short.

14. VERIFY CAMSHAFT POSITION SENSOR AIR GAP

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect camshaft position sensor harness connector F109.
4. Remove camshaft position sensor.
5. Measure camshaft position sensor air gap at several points in the camshaft's revolution. Refer to EC-570, "Component Inspection".

Is the inspection result normal?

YES >> Replace the camshaft position sensor. Refer to EM-315, "Removal and Installation".
NO >> Replace or shim the sensor if the air gap is out of specification.

15. ERASE DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT erase "ENGINE" diagnostic trouble codes.
4. Perform "DTC CONFIRMATION PROCEDURE".

Is P0A0F DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and check again.
NO >> Inspection End.

P1191 TC INLET AIR TEMPERATURE SENSOR PERFORMANCE

DTC Description

INFOID:0000000013326319

The turbocharger compressor intake temperature sensor is a variable resistor sensor and is used to measure the temperature of the air entering the compressor intake of the turbocharger.The Engine Control Module (ECM) supplies 5V to the compressor intake temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the air temperature.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the Compressor Intake Temperature reading was higher or lower than other temperature sensors after 8 hours (engine off), or the sensor reading is erratic when engine running.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P1191	(Inlet Air Temperature Sensor Performance/Rationality)	1	Diagnosis condition	Engine running 2 minutes or more
			Signal (terminal)	(–)
			Threshold	Cumulative sum of error in 150 seconds is > 1,500°C, which is ≥ 2°C. Where tolerance is defined as 68.5°C.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	• 8 hour cold soak • Engine running.
			Signal (terminal)	(–)
			Threshold	Turbocharger compressor intake pressure/temperature sensor is 40°C > the tolerance of the second most accurate sensor of the remaining sensors
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Turbocharger compressor intake pressure/temperature sensor
- Harness and connectors
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

NOTE:

If the DTC does not go past, it may be necessary to perform an 8 hour cold soak with the ignition switch OFF.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P1191 being current on the CONSULT screen.

Is DTC P1191 current?

YES >> Go to EC-844, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013326320

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P1191 being current on the CONSULT screen.

Is DTC P1191 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen:

- P1192
- P1193

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.INSPECT TURBOCHARGER COMPRESSOR INTAKE PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Inspect the harness connector and turbocharger compressor intake pressure/temperature sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P1193 DTC become current?

YES >> GO TO 5.
NO >> GO TO 6.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between turbocharger compressor intake pressure/temperature sensor harness connector F105 terminal 3 and 4.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P1192 DTC become current?

YES >> Replace turbocharger compressor intake pressure/temperature sensor. Refer to EM-214, "Removal and Installation".

NO >> GO TO 6.

6. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector E93.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P1193 DTC become current?

YES >> GO TO 8.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

8. CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between ECM harness connector F101 terminal 109 and 127.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P1192 DTC become current?

YES >> Repair or replace engine harness.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P1192 TC INLET AIR TEMPERATURE SENSOR LOW

DTC Description

INFOID:0000000013326321

The turbocharger compressor intake temperature sensor is a variable resistor sensor and is used to measure the temperature of the air entering the compressor intake of the turbocharger. The Engine Control Module (ECM) supplies 5V to the compressor intake temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the air temperature.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the compressor intake temperature signal voltage was less than 0.1V for more than 10 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1192	(Inlet Air Temperature Sensor Low)	Diagnosis condition	Engine running
		Signal (terminal)	(–)
		Threshold	Compressor air inlet temperature sensor voltage < 0.096V (> 120°C)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Turbocharger compressor intake pressure/temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P1192 being current on the CONSULT screen.

Is DTC P1192 current?

YES >> Go to EC-846, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013326322

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P1192 being current on the CONSULT screen.

Is DTC P1192 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT TURBOCHARGER COMPRESSOR INTAKE PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Inspect the harness connector and turbocharger compressor intake pressure/temperature sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector

- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P1193 DTC become current and P1192 become past?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P1192 DTC become current?

YES >> Replace turbocharger compressor intake pressure/temperature sensor. Refer to EM-214, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P1193 become current and P1192 become past?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7.CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the turbocharger compressor intake pressure/temperature sensor harness connector F105.

4. Measure the resistance between the ECM harness connector terminal 109 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	109	F101	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the engine harness for a short.

8.CHECK FOR A PIN-TO-GROUND SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the turbocharger compressor intake pressure/temperature sensor harness connector F140.
4. Measure the resistance between the ECM harness connector F101 terminal 109 and ground.

ECM		Ground	Resistance
Connector	Terminal		
F101	109	—	> 100k Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for a short to ground.

9.CHECK FOR PAST DTC

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P1192 DTC become current?

YES >> Troubleshooting procedures need to be repeated from the beginning. A DTC mode should have been be detected.
NO >> The removal and installation of the connector corrected the issue.

P1193 TC INLET AIR TEMPERATURE SENSOR HIGH

DTC Description

INFOID:0000000013326323

The compressor intake air temperature sensor is a variable resistor sensor and is used to measure the temperature of the air entering the compressor intake of the turbocharger. The Engine Control Module (ECM) supplies 5V to the compressor intake temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the air temperature.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the compressor intake temperature signal voltage was greater than 4.7V for more than 10 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1193	(Inlet Air Temperature Sensor High)	Diagnosis condition	Ignition switch ON or engine running.
		Signal (terminal)	(-)
		Threshold	Compressor inlet temperature sensor value > 4.737V (< -40°C)
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Turbocharger compressor intake pressure/temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P1193 being current on the CONSULT screen.

Is DTC P1193 current?

YES >> Go to EC-849, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013326324

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P1193 being current on the CONSULT screen.

Is DTC P1193 detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT TURBOCHARGER COMPRESSOR INTAKE PRESSURE/TEMPERATURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Inspect the harness connector and turbocharger compressor intake pressure/temperature sensor pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector

- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Connect a jumper wire between turbocharger compressor intake pressure/temperature sensor harness connector F105 terminal 3 and 4.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P1192 become current and P1193 become past?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect turbocharger compressor intake pressure/temperature sensor harness connector F105.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P1193 current?

YES >> Replace the turbocharger compressor intake pressure/temperature sensor. Refer to EM-214, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

5.INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK THE ECM RESPONSE

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Connect a jumper wire between ECM harness connector F101 terminal 109 and 127.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P1192 become current and P1193 become past?

YES >> GO TO 7.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

7.CHECK FOR AN OPEN CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the turbocharger compressor intake pressure/temperature sensor harness connector F105.
4. Measure the resistance between the ECM harness connector and the turbocharger compressor intake pressure/temperature sensor harness connector.

ECM		Turbocharger compressor intake pressure/temperature sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	127	F105	4	< 10 Ω
	109		3	

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the engine harness for an open.

8. CHECK FOR A PIN-TO-PIN SHORT CIRCUIT IN THE ENGINE HARNESS

1. Turn ignition switch OFF.
2. Disconnect the ECM harness connector F101.
3. Disconnect the turbocharger compressor intake pressure/temperature sensor harness connector F105.
4. Measure the resistance between the ECM harness connector terminal 109 and all other terminals in the ECM harness connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	109	F101	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace the engine harness for a short.

9. CHECK PAST DTC

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P1193 DTC become past?

YES >> The removal and installation of the connector corrected the fault.
NO >> Troubleshooting procedures need to be repeated from the beginning. A DTC mode should have been be detected.

P1451 DIESEL PARTICULATE FILTER SYSTEM PERFORMANCE

DTC Description

INFOID:0000000013065620

The engine aftertreatment system monitors the soot load in the aftertreatment diesel particulate filter. Under normal operating conditions, the aftertreatment diesel particulate filter is self cleaning, where soot is converted to carbon dioxide, nitrogen, and water. Under light load operating conditions, it can be necessary to perform a stationary regeneration of the aftertreatment diesel particulate filter. The soot load in the aftertreatment diesel particulate filter is estimated using the aftertreatment differential pressure sensor and the calculated soot output of the engine.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the soot load of the aftertreatment diesel particulate filter reached the first stage of plugging.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1451	(Diesel Particulate Filter System Performance)	Diagnosis condition	Engine is running
		Signal (terminal)	(-)
		Threshold	Soot load estimate > 7 g/l
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Engine has been operating in light load operating conditions that prevent exhaust temperatures from being high enough to regenerate the aftertreatment diesel particulate filter
- Engine damage that causes excessive black smoke to be generated

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Perform the aftertreatment stationary regeneration procedure.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P1451 being current on the CONSULT screen.

Is DTC P1451 current?

YES >> Go to EC-852, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065621

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any other DTCs displayed as current on the CONSULT screen.

Is DTC P1451 only current DTC detected?

YES >> GO TO 2.
NO >> Refer to EC-135, "DTC Index".

2.PERFORM STATIONARY REGENERATION PROCEDURE

1. Turn ignition switch ON.
2. Start the engine and allow it to idle.
3. Perform the aftertreatment stationary regeneration procedure.
4. Using CONSULT, perform the aftertreatment diesel particulate filter regeneration test. Refer to EX-21, "Aftertreatment DPF Regeneration Test".
   NOTE:
   If current DTCs occur during the regeneration test, abort the test and troubleshoot the current DTCs.

Is DTC P1451 detected as current?

YES >> Check for DTCs that have become current during the regeneration event. Refer to EC-135, "DTC Index".

NO >> Inspection End.

P1484 CATALYST OVERHEAT DETECTION

DTC Description

INFOID:0000000013072987

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the ECM via the CAN2 communication lines. The DPF temperature sensor module performs it's own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The DPF temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the DPF temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The DPF intake temperature sensor reading was greater than 650°C (1202°F) for 5 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P1484	Catalyst Overheat Detection (Aftertreatment 1 diesel particulate filter intake temperature - data valid but below above operating range - least severe level)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	DPF inlet temperature > 650°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	DPF inlet temperature > 800°C or DPF inlet temperature - DOC inlet temperature > 540°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Excessive engine oil or diesel fuel being introduced into the exhaust system from the engine
- A damaged engine fuel injector causing unburned diesel fuel to enter the exhaust system
- A face plugged aftertreatment diesel oxidation catalyst

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P1484 being current on the CONSULT screen.

Is DTC P1484 current?

YES >> Go to EC-854, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072988

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.

2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTCs U1611, P1613, P1614 or P1623 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.PERFORM ACTIVE TEST

1. Start the engine and run at low idle.
2. Perform the cylinder cutout “Active Test” using CONSULT.

Was engine misfire detected?

YES >> Determine the cause of misfire. Replace the injector, if necessary. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)"..
NO >> GO TO 3.

3.CHECK TURBOCHARGER OUTLET

1. Turn ignition switch OFF.
2. Remove the exhaust plumbing from the turbocharger outlet.
3. Inspect the turbocharger outlet for signs of oil or fuel being introduced into the aftertreatment system from the engine.

Is there engine oil or fuel contamination in the turbocharger exhaust outlet?

YES >> Repair or replace any components that caused the engine oil or diesel fuel contamination.
NO >> GO TO 4.

4.CHECK AFTERTREATMENT DIESEL OXIDATION CATALYST

1. Remove the aftertreatment DPF assembly.
2. Inspect the intake face of the aftertreatment diesel oxidation catalyst for damage, soot accumulation or face plugging.

Is more than 50 % of the cells on the intake face completely blocked by soot?

YES >> Replace the aftertreatment DPF assembly.
NO >> Refer to GI-43, "Intermittent Incident".

P1612 DATA COMMUNICATION

DTC Description

INFOID:0000000013312699

The immobilizer anti-theft device communicates with the ECM through the CAN communication lines. Messages sent from the immobilizer anti-theft device are received by the ECM and are used to control anti-theft features. If the ECM does not receive a message from immobilizer anti-theft device, a DTC will be set.

DTC DETECTION LOGIC

The ECM was not able to communicate with the immobilizer anti-theft system via the CAN communication lines.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1612	Data Link Error (Vehicle data link - abnormal update rate)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	—
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Malfunctioning anti-theft device
- Exhaust system leaks
- Short or open in data link wiring
- Rapid key cycles may cause this DTC to set

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P1612 being current on the CONSULT screen.

Is DTC P1612 current?

YES >> Go to EC-666, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013312700

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P1612 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for current DTCs related to the CAN system on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> Refer to GI-43, "Intermittent Incident".

P1613 DPF TEMPERATURE SENSOR MODULE PERFORMANCE

DTC Description

INFOID:0000000013065552

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the ECM via the CAN2 communication lines. The DPF temperature sensor module performs it's own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The DPF temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the DPF temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The DPF temperature sensor module reported an internal error.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P1613	DPF Temperature Sensor Module Performance (Aftertreatment DPF temperature sensor module - bad intelligence device or component)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	CAN2 communication lines (18 and 35)
			Threshold	DPF Temperature Sensor Module cold junction temperature < -55°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	CAN2 communication lines (18 and 35)
			Threshold	DPF Temperature Sensor Module cold junction temperature > 20°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		3	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	CAN2 communication lines (18 and 35)
			Threshold	DPF Temperature Sensor Module cold junction temperature < 180°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		4	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	CAN2 communication lines (18 and 35)
			Threshold	Mismatched or invalid CRC of the DPF Temperature Sensor Module ASIC's internal memory at power up
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		5	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	CAN2 communication lines (18 and 35)
			Threshold	DPF Temperature Sensor Module's parameter storage within nonvolatile memory does not match the corresponding parameters volatile storage at power up
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

DPF temperature sensor module

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P1613 being current on the CONSULT screen.

Is DTC P1613 current?

YES >> Go to EC-858, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065553

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U1611, P1614, P1615, P1616 or P1623 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> Replace the DPF temperature sensor module. Refer to EX-52, "Removal and Installation".

P1614 DPF TEMPERATURE SENSOR MODULE SHORTED HIGH

DTC Description

INFOID:0000000013065562

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the ECM via the CAN2 communication lines. The DPF temperature sensor module performs it's own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The DPF temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the DPF temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The DPF temperature sensor module battery supply voltage is greater than 18V for more than 4 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1614	DPF Temperature Sensor Module Shorted High (Aftertreatment DPF temperature sensor module - voltage above normal or shorted to high source)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	Battery supply voltage (3)
		Threshold	Current > 16 V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

High battery supply voltage

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P1614 being current on the CONSULT screen.

Is DTC P1614 current?

YES >> Go to EC-859, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065563

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for "ENGINE" diagnostic trouble codes.
3. Check for DTC P1614 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for DTC P0562, P0563, P2503 or P2504 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.INSPECT DPF TEMPERATURE SENSOR MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect DPF temperature sensor module connector C29.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK BATTERY SUPPLY VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect DPF temperature sensor module connector C29.
3. Turn ignition switch ON.
4. Check voltage between DPF temperature sensor module connector C29 and ground.

DPF temperature sensor module		Ground	Condition	Voltage (V) (Approx.)
Connector	Terminal			
C29	3	—	Ignition switch ON	> 18 V
			Engine cranking	
			Engine at idle	

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 5.

5. CHECK FOR CORRECT DPF TEMPERATURE SENSOR MODULE

1. Turn ignition switch OFF.
2. Remove the DPF temperature sensor module. Refer to EX-52, "Removal and Installation".
3. Verify that the DPF temperature sensor module is correct for the engine configuration.

Is the DPF temperature control module correct for the engine configuration?

YES >> GO TO 6.
NO >> Replace DPF temperature sensor module. Refer to EX-52, "Removal and Installation".

6. CHECK CONDITION OF DPF TEMPERATURE SENSOR MODULE

1. Turn ignition switch OFF.
2. Connect DPF temperature sensor module connector C29.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Start and idle the engine.
5. Check for DTC P1614 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Replace DPF temperature sensor module. Refer to EX-52, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

7. CHECK BATTERY VOLTAGE

Test the voltage of the battery. Refer to PG-164, "Work Flow".

Is the battery voltage greater than 18 V?

YES >> Check the battery overcharging condition. Refer to CHG-23, "Work Flow (With EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)" or CHG-29, "Work Flow (Without EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)".
NO >> GO TO 8.

8. CHECK BATTERY SUPPLY VOLTAGE CIRCUIT

1. Turn ignition switch OFF.

2. Disconnect DPF temperature sensor module connector C29.
3. Remove fuse no. 72.
4. Turn ignition switch ON.
5. Check voltage between DPF temperature sensor module connector C29 and ground.

DPF temperature sensor module		Ground	Voltage (V) (Approx)
Connector	Terminal		
C29	3	—	> 18 V

Is the inspection result normal?

YES >> Repair the short to voltage in the battery supply voltage circuit.
NO >> Refer to GI-43, "Intermittent Incident".

P1615 DPF TEMPERATURE SENSOR MODULE SHORTED LOW

DTC Description

INFOID:0000000013065566

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the ECM via the CAN2 communication lines. The DPF temperature sensor module performs it's own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The DPF temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the DPF temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The DPF temperature sensor module battery supply voltage is less than 6.5V for more than 4 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1615	DPF Temperature Sensor Module Shorted Low (Aftertreatment DPF temperature sensor module - voltage below normal or shorted to low source)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	Battery supply voltage (3)
		Threshold	Current < 6 V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- DPF temperature sensor module
- Low battery supply voltage

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P1615 being current on the CONSULT screen.

Is DTC P1615 current?

YES >> Go to EC-862, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065567

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for "ENGINE" diagnostic trouble codes.
3. Check for DTC P1615 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for DTC P0562, P0563, P2503 or P2504 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.INSPECT DPF TEMPERATURE SENSOR MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect DPF temperature sensor module connector C29.

3. Inspect the harness and module connector pins for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK BATTERY SUPPLY VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect DPF temperature sensor module connector C29.
3. Turn ignition switch ON.
4. Check voltage between DPF temperature sensor module connector C29 and ground.

DPF temperature sensor module		Ground	Condition	Voltage (V) (Approx.)
Connector	Terminal			
C29	3	—	Ignition switch ON	< 6 V
			Engine cranking	
			Engine at idle	

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5. CHECK CONDITION OF DPF TEMPERATURE SENSOR MODULE

1. Turn ignition switch OFF.
2. Connect DPF temperature sensor module connector C29.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Start and idle the engine.
5. Check for DTC P1615 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Replace DPF temperature sensor module. Refer to EX-52, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

6. CHECK BATTERY TERMINALS

Check the battery terminal connections.

Are the battery terminal connections tight and corrosion free?

YES >> GO TO 7.
NO >> Tighten and clean the terminals.

7. CHECK BATTERY SUPPLY VOLTAGE CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect DPF temperature sensor module connector C29.
3. Turn ignition switch ON.
4. Check voltage between DPF temperature sensor module connector C29 and ground.

DPF temperature sensor module		Ground	Voltage (V) (Approx.)
Connector	Terminal		
C29	3	—	< 6 V

Is the inspection result normal?

YES >> Repair the open or high resistance condition in the battery supply voltage circuit.
NO >> Repair the open or high resistance condition in the ground circuit.

P1616 DPF TEMPERATURE SENSOR MODULE OVER TEMPERATURE

DTC Description

INFOID:0000000013065570

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the ECM via the CAN2 communication lines. The DPF temperature sensor module performs it's own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The DPF temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the DPF temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The DPF temperature sensor module internal temperature is greater than 150°C.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1616	DPF Temperature Sensor Module Over Temperature (Aftertreatment DPF temperature sensor module - Data valid but above normal operating range)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	DPF temperature sensor module internal circuit board temperature > 150°C
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Exhaust system leaks
- Missing heat shields
- Dirt and debris that could lead to overheating

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P1616 being current on the CONSULT screen.

Is DTC P1616 current?

YES >> Go to EC-865, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065571

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for "ENGINE" diagnostic trouble codes.
3. Check for DTC P1614 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK THE DPF TEMPERATURE SENSOR MODULE INSTALLATION

1. Turn ignition switch OFF.
2. Verify that the DPF temperature sensor module is properly mounted and the proper heat shield is mounted over it.

Are the DPF temperature sensor module and heat shield properly installed?

YES >> GO TO 3.
NO >> Properly install the PDF temperature sensor module and heat shield. Refer to EX-51, "Exploded View".

3.CHECK FOR OBSTRUCTED OR RESTRICTED AIR FLOW TO THE DPF TEMPERATURE SENSOR MODULE

Check the DPF temperature sensor module mounting area for air flow obstructions:
- Debris on or around the temperature sensor module.
- Aftermarket shields, flaps, or brackets mounted too close to the module.
- Exhaust leaks allowing exhaust to overheat the temperature sensor module.

Are there any signs of air flow restriction or excessive heat around the DPF temperature sensor module?

YES >> Repair the cause of the restricted air flow. Remove any debris accumulated near the DPF temperature sensor module. Relocate any aftermarket accessories that might be restricting air flow.
NO >> Check for proper installation of the PDF temperature sensor module. Refer to EX-51, "Exploded View".

P1623 DPF TEMPERATURE SENSOR MODULE CIRCUIT

DTC Description

INFOID:0000000013111802

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the ECM via the CAN2 communication lines. The DPF temperature sensor module performs it's own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The DPF temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the DPF temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The ECM detected an intermittent battery voltage supply to the DPF temperature sensor module resulting in an internal reset of the module.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1623	DPF Temperature Sensor Module Circuit (Aftertreatment DPF temperature sensor module - Root cause not known)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	battery supply voltage (3)
		Threshold	The number of DPF temperature sensor module reset events within a 300 second window is ≥ 5 counts
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Intermittent battery voltage supply
- Harness or connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P1623 being current on the CONSULT screen.

Is DTC P1623 current?

YES >> Go to EC-867, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013111803

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for "ENGINE" diagnostic trouble codes.
3. Check for DTC P1623 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for DTC P0562, P0563, P2503 or P2504 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK DTC PRIORITY

Check for DTC U1611 or P1615 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4.INSPECT DPF TEMPERATURE SENSOR MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect DPF temperature sensor module connector C29.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK BATTERY SUPPLY VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect DPF temperature sensor module connector C29.
3. Turn ignition switch ON.
4. Check voltage between the terminals of the DPF temperature sensor module connector C29.

DPF temperature sensor module connector C29		Condition	Voltage (V) (Approx.)
Terminal	Terminal		
3	4	Ignition switch ON	< 6 V
		Engine cranking	
		Engine at idle	

Is the inspection result normal?

YES >> GO TO 6.
NO >> An intermittent connection has been detected at the DPF temperature sensor module. Inspect the connector and harness for signs of intermittent shorts or opens. Repair or replace the damaged component.

6.CHECK BATTERY TERMINALS

Check the battery terminal connections.

Are the battery terminal connections tight and corrosion free?

YES >> GO TO 7.
NO >> Tighten and clean the terminals.

7.CHECK BATTERY SUPPLY VOLTAGE CIRCUIT

1. Turn ignition switch OFF.
2. Turn ignition switch ON.

3. Check voltage between DPF temperature sensor module connector C29 and ground.

DPF temperature sensor module		Ground	Voltage (V) (Approx.)
Connector	Terminal		
C29	3	—	< 6 V

Is the inspection result normal?

YES >> Repair the open or high resistance condition in the battery supply voltage circuit.
NO >> Repair the open or high resistance condition in the ground circuit.

P1624 SCR TEMPERATURE SENSOR MODULE PERFORMANCE

DTC Description

INFOID:0000000013065558

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the ECM via the CAN2 communication lines. The SCR temperature sensor module performs it's own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The SCR temperature sensor module reported an internal error.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P1624	SCR Temperature Sensor Module Performance (Aftertreatment SCR temperature sensor module - bad intelligence device or component)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	CAN2 communication lines (18 and 35)
			Threshold	SCR Temperature Sensor Module cold junction temperature < -55°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	CAN2 communication lines (18 and 35)
			Threshold	SCR Temperature Sensor Module cold junction temperature > 20°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		3	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	CAN2 communication lines (18 and 35)
			Threshold	SCR Temperature Sensor Module cold junction temperature < 180°C
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		4	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	CAN2 communication lines (18 and 35)
			Threshold	Mismatched or invalid CRC of the SCR Temperature Sensor Module ASIC's internal memory at power up
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		5	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	CAN2 communication lines (18 and 35)
			Threshold	SCR Temperature Sensor Module's parameter storage within nonvolatile memory does not match the corresponding parameters volatile storage at power up
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

SCR temperature sensor module

DTC CONFIRMATION PROCEDURE

1. PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P1624 being current on the CONSULT screen.

Is DTC P1624 current?

YES >> Go to EC-871, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065559

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC U1612, P1625, P1626, P1627 or P1628 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> Replace the SCR temperature sensor module. Refer to EX-55, "Removal and Installation".

P1625 SCR TEMPERATURE SENSOR MODULE SHORTED HIGH

DTC Description

INFOID:0000000013065574

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the ECM via the CAN2 communication lines. The SCR temperature sensor module performs it's own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The SCR temperature sensor module battery supply voltage is greater than 18V for more than 4 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1625	SCR Temperature Sensor Module Shorted High (Aftertreatment SCR temperature sensor module - voltage above normal or shorted to high source)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	Battery supply voltage (3)
		Threshold	Current > 16 V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

High battery supply voltage

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P1625 being current on the CONSULT screen.

Is DTC P1625 current?

YES >> Go to EC-872, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065575

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for "ENGINE" diagnostic trouble codes.
3. Check for DTC P1625 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for DTC P0562 or P0563 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.INSPECT SCR TEMPERATURE SENSOR MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect SCR temperature sensor module connector C30.
3. Inspect the harness and module connector pins for the following:

- Loose connector

- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK BATTERY SUPPLY VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect SCR temperature sensor module connector C30.
3. Turn ignition switch ON.
4. Check voltage between the terminals of the SCR temperature sensor module connector C30.

SCR temperature sensor module connector C30		Condition	Voltage (V) (Approx.)
Terminal	Terminal		
3	4	Ignition switch ON	> 18 V
		Engine cranking	
		Engine at idle	

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5. CHECK CONDITION OF SCR TEMPERATURE SENSOR MODULE

1. Turn ignition switch OFF.
2. Connect SCR temperature sensor module connector C30.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Start and idle the engine.
5. Check for DTC P1625 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Replace SCR temperature sensor module. Refer to EX-55, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

6. CHECK BATTERY VOLTAGE

Test the voltage of the battery. Refer to PG-164, "Work Flow".

Is the battery voltage greater than 18 V?

YES >> Check the battery overcharging condition. Refer to CHG-23, "Work Flow (With EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)" or CHG-29, "Work Flow (Without EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)".
NO >> GO TO 7.

7. CHECK BATTERY SUPPLY VOLTAGE CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect SCR temperature sensor module connector C30.
3. Remove fuse no. 72.
4. Turn ignition switch ON.
5. Check voltage between SCR temperature sensor module connector C30 and ground.

SCR temperature sensor module		Ground	Voltage (V) (Approx.)
Connector	Terminal		
C30	3	—	> 18 V

Is the inspection result normal?

YES >> Repair the short to voltage in the battery supply voltage circuit.
NO >> Refer to GI-43, "Intermittent Incident".

P1626 SCR TEMPERATURE SENSOR MODULE SHORTED LOW

DTC Description

INFOID:0000000013065582

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the ECM via the CAN2 communication lines. The SCR temperature sensor module performs it's own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The SCR temperature sensor module battery supply voltage is less than 6.5V for more than 4 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1626	SCR Temperature Sensor Module Shorted Low (Aftertreatment DPF temperature sensor module - voltage below normal or shorted to low source)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	Battery supply voltage (3)
		Threshold	Current < 6 V
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- SCR temperature sensor module
- Low battery supply voltage

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P1626 being current on the CONSULT screen.

Is DTC P1626 current?

YES >> Go to EC-875, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065583

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P1626 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for DTC P0562 or P0563 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.INSPECT SCR TEMPERATURE SENSOR MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect SCR temperature sensor module connector C30.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK BATTERY SUPPLY VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect SCR temperature sensor module connector C30.
3. Turn ignition switch ON.
4. Check voltage between the terminals of the SCR temperature sensor module connector C30.

SCR temperature sensor module connector C30		Condition	Voltage (V) (Approx.)
Terminal	Terminal		
3	4	Ignition switch ON	< 6 V
		Engine cranking	
		Engine at idle	

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5. CHECK CONDITION OF SCR TEMPERATURE SENSOR MODULE

1. Turn ignition switch OFF.
2. Connect SCR temperature sensor module connector C30.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Start and idle the engine.
5. Check for DTC P1626 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Replace SCR temperature sensor module. Refer to EX-52, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

6. CHECK BATTERY TERMINALS

Check the battery terminal connections.

Are the battery terminal connections tight and corrosion free?

YES >> GO TO 7.
NO >> Tighten and clean the terminals.

7. CHECK BATTERY SUPPLY VOLTAGE CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect SCR temperature sensor module connector C30.
3. Turn ignition switch ON.
4. Check voltage between SCR temperature sensor module connector C30 and ground.

SCR temperature sensor module		Ground	Voltage (V) (Approx.)
Connector	Terminal		
C30	3	—	< 6 V

Is the inspection result normal?

YES >> Repair the open or high resistance condition in the battery supply voltage circuit.
NO >> Repair the open or high resistance condition in the ground circuit.

P1627 SCR TEMPERATURE SENSOR MODULE OVER TEMPERATURE

DTC Description

INFOID:0000000013065584

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the ECM via the CAN2 communication lines. The SCR temperature sensor module performs it's own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The SCR temperature sensor module internal temperature is greater than 150°C.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1627	SCR Temperature Sensor Module Over Temperature (Aftertreatment SCR temperature sensor module - Data valid but above normal operating range)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	SCR temperature sensor module internal temperature > 150°C
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Exhaust system leaks
- Missing heat shields
- Dirt and debris that could lead to overheating

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P1627 being current on the CONSULT screen.

Is DTC P1627 current?

YES >> Go to EC-878, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065585

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for "ENGINE" diagnostic trouble codes.
3. Check for DTC P1627 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK THE SCR TEMPERATURE SENSOR MODULE INSTALLATION

1. Turn ignition switch OFF.
2. Verify that the SCR temperature sensor module is properly mounted and the proper heat shield is mounted over it.

Are the SCR temperature sensor module and heat shield properly installed?

YES >> GO TO 3.
NO >> Properly install the SCR temperature sensor module and heat shield. Refer to EX-55, "Exploded View".

3. CHECK FOR OBSTRUCTED OR RESTRICTED AIR FLOW TO THE SCR TEMPERATURE SENSOR MODULE

Check the SCR temperature sensor module mounting area for air flow obstructions:
- Debris on or around the temperature sensor module.
- Aftermarket shields, flaps, or brackets mounted too close to the module.
- Exhaust leaks allowing exhaust to overheat the temperature sensor module.

Are there any signs of air flow restriction or excessive heat around the DPF temperature sensor module?

YES >> Repair the cause of the restricted air flow. Remove any debris accumulated near the SCR temperature sensor module. Relocate any aftermarket accessories that might be restricting air flow.
NO >> Check for proper installation of the SCR temperature sensor module. Refer to EX-55, "Exploded View".

P1628 SCR TEMPERATURE SENSOR MODULE CIRCUIT

DTC Description

INFOID:0000000013065604

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the ECM via the CAN2 communication lines. The SCR temperature sensor module performs it's own internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The ECM detected an intermittent battery voltage supply to the SCR temperature sensor module resulting in an internal reset of the module.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1628	SCR Temperature Sensor Module Circuit (Aftertreatment SCR temperature sensor module - Root cause not known)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	battery supply voltage (3)
		Threshold	The number of SCR temperature sensor module reset events within a 300 second window is ≥ 5 counts
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Intermittent battery voltage supply
- Harness or connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P1628 being current on the CONSULT screen.

Is DTC P1628 current?

YES >> Go to EC-880, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065605

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for "ENGINE" diagnostic trouble codes.
3. Check for DTC P1628 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for DTC U1612 or P1626 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. INSPECT SCR TEMPERATURE SENSOR MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect SCR temperature sensor module connector C30.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK BATTERY SUPPLY VOLTAGE

1. Turn ignition switch OFF.
2. Disconnect SCR temperature sensor module connector C30.
3. Turn ignition switch ON.
4. Check voltage between the terminals of the SCR temperature sensor module connector C30.

SCR temperature sensor module connector C30		Condition	Voltage (Approx.)
Terminal	Terminal		
3	4	Ignition switch ON	< 6 V
		Engine cranking	
		Engine at idle	

Is the inspection result normal?

YES >> GO TO 5.
NO >> An intermittent connection has been detected at the SCR temperature sensor module. Inspect the connector and harness for signs of intermittent shorts or opens. Repair or replace the damaged component.

5. CHECK BATTERY TERMINALS

Check the battery terminal connections.

Are the battery terminal connections tight and corrosion free?

YES >> GO TO 6.
NO >> Tighten and clean the terminals.

6. CHECK BATTERY SUPPLY VOLTAGE CIRCUIT

1. Turn ignition switch OFF.
2. Turn ignition switch ON.
3. Check voltage between SCR temperature sensor module connector C30 and ground.

SCR temperature sensor module		Ground	Voltage (Approx.)
Connector	Terminal		
C30	3	—	< 6 V

Is the inspection result normal?

YES >> Repair the open or high resistance condition in the battery supply voltage circuit.
NO >> Repair the open or high resistance condition in the ground circuit.

P1A62 TC ACTUATOR POSITION

DTC Description

INFOID:0000000013073121

The dual stage turbocharger is electronically activated by the rotary turbine control valve actuator. The actuator is powered by the battery via the smart power relay. The rotary turbine control valve actuator is a smart device and receives information on the CAN2 communication lines from the ECM. The rotary turbine control valve actuator performs it's own diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The ECM then decodes the error message and converts it to a DTC.

DTC DETECTION LOGIC

The turbocharger has failed to detect endpoint or stop references under engine operating conditions.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P1A62	Turbo Actuator Software Error (Engine turbocharger 1 turbine - bypass actuator 1position - special instructions)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Turbine bypass valve reports that it is in a state with no known calibration data or it is in the process of doing an installation
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Rotary turbine control valve actuator
- Loose or damaged linkage
- Turbine bypass valve

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P1A62 being current on the CONSULT screen.

Is DTC P1A62 current?

YES >> Go to EC-883, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073122

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for "ENGINE" diagnostic trouble codes.
3. Check for DTCs U010C, P00AF or P2262 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.INSPECT ROTARY TURBINE CONTROL VALVE ACTUATOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the rotary turbine control valve actuator connector F146.
3. Inspect the harness and actuator connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. PERFORM ACTIVE TEST

1. Turn ignition switch ON.
2. Perform the turbine bypass valve actuator electronic hysteresis “Active Test” using the CONSULT screen.

Did the turbine bypass valve actuator pass the test?

YES >> Refer to GI-43, "Intermittent Incident".
NO >> GO TO 4.

4. CHECK TURBOCHARGER TURBINE ACTUATOR LINKAGE

1. Turn ignition switch OFF.
2. Inspect the linkage on the turbocharger for damage.

Is the linkage broken or damaged?

YES >> Replace the turbine actuator linkage. Refer to EM-390, "Exploded View".
NO >> GO TO 5.

5. CHECK TURBINE ACTUATOR LINKAGE MOVEMENT

Rotate the turbocharger turbine actuator linkage from stop to stop by hand. Check for smooth movement between stops.

NOTE:
There will be an initial friction force that must be overcome before the actuator linkage will move. Once the movement is started, actuator linkage must move to the other stop position by hand.

Does the linkage rotate from stop to stop

YES >> Replace the rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".
NO >> Replace the turbocharger assembly. Refer to EM-391, "Removal and Installation".

P1A77 AFTERTREATMENT OVER TEMPERATURE

DTC Description

INFOID:0000000013366811

The Engine Control Module (ECM) monitors the aftertreatment for active over temperature DTCs. This DTC indicates that the aftertreatment temperature DTCs that have been active for an extended period of time and the ECM has shut down the engine.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has shut down the engine due to critical aftertreatment temperature DTCs have been active for a period of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P1A77	(Aftertreatment Over Temp)	1	Diagnosis condition	Engine is running
			Signal (terminal)	—
			Threshold	Aftertreatment temperature DTCs have been active for a period of time.
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

—

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P1A77 being current on the CONSULT screen.

Is DTC P1A77 current?

YES >> Go to EC-885, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013366812

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P1A77 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> This is an information only DTC. Troubleshoot all other current aftertreatment temperature related DTCs. Refer to EC-135, "DTC Index".
NO >> Refer to GI-43, "Intermittent Incident".

P1A78 FUEL SHUTOFF - FORCED ENGINE SHUTDOWN

DTC Description

INFOID:0000000013065735

The airbag control unit communicates to the ECM through the CAN communication lines. Messages sent from the airbag control unit are received and monitored by the ECM. The airbag control unit sends a message to the ECM turns off fueling.

DTC DETECTION LOGIC

The ECM received a message from the airbag controller to cutoff fueling.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P1A78	Forced Engine Shutdown (Engine fuel shutoff 1 control - special instructions)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Nissan airbag crash indicator = 0x54AB
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

—

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P1A78 being current on the CONSULT screen.

Is DTC P1A78 current?

YES >> Go to EC-886, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065736

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTC P1A78 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> This is an information only DTC. Inspection End.
NO >> Refer to GI-43, "Intermittent Incident".

P1C54 SCR NOX CATALYST MISSING

DTC Description

INFOID:0000000013065747

The ECM monitors the NOx concentration in the engine's exhaust gases using an aftertreatment intake NOx sensor and an aftertreatment outlet NOx sensor. By comparing these two values, the ECM is able to determine the conversion efficiency of the SCR catalyst and dosing system.

DTC DETECTION LOGIC

The ECM detected the NOx conversion efficiency of the SCR catalyst was critically low.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1C54	SCR NOx Catalyst Missing (Aftertreatment 1 SCR catalyst system missing - condition exists)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	—
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Tampering with, removal of, or malfunction of SCR catalyst system
- Malfunctioning diesel exhaust fluid dosing system
- Exhaust system leaks
- Degraded, diluted, or incorrect diesel exhaust fluid
- Diesel exhaust fluid deposits in the decomposistion tube

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
6. Check for DTC P1C54 being current on the CONSULT screen.

Is DTC P1C54 current?

YES >> Go to EC-887, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065748

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for "ENGINE" diagnostic trouble codes.
3. Check for DTC P1C54 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for current DTCs related to the aftertreatment intake NOx sensor and aftertreatment outlet NOx sensor on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK DTC PRIORITY

Check for current DTCs related to the aftertreatment SCR temperature sensor on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4.CHECK DTC PRIORITY

Check for current DTCs related to the DEF dosing system and DEF quality sensor on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 5.

5.CHECK EXHAUST SYSTEM FOR LEAKS

Check the exhaust system for leaks.
- Inspect the entire exhaust system between the turbocharger outlet and the SCR outlet.
- Inspect for loose connections and broken exhaust system components.

Are any leaks detected?

YES >> Repair or replace damaged exhaust system components.
NO >> GO TO 6.

6.CHECK DEF DOSING SYSTEM FOR LEAKS

Inspect all components of the aftertreatment DEF dosing system for signs of external leaks.

NOTE:

DEF will form white deposits around leaky fittings.
- DEF tank connectors.
- DEF dosing unit and dosing unit connectors.
- DEF lines.
- DEF dosing valve.

Are any leaks detected?

YES >> Repair the source of the external leak.
NO >> GO TO 7.

7.CHECK DEF QUALITY

Check the DEF quality.
- Inspect the DEF in the tank for signs of debris or contamination.
- Test the DEF concentration using DEF Refractometer 4919554.
- DEF lines.
- DEF dosing valve.

Is the DEF free from contamination and within concentration specifications?

YES >> GO TO 8.
NO >> Replace the DEF fluid.

8.CHECK DEF DOSING UNIT OPERATION

1. Connect all DEF lines and electrical connectors to the dosing unit and DEF tank.
2. Remove the aftertreatment DEF dosing using DEF valve from the decomposition tube.
3. Turn ignition switch ON.
4. Connect CONSULT and perform the “DEF doser pump override” in “Active Test”.
   NOTE:
   DEF dosing valve must be placed in a measuring container in order to perform in “Active Test”. Make sure valve is not plugged and DEF is flowing from all holes.

Does DEF dosing unit operate according to specifications?

YES >> GO TO 9.
NO >> Replace aftertreatment DEF dosing unit. Refer to EX-64, "Removal and Installation".

9.CHECK DEF DOSING VALVE OPERATION

Perform the DEF system leak Active Test.

Is DEF leaking from valve during Active Test?

YES >> Replace aftertreatment DEF dosing valve. Refer to EX-64, "Removal and Installation".
NO >> GO TO 10.

10. CHECK AFTERTREATMENT SYSTEM

1. Turn ignition switch OFF.
2. Inspect the decomposition tube for deposits.

- Remove the decomposition tube.
- Inspect for excessive DEF deposits.

Are any excessive DEF deposits detected?

YES >> Clean and install the decomposition tube.
NO >>
- Replace the aftertreatment SCR catalyst. Refer to EX-55, "Exploded View".
- Replace the intake NOx sensor. Refer to EX-45, "Removal and Installation".
- Replace the outlet NOx sensor. Refer to EX-48, "Removal and Installation".

P1C55 NOX SENSOR 1/1 INTERMITTENT

DTC Description

INFOID:0000000013072967

The aftertreatment intake NOx (nitrogen oxides) sensor is a smart device that communicates with the ECM via the CAN2 communication lines. The aftertreatment intake NOx sensor performs internal diagnostics and reports malfunctions back to the ECM using the CAN2 communication lines. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment intake NOx sensor is used to measure the NOx emissions at the intake of the aftertreatment system.

DTC DETECTION LOGIC

The ECM detected the NOx reading was higher or lower than what was expected for the engine operating conditions.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1C55	NOx Sensor Bank 1 Sensor 1 Sensor Circuit Intermittent/Erratic (Aftertreatment 1 intake NOx sensor - data erratic, intermittent, or incorrect)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	—
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- The ECM has detected the NOx reading is higher or lower than is possible from the engine output
- Exhaust system leaks
- Incorrectly installed aftertreatment intake NOx sensor
- Aftertreatment intake NOx sensor has carbon buildup on the tip
- Excessive oil consumption
- Possible engine misfire
- NOx sensor part number is incorrect

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 90 km/h (56 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to "P" park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
7. Check for DTC P1C55 being current on the CONSULT screen.

Is DTC P1C55 current?

YES >> Go to EC-890, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072968

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P1C55 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for DTCS U029D, P2201, P2202, P2209 or P220A being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK EGR SYSTEM FOR LEAKS

Inspect the EGR system for external leaks:
- Leaks should be easily noted by traces of soot.
- If necessary, run the engine at idle speed to help detect any leaks.

Are any leaks detected?

YES >> Repair or replace leaking EGR system component.
NO >> Replace the intake NOx sensor. Refer to EX-45, "Removal and Installation".

P1C56 NOX SENSOR 1/2 INTERMITTENT

DTC Description

INFOID:0000000013364369

The aftertreatment outlet NOx (nitrogen oxides) sensor is a smart device that communicates with the ECM via the CAN 2 communication lines. The aftertreatment outlet NOx sensor performs internal diagnostics and reports malfunctions back to the ECM using the CAN 2 communication lines. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment outlet NOx sensor is used to measure the NOx emissions at the outlet of the aftertreatment system.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a mismatch between the aftertreatment intake and outlet NOx sensor readings.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1C56	NOx Sensor Bank 1 Sensor 2 Sensor Circuit Intermittent/Erratic (Aftertreatment 1 outlet NOx sensor - data erratic, intermittent, or incorrect)	Diagnosis condition	Continuously while the Selective Catalytic Reduction (SCR) system is dosing diesel exhaust fluid into the aftertreatment system
		Signal (terminal)	—
		Threshold	—
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Excessive diesel exhaust fluid (DEF) deposits in the aftertreatment decomposition tube
- Exhaust system leaks
- Incorrectly installed aftertreatment outlet NOx sensor
- Aftertreatment outlet NOx sensor
- Aftertreatment intake NOx sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 90 km/h (56 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to “P” park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
7. Check for DTC P1C56 being current on the CONSULT screen.

Is DTC P1C56 current?

YES >> Go to EC-892, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013364370

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P1C56 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

Check for DTCS U029E, P220B, P229E or P22A7 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK DTC PRIORITY

Check for DTCS U029D, U059E, P1C55, P2201, P2202, P2209 or P220A being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4.CHECK INSTALLATION OF AFTERTREATMENT OUTLET NOX SENSOR

1. Turn ignition switch OFF.
2. Inspect aftertreatment outlet NOx sensor for proper installations.

Is the inspection result normal

YES >> GO TO 5.
NO >> Correct installation of the outlet NOx sensor. Refer to EX-45, "Removal and Installation".

5.CHECK DECOMPOSITION TUBE FOR CRYSTALLIZATION

1. Turn ignition switch OFF.
2. Disconnect the aftertreatment DEF decomposition tube.
3. Inspect the decomposition tube for crystallization.

Is the inspection result normal

YES >> GO TO 6.
NO >> Remove crystallization buildup.

6.CHECK EXHAUST SYSTEM FOR LEAKS

Inspect the exhaust system for leaks:
- Leaks should be easily noted by traces of soot.
- If necessary, run the engine at idle speed to help detect any leaks.

Are any leaks detected?

YES >> Repair or replace leaking exhaust system component.
NO >> Replace the outlet NOx sensor. Refer to EX-45, "Removal and Installation".

P1C70 SCR ERROR DETECTED - ENGINE DR-RATED

DTC Description

INFOID:0000000013081260

The ECM monitors the engine operation for critical Selective Catalytic Reduction (SCR) current DTCs. If the DTCs are current for an extended period of time and no repair action has been taken, the ECM will limit the engine torque depending on which SCR DTCs are current.

DTC DETECTION LOGIC

The ECM detected the engine has been operated for an extended amount of time with critical SCR DTCs current, and no repair action has been taken. This amount of time will vary, depending on which SCR DTCs are current.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1C70	SCR Error Detected (Aftertreatment SCR operator inducement - data valid but above normal range - most severe level)	Diagnosis condition	Continuously when key is ON, or engine is running
		Signal (terminal)	—
		Threshold	One or more conditions exist requiring severe driver inducement
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

—

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P1C70 being current on the CONSULT screen.

Is DTC P1C70 current?

YES >> Go to EC-894, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013081261

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P1C70 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> This is an information only DTC that will only become current if other SCR related DTCs are current for an extended period of time. Refer to EC-135, "DTC Index".
NO >> Refer to GI-43, "Intermittent Incident".

P200C DIESEL PARTICULATE FILTER

DTC Description

INFOID:0000000013072996

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the Engine Control Module (ECM) via CAN communication lines. The aftertreatment DPF temperature sensor module performs its own internal diagnostics and reports malfunctions back to the ECM using CAN data lines. The aftertreatment DPF temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment DPF intake temperature, and aftertreatment DPF outlet temperature. The temperature probes are permanently attached to the aftertreatment DPF temperature sensor module and cannot be replaced individually. Progressive power reduction increasing in severity from time of alert.

DTC DETECTION LOGIC

Aftertreatment DPF outlet gas temperature is continuously above a high threshold for a calibrated period of time while active regeneration of the DPF is not occurring.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P200C	DPF OUTLET TEMP	1	Diagnosis condition	DPF outlet temperature is at a moderately severe level
			Signal (terminal)	DPF temperature sensor to DPF temperature sensor module
			Threshold	A high temperature 735°C (1355°F) from the sensor is sent to the module
			Diagnosis delay time	Diagnostic runs continuously when the engine is running
		2	Diagnosis condition	DPF outlet temperature is at a most severe level
			Signal (terminal)	DPF temperature sensor to DPF temperature sensor module
			Threshold	A high temperature 810°C (1490°F) from the sensor is sent to the module
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

NOTE:
This DTC will become history after the aftertreatment temperatures drop below the warning limit and a key cycle has occurred, and will likely be "past" at the time of diagnosis. For these reasons this diagnosis procedure must be used for both current and history DTCs.

POSSIBLE CAUSE

- A malfunctioning fuel injector causing unburned fuel to enter the exhaust system.
- Excessive engine oil being introduced into the exhaust system from the engine.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-312, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072997

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If any of the following DTCs exist, perform the confirmation procedure (trouble diagnosis) for other DTC:

- U1611
- P1613
- P1614
- P1615
- P1623

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR INJECTOR MISFIRE

1. Start the engine and run it at low idle.
2. Determine if a cylinder misfire is noticed when the engine is running at low idle.
3. Connect the CONSULT and perform the cylinder performance test.

Was an engine misfire detected?

YES >> GO TO 3.
NO >> GO TO 4.

3.TEST MALFUNCTIONING INJECTOR

Using the CONSULT, perform the Cylinder Cutout Test to isolate a malfunctioning injector.

Was a malfunctioning injector identified?

YES >> Replace malfunctioning injector. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 4.

4.INSPECT TURBOCHARGER EXHAUST OUTLET FOR OIL OR FUEL

1. Turn ignition switch OFF.
2. Remove the exhaust plumbing from the turbocharger outlet.
3. Look for signs of moisture in the turbocharger exhaust outlet.
4. Inspect the turbocharger exhaust outlet for signs of oil or fuel being introduced into the aftertreatment system from the engine.

Engine oil or fuel contamination found in the turbocharger exhaust outlet?

YES >> Locate the cause of possible diesel fuel or engine oil being carried from the engine into the aftertreatment system and repair or replace any components that caused the engine oil or diesel fuel contamination. Inspect the aftertreatment system for possible damage.
NO >> GO TO 5.

5.CHECK AFTERTREATMENT DIESEL OXIDATION CATALYST FOR SOOT ACCUMULATION

1. Remove the aftertreatment Diesel Oxidation Catalyst (DOC) and Diesel Particulate Filter (DPF) assembly.
2. Inspect the aftertreatment DOC.
3. Check the intake face of the aftertreatment DOC for damage, soot accumulation and/or face plugging.

Is more than 50 % of the cells on the intake face completely blocked by soot?

YES >> Replace the DOC and DPF assembly. Refer to EX-36, "Removal and Installation".
NO >> GO TO 6.

6.ERASE DTC.

1. Connect all components.
2. With CONSULT, erase all DTCs.
3. Operate the engine within the conditions for setting DTC found in the DTC description.
4. Check for existing “ENGINE” diagnostic trouble codes.

Did the P200C DTC return?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-895, "DTC Description".
NO >> Repair complete.

P200E CATALYST SYSTEM OVER TEMPERATURE BANK 1

DTC Description

INFOID:0000000013072984

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the Engine Control Module (ECM) via CAN communication lines. The aftertreatment DPF temperature sensor module performs its own internal diagnostics and reports malfunctions back to the ECM using CAN data lines. The aftertreatment DPF temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment DPF intake temperature, and aftertreatment DPF outlet temperature. The temperature probes are permanently attached to the aftertreatment DPF temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Aftertreatment DOC delta gas temperature is continuously above a high threshold for a calibrated period of time while active regeneration of the DPF is not occurring.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P200E	DPF INLET TEMP	Diagnosis condition	DPF inlet temperature - DOC inlet temperature is above a high threshold.
		Signal (terminal)	DPF intake temperature sensor to DPF temperature sensor module.
		Threshold	A high temperature 735°C (1355°F) from the intake temperature sensor is sent to the module.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running and active regeneration of the aftertreatment DPF is not occurring.

NOTE:
This DTC will become history after the aftertreatment temperatures drop below the warning limit and a key cycle has occurred, and will likely be "past" at the time of diagnosis. For these reasons this diagnosis procedure must be used for both current and history DTCs.

POSSIBLE CAUSE

- Excessive engine oil being introduced into the exhaust system from the engine.
- A malfunctioning fuel injector causing unburned fuel to enter the exhaust system.
- A face plugged aftertreatment Diesel Oxidation Catalyst.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-312, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072985

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If any of the following DTCs exist, perform the confirmation procedure (trouble diagnosis) for other DTC:

- U1611
- P1613
- P1614
- P1615
- P1623

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR INJECTOR MISFIRE

1. Start the engine and run it at low idle.
2. Determine if a cylinder misfire is noticed when the engine is running at low idle.
3. Connect the CONSULT and perform the cylinder cutout test.

Was an engine misfire detected?

YES >> Replace malfunctioning injector. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 3.

3.INSPECT TURBOCHARGER EXHAUST OUTLET FOR OIL OR FUEL

1. Turn ignition switch OFF.
2. Remove the exhaust plumbing from the turbocharger outlet.
3. Look for signs of moisture in the turbocharger exhaust outlet.
4. Inspect the turbocharger exhaust outlet for signs of oil or fuel being introduced into the aftertreatment system from the engine.

Engine oil or fuel contamination found in the turbocharger exhaust outlet?

YES >> Locate the cause of possible diesel fuel or engine oil being carried from the engine into the aftertreatment system and repair or replace any components that caused the engine oil or diesel fuel contamination. Inspect the aftertreatment system for possible damage.
NO >> GO TO 4.

4.CHECK AFTERTREATMENT DIESEL OXIDATION CATALYST FOR SOOT ACCUMULATION

1. Remove the aftertreatment Diesel Oxidation Catalyst (DOC) and Diesel Particulate Filter (DPF) assembly.
2. Inspect the aftertreatment DOC.
3. Check the intake face of the aftertreatment DOC for damage, soot accumulation and/or face plugging.

Is more than 50 % of the cells on the intake face completely blocked by soot?

YES >> Replace the DOC and DPF assembly. Refer to EX-36, "Removal and Installation".
NO >> GO TO 5.

5.ERASE DTC.

1. Connect all harness connectors.
2. With CONSULT, erase all DTCs.
3. Operate the engine within the conditions for setting DTC found in the DTC description.
4. Check for existing “ENGINE” diagnostic trouble codes.

Did the P200E DTC return?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-895, "DTC Description".
NO >> Repair complete.

P202B REDUCTANT TANK HEATER CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013085473

The Diesel Exhaust Fluid (DEF) Tank has an internal heating coil to thaw frozen diesel exhaust fluid. The DEF Control Unit monitors the temperature of the diesel exhaust fluid in the tank. The DEF Control Unit activates the DEF Tank Heater, at freezing temperatures, to warm the Diesel Exhaust Fluid. The DEF Tank Heater is integrated into the DEF dosing unit. It must be replaced with the DEF Supply Pump assembly.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected the Selective Catalyst Reduction (SCR) control unit reporting DEF Tank Heater current is below an allowable limit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P202B	DEF TANK HEATER	Diagnosis condition	Diesel Exhaust Fluid Tank Heater is active.
		Signal (terminal)	Voltage signal transmitted to DEF tank heater
		Threshold	Tank heater current < 5 Amperes
		Diagnosis delay time	Diagnostic runs continuously when the DEF tank heating is being commanded.

POSSIBLE CAUSE

- Harness and connectors.
- A malfunctioning aftertreatment diesel exhaust fluid tank heater.
- DEF supply pump assembly.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch ON.
2. Connect CONSULT, select “ENGINE” and perform “DEF Tank Heater Test”.
3. Using CONSULT, check for existing “ENGINE” diagnostic trouble codes.
4. Check for DTC P202B being current on the CONSULT screen.

Is 1st trip DTC detected?

YES >> Proceed to EC-900, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013085474

1.CHECK FOR AN ACTIVE DTC

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.
3. Check for DTC P202B being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT DEF SUPPLY PUMP ASSEMBLY AND CONNECTOR PINS

1. Turn ignition switch OFF and wait at least 90 seconds before proceeding to allow sufficient time for the aftertreatment DEF supply pump assembly to completely power down.
2. Disconnect the DEF supply pump assembly harness connector.
3. Inspect the DEF supply pump assembly connector pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.

- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT DEF CONTROL MODULE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DEF control module harness connector.
3. Inspect for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK DEF TANK HEATER SUPPLY CIRCUIT FOR SHORT TO GROUND

Check the continuity between DEF tank heater supply circuit and ground.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	22	Ground	No

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace short circuit in harness.

5. CHECK DEF TANK HEATER CIRCUITS FOR OPEN

Check the supply and return circuits for continuity between the DEF control module harness connector and DEF supply pump assembly harness connector.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	22	C204	1	Yes
	23		3	

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair open circuit in harness or connectors.

6. CHECK THE CIRCUIT RESPONSE

1. Reconnect the DEF control module harness connector.
2. Connect a jumper wire between disconnected DEF supply pump assembly connector pins 1 and 3.
3. Turn ignition switch ON, start engine, and allow the engine to idle for 1 minute.
4. With CONSULT check for current “ENGINE” diagnostic trouble codes.

Is P202C DTC current and P202B DTC past?

YES >> An open circuit or short circuit-to-ground has been detected in the aftertreatment DEF tank heater, which is internal to the aftertreatment DEF dosing unit. Replace the aftertreatment DEF dosing unit. Refer to EX-73, "Removal and Installation".

NO >> Replace the DEF control module. Refer to EC-1259, "Removal and Installation".

P202C REDUCTANT TANK HEATER CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013084616

The Diesel Exhaust Fluid (DEF) Tank has an internal heating coil to thaw frozen diesel exhaust fluid. The DEF Control Unit monitors the temperature of the diesel exhaust fluid in the tank. The DEF Control Unit activates the DEF Tank Heater, at freezing temperatures, to warm the Diesel Exhaust Fluid. The DEF Tank Heater is integrated into the DEF dosing unit. It must be replaced with the DEF Supply Pump assembly.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected the Selective Catalyst Reduction (SCR) control unit reporting DEF Tank Heater current is above an allowable limit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P202C	DEF TANK HEATER	Diagnosis condition	Diesel Exhaust Fluid Tank Heater is active.
		Signal (terminal)	Voltage signal transmitted to DEF tank heater
		Threshold	DEF tank heater circuit shorted to battery
		Diagnosis delay time	Diagnostic runs continuously when the DEF tank heating is being commanded.

POSSIBLE CAUSE

- Harness and connectors
- A malfunctioning aftertreatment diesel exhaust fluid tank heater
- DEF supply pump assembly

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch ON.
2. Connect CONSULT and perform the Diesel Exhaust Fluid Doser System Heater Test.
3. Check for existing “ENGINE” diagnostic trouble codes.
4. Check for DTC P202C being current on the CONSULT screen.

Is 1st trip DTC detected?

YES >> Proceed to EC-900, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084617

1.CHECK FOR AN ACTIVE DTC

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.
3. Check for DTC P202C being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT DEF SUPPLY PUMP ASSEMBLY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly harness connector.
3. Inspect the DEF supply pump assembly harness and connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins

- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT DEF CONTROL MODULE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF. Wait at least 90 seconds before proceeding to allow sufficient time for the after-treatment DEF control module to completely power down.
2. Disconnect the DEF control module harness connector.
3. Inspect for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK DEF TANK HEATER SUPPLY CIRCUIT FOR SHORT

Check the continuity between DEF tank heater supply circuit and all other circuits at the DEF control module connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	22	All others	No

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace short circuit in harness.

5. CHECK DEF TANK HEATER RETURN CIRCUIT FOR SHORT

Check the continuity between DEF tank heater return circuit and all other circuits at the DEF control module connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	23	All others	No

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace short circuit in harness.

6. CHECK THE CIRCUIT RESPONSE

1. Reconnect the DEF control module harness connector.
2. Connect a jumper wire between disconnected DEF supply pump assembly connector pins 1 and 3.
3. Turn ignition switch ON.
4. With CONSULT check for current “ENGINE” diagnostic trouble codes.

Is P202B DTC current and P202C DTC past?

YES >> A short circuit has been detected in the aftertreatment DEF tank heater, which is internal to the aftertreatment DEF dosing unit. Replace the aftertreatment DEF dosing unit. Refer to EX-73, "Removal and Installation".

NO >> Replace the DEF control module. Refer to EC-1259, "Removal and Installation".

P202E REDUCTANT INJECTION VALVE CIRCUIT 1/1

DTC Description

INFOID:0000000013082013

The aftertreatment diesel exhaust fluid dosing valve is controlled by the ECM. When the Engine Control Module (ECM) commands DEF dosing, the ECM sends a Pulse Width Modulated (PWM) signal to the dosing valve, which opens the dosing valve and allows DEF to be sprayed into the exhaust stream.

DTC DETECTION LOGIC

The diagnostic checks whether the DEF supply pump assembly injector valve is mechanically stuck closed or mechanically stuck open based on the minimum pressure variation observed during On/ Off cycle at each injection period for 2 trips.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P202E	DEF DOSING VALVE POS CMP	Diagnosis condition	This diagnostic runs when the DEF dosing valve is being commanded ON. Diagnostic tests are performed 5 minutes apart.
		Signal (terminal)	DEF dosing valve signal
		Threshold	When Maximum DEF Supply Pressure - Minimum DEF Supply Pressure within one injection cycle is < 15 kPa (gauge) for greater than or equal to 2 out of 3 times within each set of diagnostic tests.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF dosing valve.
- Contamination of the DEF.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Bring the vehicle to a complete stop.
6. Repeat all of the above steps one more time.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
8. Check for DTC P202E being current on the CONSULT screen.

Is DTC P202E current?

YES >> Proceed to EC-900, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013082014

1.CHECK FOR A CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.
3. Check for DTC P202E being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT DEF SUPPLY PUMP ASSEMBLY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Remove the DEF dosing valve.
3. Check for an adequate amount of DEF in the DEF tank prior to starting this test.
4. Place the dosing valve in a plastic container capable of measuring from 0 to 500 ml (0 to 17 oz) in 5 ml (0.34 oz) increments.

   WARNING:
   To reduce the risk of personal injury, do not get Diesel exhaust fluid (DEF) in your eyes as it contains urea. In case of contact, immediately flush eyes with large amounts of water for a minimum of 15 minutes. Do not swallow. In the event DEF is ingested, contact a physician immediately. Reference the Safety Data Sheet (SDS) for additional information.
   NOTE:
   When the test begins, briefly monitor the spray pattern of the DEF exiting the aftertreatment DEF dosing valve. Check for the following:
   • Signs of larger drops and/or dripping DEF from the tip.
   • Spray pattern that is not symmetrical (sprays more to one side).
5. Turn ignition switch ON.
6. Connect CONSULT and perform ″DEF Dosing Unit Override Test″ under ″ENGINE″ which will run for 6 minutes.

Did the DEF dosing valve pump between 85 mm (2.9 in) and 115 mm (3.9 in) in a uniform spray pattern?

YES >> GO TO 3.
NO >> Replace the DEF dosing valve. Refer to EX-64, "Exploded View".

3.ERASE DTC

1. Turn ignition switch OFF.
2. Reconnect the DEF dosing valve.
3. Turn ignition switch ON.
4. With CONSULT erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing the DTC" found in the DTC description.

Is P202E DTC current?

YES >> Return to the diagnosis procedure steps if all steps have been completed and checked again. Refer to EC-906, "DTC Description".
NO >> Repair complete.

P2031 UPSTREAM DPF TEMPERATURE SENSOR

DTC Description

INFOID:0000000013073091

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the Engine Control Module via CAN lines. The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module performs its own internal diagnostics and reports malfunctions back to the Engine Control Module via CAN communication. The aftertreatment DPF temperature sensor module is used to measure the aftertreatment Diesel Oxidation Catalyst (DOC) intake temperature, aftertreatment DPF intake temperature, and aftertreatment DPF outlet temperature. The temperature probes are permanently attached to the aftertreatment DPF temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Aftertreatment DPF intake gas temperature is in-range but not rational. Possible reduced engine performance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2031	DPF INLET TEMP	Diagnosis condition	Ignition switch ON and the engine is running.
		Signal (terminal)	DEF tank temperature sensor signal.
		Threshold	• Difference between DPF inlet and outlet temperature sensor data did not match the expected value for the present engine operating condition. • Average temperature drop across DOC > 85°C or average temperature drop across DOC < -85°C. • Average temperature drop across DPF > 85°C or average temperature drop across DPF < -85°C.
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning aftertreatment diesel particulate filter intake temperature sensor.
- A malfunctioning aftertreatment diesel particulate filter outlet temperature sensor.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Bring the vehicle to a complete stop.
6. Repeat all of the above steps one more time.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
8. Check for DTC P2031 being current on the CONSULT screen.

Is P2031 DTC detected?

YES >> Proceed to EC-900, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073092

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If any of the following DTCs exist, perform the confirmation procedure (trouble diagnosis) for other DTC:

- U1611
- P1614
- P1615

- P1616
- P1623

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> • Replace the aftertreatment DPF temperature sensor module. Refer to EX-51, "Exploded View".
• GO TO 2.

2.ERASE DTC.

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON.
4. With CONSULT, erase all DTCs.
5. Operate the engine within the conditions for setting DTC found in the DTC description.
6. Check for existing “ENGINE” diagnostic trouble codes.

Did the P2031 DTC return?

YES >> Diagnosis procedure needs to be repeated. Go to EC-895, "DTC Description".
NO >> Repair complete.

P2032 TEMPERATURE SENSOR UPSTREAM DPF

DTC Description

INFOID:0000000013073095

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the Engine Control Module via CAN lines. The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module performs its own internal diagnostics and reports malfunctions back to the Engine Control Module via CAN communication. The aftertreatment DPF temperature sensor module is used to measure the aftertreatment Diesel Oxidation Catalyst (DOC) intake temperature, aftertreatment DPF intake temperature, and aftertreatment DPF outlet temperature. The temperature probes are permanently attached to the aftertreatment DPF temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The Smart Exhaust Gas Temperature Module has detected a sensor short to ground that causes too low of an input voltage condition in the outlet DOC thermocouple sensor circuit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2032	DPF INLET TEMP	Diagnosis condition	Ignition switch ON and the engine is running.
		Signal (terminal)	DEF tank temperature sensor signal
		Threshold	Aftertreatment outlet DOC gas temperature sensor input voltage ≤ 1 V (-40°C)
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning aftertreatment diesel particulate filter intake temperature sensor.
- Wiring harness.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check 1st trip DTC.

Is P2032 DTC detected?

YES >> Proceed to EC-900, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073096

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If any of the following DTCs exist, perform the confirmation procedure (trouble diagnosis) for other DTC:

- U1611
- P1614
- P1615
- P1616
- P1623

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> • Replace the aftertreatment DPF temperature sensor module. Refer to EX-51, "Exploded View".
• GO TO 2.

2.ERASE DTC.

1. Turn ignition switch OFF.
2. Connect all components.

3. Turn ignition switch ON.
4. With CONSULT, erase all DTCs.
5. Operate the engine within the conditions for setting DTC found in the DTC description.
6. Check for existing “ENGINE” diagnostic trouble codes.

Did the P2032 DTC return?

YES >> Diagnosis procedure needs to be repeated. Go to EC-910, "DTC Description".
NO >> Repair complete.

P2033 TEMPERATURE SENSOR UPSTREAM DPF

DTC Description

INFOID:0000000013073098

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the Engine Control Module via CAN lines. The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module performs its own internal diagnostics and reports malfunctions back to the Engine Control Module via CAN communication. The aftertreatment DPF temperature sensor module is used to measure the aftertreatment Diesel Oxidation Catalyst (DOC) intake temperature, aftertreatment DPF intake temperature, and aftertreatment DPF outlet temperature. The temperature probes are permanently attached to the aftertreatment DPF temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Within the Smart Exhaust Gas Temperature Module an ASIC communication error is causing no data transfer between outlet DOC thermocouple and the internal ASIC.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2033	DEF INLET TEMP	Diagnosis condition	Ignition switch ON and the engine is running
		Signal (terminal)	DEF tank temperature sensor signal
		Threshold	The aftertreatment Temperature Sensor Module has detected a sensor short to battery or open circuit condition that causes a high input voltage.
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning aftertreatment diesel particulate filter intake temperature sensor.
- Wiring harness.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-900, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073099

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If any of the following DTCs exist, perform the confirmation procedure (trouble diagnosis) for other DTC:

- U1611
- P1614
- P1615
- P1616
- P1623

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> • Replace the aftertreatment DPF temperature sensor module. Refer to EX-51, "Exploded View".
• GO TO 2.

2.ERASE DTC.

1. Turn ignition switch OFF.
2. Connect all components.
3. Turn ignition switch ON.
4. With CONSULT, erase all DTCs.
5. Operate the engine within the conditions for setting DTC found in the DTC description.
6. Check for existing “ENGINE” diagnostic trouble codes.

Did the P2033 DTC return?

YES >> Diagnostic procedure needs to be repeated. Go to EC-912, "DTC Description".
NO >> Repair complete.

P203B REDUCTANT LEVEL SENSOR CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013086367

NOTE:
If DTC P21CA is displayed with this DTC, first perform the trouble diagnosis for other DTC.
• P21CA present. Refer to EC-1036, "DTC Description".

The Diesel Exhaust Fluid (DEF) Tank Level Sensor measures the level of the fluid inside the DEF Tank. The DEF Controller unit provides a 5V source and monitors the voltage that determines the fluid level in the tank. DEF Tank Level Sensor is integrated in the DEF Dosing Unit. It must be replaced with the DEF Supply Pump assembly.

DTC DETECTION LOGIC

Diesel Exhaust Fluid (DEF) tank level sensor circuit - Voltage below normal or shorted to low source. Low signal voltage detected at the DEF tank level sensor circuit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P203B	DEF TANK LEVEL	Diagnosis condition	Ignition switch ON or the engine is running
		Signal (terminal)	DEF tank level sensor signal
		Threshold	DEF Tank Level Sensor Signal circuit is less than 0.3V for 1 second.
		Diagnosis delay time	—

POSSIBLE CAUSE

• DEF level sensor.
• SCR control unit.
• Harness and connectors.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P203B being current on the CONSULT screen.

Is P203B DTC current?

YES >> Go to EC-914, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013086368

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21CA is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".

NO >> GO TO 2.

2. CHECK FOR CURRENT DEF LEVEL SENSOR DTC

Check for DTC P203B being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK DEF LEVEL SENSOR POWER SUPPLY CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between DEF supply pump assembly connector sensor supply voltage and ground circuit terminals.

DEF supply pump assembly			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
C204	5	14	Approx. 5

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace the DEF control module harness for open or high resistance.

5. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Disconnect the DEF control module.
2. Inspect both connectors and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK TANK LEVEL SENSOR CIRCUITS FOR OPEN

Check the signal and ground circuits for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	20	C204	6	Yes
	26		14	

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair open signal circuit in harness or connectors.

7.CHECK THE CIRCUIT RESPONSE

1. Reconnect the DEF control module.
2. Connect a jumper wire between DEF supply pump assembly 5 volt supply terminal 5 and signal circuit terminal 6.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P203C DTC become current?

YES >> A damaged tank level sensor has been detected. Replace the aftertreatment DEF supply pump assembly. Refer to EX-73, "Exploded View".
NO >> Replace the DEF control module. Refer to EC-1259, "Exploded View".

P203C REDUCTANT LEVEL SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013084593

NOTE:
If DTC P21CA is displayed with this DTC, first perform the trouble diagnosis for other DTC.
• P21CA present. Refer to EC-1036, "DTC Description".

The Diesel Exhaust Fluid (DEF) Tank Level Sensor measures the level of the fluid inside the DEF Tank. The DEF Controller unit provides a 5V source and monitors the voltage that determines the fluid level in the tank. DEF Tank Level Sensor is integrated in the DEF Dosing Unit. It must be replaced with the DEF Supply Pump assembly.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected the DEF supply pump assembly Diesel Exhaust Fluid (DEF) Tank Level Sensor voltage is below an allowable value.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P203C	DEF TANK LEVEL	Diagnosis condition	Ignition switch ON or the engine is running
		Signal (terminal)	DEF tank level sensor signal
		Threshold	DEF Tank Level Sensor Signal circuit is less than 0.32 volt (0% DEF tank level) for 1 second.
		Diagnosis delay time	—

POSSIBLE CAUSE

• DEF level sensor.
• Harness and connectors.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P203C being current on the CONSULT screen.

Is P203C DTC current?

YES >> Go to EC-917, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084594

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21CA is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR CURRENT DEF LEVEL SENSOR DTC

Check for DTC P203D current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK DEF LEVEL SENSOR POWER SUPPLY CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between DEF supply pump assembly connector sensor supply voltage and return circuit terminals.

DEF supply pump assembly			Voltage (V) (Approx)
Connector	Terminal (+)	Terminal (-)	
C204	5	14	Approx. 5

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between DEF supply pump assembly 5V supply terminal 5 and signal circuit terminal 6.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P203D become current and P203C become past?

YES >> GO TO 6.
NO >> GO TO 7.

6.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P203C DTC become current?

YES >> A damaged tank level sensor has been detected. Replace the aftertreatment DEF supply pump assembly. Refer to EX-73, "Exploded View".
NO >> The removal and installation of the connector corrected the issue. Repair complete.

7. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Disconnect the DEF control module.
2. Inspect both connectors and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK TANK LEVEL SENSOR SIGNAL CIRCUIT FOR OPEN

Check the signal circuit for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	20	C204	6	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair open circuit in harness or connectors.

9. CHECK TANK LEVEL SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DEF tank level sensor signal and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	20	All others	No

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair short circuit in harness or connectors.

10. CHECK TANK LEVEL SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

Check the continuity between DEF tank level sensor signal circuit and ground.

DEF control module		Ground	Continuity
Connector	Terminal		
C205	20	—	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace harness for a short to ground.

11. CHECK FOR CURRENT DTC

1. Connect all components in the correct positions.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is P203C DTC current?

YES >> Replace DEF control module. Refer to EC-1259, "Exploded View".

NO >> The removal and installation of the connector corrected the issue.

P203D REDUCTANT LEVEL SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013084598

NOTE:
If DTC P21CA is displayed with this DTC, first perform the trouble diagnosis for other DTC.
• P21CA present. Refer to EC-1036, "DTC Description".

The Diesel Exhaust Fluid (DEF) Tank Level Sensor measures the level of the fluid inside the DEF Tank. The DEF Controller unit provides a 5V source and monitors the voltage that determines the fluid level in the tank. DEF Tank Level Sensor is integrated in the DEF Dosing Unit. It must be replaced with the DEF Supply Pump assembly.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected the DEF supply pump assembly Diesel Exhaust Fluid (DEF) Tank Level Sensor voltage is in excess of an allowable value.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P203D	DEF TANK LEVEL	Diagnosis condition	Ignition switch ON or the engine is running
		Signal (terminal)	DEF tank level sensor signal
		Threshold	DEF Tank Level Sensor Signal circuit is greater than 4.8V (100% DEF tank level) for 1 second.
		Diagnosis delay time	—

POSSIBLE CAUSE

• DEF level sensor.
• Harness and connectors.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P203D being current on the CONSULT screen.

Is P203D DTC current?

YES >> Go to EC-921, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084599

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21CA is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. CHECK FOR CURRENT DEF LEVEL SENSOR DTC

Check for DTC P203D current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P203C current and P203D past?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK DEF LEVEL SENSOR POWER SUPPLY AND SIGNAL CIRCUITS

1. Turn ignition switch ON.
2. Check voltage between DEF supply pump assembly connector sensor 5V and ground circuit terminals.

DEF supply pump assembly			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
C204	5	14	Approx. 5

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK THE DTC AND VERIFY SENSOR CONDITION

1. Turn ignition OFF.
2. Reconnect the DEF supply pump assembly.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is P203D DTC current?

YES >> Replace the aftertreatment DEF dosing unit. Refer to EX-73, "Exploded View".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Turn ignition OFF.
2. Disconnect the DEF control module.
3. Inspect both connectors and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK TANK LEVEL SENSOR GROUND CIRCUIT FOR OPEN

Check the ground circuit for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	26	C204	14	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair open circuit in harness or connectors.

9. CHECK TANK LEVEL SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DEF tank level sensor signal and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	20	All others	No

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair short circuit in harness or connectors.

10. CHECK TANK LEVEL SENSOR POWER CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DEF tank level sensor 5 volt supply and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	28	All others	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace harness for a short circuit.

11. CHECK THE DTC AND VERIFY SENSOR CONDITION

1. Reconnect all components.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is P203D DTC current?

YES >> Replace DEF control module. Refer to EC-1259, "Exploded View".
NO >> The removal and installation of the connector corrected the issue.

P203F REDUCTANT LEVEL TOO LOW

DTC Description

INFOID:0000000013073854

The Diesel Exhaust Fluid (DEF) Tank Level Sensor measures the level of the fluid inside the DEF Tank. The DEF control module provides a 5V source and monitors the voltage that determines the fluid level in the tank. DEF Tank Level Sensor is integrated in the DEF Dosing Unit. It must be replaced with the DEF Supply Pump assembly.

DTC DETECTION LOGIC

The monitor checks whether the DEF tank is low, very low, or empty.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P203F	DEF TANK LEVEL	Diagnosis condition	Ignition switch ON or the engine is running
		Signal (terminal)	DEF tank level sensor signal
		Threshold	• Stage 1: DEF tank level low (22% - 65%). • Stage 2: DEF tank level very low (19% - 35%). • Stage 3: DEF tank level empty (0%).
		Diagnosis delay time	—

POSSIBLE CAUSE

Low DEF tank level.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P203F being current on the CONSULT screen.

Is P203F DTC current?

YES >> Go to EC-924, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073855

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P203F being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.DISABLE THE DTC

1. Low DEF level has been detected in the tank. Add DEF to the DEF tank.
2. Using CONSULT erase ENGINE diagnostic trouble codes.
3. Operate the engine within the "Conditions for Clearing the DTC" found in the DTC description.
4. Using CONSULT check for current “ENGINE” diagnostic trouble codes.

Is P203F DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-924, "DTC Description".
NO >> Repair complete.

P2044 REDUCTANT TEMPERATURE SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013065592

NOTE:
If DTC P0687 is displayed with this DTC, first perform the trouble diagnosis for other DTC.
- P0687 present. Refer to EC-780, "DTC Description".

The aftertreatment DEF quality sensor is a smart device that communicates to the ECM via CAN lines. The aftertreatment DEF quality sensor performs its own internal diagnostics and reports malfunctions back to the primary engine control module via the CAN lines. The aftertreatment DEF quality sensor is used to measure the concentration of the aftertreatment DEF in the tank.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the aftertreatment diesel exhaust fluid tank temperature signal voltage was out of range high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2044	DEF QUALITY SENSOR TEMP	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	DEF quality sensor signal.
		Threshold	DEF quality sensor temperature sensor element shorted to a high source for longer than 5 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF quality sensor.
- Harness and connectors.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2044 being current on the CONSULT screen.

Is P2044 DTC current?

YES >> Go to EC-926, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065593

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P0687 is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-780, "DTC Description".
NO >> GO TO 2.

2.CHECK FOR CURRENT DEF QUALITY SENSOR DTC

Check for DTC P2044 current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> An internal error has been detected in the aftertreatment DEF quality temperature sensor circuit. Replace the aftertreatment DEF supply pump assembly. Refer to EX-73, "Exploded View".
NO >> Repair or replace error-detected parts. GO TO 4.

4.CHECK FOR INACTIVE DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Connect CONSULT, and erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for Clearing DTC".
5. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2044 DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-926, "DTC Description".
NO >> The removal and installation of the connector corrected the issue.

P2045 REDUCTANT TEMPERATURE SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013065598

NOTE:
If DTC P0687 is displayed with this DTC, first perform the trouble diagnosis for other DTC.
- P0687 present. Refer to EC-780, "DTC Description".

The aftertreatment DEF quality sensor is a smart device that communicates to the ECM via CAN lines. The aftertreatment DEF quality sensor performs its own internal diagnostics and reports malfunctions back to the primary engine control module via the CAN lines. The aftertreatment DEF quality sensor is used to measure the concentration of the aftertreatment DEF in the tank.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the aftertreatment diesel exhaust fluid tank temperature signal voltage was out of range low.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2045	DEF QUALITY SENSOR TEMP	Diagnosis condition	Ignition switch ON or the engine is running
		Signal (terminal)	DEF quality sensor signal
		Threshold	DEF quality sensor temperature sensor element shorted to a low source for longer than 5 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF quality sensor.
- Harness and connectors.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2045 being current on the CONSULT screen.

Is P2045 DTC current?

YES >> Go to EC-928, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065599

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P0687 is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-780, "DTC Description".
NO >> GO TO 2.

2.CHECK FOR CURRENT DEF QUALITY SENSOR DTC

Check for DTC P2045 current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> An internal error has been detected in the aftertreatment DEF quality temperature sensor circuit. Replace the aftertreatment DEF supply pump assembly. Refer to EX-73, "Exploded View".
NO >> Repair or replace error-detected parts. GO TO 4.

4.CHECK FOR INACTIVE DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Connect CONSULT, and erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for Clearing DTC".
5. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2045 DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-928, "DTC Description".
NO >> The removal and installation of the connector corrected the issue.

P2048 REDUCTANT INJECTION VALVE CIRCUIT LOW 1/1

DTC Description

INFOID:0000000013081719

The aftertreatment diesel exhaust fluid dosing valve is controlled by the ECM. When the Engine Control Module (ECM) commands DEF dosing, the ECM sends a pulse width modulated (PWM) signal to the dosing valve, which opens the dosing valve and allows DEF to be sprayed into the exhaust stream.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the aftertreatment diesel exhaust fluid dosing valve circuit was shorted high, shorted low, or open.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2048	DEF DOSING VALVE POS CMD	Diagnosis condition	DEF dosing valve is being commanded ON
		Signal (terminal)	DEF dosing valve signal
		Threshold	Either one of DEF dosing valve circuits is shorted to ground.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF dosing valve.
- Harness and connectors.
- ECM.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Connect CONSULT and activate ″DEF Dosing Unit Override Test″.
3. The DTC will move to ″Past″ when the test runs and passes.

Is P2048 DTC current?

YES >> Go to EC-930, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013081720

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.
3. Check for DTC P2048 current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF dosing valve.
3. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE DEF DOSING VALVE

Check the DEF dosing valve. Refer to EC-932, "Component Inspection".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace the DEF dosing valve. Refer to EX-64, "Exploded View".

4. CHECK DEF DOSING VALVE FOR A SHORT TO GROUND

Measure the resistance between the aftertreatment DEF dosing valve SIGNAL (pin 1) and the metal case of the aftertreatment DEF dosing valve.

Is the resistance above 100 Kohms?

YES >> GO TO 5.
NO >> Replace the DEF dosing valve. Refer to EX-64, "Exploded View".

5. INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Disconnect the ECM.
2. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK DEF DOSING VALVE CIRCUITS FOR OPEN

Check the signal and ground circuits for continuity between the ECM and the DEF dosing valve.

ECM		DEF dosing valve		Continuity
Connector	Terminal	Connector	Terminal	
E93	73	C36	2	Yes
	74		1	

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair open signal circuit in harness or connectors.

7. CHECK DEF DOSING VALVE CIRCUITS FOR SHORT

Check the continuity between DEF dosing valve circuits and ground at ECM harness connector.

ECM		Ground	Continuity
Connector	Terminal		
E93	73	—	No
	74		

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair short circuit in harness connector.

8.CHECK DEF DOSING VALVE CIRCUIT CONNECTOR FOR SHORT

Check the continuity between DEF dosing valve power circuit and all other circuits at ECM harness connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	74	All others	No

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair short circuit in harness connector.

9.CHECK FOR CURRENT DTC

1. Connect all harness connectors.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.

Is P2048 DTC current?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

Component Inspection

INFOID:0000000013191071

1.CHECK THE DEF DOSING VALVE RESISTANCE

Measure the resistance between the DEF dosing valve pins at the DEF dosing valve.

Is the resistance between 11 and 18 ohms?

YES >> GO TO 2.
NO >> Replace the DEF dosing valve. Refer to EX-64, "Exploded View".

2.CHECK DEF DOSING VALVE FOR A SHORT TO GROUND

Measure the resistance between the aftertreatment DEF dosing valve SIGNAL (pin 1) and the metal case of the aftertreatment DEF dosing valve.

Is the resistance above 100 Kohms?

YES >> Inspection End.
NO >> Replace the DEF dosing valve. Refer to EX-64, "Exploded View".

P204A REDUCTANT PRESSURE SENSOR CIRCUIT

DTC Description

INFOID:0000000013065713

NOTE:
If DTC P204A is displayed with the following DTC, first perform the trouble diagnosis for other DTC:
• P203F. Refer to EC-135, "DTC Index".

The SCR dosing system is an In-tank system with a DEF supply pump assembly that controls the dosing pump and monitors DEF heating, level, quality, pressure and temperature. This Dosing system is powered by battery voltage. The DEF supply pump assembly activates priming, dosing, heating and purging of DEF using data provided by the Engine Control module (ECM) via CAN lines. The DEF supply pump assembly performs its own diagnostics and reports malfunctions back to the ECM. The ECM then decodes the error and converts it to a Diagnostic Trouble Code.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected that the DEF supply pump assembly pump is stuck.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P204A	DEF PUMP STATUS	Diagnosis condition	Immediately after turning the ignition ON and continues until DEF dosing unit attempts to prime
		Signal (terminal)	DEF dosing pump
		Threshold	DEF dosing unit was unable to maintain the commanded DEF pressure.
		Diagnosis delay time	—

POSSIBLE CAUSE

• DEF supply pump assembly.
• Harness and connectors.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Connect CONSULT and activate ″DEF System Leak Test″.
3. The DTC will move to ″Past″ when the test runs and passes.

Is P204A DTC current?

YES >> Go to EC-933, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065714

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.
3. Check for DTC P204A current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FOR ANOTHER CURRENT DTC

1. Make sure the aftertreatment DEF tank is **not** empty and the tank level gauge is accurate.
2. Using CONSULT check for other ENGINE diagnostic trouble codes.

Is P203F DTC current?

YES >> Fill the DEF tank.
NO >> GO TO 3.

3.CHECK THE DEF TANK

1. Turn ignition switch OFF.
2. Check the DEF tank for debris or foreign particles.
3. Check the DEF tank vent for crystallization buildup and clogging.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Clean the DEF tank thoroughly and fill with certified DEF.

4.CHECK FOR OTHER CURRENT DTCS

1. Turn ignition switch ON.
2. Using CONSULT check for the following “ENGINE” diagnostic trouble codes:

- P204C
- P204D
- P20E8
- P20E9

Are any of the above DTCs current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 5.

5.INSPECT DEF DOSING UNIT LINES AND FITTINGS

1. Turn ignition switch OFF.
2. Inspect the DEF line on the selective catalytic reduction (SCR) dosing system.
3. Inspect dosing valve supply line between the dosing unit and dosing valve (pressure line).
4. Inspect the DEF line and associated fittings or connectors:

- Check the DEF tank connections for cracks and pitting.
- Check the dosing unit connections and fittings for loose, leaking, or damaged connections.
- Disconnect the pressure line dosing unit connectors and look for signs of buildup or blockage.
- Verify proper sealing at all connection points, including DEF tank, dosing unit, and dosing valve.

Any damaged, leaking, or restricted connections found?

YES >> Repair or replace the leaking DEF line or fitting, or replace the DEF dosing unit as necessary.
NO >> GO TO 6.

6.CHECK FOR AIR IN THE DEF

1. Turn ignition switch ON.
2. Connect CONSULT.
3. Check for air in the DEF.

Is air found in the DEF?

YES >> Check the DEF dosing unit fittings, pressure line fittings, tank fittings and repair as necessary.
NO >> GO TO 7.

7.INSPECT THE DEF TANK FILTER FOR BLOCKAGE

1. Turn ignition switch OFF.
2. Remove the tank level and temperature sensor from the DEF tank.
3. Inspect the aftertreatment DEF tank filter for signs of blockage or buildup.

Is the DEF tank filter blocked?

YES >> Drain, clean, and refill the DEF tank.
NO >> GO TO 8.

8.CHECK DEF DOSING UNIT FOR PROPER OPERATION

1. Connect all harness connectors.
2. Remove the aftertreatment DEF dosing valve from the decomposition tube.
3. Place the DEF dosing valve in a measuring container having greater than a 1.5 liter [50 oz] capacity.
4. Turn ignition switch ON.
5. Using CONSULT, access “ENGINE” and select ″DEF Dosing Unit Override Test″ active test.

Did the DEF dosing unit operate according to specifications?

YES >> GO TO 9.
NO >> Replace the DEF supply pump assembly. Refer to EX-64, "Exploded View".

9.ERASE DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, select “ENGINE” and clear DTCs.
5. Operate the engine within the "Conditions for Clearing the DTC" found in the DTC description of this diagnosis procedure.

Is P204A DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-933, "DTC Description".
NO >> Repair complete.

P204C REDUCTANT PRESSURE SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013082533

NOTE:
If DTC P21CA is displayed with this DTC, first perform the trouble diagnosis for other DTC.
• P21CA present. Refer to EC-780, "DTC Description".

The Engine Control Module (ECM) provides a 5V supply and a ground to the aftertreatment diesel exhaust fluid pressure sensor. The pressure sensor provides a signal to the ECM on the sensor signal circuit. This sensor signal voltage changes, based on the aftertreatment diesel exhaust fluid pressure supplied by the dosing unit. The ECM will detect a low signal voltage at low diesel exhaust fluid pressures, and a high signal voltage at high diesel exhaust fluid pressures. Possible reduced engine performance.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the aftertreatment diesel exhaust fluid tank temperature signal voltage was out of range high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P204C	DEF LINE PRESS	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	DEF pressure sensor signal.
		Threshold	DEF pressure sensor signal voltage is less than 0.5 volt for 1 second.
		Diagnosis delay time	—

POSSIBLE CAUSE

• Harness and connectors.
• DEF pressure sensor.
• DEF control module.
• DEF supply pump assembly.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P204C current on the CONSULT screen.

Is P204C DTC current?

YES >> Go to EC-936, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013082534

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21CA is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-1036, "DTC Description".
NO >> GO TO 2.

2.CHECK FOR CURRENT DEF PRESSURE SENSOR DTC

Check for DTC P204C current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK DEF PRESSURE SENSOR POWER SUPPLY CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between DEF supply pump assembly connector sensor supply voltage and return circuit terminals.

DEF supply pump assembly			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
C204	13	11	Approx. 5

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between DEF supply pump assembly 5V supply terminal 13 and signal circuit terminal 12.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P204D become current and P204C become past?

YES >> GO TO 6.
NO >> GO TO 7.

6.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Reconnect the DEF supply pump assembly connector.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P203C DTC become current?

YES >> A damaged tank level sensor has been detected. Replace the aftertreatment DEF supply pump assembly. Refer to EX-73, "Exploded View".
NO >> The removal and installation of the connector corrected the issue. Repair complete.

7. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Disconnect the DEF control module.
2. Inspect both connectors and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK TANK PRESSURE SENSOR POWER CIRCUIT FOR OPEN

Check the 5 volt power circuit for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	27	C204	13	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair open circuit in harness or connectors.

9. CHECK TANK PRESSURE SENSOR SIGNAL CIRCUIT FOR OPEN

Check the signal circuit for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	25	C204	12	Yes

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair open circuit in harness or connectors.

10. CHECK TANK PRESSURE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DEF tank pressure sensor signal and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	25	All others	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair short circuit in harness or connectors.

11. CHECK TANK PRESSURE SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

Check the continuity between DEF tank pressure sensor signal circuit and ground.

DEF control module		Ground	Continuity
Connector	Terminal		
C205	25	—	No

Is the inspection result normal?

YES >> GO TO 12.
NO >> Repair or replace harness for a short to ground.

12. CHECK FOR CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is P204C DTC current?

YES >> Replace DEF control module. Refer to EC-1259, "Exploded View".
NO >> The removal and installation of the connector corrected the issue.

P204D REDUCTANT PRESSURE SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013082531

NOTE:
If DTC P21CA is displayed with this DTC, first perform the trouble diagnosis for other DTC.
- P21CA present. Refer to EC-1036, "DTC Description".

The Diesel Exhaust Fluid (DEF) Pressure Sensor is a three wire sensor, integrated into the DEF Supply Pump assembly and is not serviceable separate. The DEF Pressure Sensor monitors supply pressure to the DEF Injector. The Diesel Exhaust Fluid (DEF) Dosing Control Unit provides a 5V Supply and a ground to the DEF Pressure Sensor. The sensor provides a signal to the DEF Dosing Control Unit on the DEF Pressure sensor signal circuit. This DEF Pressure Sensor Signal voltage changes, based on the diesel exhaust fluid pressure supplied by the DEF Supply Pump.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected the DEF supply pump assembly Diesel Exhaust Fluid (DEF) tank pressure sensor voltage is in excess of an allowable value.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P204C	DEF LINE PRESS	Diagnosis condition	Ignition switch ON or the engine is running
		Signal (terminal)	DEF pressure sensor signal
		Threshold	DEF pressure sensor signal voltage is greater than 4.5 volt for 1 second.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness and connectors.
- DEF pressure sensor.
- DEF control module.
- DEF supply pump assembly.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P204D being current on the CONSULT screen.

Is P204D DTC current?

YES >> Go to EC-940, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013082532

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21CA is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-1036, "DTC Description".
NO >> GO TO 2.

2. CHECK FOR CURRENT DEF PRESSURE SENSOR DTC

Check for DTC P204D current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Connect a jumper wire between DEF supply pump assembly 5 volt supply terminal 13 and signal circuit terminal 12.
3. Wait for 1 minute.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is DTC P204C current and P204D past?

YES >> GO TO 10.
NO >> GO TO 5.

5. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Turn ignition OFF.
2. Disconnect the DEF control module.
3. Inspect both connectors and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK TANK PRESSURE SENSOR GROUND CIRCUIT FOR OPEN

Check the ground circuit for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	24	C204	11	Yes

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair open circuit in harness or connectors.

7.CHECK TANK PRESSURE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DEF tank pressure sensor signal and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	25	All others	No

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair short circuit in harness or connectors.

8.CHECK TANK PRESSURE SENSOR POWER CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DEF tank pressure sensor 5V supply and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	27	All others	No

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace harness for a short circuit.

9.CHECK THE DTC AND VERIFY SENSOR CONDITION

1. Reconnect all harness connectors.
2. Turn ignition switch ON and wait 30 seconds.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is P204D DTC current?

YES >> Replace DEF control module. Refer to EC-1259, "Exploded View".
NO >> The removal and installation of the connector corrected the issue.

10.CHECK FOR CURRENT DTC

1. Turn ignition OFF.
2. Remove the jumper wire.
3. Connect all components in the correct positions.
4. Turn ignition switch ON and wait 30 seconds.
5. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is P204D DTC current?

YES >> Return to the diagnosis procedure steps. Refer to EC-940, "DTC Description".
NO >> Repair complete.

P205C REDUCTANT TANK TEMPERATURE SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013087070

NOTE:
If DTC P21CA is displayed with this DTC, first perform the trouble diagnosis for other DTC.
- P21CA present. Refer to EC-780, "DTC Description".

The Diesel Exhaust Fluid (DEF) tank temperature sensor measures the temperature of the fluid inside the DEF tank. The DEF control module monitors the variation in voltage caused by changes in the sensor resistance to determine the fluid temperature. DEF tank temp sensor is integrated in the DEF supply pump assembly. It must be replaced with the DEF Supply Pump assembly.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the aftertreatment diesel exhaust fluid tank temperature signal voltage was out of range low.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P205C	UREA TANK TEMP	Diagnosis condition	Ignition switch ON or the engine is running
		Signal (terminal)	DEF temperature sensor signal
		Threshold	DEF tank temperature sensor signal voltage is less than 0.17 volt (80°C) for 1 second.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF temperature sensor
- DEF control module
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P205C current on the CONSULT screen.

Is P205C DTC current?

YES >> Go to EC-943, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013087071

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21CA is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-1036, "DTC Description".

NO >> GO TO 2.

2. CHECK FOR CURRENT DEF PRESSURE SENSOR DTC

Check for DTC P205C current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P205D become current and P205C become past?

YES >> GO TO 5.
NO >> GO TO 6.

5. CHECK FOR CURRENT DTC

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is P205C DTC current?

YES >> Replace the DEF supply pump assembly. Refer to EX-73, "Exploded View".
NO >> The removal and installation of the connector corrected the issue.

6. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF control module.
3. Inspect both connectors and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 7.

NO >> Repair or replace error-detected parts.

7. CHECK TANK TEMPERATURE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check for continuity between DEF tank temperature sensor signal and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	21	All others	No

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair short circuit in harness or connectors.

8. CHECK TANK TEMPERATURE SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

Check for continuity between DEF tank temperature sensor signal circuit and ground.

DEF control module		Ground	Continuity
Connector	Terminal		
C205	21	—	No

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace harness for a short to ground.

9. CHECK FOR CURRENT DTC

1. Connect all harness connectors.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.
4. Turn ignition switch ON.
5. Using CONSULT check for current “ENGINE” diagnostic trouble codes.

Is P205C DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-943, "DTC Description".
NO >> Repair complete.

P205D REDUCTANT TANK TEMPERATURE SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013087072

NOTE:
If DTC P21CA is displayed with this DTC, first perform the trouble diagnosis for other DTC.
- P21CA present. Refer to EC-780, "DTC Description".

The Diesel Exhaust Fluid (DEF) tank temperature sensor measures the temperature of the fluid inside the DEF tank. The DEF control module monitors the variation in voltage caused by changes in the sensor resistance to determine the fluid temperature. DEF tank temp sensor is integrated in the DEF supply pump assembly. It must be replaced with the DEF Supply Pump assembly.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the aftertreatment diesel exhaust fluid tank temperature signal voltage was out of range high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P205D	UREA TANK TEMP	Diagnosis condition	Ignition switch ON or the engine is running
		Signal (terminal)	DEF temperature sensor signal
		Threshold	DEF tank temperature sensor signal voltage is greater than 4.4 volt (40°C) for 1 second.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF temperature sensor.
- DEF control module.
- Harness and connectors.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P205D current on the CONSULT screen.

Is P205D DTC current?

YES >> Go to EC-946, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013087073

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21CA is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-1036, "DTC Description".

NO >> GO TO 2.

2. CHECK FOR CURRENT DEF TEMPERATURE SENSOR DTC

Check for DTC P205D current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Connect a jumper wire between the DEF supply pump assembly connector temperature SIGNAL terminal 9 and temperature ground terminal 10.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P205C become current and P205D become past?

YES >> GO TO 5.
NO >> GO TO 6.

5. CHECK THE DTC AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Remove the jumper wire.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P205D become current?

YES >> Replace the DEF supply pump assembly. Refer to EX-73, "Exploded View".
NO >> The removal and installation of the connector corrected the issue. Repair complete.

6. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF control module.
3. Inspect both connectors and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.

- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK TANK TEMPERATRE SENSOR SIGNAL CIRCUIT FOR OPEN

Check the signal circuit for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	21	C204	9	Yes

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair open circuit in harness or connectors.

8. CHECK TANK TEMPERATRE SENSOR GROUND CIRCUIT FOR OPEN

Check the ground circuit for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	29	C204	10	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair open circuit in harness or connectors.

9. CHECK TANK TEMPERATURE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DEF tank temperature sensor signal and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	21	All others	No

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair short circuit in harness or connectors.

10. CHECK FOR CURRENT DTC

1. Connect all harness connectors.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.
4. Turn ignition switch ON.
5. Using CONSULT check for current “ENGINE” diagnostic trouble codes.

Is P205D DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-946, "DTC Description".
NO >> Repair complete.

P205E REDUCTANT TANK TEMPERATURE SENSOR CIRCUIT INTERMITTENT

DTC Description

INFOID:0000000013087096

NOTE:
If DTC P21CA is displayed with this DTC, first perform the trouble diagnosis for other DTC.
- P21CA present. Refer to EC-780, "DTC Description".

The Diesel Exhaust Fluid (DEF) tank temperature sensor measures the temperature of the fluid inside the DEF tank. The DEF control module monitors the variation in voltage caused by changes in the sensor resistance to determine the DEF temperature. DEF tank temperature sensor is integrated in the DEF supply pump assembly. It must be replaced with the DEF Supply Pump assembly.

DTC DETECTION LOGIC

The aftertreatment diesel exhaust fluid controller (DCU) detected the diesel exhaust fluid tank temperature reading was higher or lower than other temperature sensors or no increase in DEF tank temperature during tank heating.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P205E	DEF QUALITY SENSOR TEMP UREA TANK TEMP COOLANT TEMP	Diagnosis condition	Engine OFF for 8 hours, start the engine and let it idle for 1 minute.
		Signal (terminal)	DEF temperature sensor signal
		Threshold	The difference in DEF temperature from start to 700 seconds later is less than 2°
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF temperature sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Allow the engine to stay OFF for 8 hours.
3. Start the engine and let it idle for 1 minute.
4. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P205E being current on the CONSULT screen.

Is P205E DTC current?

YES >> Go to EC-949, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013087097

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21CA is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-1036, "DTC Description".
NO >> GO TO 2.

2. CHECK FOR CURRENT DEF TEMPERATURE SENSOR DTC

Check for DTC P205E current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
   NOTE:
   Other diagnostic codes related to the DEF supply pump assembly will be set.

Did DTC P205D become current?

YES >> GO TO 5.
NO >> GO TO 6.

5. CHECK THE CIRCUIT RESPONSE

1. Connect a jumper wire between the DEF supply pump assembly connector temperature SIGNAL terminal 9 and temperature ground terminal 10.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Using CONSULT check for current “ENGINE” diagnostic trouble codes.

Did DTC P205C become current and P205D become past?

YES >> Replace the DEF supply pump assembly. Refer to EX-73, "Exploded View".
NO >> GO TO 6.

6. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Remove the jumper wire.
2. Turn ignition switch OFF.
3. Disconnect the DEF control module.
4. Inspect both connectors and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.

- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK TANK TEMPERATURE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DEF tank temperature sensor signal and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	21	All others	No

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair short circuit in harness or connectors.

8. CHECK FOR CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for Clearing the DTC".
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P205E DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-949, "DTC Description".
NO >> Repair complete.

P206B REDUCTANT QUALITY SENSOR CIRCUIT

DTC Description

INFOID:0000000013087068

NOTE:
If DTC U02A2 is displayed with this DTC, first perform the trouble diagnosis for other DTC.
• U02A2 present. Refer to EC-232, "DTC Description".

The aftertreatment diesel exhaust fluid quality sensor is a smart device that communicates to the ECM via CAN communication. The aftertreatment diesel exhaust fluid quality sensor performs its own internal diagnostics and reports malfunctions back to the engine control module via CAN communication. The aftertreatment diesel exhaust fluid quality sensor is used to measure the concentration of the aftertreatment diesel exhaust fluid in the tank.

DTC DETECTION LOGIC

The DEF quality sensor has reported an internal error. Engine power will be reduced.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P206B	DEF QLTY SENS	Diagnosis condition	Ignition switch ON or the engine is running
		Signal (terminal)	DEF quality sensor signal
		Threshold	DEF tank concentration detection element signal is out of range, shorted low or shorted high for 5 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

• DEF tank quality sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P206B current on the CONSULT screen.

Is P206B DTC current?

YES >> Go to EC-952, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013087069

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC U02A2 is present, perform the confirmation procedure (diagnosis procedure) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-232, "DTC Description".
NO >> GO TO 2.

2.CHECK FOR CURRENT DEF QUALITY SENSOR DTC

Check for DTC P206B current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.CHECK FOR CURRENT DTC

1. Using CONSULT erase “ENGINE” diagnostic trouble codes.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.
4. Turn ignition switch ON.
5. Using CONSULT check for current “ENGINE” diagnostic trouble codes.

Is P206B DTC current?

YES >> Replace the quality sensor. Refer to EX-73, "Exploded View".
NO >> Repair complete.

P206D REDUCTANT QUALITY SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013087567

NOTE:
If DTC U02A2 is displayed with this DTC, first perform the trouble diagnosis for other DTC.
• U02A2 present. Refer to EC-232, "DTC Description".

The aftertreatment diesel exhaust fluid quality sensor is a smart device that communicates to the ECM via CAN communication. The aftertreatment diesel exhaust fluid quality sensor performs its own internal diagnostics and reports malfunctions back to the engine control module via CAN communication. The aftertreatment diesel exhaust fluid quality sensor is used to measure the concentration of the aftertreatment diesel exhaust fluid in the tank.

DTC DETECTION LOGIC

The DEF quality sensor has reported an internal error. Engine power will be reduced.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P206D	DEF QLTY SENS	Diagnosis condition	Ignition switch ON or the engine is running
		Signal (terminal)	DEF quality sensor signal
		Threshold	DEF tank concentration detection element signal is shorted to a high voltage source for 5 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

• DEF tank quality sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P206D current on the CONSULT screen.

Is P206D DTC current?

YES >> Go to EC-954, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013087568

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC U02A2 is present, perform the confirmation procedure (diagnosis procedure) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-232, "DTC Description".
NO >> GO TO 2.

2.CHECK FOR CURRENT DEF QUALITY SENSOR DTC

Check for DTC P206D current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.CHECK FOR CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.
4. Turn ignition switch ON.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P206D DTC current?

YES >> Replace the DEF quality sensor. Refer to EX-75, "Exploded View".
NO >> Repair complete.

P207F REDUCTANT QUALITY PERFORMANCE

DTC Description

INFOID:0000000013065616

The aftertreatment diesel exhaust fluid quality sensor is a smart device that communicates to the ECM via CAN communication. The aftertreatment diesel exhaust fluid quality sensor performs its own internal diagnostics and reports malfunctions back to the engine control module via CAN communication. The aftertreatment diesel exhaust fluid quality sensor is used to measure the concentration of the aftertreatment diesel exhaust fluid in the tank. The concentration level is expected to be at 32.5 Â ±1.5%.

DTC DETECTION LOGIC

The DEF quality sensor has measured the concentration of DEF in the tank to be:
- Below the minimum concentration threshold.
- Above the maximum concentration threshold.
- Sensor is unable to generate a concentration estimate for longer than the maximum wait time threshold

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P207F	DEF QLTY SENS	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	DEF quality sensor signal.
		Threshold	DEF tank concentration detection element signal is out of range, shorted low or shorted high for 5 seconds. • DEF concentration level > 40%. • 22.5% < DEF concentration level < 15%. • DEF concentration level cannot be detected (frozen or not present).
		Diagnosis delay time	—

POSSIBLE CAUSE

- Degraded, diluted, or incorrect DEF.
- CAN lines open or shorted.
- DEF quality sensor.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-956, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065617

1.CHECK AFTERTREATMENT DEF LEVEL

1. Turn ignition OFF.
2. Check the DEF fluid tank level.
   NOTE:
   Having low level DEF fluid in the tank can cause this DTC to set.

Is DEF fluid tank level less than 50%?

YES >> Fill tank completely with fresh DEF.
NO >> GO TO 2.

2.CHECK AFTERTREATMENT DEF CONCENTRATION

Using a refractometer [SST: J-54466] measure the concentration of the DEF in the tank.

Is DEF concentration within 32.5 Â± 1.5 %?

YES >> GO TO 3.
NO >> Drain the DEF fluid tank and fill with new DEF.

3.CHECK FOR CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for Clearing DTC".
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P207F DTC current?

YES >> Replace the Aftertreatment DEF quality sensor. Refer to EX-75, "Exploded View".
NO >> Repair complete.

P2080 EXHAUST GAS TEMPERATURE SENSOR 1

DTC Description

INFOID:0000000013072977

The aftertreatment Diesel Particulate Filter (DPF) temperature sensor module is a smart device that communicates with the Engine Control Module (ECM) via CAN communication lines. The aftertreatment DPF temperature sensor module performs its own internal diagnostics and reports malfunctions back to the ECM using CAN data lines. The aftertreatment DPF temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment DPF intake temperature, and aftertreatment DPF outlet temperature. The temperature probes are permanently attached to the aftertreatment DPF temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Aftertreatment DOC inlet gas temperature is continuously above a high threshold for a calibrated period of time while active regeneration of the DPF is not occurring.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2080	DOC INLET TEMP	Diagnosis condition	This diagnostic runs continuously when the engine is running and active regeneration of the aftertreatment diesel particulate filter is not occurring.
		Signal (terminal)	DOC inlet temperature sensor
		Threshold	ECM detected the temperature at the DOC intake was > 745°C [1373°F] for 65 seconds.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

NOTE:
This DTC will become history after the aftertreatment temperatures drop below the warning limit and a key cycle has occurred, and will likely be "past" at the time of diagnosis. For these reasons this diagnosis procedure must be used for both current and past DTCs.

POSSIBLE CAUSE

- Excessive engine oil being introduced into the exhaust system from the engine.
- A malfunctioning fuel injector causing unburned fuel to enter the exhaust system.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Bring the vehicle to a complete stop.
6. Repeat all of the above steps one more time.
7. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
8. Check for DTC P2080 being current on the CONSULT screen.

Is 1st trip DTC detected?

YES >> Proceed to EC-958, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013072978

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other current and past “ENGINE” diagnostic trouble codes.

NOTE:

The following current and past DTCs have priority over this DTC if any of them exists:
- U1611
- P1613
- P1614
- P1615
- P1623

Are there any current or past applicable DTCs?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR INJECTOR MISFIRE

1. Start the engine and run it at low idle.
2. Determine if a cylinder misfire is noticed when the engine is running at low idle.
3. Using CONSULT, select “ENGINE” and perform the ″Cylinder Cutout Test″ under ″active test″ to check for a cylinder misfire.

Was an engine misfire detected?

YES >>
- Replace malfunctioning injector. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
- Inspect and repair the aftertreatment system for possible damage.

NO >> GO TO 3.

3.INSPECT TURBOCHARGER EXHAUST OUTLET FOR OIL OR FUEL

1. Turn ignition switch OFF.
2. Remove the exhaust plumbing from the turbocharger outlet.
3. Look for signs of moisture in the turbocharger exhaust outlet.
4. Inspect the turbocharger exhaust outlet for signs of oil or fuel being introduced into the aftertreatment system from the engine.

Was engine oil or fuel contamination found in the turbocharger exhaust outlet?

YES >> Locate the cause of possible diesel fuel or engine oil being carried from the engine into the aftertreatment system and repair or replace any components that caused the engine oil or diesel fuel contamination. Inspect the aftertreatment system for possible damage.
NO >> GO TO 4.

4.CHECK AFTERTREATMENT DIESEL OXIDATION CATALYST FOR SOOT ACCUMULATION

1. Remove the aftertreatment Diesel Oxidation Catalyst (DOC) and Diesel Particulate Filter (DPF) assembly.
2. Inspect the aftertreatment DOC.
3. Check the intake face of the aftertreatment DOC for damage, soot accumulation and/or face plugging.

Is more than 50 % of the cells on the intake face completely blocked by soot?

YES >> Replace the DOC and DPF assembly. Refer to EX-36, "Removal and Installation".
NO >> GO TO 5.

5.ERASE DTC.

1. Connect all components.
2. With CONSULT, erase all DTCs.
3. Operate the engine within the conditions for setting DTC found in the DTC description.
4. Check for existing “ENGINE” diagnostic trouble codes.

Did the P2080 DTC return?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-958, "DTC Description".
NO >> Repair complete.

P208A REDUCTANT PUMP CONTROL CIRCUIT OPEN

DTC Description

INFOID:0000000013074593

The SCR dosing system is an in-tank system with a DEF supply pump assembly that controls the dosing pump and monitors Urea heating, level, quality, pressure and temperature. This dosing system is powered by battery voltage and an initialization signal from the DEF control module. The DEF supply pump assembly activates Priming, dosing, heating and purging of DEF using data provided by the Engine Control module (ECM) via CAN communication. The DEF supply pump assembly performs its own diagnostics and reports malfunctions back to the ECM. The ECM then decodes the error and converts it to a DTC.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected that any of the 3 brushless direct current motor phases, within the DEF supply pump assembly pump, has an open circuit condition.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P208A	DEF PUMP STATE DEF PUMP STATUS DEF PUMP TIME DEF DOSING VALVE POS CMP	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	DEF pump signal.
		Threshold	DEF control module detected there is an open circuit in one of the three DEF supply pump assembly unit motor phases.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness and connectors.
- DEF control module.
- DEF supply pump assembly.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P208A current on the CONSULT screen.

Is P208A DTC current?

YES >> Go to EC-960, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013074594

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes for DTC P208A being current.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE CIRCUIT RESPONSE

1. Connect a jumper wire between the DEF supply pump assembly connector pump motor A supply terminal 15 and motor B supply terminal 16 or motor C supply terminal 8.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P208D become current and P208A become past?

YES >> GO TO 4.
NO >> Replace the DEF control module. Refer to EC-1259, "Removal and Installation".

4. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Disconnect the DEF control module.
4. Inspect both connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK DEF SUPPLY PUMP MOTOR A SUPPLY CIRCUIT FOR OPEN

Check the pump motor A supply circuit for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	19	C204	15	Yes

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair open circuit in harness or connectors.

6. CHECK DEF SUPPLY PUMP MOTOR B SUPPLY CIRCUIT FOR OPEN

Check the pump motor B supply circuit for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	18	C204	16	Yes

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair open circuit in harness or connectors.

7.CHECK DEF SUPPLY PUMP MOTOR C SUPPLY CIRCUIT FOR OPEN

Check the pump motor C supply circuit for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	17	C204	8	Yes

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair open circuit in harness or connectors.

8.CHECK DEF SUPPLY PUMP MOTOR GROUND CIRCUIT FOR OPEN

Check the pump motor ground circuit for continuity between the DEF control module and the DEF supply pump assembly.

DEF control module		DEF supply pump assembly		Continuity
Connector	Terminal	Connector	Terminal	
C205	7	C204	7	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair open circuit in harness or connectors.

9.ERASE CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for clearing the DTC".
5. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P208A DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-960, "DTC Description".
NO >> Repair complete.

P208C REDUCTANT PUMP CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013074591

The aftertreatment Diesel Exhaust Fluid (DEF) dosing control module performs many functions, one of which is to generate adequate diesel exhaust fluid pressure in the lines, using a pump, to allow for dosing. The ECM provides a battery voltage supply and a ground to the DEF supply pump assembly. The ECM also supplies a signal to the dosing unit to control the diesel exhaust fluid output. This signal changes, based on the diesel exhaust fluid pressure being commanded.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected that any of the 3 brushless direct current motor phases, within the DEF supply pump assembly pump, has a voltage below an allowable value.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P208C	DEF PUMP STATE DEF PUMP STATUS DEF PUMP TIME DEF DOSING VALVE POS CMP	Diagnosis condition	This diagnostic runs when the DEF supply pump assembly is in the priming or dosing state.
		Signal (terminal)	DEF pump signal
		Threshold	The DEF control module detected the dosing pump motor circuit is shorted to ground.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF supply pump assembly.
- Harness and connectors.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch ON.
2. Connect CONSULT, select ″ENGINE″ and perform ″DEF System Leak Test″ under ″Active test″.
3. Check for DTC P208C being current on the CONSULT screen.

Is DTC P208C current?

YES >> Proceed to EC-963, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013074592

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes for DTC P208C being current.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.

- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF control module.
3. Inspect both connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK DEF SUPPLY PUMP MOTOR A SUPPLY CIRCUIT FOR SHORT TO GROUND

Check for continuity between the pump motor A supply circuit and ground at the DEF control module harness connector.

DEF control module		Ground	Continuity
Connector	Terminal		
C205	19	—	No

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair short circuit in harness or connectors.

5. CHECK DEF SUPPLY PUMP MOTOR B SUPPLY CIRCUIT FOR SHORT TO GROUND

Check for continuity between the pump motor B supply circuit and ground at the DEF control module harness connector.

DEF control module		Ground	Continuity
Connector	Terminal		
C205	18	—	No

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair short circuit in harness or connectors.

6. CHECK DEF SUPPLY PUMP MOTOR C SUPPLY CIRCUIT FOR SHORT TO GROUND

Check for continuity between the pump motor C supply circuit and ground at the DEF control module harness connector.

DEF control module		Ground	Continuity
Connector	Terminal		
C205	17	—	No

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair short circuit in harness or connectors.

7.CHECK FOR CURRENT DTC

1. Connect DEF control module.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Using CONSULT check for “ENGINE” diagnostic trouble codes.

NOTE:
Other DTCs will be set.

Is P208A DTC current and P208C DTC past?

YES >> • Replace the DEF supply pump assembly. Refer to EX-73, "Removal and Installation".
• GO TO 8.
NO >> • Replace the DEF control module. Refer to EC-1259, "Removal and Installation".
• GO TO 8.

8.ERASE CURRENT DTC

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for setting the DTC".
6. Check for “ENGINE” diagnostic trouble codes.

Is P208C DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-963, "DTC Description".
NO >> Repair complete.

P208D REDUCTANT PUMP CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013074062

The aftertreatment Diesel Exhaust Fluid (DEF) dosing control module performs many functions, one of which is to generate adequate diesel exhaust fluid pressure in the lines, using a pump, to allow for dosing. The ECM provides a battery voltage supply and a ground to the DEF supply pump assembly. The ECM also supplies a signal to the dosing unit to control the diesel exhaust fluid output. This signal changes, based on the diesel exhaust fluid pressure being commanded.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected that any of the 3 brushless direct current motor phases, within the DEF supply pump assembly pump, has a voltage in excess of an allowable value.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P208C	DEF PUMP STATE DEF PUMP STATUS DEF PUMP TIME DEF DOSING VALVE POS CMP	Diagnosis condition	This diagnostic runs when the DEF supply pump assembly is in the priming or dosing state.
		Signal (terminal)	DEF pump signal
		Threshold	The DEF control module detected the dosing pump motor circuit is shorted to high voltage.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF supply pump assembly.
- Harness and connectors.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch ON.
2. Connect CONSULT, select ″ENGINE″ and perform ″DEF System Leak Test″ under ″Active Test″.
3. Check for DTC P208D being current on the CONSULT screen.

Is DTC P208D current?

YES >> Proceed to EC-966, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013074063

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes for DTC P208D being current.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FOR OBSTRUCTED OR RESTRICTED AIR FLOW TO THE DEF CONTROL MODULE

Check the aftertreatment DEF control module mounting area for air flow obstructions. Restrictions or blockage ofthe air flow could cause the DEF control module to overheat. Check for the following:

1. Debris on or around the DEF control module.
2. Aftermarket shields, flaps, or brackets mounted too close to the DEF control module.
3. Exhaust leaks allowing exhaust to overheat the temperature sensor module.

Is the inspection result normal?

YES >> GO TO 3.
NO >> • Repair or replace the cause of the restricted air flow.
• Remove any debris accumulated near the DEF control module.
• Relocate any aftermarket accessories that might be restricting air flow.

- Repair any causes of excessive heat to the DEF control module.
- GO TO 9.

3. INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly connector.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF control module.
3. Inspect both connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK DEF SUPPLY PUMP MOTOR A SUPPLY CIRCUIT FOR SHORT TO ANOTHER CIRCUIT

1. Turn ignition switch ON.
2. Check for continuity between the pump motor A supply circuit and all other pins at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	19	All others	No

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair short circuit in harness or connectors.

6. CHECK DEF SUPPLY PUMP MOTOR B SUPPLY CIRCUIT FOR SHORT TO ANOTHER CIRCUIT

1. Turn ignition switch ON.
2. Check for continuity between the pump motor B supply circuit and all other pins at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	18	All others	No

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair short circuit in harness or connectors.

7. CHECK DEF SUPPLY PUMP MOTOR C SUPPLY CIRCUIT FOR SHORT TO ANOTHER CIRCUIT

1. Turn ignition switch ON.
2. Check for continuity between the pump motor C supply circuit and all other pins at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	17	All others	No

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair short circuit in harness or connectors.

8. CHECK FOR CURRENT DTC

1. Turn ignition switch OFF.
2. Connect DEF control module.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT check for “ENGINE” diagnostic trouble codes.
   NOTE:
   Other DTCs will be set.

Is P208A DTC current and P208D DTC past?

YES >> • Replace the DEF supply pump assembly. Refer to EX-73, "Removal and Installation".
• GO TO 9.
NO >> • Replace the DEF control module. Refer to EC-1259, "Removal and Installation".
• GO TO 9.

9. ERASE CURRENT DTC

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for setting the DTC".
6. Check for “ENGINE” diagnostic trouble codes.

Is P208D DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-966, "DTC Description".
NO >> Repair complete.

P209F REDUCTANT TANK HEATER CONTROL CIRCUIT PERFORMANCE

DTC Description

INFOID:0000000013087066

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- P202B present. Refer to EC-900, "DTC Description".
- P202C present. Refer to EC-903, "DTC Description".
- P205C present. Refer to EC-943, "DTC Description".
- P205D present. Refer to EC-946, "DTC Description".
- P205E present. Refer to EC-949, "DTC Description".

The Diesel Exhaust Fluid (DEF) Tank has an internal heating coil to thaw frozen diesel exhaust fluid. The DEF control module monitors the temperature of the diesel exhaust fluid in the tank. The DEF control module activates the DEF tank heater, at freezing temperatures to warm the diesel exhaust fluid. The DEF tank heater is integrated into the DEF supply pump assembly. It must be replaced with the DEF supply pump assembly.

DTC DETECTION LOGIC

The monitor checks whether the DEF tank temperature has failed to reach a target threshold within a time window after the heating is commanded ON.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P209F	DEF HTR TEST TIME UREA TANK TEMP DEF TANK TEMP SENS V	Diagnosis condition	This diagnostic runs a calibrated amount of time after DEF tank heating is first commanded.
		Signal (terminal)	DEF tank heater signal
		Threshold	The DEF control module detected the DEF tank temperature did not reach dosing temperature (minimum of –6°C (21°F) in the required time, when the DEF tank heater was commanded ON.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF supply pump assembly (DEF tank heater).
- DEF supply pump assembly (DEF tank temperature sensor).
- Frozen DEF in the DEF tank.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P209F being current on the CONSULT screen.

Is P209F DTC current?

YES >> Go to EC-969, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013087067

1.CHECK FOR OTHER RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current “ENGINE” diagnostic trouble codes:

- P202B
- P202C
- P205C
- P205D
- P205E

Are any of the above DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR LOW DEF TANK LEVEL

1. Make sure the DEF tank is **not** empty and the tank level gauge is accurate.
2. .Check for P203F being a current ENGINE diagnostic trouble code:

Is the above DTC detected?

YES >> Fill the DEF tank.
NO >> GO TO 3.

3.CHECK FOR CURRENT TANK HEATER DTC

Check for DTC P209F being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 4.
NO >> Refer to GI-43, "Intermittent Incident".

4.INSPECT DEF TANK HEATER SUPPLY CIRCUIT FOR OPEN

1. Turn ignition switch OFF.
2. Disconnect the DEF control module.
3. Disconnect the DEF supply pump assembly.
4. Check the DEF tank heater power supply circuit for continuity between the DEF supply pump assembly and the DEF control module.

DEF supply pump assembly		DEF control module		Continuity
Connector	Terminal	Connector	Terminal	
C204	1	C205	22	Yes

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair open power supply circuit in harness or connectors.

5.INSPECT DEF TANK HEATER RETURN CIRCUIT FOR OPEN

Check the DEF tank heater return circuit for continuity between the DEF supply pump assembly and the DEF control module.

DEF supply pump assembly		DEF control module		Continuity
Connector	Terminal	Connector	Terminal	
C204	3	C205	23	Yes

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair open return circuit in harness or connectors.

6.VERIFY PPROPER OPERATION OF THE DEF TANK HEATER

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Connect CONSULT and select “ENGINE” then perform the ″DEF Tank Heater Test″.
4. Using the CONSULT, monitor the DEF tank temperature ″ UREA TANK TEMP″.
5. Allow the DEF tank temperature 3 to 5 minutes to rise.

Did the DEF tank temperature rise?

YES >> GO TO 7.
NO >> Replace the DEF supply pump assembly. Refer to EX-73, "Removal and Installation".

7.ERASE CURRENT DTC

1. Using CONSULT erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Check for ENGINE diagnostic trouble codes.

Is P209F DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-969, "DTC Description".
NO >> Repair complete.

P20B7 REDUCTANT METERING UNIT HEATER CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013112470

The aftertreatment diesel exhaust fluid dosing unit heater is used to defrost and/or prevent freezing of the diesel exhaust fluid dosing unit.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected the heater input power source voltage to the DEF supply pump assembly is below an allowable value.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P20B7	DEF HTR TEST TIME DEF HTR TEST TIMER DEF HTR TEST COUNTS Def tank heater test status	Diagnosis condition	This diagnostic runs when the DEF supply pump assembly heater is commanded ON.
		Signal (terminal)	DEF tank heater signal
		Threshold	The heater input power source voltage to the DEF supply pump assembly < 8.99 V
		Diagnosis delay time	—

POSSIBLE CAUSE

- Urea heater relay.
- Wiring harness.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Connect CONSULT and activate ″DEF Tank Heater Test″.
3. The DTC will move to ″Past″ when the test runs and passes.

Is P20B7 DTC current?

YES >> Go to EC-972, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013112471

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21CB or P21CC are present, perform the confirmation procedure (diagnosis procedure) for these other DTCs first.

Are any applicable DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR CURRENT DEF HEATER CIRCUIT DTC

Check for DTC P20B7 current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT UREA HEATER RELAY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the urea heater relay.
3. Inspect urea heater relay and connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.

- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK UREA HEATER RELAY CIRCUIT

1. Replace urea heater relay with a known good relay.
2. Turn ignition switch ON.
3. Connect CONSULT and erase DTCs.
4. Using CONSULT, activate "DEF Tank Heater Test".
5. The DTC will move to "Past" when the test runs and passes.

Is P20B7 DTC current?

YES >> GO TO 5.
NO >> Repair complete.

5. INSPECT DEF CONTROL MODULE AND VEHICLE HARNESS CONNECTOR PINS

1. Turn ignition OFF.
2. wait at least 90 seconds before proceeding to allow sufficient time for the DEF control module to completely power down.
3. Disconnect the DEF control module.
4. Inspect both connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK DEF TANK HEATER SUPPLY CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check for continuity between DEF tank heater supply circuit and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C35	1	All others	No

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair short circuit in harness or connectors.

7. CHECK TANK HEATER SUPPLY CIRCUIT FOR OPEN

Check the DEF tank heater supply circuit for continuity between the DEF control module connector C35 terminal 1 and the urea heater relay terminal 3.

DEF control module		Urea heater relay		Continuity
Connector	Terminal	Connector	Terminal	
C35	1	E90	3	Yes

Is the inspection result normal?

YES >> Replace the DEF control module. Refer to EC-1259, "Removal and Installation".
NO >> Repair open circuit in harness or connectors.

P20B8 REDUCTANT METERING UNIT HEATER CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013112150

The aftertreatment diesel exhaust fluid dosing unit heater is used to defrost and/or prevent freezing of the diesel exhaust fluid dosing unit.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected the heater input power source voltage to the DEF supply pump assembly is in excess of an allowable value.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P20B7	DEF HTR TEST TIME DEF HTR TEST TIMER DEF HTR TEST COUNTS Def tank heater test status	Diagnosis condition	This diagnostic runs when the DEF supply pump assembly heater is commanded ON.
		Signal (terminal)	DEF tank heater signal.
		Threshold	ECM detects the DEF supply pump assembly heater temperature is rising when the heater was commanded OFF.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Urea heater relay.
- Wiring harness.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and activate ″DEF Tank Heater Test″.
3. The DTC will move to ″Past″ when the test runs and passes.

Is P20B8 DTC current?

YES >> Go to EC-975, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013112151

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21CB or P21CC are present, perform the confirmation procedure (diagnosis procedure) for these other DTCs first.

Are any applicable DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR CURRENT DEF HEATER CIRCUIT DTC

Check for DTC P20B8 current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT UREA HEATER RELAY AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the urea heater relay.
3. Inspect urea heater relay and connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.

- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK UREA HEATER RELAY CIRCUIT

1. Replace urea heater relay with a known good relay.
2. Turn ignition switch ON.
3. Connect CONSULT and erase DTCs.
4. Using CONSULT, activate ″DEF Tank Heater Test″.
5. The DTC will move to ″Past″ when the test runs and passes.

Is P20B8 DTC current?

YES >> GO TO 5.
NO >> Repair complete.

5. INSPECT DEF CONTROL MODULE AND VEHICLE HARNESS CONNECTOR PINS

1. Turn ignition OFF.
2. wait at least 90 seconds before proceeding to allow sufficient time for the DEF control module to completely power down.
3. Disconnect the DEF control module.
4. Inspect both connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK DEF TANK HEATER SUPPLY CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check for continuity between DEF tank heater supply circuit and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C35	1	All others	No

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair short circuit in harness or connectors.

7. CHECK THE UREA HEATER RELAY

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Connect CONSULT and erase all “ENGINE” diagnostic trouble codes.
4. Using CONSULT, activate ″DEF Tank Heater Test″.
5. The DTC will move to ″Past″ when the test runs and passes.

Is P20B8 DTC current?

YES >> Replace the DEF control module. Refer to EC-1259, "Removal and Installation".
NO >> Inspection End.

P20B9 REDUCTANT HEATER CONTROL CIRCUIT OPEN

DTC Description

INFOID:0000000013099964

NOTE:
If the following DTC is displayed with P20B9, first perform the diagnosis procedure for other DTC.
- P21C4 present. Refer to EC-1034, "DTC Description".

The heater relay supplies power to the DEF supply pump assembly. The DEF Line heater power supply and ground circuits are controlled by the DEF Control module. Aftertreatment DEF Line heating is based on the input of the ambient temperature sensor. Heating of the line is initiated when the ambient temperature is below 0 degrees Celsius. The DEF supply pump assembly reports status back to the Engine Control Module (ECM) via CAN communication.

DTC DETECTION LOGIC

The DEF control module detected the DEF line heater has an open circuit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P20B9	DEF LINE HTR TEST STATUS DEF LINE HTR TEST COUNTS DEF LINE HTR OP STATE	Diagnosis condition	This diagnostic runs when the key switch is ON and line heating is commanded ON.
		Signal (terminal)	DEF line heater signal
		Threshold	DEF supply pump assembly line heater current < 1 A
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF line heater.
- DEF control module.
- Urea heater relay.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Connect CONSULT and activate ″DEF Line Heater Test″.
3. The DTC will move to ″Past″ when the test runs and passes.

Is P20B9 DTC current?

YES >> Go to EC-978, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099965

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21C4 is present, perform the confirmation procedure (diagnosis procedure) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-1034, "DTC Description".
NO >> GO TO 2.

2.CHECK FOR CURRENT DEF LINE HEATER CIRCUIT DTC

Check for DTC P20B9 current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT DEF CONTROL MODULE LINE HEATER AND CONNECTOR PINS

1. Turn ignition OFF.
2. Disconnect the DEF line heater from the harness.
3. Disconnect the DEF control module.
4. Inspect both connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK DEF LINE HEATER SUPPLY CIRCUIT FOR OPEN

Check the power supply circuit for continuity between the DEF control module and the DEF line heater.

DEF control module		DEF line heater		Continuity
Connector	Terminal	Connector	Terminal	
C205	15	C202	1	Yes

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair open power supply circuit in harness or connectors.

5. CHECK DEF LINE HEATER GROUND CIRCUIT FOR OPEN

Check the ground supply circuit for continuity between the DEF control module and the DEF line heater.

DEF control module		DEF line heater		Continuity
Connector	Terminal	Connector	Terminal	
C205	30	C202	2	Yes

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair open ground circuit in harness or connectors.

6. CHECK THE DEF LINE HEATER INTEGRITY

Check the DEF line heater resistance. Refer to EC-980, "Component Inspection".

Is the inspection result normal?

YES >> GO TO 7.
NO >> Replace the DEF line heater. Refer to EX-64, "Exploded View".

7. CHECK FOR CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Connect CONSULT and erase ENGINE diagnostic trouble codes.
4. Using CONSULT, activate "DEF Line Heater Test".
5. The DTC will move to "Past" when the test runs and passes.

Is P20B9 DTC current?

YES >> Return to diagnostic procedure. Refer to EC-978, "DTC Description".
NO >> Repair complete.

Component Inspection

INFOID:0000000013211358

1.CHECK THE DEF LINE HEATER RESISTANCE

Measure the resistance between the DEF line heater pins at the DEF line heater.

Is the resistance between 4 and 10 ohms?

YES >> GO TO 2.
NO >> Replace the DEF line heater. Refer to EX-64, "Exploded View".

2.CHECK DEF LINE HEATER FOR A SHORT TO GROUND

Measure the resistance between the DEF line heater power supply (pin 1) and the metal case of the DEF line heater.

Is the resistance above 100 KΩ?

YES >> Inspection End.
NO >> Replace the DEF line heater. Refer to EX-64, "Exploded View".

P20BB REDUCTANT HEATER CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013099960

The heater relay supplies power to the DEF supply pump assembly. The DEF Line heater power supply and ground circuits are controlled by the DEF control module. Aftertreatment DEF Line heating is based on the input of the ambient temperature sensor. Heating of the line is initiated when the ambient temperature is below 0 degrees Celsius. The DEF supply pump assembly reports status back to the Engine Control Module (ECM) via CAN communication.

DTC DETECTION LOGIC

The DEF control module detected the DEF line heater is shorted to ground.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P20BB	DEF LINE HTR TEST STATUS DEF LINE HTR TEST COUNTS DEF LINE HTR OP STATE	Diagnosis condition	This diagnostic runs when the key switch is ON and line heating is commanded ON.
		Signal (terminal)	DEF line heater signal
		Threshold	DEF supply pump assembly line heater current > 15 A
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness and connectors.
- DEF line heater.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Connect CONSULT and activate "DEF Line Heater Test".
3. The DTC will move to "Past" when the test runs and passes.

Is P20BB DTC current?

YES >> Go to EC-981, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099961

1.CHECK FOR CURRENT DEF LINE HEATER CIRCUIT DTC

Check for DTC P20BB current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT DEF CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition OFF.
2. Disconnect the DEF control module.
3. Inspect both connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.

NO >> Repair or replace error-detected parts.

3.CHECK DEF LINE HEATER POWER CIRCUIT FOR SHORT TO GROUND

1. Disconnect the DEF line heater from the harness.
2. Check for continuity between DEF line heater power circuit at the DEF control module and ground.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	15	Ground	No

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair short circuit in harness connector.

4.CHECK DEF LINE HEATER GROUND CIRCUIT FOR SHORT TO GROUND

Check for continuity between DEF line heater ground circuit at the DEF control module and ground.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	30	Ground	No

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair short circuit in harness connector.

5.CHECK DEF LINE HEATER POWER CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check for continuity between DEF line heater power circuit at the DEF control module and all other circuits.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	15	All others	No

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair short circuit in harness connector.

6.CHECK DEF LINE HEATER GROUND CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check for continuity between DEF line heater ground circuit at the DEF control module and all other circuits.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	30	All others	No

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair short circuit in harness connector.

7.CHECK FOR CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Connect CONSULT and erase “ENGINE” diagnostic trouble codes.
4. Using CONSULT, activate ″DEF Line Heater Test″.
5. The DTC will move to ″Past″ when the test runs and passes.

Is P20BB DTC current?

YES >> A malfunctioning line heater has been detected. Replace the DEF line heater. Refer to EX-64, "Removal and Installation".

NO >> A malfunctioning DEF control module has been detected. Replace the DEF control module. Refer to EC-1259, "Removal and Installation".

P20BC REDUCTANT HEATER CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013099937

The heater relay supplies power to the DEF supply pump assembly. The DEF Line heater power supply and ground circuits are controlled by the DEF Control module. Aftertreatment DEF Line heating is based on the input of the ambient temperature sensor. Heating of the line is initiated when the ambient temperature is below 0 degrees Celsius. The DEF supply pump assembly reports status back to the Engine Control Module (ECM) via CAN communication.

DTC DETECTION LOGIC

The DEF control module detected the DEF line heater is shorted to battery.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P20BC	DEF LINE HTR TEST STATUS DEF LINE HTR TEST COUNTS DEF LINE HTR OP STATE	Diagnosis condition	This diagnostic runs when the key switch is ON and line heating is commanded ON.
		Signal (terminal)	DEF line heater signal
		Threshold	DEF supply pump assembly line heater current ≥ 4 A
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF line heater.
- DEF control module.
- Urea heater relay.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Connect CONSULT and activate "DEF Line Heater Test".
3. The DTC will move to "Past" when the test runs and passes.

Is P20BC DTC current?

YES >> Go to EC-984, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099938

1.CHECK FOR CURRENT DEF LINE HEATER CIRCUIT DTC

Check for DTC P20BC current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT DEF CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition OFF.
2. Disconnect the DEF control module.
3. Inspect both connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK DEF LINE HEATER POWER CIRCUIT FOR SHORT TO GROUND

1. Disconnect the DEF line heater from the harness.
2. Check for continuity between DEF line heater power circuit at the DEF control module and all other circuits.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	15	All others	No

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair short circuit in harness connector.

4. CHECK DEF LINE HEATER GROUND CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check for continuity between DEF line heater ground circuit at the DEF control module and all other circuits.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	30	All others	No

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair short circuit in harness connector.

5. CHECK FOR CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Using CONSULT, activate "DEF Line Heater Test".
4. The DTC will move to "Past" when the test runs and passes.

Is P20BC DTC current?

YES >> A malfunctioning line heater has been detected. Replace the DEF line heater. Refer to EX-64, "Removal and Installation".
NO >> A malfunctioning DEF control module has been detected. Replace the DEF control module. Refer to EC-1259, "Removal and Installation".

P20E8 REDUCTANT PRESSURE TOO LOW

DTC Description

INFOID:0000000013105359

NOTE:
If DTC P203F is displayed with this DTC, first perform the trouble diagnosis for the other DTC.

The Aftertreatment DEF control module activates priming, dosing and purging of the Diesel Exhaust Fluid (DEF). The DEF supply pump assembly is responsible for transporting diesel exhaust fluid between the dosing unit and the dosing valve. A restriction or damage to the pressure line or connections can cause DEF pressure to be erratic.

DTC DETECTION LOGIC

The DEF supply pump assembly was unable to successfully prime after multiple attempts.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P20E8	DEF LINE PRESS DEF PUMP STATUS	Diagnosis condition	When the DEF supply pump assembly attempts to prime.
		Signal (terminal)	DEF dosing pump
		Threshold	The DEF supply pump assembly has detected the Diesel Exhaust Fluid (DEF) Pressure ≤ 450 kPa (65 psi).
		Diagnosis delay time	—

POSSIBLE CAUSE

- Low DEF level in the tank.
- Frozen DEF in the line.
- DEF pressure line is kinked, broken, or disconnected.
- DEF supply pump assembly.
- Debris in the DEF tank.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Connect CONSULT and activate ″DEF System Leak Test″.
3. The DTC will move to ″Past″ when the test runs and passes.

Is P20E8 DTC current?

YES >> Go to EC-986, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013105360

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.
3. Check for DTC P20E8 current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DEF TANK LEVEL

1. Make sure the aftertreatment DEF tank is **not** empty and the tank level gauge is accurate.
2. Using CONSULT check for other ENGINE diagnostic trouble codes.

Is P203F DTC current?

YES >> Fill the DEF tank.
NO >> GO TO 3.

3.CHECK FOR OTHER CURRENT DEF DOSING VALVE DTCS

1. Turn ignition switch ON.
2. Using CONSULT check for the following “ENGINE” diagnostic trouble codes:

- P2048
- P202E

Are any of the above DTCs current?

YES >> Go to the appropriate diagnosis procedure. Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4. CHECK THE DEF TANK

1. Turn ignition switch OFF.
2. Check the DEF tank for debris or foreign particles.
3. Check the DEF tank vent for crystallization buildup and clogging.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Clean the DEF tank thoroughly and fill with certified DEF.

5. CHECK FOR OTHER RELATED CURRENT DTCS

1. Turn ignition switch ON.
2. Using CONSULT check for the following “ENGINE” diagnostic trouble code:

- P20E9

Is the above DTC current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 6.

6. INSPECT DEF SUPPLY PUMP ASSEMBLY, LINES AND FITTINGS

1. Connect CONSULT, select “ENGINE” and activate ″DEF System Leak Test″.
2. While the test is running, inspect all DEF lines, fittings, and connections for external leaks.

Any damaged, leaking, or restricted connections found?

YES >> Repair or replace the leaking DEF line, fitting, or DEF supply pump assembly.
NO >> GO TO 7.

7. CHECK FOR AIR IN THE DEF

1. Turn ignition switch ON.
2. Using CONSULT, check for air in the DEF.

Is air found in the DEF?

YES >> Check the DEF dosing unit fittings, pressure line fittings, tank fittings and repair as necessary.
NO >> GO TO 8.

8. INSPECT THE DEF TANK FILTER FOR BLOCKAGE

1. Turn ignition switch OFF.
2. Remove the tank level and temperature sensor from the DEF tank.
3. Inspect the aftertreatment DEF tank filter for signs of blockage or buildup.

Is the DEF tank filter blocked?

YES >> Clean the DEF tank or replace the DEF supply pump assembly. Drain, clean, and refill the DEF tank.
NO >> GO TO 9.

9. CHECK DEF DOSING UNIT FOR PROPER OPERATION

1. Connect all components and harness connectors.
2. Remove the aftertreatment DEF dosing valve from the decomposition tube.
3. Place the DEF dosing valve in a measuring container having greater than a 1.5 liter [50 oz] capacity.
4. Turn ignition switch ON.
5. Using CONSULT, access “ENGINE” and select ″DEF Dosing Unit Override Test″ active test.

Did the DEF dosing unit operate according to specifications?

YES >> GO TO 10.
NO >> Replace the DEF supply pump assembly. Refer to EX-64, "Exploded View".

10. ERASE DTCS

1. Using CONSULT, select “ENGINE” and erase DTCs.
2. Operate the engine within the "Conditions for Clearing the DTC".

Is P20E8 DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-986, "DTC Description".
NO >> Repair complete.

P20E9 REDUCTANT PRESSURE TOO HIGH

DTC Description

INFOID:0000000013111617

The Diesel Exhaust Fluid (DEF) Pressure Sensor is a three wire sensor, integrated into the DEF Supply Pump assembly and is not serviceable separate. The DEF Pressure Sensor monitors supply pressure to the DEF Injector. The Diesel Exhaust Fluid (DEF) control module provides a 5V Supply and a ground to the DEF Pressure Sensor. The sensor provides a signal to the DEF control module on the DEF Pressure Sensor Signal circuit. This DEF Pressure Sensor Signal voltage changes, based on the diesel exhaust fluid pressure supplied by the DEF supply pump.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected that the DEF supply pump assembly pressure control is too high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P20E9	DEF LINE PRESS DEF PUMP STATUS	Diagnosis condition	When the key switch is ON or the engine is running.
		Signal (terminal)	DEF pressure sensor
		Threshold	The DEF control module has detected the Diesel Exhaust Fluid (DEF) Pressure ≤> 600 kPa (87 psi) for more than 20 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Blocked, restricted, or frozen DEF return line or return line fitting.
- DEF supply pump assembly.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Connect CONSULT and activate ″DEF System Leak Test″.
3. The DTC will move to ″Past″ when the test runs and passes.

Is P20E9 DTC current?

YES >> Go to EC-989, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013111618

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.
3. Check for DTC P20E9 current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DEF TANK LEVEL

1. Make sure the aftertreatment DEF tank is **not** empty and the tank level gauge is accurate.
2. Using CONSULT check the DEF tank level and compare it to the gauge on the dash.

DEF tank empty?

YES >> Fill the DEF tank.
NO >> GO TO 3.

3.CHECK FOR OTHER CURRENT DEF QUALITY DTCS

Using CONSULT check ENGINE diagnostic trouble codes for DTCs related to DEF quality.

Are there any current DTCs related to DEF quality?

YES >> Go to the appropriate diagnosis procedure. Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4. CHECK FOR OTHER CURRENT DEF DOSING SYSTEM DTCS

Using CONSULT check ENGINE diagnostic trouble codes for DTCs related to DEF dosing system.

Are there any current DTCs related to DEF dosing system?

YES >> Go to the appropriate diagnosis procedure. Refer to EC-135, "DTC Index".
NO >> GO TO 5.

5. INSPECT DEF SUPPLY PUMP ASSEMBLY, LINES AND FITTINGS

1. Turn ignition switch OFF.
2. Disconnect the aftertreatment DEF dosing line from the dosing valve.
3. Disconnect the aftertreatment DEF dosing line from the DEF tank.
4. Check the aftertreatment DEF dosing line for blockage.
5. Check the dosing unit supply, dosing valve supply, return connectors, and fittings for loose or leaking connections.
6. Look at both ends of the line to check for signs of buildup or blockage.
7. Blow compressed shop air through the supply line to establish/confirm free flow.
8. Check the dosing line for signs of leakage or openings which would allow the dosing unit to suck in air with the DEF.

DEF dosing line or connections blocked, cracked, or restricted?

YES >> Repair or replace the dosing line or fittings.
NO >> GO TO 6.

6. PERFORM DEF DOSING UNIT OVERRIDE TEST

1. Connect all components and harness connectors.
2. Remove the aftertreatment DEF dosing valve from the decomposition tube.
3. Place the DEF dosing valve in a measuring container having greater than a 1.5 liter [50 oz] capacity.
4. Turn ignition switch ON.
5. Using CONSULT, access ’ENGINE” and select ″DEF Dosing Unit Override Test″ active test.

Did the DEF dosing unit operate according to specifications?

YES >> GO TO 7.
NO >> Replace the DEF supply pump assembly. Refer to EX-64, "Exploded View".

7. ERASE DTCS

1. Turn ignition switch OFF.
2. Connect all components and harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, select “ENGINE” and erase DTCs.
5. Operate the engine within the "Conditions for Clearing the DTC".

Is P20E9 DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-989, "DTC Description".
NO >> Repair complete.

P20EE SCR NOX CATALYST EFFICIECY

DTC Description

INFOID:0000000013073093

The engine control module (ECM) monitors the NOx concentration in the engine's exhaust gases using an aftertreatment intake NOx sensor and an aftertreatment outlet NOx sensor. By comparing these two values, the ECM is able to determine the conversion efficiency of the SCR catalyst and dosing system.

DTC DETECTION LOGIC

The system has detected a decrease of the NOx converting catalyst's conversion capability resulting in tailpipe out NOx emissions exceeding the applicable threshold.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P20EE	INTAKE NOX INTAKE NOX CORRCTD INTAKE NOX READING STBL OUTLET NOX OUTLET NOX CORRCTD OUTLET NOX READING STBL	Diagnosis condition	This diagnostic has to meet specific engine and after-treatment conditions to run and complete (pattern 3 four times).
		Signal (terminal)	NOx sensor signal.
		Threshold	Amplified catalyst in-efficiency (ACIE) Where: ACIE is the SCR catalyst inefficiency amplified using the ammonia to NOx ratio ≥ 40 (unitless).
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning DEF supply pump assembly.
- Exhaust system leaks.
- Malfunctioning SCR catalyst
- Degraded, diluted, or incorrect DEF.
- DEF deposits in the decomposition tube.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 eleven more times.
6. Check 1st trip DTC.

Is P20EE DTC detected?

YES >> Proceed to EC-991, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073094

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing ENGINE diagnostic trouble codes.
3. Check for DTC P20EE current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FOR OTHER PRIORITY DTCS

Using CONSULT, check ENGINE diagnostic trouble codes for the following higher priority DTCs:

- U029D
- U029E
- U059E
- U059F
- P1C55
- P2201
- P2202
- P2209
- P220A
- P220B
- P229E
- P229F
- P22A7

Are there any of the above DTCs current?

YES >> Go to the appropriate diagnosis procedure. Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. CHECK FOR CURRENT SCR TEMPERATURE SENSOR DTCS

Using CONSULT check ENGINE diagnostic trouble codes for DTCs related to SCR temperature sensor.

Are there any current DTCs related to SCR temperature sensor?

YES >> Go to the appropriate diagnosis procedure. Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4. CHECK FOR CURRENT DEF DOSING SYSTEM DTCS

Using CONSULT check ENGINE diagnostic trouble codes for DTCs related to DEF dosing system.

Are there any current DTCs related to DEF dosing system?

YES >> Go to the appropriate diagnosis procedure. Refer to EC-135, "DTC Index".
NO >> GO TO 5.

5. INSPECT THE EXHAUST SYSTEM FOR LEAKS

1. Start the engine.
2. Check the exhaust for leaks.
3. Inspect the entire exhaust system between the turbocharger outlet and the SCR outlet. Inspect for loose connections, leaking connections, and broken exhaust system components.

Exhaust system leaks found?

YES >> Repair or replace the damaged exhaust system component.
NO >> GO TO 6.

6. INSPECT THE DEF DOSING SYSTEM FOR EXTERNAL LEAKS

1. Turn ignition switch OFF.
2. Inspect all components of the aftertreatment DEF dosing system for signs of external leaks, including:

- Tank connectors.
- Dosing unit and dosing unit connectors.
- Lines.
- Dosing valve.
- DEF will form white deposits around leaky fittings.

DEF leaks detected in the system?

YES >> Repair the source of the external leak.
NO >> GO TO 7.

7. CHECK DEF QUALITY

1. Inspect the DEF in the tank for signs of debris or contamination.
2. Using a refractometer [SST: J-54466] measure the concentration of the DEF in the tank.

Is DEF concentration within 32.5 Â± 1.5 %?

YES >> GO TO 8.
NO >> Drain the DEF tank, rinse with water, and refill with pure DEF.

8. PERFORM DEF DOSING UNIT FOR PROPER OPERATION

1. Connect all components and harness connectors.
2. Remove the aftertreatment DEF dosing valve from the decomposition tube.
3. Place the DEF dosing valve in a measuring container having greater than a 1.5 liter [50 oz] capacity.
4. Turn ignition switch ON.
5. Using CONSULT, access ENGINE and select "DEF Dosing Unit Override Test" active test.

Did the DEF dosing unit operate according to specifications?

YES >> GO TO 9.
NO >> Replace the DEF supply pump assembly. Refer to EX-64, "Exploded View".

9. CHECK DEF DOSING VALVE FOR PROPER OPERATION

Using CONSULT, access ENGINE and select DEF Dosing Unit Leak Test active test.

DEF leaking from the DEF dosing valve during the system leak test?

YES >> A leaking aftertreatment DEF dosing valve has been detected. Replace the aftertreatment DEF dosing valve.
NO >> GO TO 10.

10. CHECK DEF DEPOSITS IN THE DECOMPOSITION TUBE

1. Turn ignition switch OFF (do not operate the engine).
2. Inspect the decomposition tube for deposits.
3. Remove the decomposition tube from the vehicle.
4. Inspect for excessive DEF deposits.

Excessive DEF deposits found inside the decomposition tube?

YES >>
- Clean and install the decomposition tube.
- GO TO 11.

NO >>
- A malfunctioning SCR catalyst has been detected. Replace the aftertreatment SCR catalyst. Refer to EX-36, "Removal and Installation".
- Replace the aftertreatment intake NOx sensor. Refer to EX-45, "Removal and Installation".
- Replace the aftertreatment outlet NOx sensor. Refer to EX-48, "Removal and Installation".
- GO TO 11.

11. ERASE DTCS

1. Using CONSULT, select ENGINE and erase DTCs.
2. Operate the engine within the "Conditions for Clearing the DTC".

Is P20EE DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-991, "DTC Description".
NO >> Repair complete.

P20FF REDUCTANT CONTROL MODULE PERFORMANCE

DTC Description

INFOID:0000000013102941

The Diesel Exhaust Fluid (DEF) control module is the central control for the Selective Catalytic Reduction (SCR) diesel exhaust fluid dosing system, and handles the dosing activity, tank level sensing, tank temperature sensing, line heating, and tank heating. The DEF control module communicates to the engine control module (ECM) via CAN communication.

DTC DETECTION LOGIC

An internal error has been detected in the DEF control module.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P20FF	Byte order	Diagnosis condition	When the key switch is ON or the engine is running.
		Signal (terminal)	DEF control module
		Threshold	Bad intelligent device or component was detected in the DEF control module, and has been communicated to the ECM via CAN communication.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF control module.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P20FF being current on the CONSULT screen.

Is P20FF DTC current?

YES >> Go to EC-994, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102942

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.
3. Check for DTC P20FF current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.RESET DTCS

1. Using CONSULT, select “ENGINE” and erase DTCs.
2. Turn ignition switch OFF.
3. Wait 90 seconds.

4. Turn ignition switch ON.
5. Using CONSULT, check for existing “ENGINE” diagnostic trouble codes.

Is P20FF DTC current?

YES >> Replace the DEF control module. Refer to EC-1259, "Removal and Installation".
NO >> GO TO 3.

3. PERFORM LEAK TEST

1. Using CONSULT, select “ENGINE” and perform the ″DEF System Leak Test″ active test.
2. Turn ignition switch OFF.
3. Wait 90 seconds.
4. Turn ignition switch ON.
5. Using CONSULT, check for existing “ENGINE” diagnostic trouble codes.

Is P20FF DTC current?

YES >> Replace the DEF control module. Refer to EC-1259, "Removal and Installation".
NO >> GO TO 4.

4. ERASE DTCS

1. Using CONSULT, select “ENGINE” and erase DTCs.
2. Operate the engine within the "Conditions for Clearing the DTC".

Is P20FF DTC current?

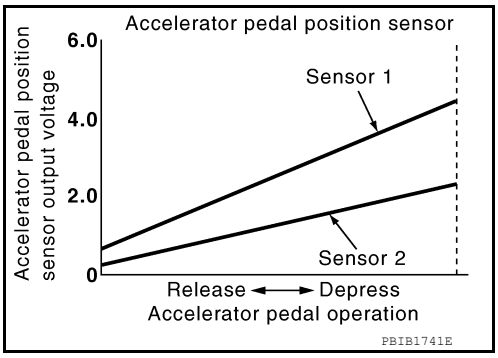
YES >> Diagnosis procedure needs to be repeated. Refer to EC-994, "DTC Description".
NO >> Repair complete.

P2121 ACCELERATOR PEDAL POSITION SENSOR 1

DTC Description

INFOID:0000000013102608

NOTE:
If DTC P2121 is displayed with any of the following DTCs, first perform the trouble diagnosis for other DTC:
- P2122. Refer to EC-1000, "DTC Description".
- P2123. Refer to EC-1004, "DTC Description".
- P2127. Refer to EC-1008, "DTC Description".
- P2128. Refer to EC-1012, "DTC Description".



The accelerator pedal position sensor is a potentiometer type sensor attached to the accelerator pedal assembly. The accelerator position position sensor varies the signal voltage to the ECM as the accelerator pedal is depressed and released. Low signal voltage is received by the ECM when the accelerator pedal is at 0%. A high signal voltage is received by the ECM when the accelerator pedal is at 100%. The accelerator pedal position circuit contains an accelerator pedal position 5V supply, accelerator pedal return, and accelerator pedal position signal.
The accelerator pedal position sensor contains two sensors. These sensors are used to measure the throttle position. Both position sensors receive a 5 volt supply from the ECM. A corresponding signal voltage based on the position of the accelerator pedal is then received from the ECM. The signal voltage for accelerator position 1 is twice as much as the signal voltage from the accelerator position 2.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2121	ACC POS SENS V ACC POS SENS SPLY V	Diagnosis condition	When the key switch is ON or the engine is running.
		Signal (terminal)	Accelerator pedal position sensor signals
		Threshold	The difference between accelerator pedal position sensor 1 signal and accelerator pedal position sensor 2 signal differ by more than 10%.
		Diagnosis delay time	—

POSSIBLE CAUSE
- Accelerator Pedal Position (APP) Sensor
- Harness or connectors

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.

Is P2121 DTC detected?

YES >> Go to EC-997, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102609

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following other existing “ENGINE” diagnostic trouble codes:

- P2122
- P2123
- P2127
- P2128

Are any of the above applicable DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.INSPECT ACCELERATOR PEDAL POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the accelerator pedal position sensor from engine harness connector.
3. Inspect the accelerator pedal position sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Are both P2122 and P2127 DTCs current?

YES >> GO TO 4.
NO >> • P2122 is not current. Refer to EC-1000, "DTC Description".
• P2127 is not current. Refer to EC-1008, "DTC Description".

4.CHECK ACCELERATOR PEDAL POSITION 1 SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the accelerator pedal position sensor.
3. Turn ignition switch ON.
4. Check the voltage between accelerator pedal position sensor supply voltage and return circuit terminals.

Accelerator Pedal Position Sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
E20	2	4	5

Is the inspection result normal?

YES >> GO TO 5.
NO >> Low sensor supply voltage has been detected. Refer to EC-1000, "DTC Description".

5.CHECK ACCELERATOR PEDAL POSITION 2 SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the accelerator pedal position sensor.
3. Turn ignition switch ON.

4. Check the voltage between accelerator pedal position sensor supply voltage and return circuit terminals.

Accelerator pedal position sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
E20	1	5	5

Is the inspection result normal?

YES >> GO TO 6.
NO >> Low sensor supply voltage has been detected. Refer to EC-1008, "DTC Description".

6. CHECK FOR DTCS

1. Turn ignition switch OFF.
2. Reconnect the accelerator pedal position sensor connector.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P2121 DTC become ″past″?

YES >> The removal and installation of the connector corrected the issue.
NO >> GO TO 7.

7. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector.
3. Inspect the ECM connector for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT CONNECTOR FOR SHORT

1. Disconnect the accelerator pedal position sensor.
2. Check the continuity between accelerator pedal position sensor 1 signal and all other circuits at ECM harness connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	79	All others	No

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair short circuit in harness connector.

9. CHECK ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL CIRCUIT CONNECTOR FOR SHORT

Check the continuity between Accelerator pedal position sensor 2 signal and all other circuits at ECM harness connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	78	All others	No

Is the inspection result normal?

YES >> • A damaged accelerator pedal has been detected. Replace the Accelerator pedal position sensor. Refer to ACC-3, "Removal and Installation".
• GO TO 10.

NO >> Repair short circuit in harness connector.

10. ERASE DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, select “ENGINE” and erase DTCs.
5. Operate the engine within the "Conditions for Clearing the DTC".

Is P2121 DTC current?

YES >> Diagnosis procedure needs to be repeated. Refer to EC-996, "DTC Description".

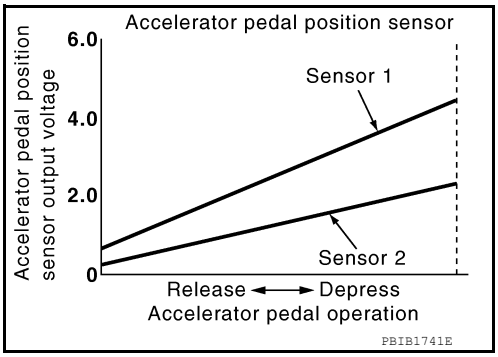
NO >> Repair complete.

P2122 ACCELERATOR PEDAL POSITION SENSOR 1

DTC Description

INFOID:0000000013025119

NOTE:
If DTC P2122 is displayed with any of the following DTCs, first perform the trouble diagnosis for other DTC:
- P06A4. Refer to EC-135, "DTC Index".
- P06A5. Refer to EC-135, "DTC Index".



The accelerator pedal position sensor is a potentiometer type sensor attached to the accelerator pedal assembly. The accelerator position position sensor varies the signal voltage to the ECM as the accelerator pedal is depressed and released. Low signal voltage is received by the ECM when the accelerator pedal is at 0%. A high signal voltage is received by the ECM when the accelerator pedal is at 100%. The accelerator pedal position circuit contains an accelerator pedal position 5V supply, accelerator pedal return, and accelerator pedal position signal.
The accelerator pedal position sensor contains two sensors. These sensors are used to measure the throttle position. Both position sensors receive a 5V supply from the ECM. A corresponding signal voltage based on the position of the accelerator pedal is then received from the ECM. The signal voltage for accelerator position 1 is twice as much as the signal voltage from the accelerator position 2.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2122	ACC POS SENS V ACC POS SENS SPLY V	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Accelerator pedal position sensor signal
		Threshold	• The accelerator pedal position sensor signal is not detected by the ECM during the first 0.8 second of engine cranking. • The proper accelerator pedal position sensor (POS) is not sent to ECM while the engine is running. • The accelerator pedal position sensor signal is not in the normal pattern during engine running. • The accelerator pedal position sensor 1 signal is < 0.293 volt (0%).
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
- Sensor 5 volt supply circuit is open or shorted.
- Sensor return circuit is open or shorted.
- Sensor signal circuit is open or shorted.
- Accelerator Pedal Position (APP) Sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-567, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013025122

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P06A4 or P06A5 is present, perform the confirmation procedure (trouble diagnosis) for these other DTCs first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR ACTIVE ACCELERATOR PEDAL POSITION SENSOR DTC

Check for DTC P2122 being active on the CONSULT screen.

Is applicable DTC active?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT ACCELERATOR PEDAL POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the accelerator pedal position sensor from engine harness connector.
3. Inspect the accelerator pedal position sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK ACCELERATOR PEDAL POSITION SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch ON.
2. Check the voltage between accelerator pedal position sensor supply voltage and return circuit terminals.

Accelerator pedal position sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
E20	2	4	5

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.

2. Connect a jumper wire between accelerator pedal position sensor connector 5V supply terminal 2 and signal circuit terminal 3.
3. Turn key ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P2123 DTC become active and P2122 DTC become inactive?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Reconnect the accelerator pedal position sensor connector.
4. Key ON. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P2122 DTC become active?

YES >> Replace the accelerator pedal position sensor. Refer to ACC-3, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK ACCELERATOR PEDAL POSITION SENSOR CIRCUITS FOR OPEN

Check the continuity between accelerator pedal position sensor harness connector and ECM harness connector.

Accelerator pedal position sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E20	2	E93	80	Yes
	3		79	

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair open circuit in harness or connectors.

9. CHECK ACCELERATOR PEDAL POSITION SENSOR SIGNAL CIRCUIT CONNECTOR FOR SHORT

Check the continuity between accelerator pedal position sensor signal and all other circuits at ECM harness connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	79	All others	No

Is the inspection result normal?

YES >> GO TO 10.

NO >> Repair short circuit in harness connector.

10. CHECK ACCELERATOR PEDAL POSITION SENSOR SIGNAL CIRCUIT FOR SHORT

Check the continuity between accelerator pedal position sensor harness connector and ground.

ECM		Ground	Continuity
Connector	Terminal		
E93	79	—	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair short circuit in harness or connectors.

11. CHECK FOR INACTIVE DTC

1. Connect all components in the correct positions.
2. Turn ignition switch ON.
3. Connect CONSULT and check for inactive “ENGINE” diagnostic trouble codes.

Is P2122 DTC inactive?

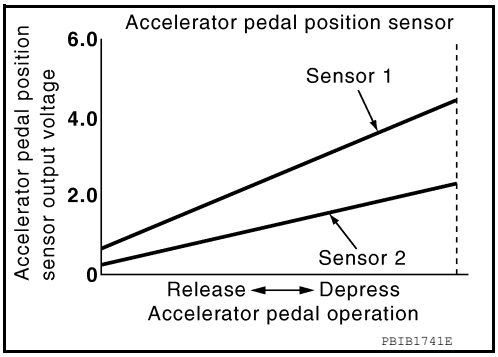
YES >> The removal and installation of the connector corrected the issue.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P2123 ACCELERATOR PEDAL POSITION SENSOR 1

DTC Description

INFOID:0000000013057474

NOTE:
If DTC P2123 is displayed with any of the following DTCs, first perform the trouble diagnosis for other DTC:
- P2122. Refer to EC-135, "DTC Index".
- P06A5. Refer to EC-135, "DTC Index".



The accelerator pedal position sensor is a potentiometer type sensor attached to the accelerator pedal assembly. The accelerator position position sensor varies the signal voltage to the ECM as the accelerator pedal is depressed and released. Low signal voltage is received by the ECM when the accelerator pedal is at 0%. A high signal voltage is received by the ECM when the accelerator pedal is at 100%. The accelerator pedal position circuit contains an accelerator pedal position 5V supply, accelerator pedal return, and accelerator pedal position signal.
The accelerator pedal position sensor contains two sensors. These sensors are used to measure the throttle position. Both position sensors receive a 5V supply from the ECM. A corresponding signal voltage based on the position of the accelerator pedal is then received from the ECM. The signal voltage for accelerator position 1 is twice as much as the signal voltage from the accelerator position 2.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2123	ACC POS SENS 2 V ACC POS SENS 2 SPLY V	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Accelerator pedal position sensor signal
		Threshold	• The accelerator pedal position sensor signal is not detected by the ECM during the first 0.8 second of engine cranking. • The proper accelerator pedal position sensor (POS) is not sent to ECM while the engine is running. • The accelerator pedal position sensor signal is not in the normal pattern during engine running. • The accelerator pedal position sensor 1 signal voltage is > 4.692 volt (100%).
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
- Sensor 5 volt supply circuit is shorted to battery.
- Sensor return circuit is open.
- Sensor signal circuit is shorted to battery or 5V supply.
- Accelerator Pedal Position (APP) Sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-567, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013057475

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P2122 or P06A5 is present, perform the confirmation procedure (trouble diagnosis) for these other DTCs first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR ACTIVE ACCELERATOR PEDAL POSITION SENSOR DTC

Check for DTC P2123 being active on the CONSULT screen.

Is applicable DTC active?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT ACCELERATOR PEDAL POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the accelerator pedal position sensor from engine harness connector.
3. Inspect the accelerator pedal position sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK ACCELERATOR PEDAL POSITION SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch ON.
2. Check the voltage between accelerator pedal position sensor supply voltage and return circuit terminals.

Accelerator pedal position sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
E20	2	4	5

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE CIRCUIT RESPONSE

1. Insure ignition switch is still ON.
2. Wait 30 seconds.

3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P2122 DTC become active and P2123 DTC become inactive?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Reconnect the accelerator pedal position sensor connector.
3. Key ON. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P2123 DTC become active?

YES >> Replace the accelerator pedal position sensor. Refer to ACC-3, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK ACCELERATOR PEDAL POSITION SENSOR RETURN CIRCUIT FOR OPEN

Check the return circuit for continuity between accelerator pedal position sensor harness connector and ECM harness connector.

Accelerator pedal position sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E20	4	E93	63	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair open circuit in harness or connectors.

9. CHECK ACCELERATOR PEDAL POSITION SENSOR SIGNAL CIRCUIT CONNECTOR FOR SHORT

Check the continuity between accelerator pedal position sensor signal and all other circuits at ECM harness connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	79	All others	No

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair short circuit in harness connector.

10. CHECK FOR INACTIVE DTC

1. Connect all components in the correct positions.
2. Turn ignition switch ON.

3. Connect CONSULT and check for inactive “ENGINE” diagnostic trouble codes.

Is P2123 DTC inactive?

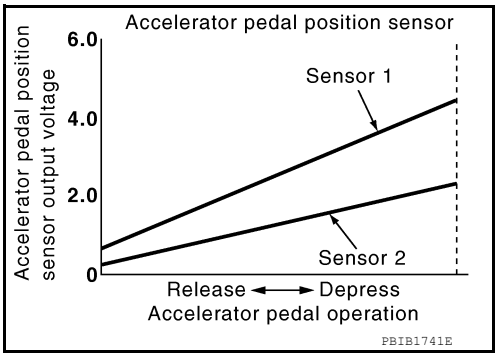
YES >> The removal and installation of the connector corrected the issue.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P2127 ACCELERATOR PEDAL POSITION SENSOR 2

DTC Description

INFOID:0000000013057469

NOTE:
If DTC P2127 is displayed with any of the following DTCs, first perform the trouble diagnosis for other DTC:
- P06D3. Refer to EC-135, "DTC Index".
- P06D4. Refer to EC-135, "DTC Index".



The accelerator pedal position sensor is a potentiometer type sensor attached to the accelerator pedal assembly. The accelerator position sensor varies the signal voltage to the ECM as the accelerator pedal is depressed and released. Low signal voltage is received by the ECM when the accelerator pedal is at 0%. A high signal voltage is received by the ECM when the accelerator pedal is at 100%. The accelerator pedal position circuit contains an accelerator pedal position 5V supply, accelerator pedal return, and accelerator pedal position signal.
The accelerator pedal position sensor contains two sensors. These sensors are used to measure the throttle position. Both position sensors receive a 5V supply from the ECM. A corresponding signal voltage based on the position of the accelerator pedal is then received from the ECM. The signal voltage for accelerator position 1 is twice as much as the signal voltage from the accelerator position 2.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2127	ACC POS SENS 2 V ACC POS SENS 2 SPLY V	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Accelerator pedal position sensor 2 signal
		Threshold	• The accelerator pedal position sensor signal is not detected by the ECM during the first 0.8 second of engine cranking. • The proper accelerator pedal position sensor (POS) is not sent to ECM while the engine is running. • The accelerator pedal position sensor signal is not in the normal pattern during engine running. • The accelerator pedal position sensor 2 signal voltage is < 0.4 volt for more than 1 second.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
- Sensor 5 volt supply circuit is open or shorted.
- Sensor return circuit is open or shorted.
- Sensor signal circuit is open or shorted.
- Accelerator Pedal Position (APP) Sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-567, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013057470

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P06D3 is present, perform the confirmation procedure (diagnosis procedure) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-825, "DTC Description".
NO >> GO TO 2.

2.CHECK FOR ACTIVE ACCELERATOR PEDAL POSITION SENSOR DTC

Check for DTC P2127 being active on the CONSULT screen.

Is applicable DTC active?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT ACCELERATOR PEDAL POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the accelerator pedal position sensor from engine harness connector.
3. Inspect the accelerator pedal position sensor connector for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK ACCELERATOR PEDAL POSITION SENSOR POWER SUPPLY AND RETURN CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between accelerator pedal position sensor supply voltage and return circuit terminals.

Accelerator pedal position sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
E20	1	5	5

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.

2. Connect a jumper wire between accelerator pedal position sensor connector 5V supply terminal 1 and signal circuit terminal 6.
3. Turn key ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did P2128 DTC become active and P2127 DTC become inactive?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK THE DTC AND VERIFY ACCELERATOR PEDAL CONDITION

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Reconnect the accelerator pedal position sensor connector.
4. Turn ignition switch ON.
5. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P2127 DTC become active?

YES >> Replace the accelerator pedal position sensor. Refer to ACC-3, "Removal and Installation".
NO >> The removal and installation of the connector corrected the issue.

7. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector.
3. Inspect the ECM connector for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK ACCELERATOR PEDAL POSITION SENSOR POWER SUPPLY CIRCUIT FOR OPEN

Check the power circuit for continuity between accelerator pedal position sensor harness connector and ECM harness connector.

Accelerator pedal position sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E20	1	E93	81	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair open power supply circuit in harness or connectors.

9. CHECK ACCELERATOR PEDAL POSITION SENSOR SIGNAL CIRCUIT FOR OPEN

Check the signal circuit for continuity between accelerator pedal position sensor harness connector and ECM harness connector.

Accelerator pedal position sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E20	6	E93	78	Yes

Is the inspection result normal?

YES >> GO TO 10.

NO >> Repair open signal circuit in harness or connectors.

10.CHECK FOR A PIN TO PIN SHORT IN SIGNAL CIRCUIT

Check for continuity between accelerator pedal position sensor signal circuit and all other circuits at ECM harness connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	78	All others	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair short signal circuit in harness connector.

11.CHECK ACCELERATOR PEDAL POSITION SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

Check for continuity between accelerator pedal position sensor signal circuit and ground at ECM harness connector.

ECM		Ground	Continuity
Connector	Terminal		
E93	78	—	No

Is the inspection result normal?

YES >> GO TO 12.
NO >> Repair accelerator pedal position sensor signal circuit for a short to ground.

12.CHECK FOR CURRENT VS PAST DTC

1. Connect all components in the correct positions.
2. Turn ignition switch ON.
3. Connect CONSULT and check for ″past″ “ENGINE” diagnostic trouble codes.

Is P2127 DTC inactive?

YES >> • The removal and installation of the connector corrected the issue.
• GO TO 13.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 13.

13.ERASE DTC

1. Using CONSULT, erase all DTCs.
2. Operate the engine within the conditions for setting the DTC.
3. Using CONSULT, check for existing “ENGINE” diagnostic trouble codes.

Is P2127 DTC current?

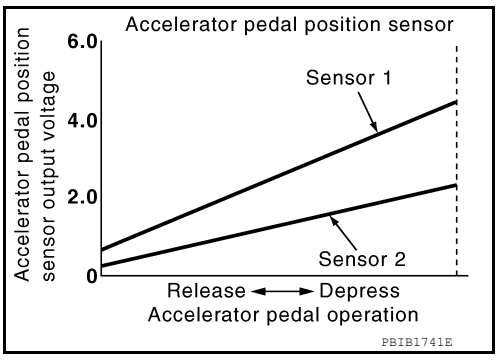
YES >> Troubleshooting procedure needs to be repeated. Go to EC-1008, "DTC Description".
NO >> Repair complete.

P2128 ACCELERATOR PEDAL POSITION SENSOR 2

DTC Description

INFOID:0000000013057533

NOTE:
If DTC P2128 is displayed with any of the following DTCs, first perform the trouble diagnosis for other DTC:
• P06D4. Refer to EC-135, "DTC Index".



The accelerator pedal position sensor is a potentiometer type sensor attached to the accelerator pedal assembly. The accelerator position sensor varies the signal voltage to the ECM as the accelerator pedal is depressed and released. Low signal voltage is received by the ECM when the accelerator pedal is at 0%. A high signal voltage is received by the ECM when the accelerator pedal is at 100%. The accelerator pedal position circuit contains an accelerator pedal position 5 volt supply, accelerator pedal return, and accelerator pedal position signal.
The accelerator pedal position sensor contains two sensors. These sensors are used to measure the throttle position. Both position sensors receive a 5 volt supply from the ECM. A corresponding signal voltage based on the position of the accelerator pedal is then received from the ECM. The signal voltage for accelerator position 1 is twice as much as the signal voltage from the accelerator position 2.

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2128	ACC POS SENS 2 V ACC POS SENS 2 SPLY V	Diagnosis condition	Ignition switch ON.
		Signal (terminal)	Accelerator pedal position sensor 2 signal.
		Threshold	• The accelerator pedal position sensor signal is not detected by the ECM during the first 0.8 second of engine cranking. • The proper accelerator pedal position sensor (POS) is not sent to ECM while the engine is running. • The accelerator pedal position sensor signal is not in the normal pattern during engine running. • The accelerator pedal position sensor 2 signal voltage is > 2.4 volt for more than 1 second.
		Diagnosis delay time	—

POSSIBLE CAUSE

• Harness or connectors
- Sensor 5 volt supply circuit is shorted to battery.
- Sensor return circuit is open.
- Sensor signal circuit is shorted to battery or 5 volt supply.
• Accelerator Pedal Position (APP) Sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-567, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013057534

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing ENGINE diagnostic trouble codes.

If DTC P06D4 is present, perform the confirmation procedure (diagnosis procedure) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-828, "DTC Description".
NO >> GO TO 2.

2.CHECK FOR ACTIVE APPS DTC

Check for DTC P2128 being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT ACCELERATOR PEDAL POSITION SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the accelerator pedal position sensor from engine harness connector.
3. Inspect the accelerator pedal position sensor connector for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK ACCELERATOR PEDAL POSITION SENSOR POWER SUPPLY AND RETURN CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between accelerator pedal position sensor supply voltage and return circuit terminals.

APPS			Voltage (V)
Connector	Terminal (+)	Terminal (-)	
E20	1	5	Approx. 5

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE CIRCUIT RESPONSE

1. Insure ignition switch is still ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did P2127 DTC become current and P2128 DTC become past?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK DTC AND VERIFY ACCELERATOR PEDAL CONDITION

1. Turn ignition switch OFF.
2. Reconnect the accelerator pedal position sensor connector.
3. Turn ignition switch ON.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did P2123 DTC become current?

YES >> • Replace the accelerator pedal position sensor. Refer to ACC-3, "Removal and Installation".
• GO TO 11.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 11.

7. INSPECT ECM AND ENGINE HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM from engine harness connector.
3. Inspect the ECM connector for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK APPS SENSOR RETURN CIRCUIT FOR OPEN

Check the return circuit for continuity between APPS sensor harness connector and ECM harness connector.

APPS		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E20	5	E93	62	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair return circuit for open in harness or connectors.

9. CHECK FOR PIN TO PIN SHORT WITH SENSOR SIGNAL CIRCUIT

Check the continuity between APPS sensor signal and all other circuits at ECM harness connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	78	All others	No

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair signal circuit for a short in harness connector.

10. CHECK FOR CURRENT VS PAST DTC

1. Connect all components in the correct positions.
2. Turn ignition switch ON.

3. Wait 30 seconds.
4. Using CONSULT, check for past ENGINE diagnostic trouble codes.

Is P2128 DTC past?

YES >> • The removal and installation of the connector corrected the issue.
• GO TO 11.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 11.

11. ERASE DTC

1. Using CONSULT, erase all DTCs.
2. Operate the engine within the conditions for setting the DTC.
3. Using CONSULT, check for existing ENGINE diagnostic trouble codes.

Is P2128 DTC current?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-1012, "DTC Description".
NO >> Repair complete.

P2146 FUEL INJECTOR GROUP 1 POWER CIRCUIT

DTC Description

INFOID:0000000013098747

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2146	INJECTOR	Diagnosis condition	This diagnostic runs continuously when the engine is running.
		Signal (terminal)	Fuel injector signal.
		Threshold	The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness and connectors.
- Fuel injector.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P2146 being current on the CONSULT screen.

Is P2146 DTC current?

YES >> Go to EC-1016, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013098748

1.CHECK FOR CURRENT DEF LEVEL SENSOR DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing ENGINE diagnostic trouble codes.

Is P2146 DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel injectors 1, 4, 6, and 7.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE FUEL INJECTOR RESISTANCE

Check the resistance value across the two pins of each of the injectors 1, 4, 6, and 7. Refer to EC-980, "Component Inspection".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace the malfunctioning fuel injector. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

4. INSPECT ECM AND ELECTRICAL CONNECTIONS

1. Disconnect the ECM.
2. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK INJECTOR 1 SIGNAL AND DRIVER CIRCUITS FOR SHORT

Check injector 1 signal and driver circuits for continuity between the ECM connector and battery post.

ECM		Battery post	Continuity
Connector	Terminal		
F101	155	(+)	No
		(–)	
	176	(+)	
		(–)	

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace the engine harness.

6. CHECK INJECTOR 4 SIGNAL AND DRIVER CIRCUITS FOR SHORT

Check injector 4 signal and driver circuits for continuity between the ECM connector and battery post.

ECM		Battery post	Continuity
Connector	Terminal		
F101	157	(+)	No
		(–)	
	178	(+)	
		(–)	

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the engine harness.

7. CHECK INJECTOR 6 SIGNAL AND DRIVER CIRCUITS FOR SHORT

Check injector 6 signal and driver circuits for continuity between the ECM connector and battery post.

ECM		Battery post	Continuity
Connector	Terminal		
F101	158	(+)	No
		(–)	
	179	(+)	
		(–)	

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the engine harness.

8. CHECK INJECTOR 7 SIGNAL AND DRIVER CIRCUITS FOR SHORT

Check injector 7 signal and driver circuits for continuity between the ECM connector and battery post.

ECM		Battery post	Continuity
Connector	Terminal		
F101	156	(+)	No
		(–)	
	177	(+)	
		(–)	

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace the engine harness.

9. PERFORM FUEL SYSTEM DIAGNOSTIC TEST

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Use SST J-54421 to perform the next step.
4. Using CONSULT, select ENGINE and perform the ″Fuel Injector Drain Flow Test″ on bank 1.

NOTE:
The purpose of this test is to check for excessive fuel drain from each injector.

- Disconnect the fuel drain lines from the bank of injectors being tested.
- Plug injector drain lines with the plug provided in the kit.
- Connect the piezo adapter line drain tool connection to each of the injectors.
- Start the engine until top mark is reached or crank for 30 seconds if the engine does not start.
- The maximum permissible drain is 3 times the lowest measured drain quantity.
- A failed injector will have a higher flow and exhibits 3 times the lowest measured drain quantity.

Filling quantity up to:	Engine cranks but does not start (small diameter)		Engine starts (large diameter)	
	ml	oz	ml	oz
1	1.8	0.06	6	0.2
2	2.4	0.08	13	0.44
3	3.2	0.11	21	0.71
4	4	0.14	29	0.98
5	—	—	37	1.25
6	—	—	45	1.52
7	—	—	53	1.79

Does each fuel injector meet the specification in injector drain flow test?

YES >> GO TO 10.
NO >> Replace the malfunctioning injector(s). Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

10. CHECK FOR CURRENT DTC

1. Start the engine.
2. Wait 30 seconds.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Is P2146 DTC current?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> GO TO 11.

11. ERASE DTCS

1. Connect CONSULT and erase ENGINE diagnostic trouble codes.
2. Operate the engine within the "Conditions for Clearing the DTC".
3. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2146 DTC current?

YES >> Return to diagnostic procedure. Refer to EC-1016, "DTC Description".
NO >> Repair complete.

Component Inspection

INFOID:0000000013235659

1. CHECK THE INJECTOR INTERNAL RESISTANCE

Measure the resistance between the two injector pins.

Is the resistance below 150 KΩ?

YES >> Replace the injector. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 2.

2. CHECK INJECTOR COIL FOR A SHORT TO GROUND

Measure the resistance between each of the injector pins and the metal case of the injector.

Is the resistance below 150 KΩ?

YES >> Replace the injector. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> Inspection End.

P2149 FUEL INJECTOR GROUP 2 POWER CIRCUIT

DTC Description

INFOID:0000000013098751

The Fuel Injectors' timing and quantity is controlled by the Engine Control Module (ECM). The ECM provides current to energize the actuator (Piezo) in the Fuel Injector. This causes the needle valve to rise and flow fuel into the combustion chamber. The ECM has an internal injector driver for each group of injectors. Each injector circuit has a dedicated low-side switch that completes the circuit path to ground inside the ECM. Electrically, fuel injectors 1, 4, 6, and 7 make-up group 1. Fuel injectors 2, 3, 5, and 8 make-up group 2.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2149	INJECTOR	Diagnosis condition	This diagnostic runs continuously when the engine is running.
		Signal (terminal)	Fuel injector signal.
		Threshold	The Engine Control Module (ECM) detected the injector is shorted to a voltage source, shorted to a battery source, or low injector solenoid resistance.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness and connectors.
- Fuel injector.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P2149 being current on the CONSULT screen.

Is P2149 DTC current?

YES >> Go to EC-1020, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013098752

1.CHECK FOR CURRENT DEF LEVEL SENSOR DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing "ENGINE" diagnostic trouble codes.

Is P2149 DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT FUEL INJECTOR CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect fuel injectors 2, 3, 5, and 8.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE FUEL INJECTOR RESISTANCE

Check the resistance value across the two pins of each of the injectors 2, 3, 5, and 8. Refer to EC-980, "Component Inspection".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace the malfunctioning fuel injector. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

4. INSPECT ECM AND ELECTRICAL CONNECTIONS

1. Disconnect the ECM.
2. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK INJECTOR 2 SIGNAL AND DRIVER CIRCUITS FOR SHORT

Check injector 2 signal and driver circuits for continuity between the ECM connector and battery post.

ECM		Battery post	Continuity
Connector	Terminal		
F101	113	(+)	No
		(–)	
	92	(+)	
		(–)	

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace the engine harness.

6.CHECK INJECTOR 3 SIGNAL AND DRIVER CIRCUITS FOR SHORT

Check injector 3 signal and driver circuits for continuity between the ECM connector and battery post.

ECM		Battery post	Continuity
Connector	Terminal		
F101	116	(+)	No
		(–)	
	95	(+)	
		(–)	

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace the engine harness.

7.CHECK INJECTOR 5 SIGNAL AND DRIVER CIRCUITS FOR SHORT

Check injector 5 signal and driver circuits for continuity between the ECM connector and battery post.

ECM		Battery post	Continuity
Connector	Terminal		
F101	115	(+)	No
		(–)	
	94	(+)	
		(–)	

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace the engine harness.

8.CHECK INJECTOR 8 SIGNAL AND DRIVER CIRCUITS FOR SHORT

Check injector 8 signal and driver circuits for continuity between the ECM connector and battery post.

ECM		Battery post	Continuity
Connector	Terminal		
F101	114	(+)	No
		(–)	
	93	(+)	
		(–)	

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace the engine harness.

9.PERFORM FUEL SYSTEM DIAGNOSTIC TEST

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Use SST J-54421 to perform the next step.
4. Using CONSULT, select “ENGINE” and perform the ″Fuel Injector Drain Flow Test″ on bank 2.

NOTE:
The purpose of this test is to check for excessive fuel drain from each injector.

- Disconnect the fuel drain lines from the bank of injectors being tested.
- Plug injector drain lines with the plug provided in the kit.
- Connect the piezo adapter line drain tool connection to each of the injectors.
- Start the engine until top mark is reached or crank for 30 seconds if the engine does not start.
- The maximum permissible drain is 3 times the lowest measured drain quantity.
- A failed injector will have a higher flow and exhibits 3 times the lowest measured drain quantity.

Filling quantity up to:	Engine cranks but does not start (small diameter)		Engine starts (large diameter)	
	ml	oz	ml	oz
1	1.8	0.06	6	0.2
2	2.4	0.08	13	0.44
3	3.2	0.11	21	0.71
4	4	0.14	29	0.98
5	—	—	37	1.25
6	—	—	45	1.52
7	—	—	53	1.79

Does each fuel injector meet the specification in injector drain flow test?

YES >> GO TO 10.
NO >> Replace the malfunctioning injector(s). Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".

10. CHECK FOR CURRENT DTC

1. Start the engine.
2. Wait 30 seconds.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is P2149 DTC current?

YES >> Replace ECM. Refer to EC-1254, "Removal and Installation".
NO >> GO TO 11.

11. ERASE DTCS

1. Connect CONSULT and erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for Clearing the DTC".
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2149 DTC current?

YES >> Return to diagnostic procedure. Refer to EC-1020, "DTC Description".
NO >> Repair complete.

Component Inspection

INFOID:0000000013242449

1. CHECK THE INJECTOR INTERNAL RESISTANCE

Measure the resistance between the two injector pins.

Is the resistance below 150 KΩ?

YES >> Replace the injector. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)"..
NO >> GO TO 2.

2. CHECK INJECTOR COIL FOR A SHORT TO GROUND

Measure the resistance between each of the injector pins and the metal case of the injector.

Is the resistance below 150 KΩ?

YES >> Replace the injector. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> Inspection End.

P214A SCR NOX CATALYST INLET TEMPERATURE TOO HIGH

DTC Description

INFOID:0000000013102062

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- U1612 present. Refer to EC-262, "DTC Description".
- P1624 present. Refer to EC-870, "DTC Description".
- P1625 present. Refer to EC-872, "DTC Description".
- P1626 present. Refer to EC-875, "DTC Description".
- P1628 present. Refer to EC-880, "DTC Description".

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the engine control module via CAN communication. The aftertreatment SCR temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using CAN communication. The aftertreatment SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the aftertreatment SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Aftertreatment SCR inlet gas temperature is above a high threshold for a calibrated period of time while active regeneration of the DPF is not occurring.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P214A	DPF INLET TEMP DPF OUTLET TEMP SCR INLET TEMP SCR OUTLET TEMP	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	SCR inlet temperature sensor signal.
		Threshold	SCR Inlet Temperature > 650°C (1202°F).
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning fuel injector.
- Malfunctioning SCR intermediate temperature sensor.
- Contaminated DEF.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip P214A DTC detected?

YES >> Proceed to EC-1024, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102063

1.CHECK FOR OTHER RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current “ENGINE” diagnostic trouble codes:

- U1612
- P1624
- P1625
- P1626
- P1628

Are any of the above DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR DEF QUALITY RELATED DIAGNOSTIC TROUBLE CODES

Using CONSULT, check ENGINE for any current DEF quality related diagnostic trouble codes:

Any DEF quality related DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK FOR INJECTOR MISFIRE

1. Start the engine and run it at low idle.
2. Determine if a cylinder misfire is noticed when the engine is running at low idle.
3. Using CONSULT, select “ENGINE” and perform the ″Cylinder Cutout Test″ active test to check for a cylinder misfire.

Was an engine misfire detected?

YES >> Replace malfunctioning injector. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 4.

4.INSPECT TURBOCHARGER EXHAUST OUTLET FOR OIL OR FUEL

1. Turn ignition switch OFF.
2. Remove the exhaust plumbing from the turbocharger outlet.
3. Look for signs of moisture in the turbocharger exhaust outlet.
4. Inspect the turbocharger exhaust outlet for signs of oil or fuel being introduced into the aftertreatment system from the engine.

Was engine oil or fuel contamination found in the turbocharger exhaust outlet?

YES >> Locate the cause of possible diesel fuel or engine oil being carried from the engine into the aftertreatment system and repair or replace any components that caused the engine oil or diesel fuel contamination. Inspect the aftertreatment system for possible damage.
NO >> GO TO 5.

5.CHECK AFTERTREATMENT DIESEL OXIDATION CATALYST FOR SOOT ACCUMULATION

1. Remove the aftertreatment Diesel Oxidation Catalyst (DOC) and Diesel Particulate Filter (DPF) assembly.
2. Inspect the aftertreatment DOC.
3. Check the intake face of the aftertreatment DOC for damage, soot accumulation and/or face plugging.

Is more than 50% of the cells on the intake face completely blocked by soot?

YES >> Replace the DOC and DPF assembly. Refer to EX-36, "Removal and Installation".
NO >> GO TO 6.

6.ERASE DTC.

1. Connect all components.
2. With CONSULT, erase all DTCs.
3. Operate the engine within the conditions for setting DTC found in the DTC description.
4. Check for existing “ENGINE” diagnostic trouble codes.

Did the P214A DTC return?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-1024, "DTC Description".
NO >> Repair complete.

P214B SCR NOX CATALYST INLET TEMPERATURE TOO HIGH DURING REGEN

DTC Description

INFOID:0000000013102066

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- U1612 present. Refer to EC-262, "DTC Description".
- P1624 present. Refer to EC-870, "DTC Description".
- P1625 present. Refer to EC-872, "DTC Description".
- P1626 present. Refer to EC-875, "DTC Description".
- P1628 present. Refer to EC-880, "DTC Description".

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the engine control module via CAN communication. The aftertreatment SCR temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using CAN communication. The aftertreatment SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the aftertreatment SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Aftertreatment SCR inlet gas temperature is above a high threshold for a calibrated period of time while active regeneration of the DPF is not occurring.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P214B	DPF INLET TEMP DPF OUTLET TEMP SCR INLET TEMP SCR OUTLET TEMP	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	SCR inlet temperature sensor signal.
		Threshold	SCR Inlet Temperature > 700°C (1292°F) for 60 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning fuel injector.
- Malfunctioning SCR intermediate temperature sensor.
- Contaminated DEF.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NO >> GO TO 5.

5. CHECK AFTERTREATMENT DIESEL OXIDATION CATALYST FOR SOOT ACCUMULATION

1. Remove the aftertreatment Diesel Oxidation Catalyst (DOC) and Diesel Particulate Filter (DPF) assembly.
2. Inspect the aftertreatment DOC.
3. Check the intake face of the aftertreatment DOC for damage, soot accumulation and/or face plugging.

Is more than 50 % of the cells on the intake face completely blocked by soot?

YES >> Replace the DOC and DPF assembly. Refer to EX-36, "Removal and Installation".
NO >> GO TO 6.

6. ERASE DTC.

1. Connect all components.
2. With CONSULT, erase all DTCs.
3. Operate the engine within the conditions for setting DTC found in the DTC description.
4. Check for existing “ENGINE” diagnostic trouble codes.

Did the P214B DTC return?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-1026, "DTC Description".
NO >> Repair complete.

P214C SCR NOX CATALYST OUTLET TEMPERATURE TOO HIGH

DTC Description

INFOID:0000000013099935

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the engine control module via CAN communication. The aftertreatment SCR temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using CAN communication. The aftertreatment SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the aftertreatment SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Aftertreatment SCR outlet gas temperature is continuously above a high threshold for a calibrated period of time while active regeneration of the DPF is not occurring.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P214C	DPF INLET TEMP DPF OUTLET TEMP SCR INLET TEMP SCR OUTLET TEMP	Diagnosis condition	This diagnostic runs continuously when the engine is running and active regeneration of the DPF is not occurring.
		Signal (terminal)	SCR outlet temperature sensor signal.
		Threshold	SCR outlet Temperature > 650°C (1202°F).
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning SCR catalyst.
- Degraded, diluted, or incorrect DEF.
- Malfunctioning SCR outlet temperature sensor.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:

- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip P214C DTC detected?

YES >> Proceed to EC-1028, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099936

1.CHECK FOR OTHER RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current “ENGINE” diagnostic trouble codes:

- U1612
- P1624
- P1625

3. Operate the engine within the conditions for setting DTC found in the DTC description.
4. Check for existing “ENGINE” diagnostic trouble codes.

Did the P214C DTC return?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-1024, "DTC Description".
NO >> Repair complete.

P214D SCR NOX CATALYST OUTLET TEMPERATURE TOO HIGH DURING REGEN

DTC Description

INFOID:0000000013099925

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the engine control module via CAN communication. The aftertreatment SCR temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using CAN communication. The aftertreatment SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the aftertreatment SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Aftertreatment SCR outlet gas temperature is continuously above a severe, high threshold for a calibrated period of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P214D	DPF INLET TEMP DPF OUTLET TEMP SCR INLET TEMP SCR OUTLET TEMP	Diagnosis condition	This diagnostic runs continuously when the engine is running.
		Signal (terminal)	SCR outlet temperature sensor signal
		Threshold	SCR outlet Temperature > 800°C (1472°F).
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning SCR catalyst.
- Degraded, diluted, or incorrect DEF.
- Malfunctioning SCR outlet temperature sensor.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:

- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip P214D DTC detected?

YES >> Proceed to EC-1030, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099926

1.CHECK FOR OTHER RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current “ENGINE” diagnostic trouble codes:

- U1612
- P1624
- P1625
- P1626
- P1628

Are any of the above DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. CHECK FOR DEF QUALITY RELATED DIAGNOSTIC TROUBLE CODES

Using CONSULT, check “ENGINE” for any current DEF related diagnostic trouble codes:

Any DEF quality related DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. CHECK FOR INJECTOR MISFIRE

1. Start the engine and run it at low idle.
2. Determine if a cylinder misfire is noticed when the engine is running at low idle.
3. Using CONSULT, select “ENGINE” and perform the ″Cylinder Cutout Test″ active test to check for a cylinder misfire.

Was an engine misfire detected?

YES >> Replace malfunctioning injector. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
NO >> GO TO 4.

4. INSPECT TURBOCHARGER EXHAUST OUTLET FOR OIL OR FUEL

1. Turn ignition switch OFF.
2. Remove the exhaust plumbing from the turbocharger outlet.
3. Look for signs of moisture in the turbocharger exhaust outlet.
4. Inspect the turbocharger exhaust outlet for signs of oil or fuel being introduced into the aftertreatment system from the engine.

Was engine oil or fuel contamination found in the turbocharger exhaust outlet?

YES >> Locate the cause of possible diesel fuel or engine oil being carried from the engine into the aftertreatment system and repair or replace any components that caused the engine oil or diesel fuel contamination. Inspect the aftertreatment system for possible damage.
NO >> GO TO 5.

5. CHECK AFTERTREATMENT DIESEL OXIDATION CATALYST FOR SOOT ACCUMULATION

1. Remove the aftertreatment Diesel Oxidation Catalyst (DOC) and Diesel Particulate Filter (DPF) assembly.
2. Inspect the aftertreatment DOC.
3. Check the intake face of the aftertreatment DOC for damage, soot accumulation and/or face plugging.

Is more than 50 % of the cells on the intake face completely blocked by soot?

YES >> Replace the DOC and DPF assembly. Refer to EX-36, "Removal and Installation".
NO >> GO TO 6.

6. INSPECT AFTERTREATMENT DIESEL OXIDATION CATALYST FOR CRACKS IN THE CELL WALL

Visually inspect the DOC cell walls for cracks.

Any cracks found in the cell walls?

YES >> Replace the DOC and DPF assembly. Refer to EX-36, "Removal and Installation".
NO >> GO TO 7.

7. ERASE DTC.

1. Connect all components.
2. With CONSULT, erase all DTCs.
3. Operate the engine within the conditions for setting DTC.
4. Check for existing “ENGINE” diagnostic trouble codes.

Did the P214D DTC return?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-1030, "DTC Description".
NO >> Repair complete.

P218F REDUCTANT NO FLOW DETECTED

DTC Description

INFOID:0000000013263358

The DEF supply pump assembly precisely measures the amount of aftertreatment diesel exhaust fluid to beinjected into the aftertreatment system. The DEF supply pump assembly has three primary cycles. A priming cycle makes sure that aftertreatment diesel exhaust fluid is available at the DEF supply pump assembly. During the dosing cycle, aftertreatment diesel exhaust fluid is being delivered to the aftertreatment dosing valve. A purge cycle occurs when the engine is turned OFF. The purge cycle makes sure that all the aftertreatment diesel exhaust fluid is removed from the diesel exhaust fluid lines and dosing valve.

DTC DETECTION LOGIC

To determine degraded doser performance based on accumulated nominal error between commanded and estimated DEF flow.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P218F	DEF DOSING VALVE POS CMD DPF PUMP DOSING RATE DEF PUMP STATUS DEF TANK LEVEL	Diagnosis condition	diagnostic runs when the DEF dosing valve is commanded ON.
		Signal (terminal)	Dosing valve signal
		Threshold	The ECM detected the DEF dosing performance is low.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF supply pump assembly.
- DEF dosing valve.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch ON.
2. Connect CONSULT and perform ″DEF Dosing Unit Override Test″ active test.
3. Check 1st trip DTC.

Is P218F DTC detected?

YES >> Proceed to EC-1032, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013263359

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes for DTC P218F being current.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DEF QUALITY

1. Using CONSULT erase “ENGINE” diagnostic trouble codes.
2. Inspect the DEF in the tank for signs of debris or contamination.
3. Using a refractometer [SST: J-54466] measure the concentration of the DEF in the tank.

Is DEF concentration within 32.5 Â± 1.5 %?

YES >> GO TO 3.
NO >> Drain the DEF tank, rinse with water, and refill with pure DEF.

3.PERFORM DEF DOSING UNIT OVERRIDE TEST

1. Turn ignition switch OFF.
2. Remove the aftertreatment DEF dosing valve from the decomposition tube.

3. Place the DEF dosing valve in a measuring container having greater than a 1.5 liter [50 oz] capacity.
4. Turn ignition switch ON.
5. Using CONSULT, access “ENGINE” and select ″DEF Dosing Unit Override Test″ active test.

Did the DEF dosing unit operate according to specifications?

YES >> GO TO 4.
NO >> Replace the DEF supply pump assembly. Refer to EX-64, "Exploded View".

4. ERASE DTC.

1. Connect all components.
2. With CONSULT, erase all DTCs.
3. Operate the engine within the conditions for setting DTC.
4. Check for existing “ENGINE” diagnostic trouble codes.

Did the P218F DTC return?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-1032, "DTC Description".
NO >> Repair complete.

P21C4 REDUCTANT HEATER RELAY CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013103726

Urea heater relay supplies heating power for the DEF Dosing Control Unit. The DEF Line Heater supply and ground circuitsare controlled by the DEF control module. Aftertreatment DEF Line heating is based on the input of the ambient temperature sensor. Heating of the line is initiated when the ambient temperature is below 0 degrees Celsius. The DEF control module reports status and issues back to the Engine Control Module (ECM) via CAN communication.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the aftertreatment DEF line heater relay driver signal was shorted to high source.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P21C4	DEF HTR TEST TIME DEF HTR TEST TIMER DEF HTR TEST COUNTS Def tank heater test status	Diagnosis condition	This diagnostic runs when the ignition key switch is ON and line heating is commanded ON.
		Signal (terminal)	DEF line heater relay signal.
		Threshold	Urea heater relay driver signal is shorted to battery.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Short to battery in the urea heater relay driver
- Urea heater relay
- Wiring harness

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Connect CONSULT and activate ″DEF Line Heater Test″.
3. The DTC will move to ″Past″ when the test runs and passes.

Is P21C4 DTC current?

YES >> Go to EC-1034, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013103727

1.CHECK FOR CURRENT UREA HEATER RELAY CIRCUIT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.

Is DTC P21C4 current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK UREA HEATER RELAY CIRCUIT

1. Using CONSULT, erase existing “ENGINE” diagnostic trouble codes.
2. Turn ignition switch OFF.
3. Replace urea heater relay with a known good relay.
4. Turn ignition switch ON.
5. Using CONSULT, activate ″DEF Tank Heater Test″ and the ″DEF Line Heater Test″.
6. Using CONSULT, check “ENGINE” diagnostic trouble codes.

Is P21C4 DTC current?

YES >> GO TO 3.
NO >> Relay was malfunctioning. Repair complete.

3.INSPECT DEF CONTROL MODULE AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DEF control module.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK DEF HEATER SUPPLY CIRCUIT FOR SHORT TO OTHER CIRCUITS

1. Disconnect urea heater relay.
2. Check resistance between DEF tank heater supply circuit and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C35	1	All others	No

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair short circuit in harness or connectors.

5. CHECK DEF HEATER SUPPLY CIRCUIT FOR SHORT TO VOLTAGE

Measure the voltage between the DEF heater supply circuit at the relay connector and ground.

Urea heater relay		Terminal (–)	Voltage (Approx.)
Connector	Terminal (+)		
E90	3	Ground	0

Was any voltage measured?

YES >> • Repair or replace the harness for a short to voltage source.
• GO TO 6.
NO >> • Replace the DEF control module. Refer to EC-1259, "Removal and Installation".
• GO TO 6.

6. ERASE CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Using CONSULT erase ENGINE diagnostic trouble codes.
4. Operate the engine within the "Conditions for setting the DTC".
5. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P21C4 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-963, "DTC Description".
NO >> Repair complete.

P21CA REDUCTANT SUPPLY VOLTAGE INTERMITTENT

DTC Description

INFOID:0000000013103721

NOTE:
If any of the following DTCs is displayed with this DTC, first perform the trouble diagnosis for other DTC.
- P21CB present. Refer to EC-1039, "DTC Description".
- P21CC present. Refer to EC-1042, "DTC Description".

The DEF control module is the central control for the selective catalytic reduction (SCR) diesel exhaust fluid dosing system, and handles the dosing activity, tank level sensing, tank temperature sensing, line heating, and tank heating. The DEF control module communicates to the Engine Control Module (ECM) via CAN communication.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected the DEF supply pump assembly internal sensor power supply ground is in excess of an allowable value.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P21CA	DEF TANK LEVEL	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	DEF tank level sensor signal
		Threshold	DEF Tank Level Sensor voltage supply circuit is > 5.1V or < 4.8V.
		Diagnosis delay time	—

POSSIBLE CAUSE

- DEF control module
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P21CA being current on the CONSULT screen.

Is P21CA DTC current?

YES >> Go to EC-1036, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013103722

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P21CB or P21CC is present, perform the confirmation procedure (diagnosis procedure) for the other DTC first.

Any of the two applicable DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. CHECK FOR CURRENT DTC

Check for DTC P21CA being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT DEF SUPPLY PUMP ASSEMBLY AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the DEF supply pump assembly.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK THE DOSING UNIT SENSOR SUPPLY

1. Turn ignition ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P21CA DTC current?

YES >> GO TO 5.
NO >> Replace DEF supply pump assembly. Refer to EX-73, "Exploded View".

5. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Turn ignition OFF.
2. Disconnect the DEF control module.
3. Inspect both connectors and pins for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK TANK LEVEL SENSOR POWER CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DEF tank level sensor 5V supply and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	28	All others	No

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace harness for a short circuit.

7. CHECK TANK PRESSURE SENSOR POWER CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DEF tank pressure sensor 5V supply and all other circuits at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C205	27	All others	No

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace harness for a short circuit.

8. CHECK TANK PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND

Check the continuity between DEF tank pressure sensor supply circuit and ground.

DEF control module		Ground	Continuity
Connector	Terminal		
C205	27	—	No

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace harness for a short to ground.

9. CHECK FOR CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON and wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P21CA DTC current?

YES >> • Replace the DEF supply pump assembly. Refer to EX-73, "Removal and Installation".
• GO TO 10.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 10.

10. ERASE THE DIAGNOSTIC TROUBLE CODES

1. Using CONSULT, erase ENGINE DTCs.
2. Operate the engine within the "Conditions for Clearing the DTC".
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P21CA DTC current?

YES >> Return to diagnostic procedure. Refer to EC-1036, "DTC Description".
NO >> Repair complete.

P21CB REDUCTANT SUPPLY VOLTAGE LOW

DTC Description

INFOID:0000000013101144

NOTE:
If the following DTC is displayed with P21CB, first perform the trouble diagnosis for other DTC.
- P0562 present. Refer to EC-670, "DTC Description".

The aftertreatment diesel exhaust fluid controller is the central control for the Selective Catalytic Reduction (SCR) diesel exhaust fluid dosing system, and handles the dosing activity, tank level sensing, tank temperature sensing, line heating, and tank heating. The diesel exhaust fluid control module communicates to the Engine Control Module (ECM) via CAN communication.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected the input power source voltage to the DEF supply pump assembly is below an allowable value.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P21CB	DEF TANK VOLTAGE SEN SUPPLY VOL	Diagnosis condition	When the engine is running
		Signal (terminal)	DEF tank voltage supply signal
		Threshold	The DEF control module detected the battery supply voltage is less than 9V.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Damaged generator causing low voltage.
- Weak or damaged battery.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P21CB being current on the CONSULT screen.

Is P21CB DTC detected?

YES >> Proceed to EC-1039, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013101145

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes.
3. Check for DTC P21CB being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. If DTC P0562 is present, perform the confirmation procedure (diagnosis procedure) for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-670, "DTC Description".
NO >> GO TO 3.

3. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Wait 1 minute to allow sufficient time for the DEF control module to completely power down.
3. Disconnect the DEF control module.
4. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK DEF CONTROL MODULE POWER AND GROUND SUPPLY CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between DEF control module connector battery power and ground circuit terminals.

Condition	DEF control module			Voltage (V) (Approx.)
	Connector	Terminal (+)	Terminal (-)	
Key ON	C35	1	7	Battery voltage
Cranking		3		
Engine idling		4		

Are the measured voltages within 1 volt of battery voltage?

YES >> • Replace DEF control module. Refer to EC-1259, "Removal and Installation".
• GO TO 11.
NO >> GO TO 5.

5. CHECK BATTERY CONNECTIONS

1. Turn ignition switch ON.
2. Check battery voltage.
3. Check the battery terminal connections on both positive (+) and negative (-) terminals.

Are the connections tight and corrosion-free?

YES >> GO TO 6.
NO >> • Tighten the loose connections, and clean the terminals.
• GO TO 11.

6. VERIFY THE FUSES ARE INSTALLED CORRECTLY

1. Turn ignition switch OFF.
2. Verify the supply fuses in the IPDM E/R are not blown.

- Maxi fuse Y (30A)
- Fuse #55 (15A)
- Fuse #69 (5A)
- Fuse #72 (10A)

3. Inspect the fuses for correct installation.

Fuses are good and installed correctly?

YES >> GO TO 7.
NO >> • Replace the fuse or correct the fuse installation as necessary.
• GO TO 11.

7. CHECK BATTERY SUPPLY CIRCUIT FOR OPEN

Check the signal circuit for continuity between the battery post and the DEF control module.

Battery post	DEF control module		Continuity
Terminal	Connector	Terminal	
(+)	C35	3	Yes
(–)		7	

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair open circuit in harness or connectors.
• GO TO 11.

8.CHECK FOR A SHORT CIRCUIT IN THE POWER HARNESS

Check for continuity between the battery and ground supply terminals at the DEF control module harness connector.

DEF control module			Continuity
Connector	Terminal	Terminal	
C35	3	7	No

Is the inspection result normal?

YES >> GO TO 9.
NO >> • Repair short circuit in harness or connectors.
• GO TO 11.

9.CHECK FOR A SHORT CIRCUIT IN THE POWER HARNESS

Check for continuity between the battery supply terminal at the DEF control module harness connector and engine block ground.

DEF control module		Ground	Continuity
Connector	Terminal		
C35	3	Engine block ground	No

Is the inspection result normal?

YES >> GO TO 10.
NO >> • Repair short circuit in harness or connectors.
• GO TO 11.

10.CHECK THE CHARGING SYSTEM

Check the charging system for proper operation. Refer to CHG-23, "Work Flow (With EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)" or STR-27, "Work Flow (Without GR8-1200 NI)".

Is generator charging within specification?

YES >> • Replace DEF control module. Refer to EC-1259, "Removal and Installation".
• GO TO 11.
NO >> • Replace the generator. Refer to CHG-44, "Removal and Installation: VK56VD".
• GO TO 11.

11.ERASE CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Using CONSULT erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for setting the DTC".
5. Check for “ENGINE” diagnostic trouble codes.

Is P21CB DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1039, "DTC Description".
NO >> Repair complete.

P21CC REDUCTANT SUPPLY VOLTAGE HIGH

DTC Description

INFOID:0000000013101488

NOTE:
If the following DTC is displayed with P21CC, first perform the trouble diagnosis for other DTC.
- P0563 present. Refer to EC-673, "DTC Description".

The aftertreatment diesel exhaust fluid controller is the central control for the Selective Catalytic Reduction (SCR) diesel exhaust fluid dosing system, and handles the dosing activity, tank level sensing, tank temperature sensing, line heating, and tank heating. The diesel exhaust fluid control module communicates to the Engine Control Module (ECM) via CAN communication.

DTC DETECTION LOGIC

The Engine Control Module (ECM) has detected the input power source voltage to the DEF supply pump assembly is in excess of an allowable value.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P21CC	DEF TANK VOLTAGE SEN SUPPLY VOL	Diagnosis condition	When the engine is running.
		Signal (terminal)	DEF tank voltage supply signal
		Threshold	The DEF control module detected the battery supply voltage is greater than 16V.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Damaged generator causing high voltage
- Weak or damaged battery
- Improperly connected batteries

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
3. Check for DTC P21CC being current on the CONSULT screen.

Is P21CC DTC detected?

YES >> Proceed to EC-1042, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013101489

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes.
3. Check for DTC P21CC being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. If DTC P0563 is present, perform the confirmation procedure “diagnosis procedure” for this other DTC first.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-673, "DTC Description".

NO >> GO TO 3.

3. INSPECT DEF CONTROL MODULE AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Wait 1 minute to allow sufficient time for the DEF control module to completely power down.
3. Disconnect the DEF control module.
4. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK DEF CONTROL MODULE POWER AND GROUND SUPPLY CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between DEF control module connector battery power and ground circuit terminals.

Condition	DEF control module			Voltage (V) (Approx.)
	Connector	Terminal (+)	Terminal (-)	
Key ON	C35	1	7	Battery voltage
Cranking		3		
Engine idling		4		

Do all the measured voltages read less than 18V?

YES >> • Replace DEF control module. Refer to EC-1259, "Removal and Installation".
• GO TO 6.
NO >> GO TO 5.

5. CHECK THE CHARGING SYSTEM

Check the charging system for proper operation. Refer to CHG-23, "Work Flow (With EXP-800 NI or GR8-1200 NI) (with Cummins 5.0L)" or STR-27, "Work Flow (Without GR8-1200 NI)".

Is generator charging within specification?

YES >> GO TO 6.
NO >> • Replace the generator. Refer to CHG-44, "Removal and Installation: VK56VD".
• GO TO 6.

6. ERASE CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Using CONSULT erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for setting the DTC".
5. Check for “ENGINE” diagnostic trouble codes.

Is P21CC DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1042, "DTC Description".
NO >> Repair complete.

P2201 NOX SENSOR 1

DTC Description

INFOID:0000000013083379

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- U029D present. Refer to EC-224, "DTC Description".
- P2202 present. Refer to EC-1046, "DTC Description".
- P2209 present. Refer to EC-1048, "DTC Description".
- P220A present. Refer to EC-1051, "DTC Description".

The aftertreatment intake NOx (nitrogen oxides) sensor is a smart device and communicates with the Engine Control Module (ECM) via CAN communication. The aftertreatment intake NOx sensor performs internal diagnostics and reports malfunctions back to the primary ECM using CAN communication. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment intake NOx sensor is used to measure the NOx emissions at the intake of the aftertreatment system.

DTC DETECTION LOGIC

Engine Out NOx sensor reading is stuck in range.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2201	OUTLET NOX INLET NOX	Diagnosis condition	This diagnostic runs when the DOC intake temperature is above 150°C [302°F], and theengine is in a motoring condition.
		Signal (terminal)	NOx sensor signal
		Threshold	Change of Engine Out NOx Sensor value over the monitoring period < 150 ppm
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning intake NOx sensor
- Improperly installed intake NOx sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Perform coast down event from 88 km/h (55 MPH) to 72 km/h (45 MPH) for 2 minutes.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Check 1st trip DTC.

Is P2201 DTC detected?

YES >> Proceed to EC-1044, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013083380

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes.
3. Check for DTC P2201 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.

NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FOR PRIORITY DTC

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Check If any of the following DTCs are present:

- U029D
- P2202
- P2209
- P220A

Is applicable DTC current?

YES >> Refer to EC-135, "DTC Index".
NO >> • Verify intake NOx sensor is present and installed properly. Replace the intake NOx sensor. Refer to EX-45, "Removal and Installation".
• GO TO 3.

3.ERASE CURRENT DTC

1. Using CONSULT erase ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Check for “ENGINE” diagnostic trouble codes.

Is P2201 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1044, "DTC Description".
NO >> Repair complete.

P2202 NOX SENSOR 1

DTC Description

INFOID:0000000013084604

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- U029D present. Refer to EC-224, "DTC Description".
- P220A present. Refer to EC-1051, "DTC Description".

The aftertreatment intake NOx (nitrogen oxides) sensor is a smart device and communicates with the Engine Control Module (ECM) via CAN communication. The aftertreatment intake NOx sensor performs internal diagnostics and reports malfunctions back to the primary ECM using CAN communication. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment intake NOx sensor is used to measure the NOx emissions at the intake of the aftertreatment system.

DTC DETECTION LOGIC

Engine Out NOx sensor reading is stuck in range.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2201	OUTLET NOX INLET NOX	Diagnosis condition	This diagnostic runs when the DOC intake temperature sensor has been above 150° C (302°F) for 5 seconds while the engine is running.
		Signal (terminal)	NOx sensor signal
		Threshold	Intake NOx sensor circuit voltage below normal or shorted to low source. An internal circuit error has been detected by the NOx control module.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning intake NOx sensor
- Intake NOx sensor internal heater failure
- Incorrect NOx sensor installed

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1046, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084605

1.CHECK FOR PRIORITY DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes.
3. Check for DTC P2201 being current on the CONSULT screen.

4. Check If any of the following DTCs are present:
- U029D
- P220A

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR CURRENT DTC

Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2202 DTC current?

YES >> An internal error has been detected in the aftertreatment intake NOx sensor. Replace the intake NOx sensor. Refer to EX-45, "Removal and Installation".
NO >> GO TO 3.

3.ERASE CURRENT DTC

1. Using CONSULT erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Check for “ENGINE” diagnostic trouble codes.

Is P2202 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1046, "DTC Description".
NO >> Repair complete.

P2209 NOX SENSOR HEATER SENSE CIRCUIT 1/1

DTC Description

INFOID:0000000013111799

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- U029D present. Refer to EC-224, "DTC Description".
- P2202 present. Refer to EC-1046, "DTC Description".
- P220A present. Refer to EC-1051, "DTC Description".

The aftertreatment intake NOx (nitrogen oxides) sensor is a smart device and communicates with the Engine Control Module (ECM) via CAN communication. The aftertreatment intake NOx sensor performs internal diagnostics and reports malfunctions back to the primary ECM using CAN communication. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment intake NOx sensor is used to measure the NOx emissions at the intake of the aftertreatment system.

DTC DETECTION LOGIC

Amount of time that heater reaches working temperature > 30 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2209	OUTLET NOX INLET NOX	Diagnosis condition	This diagnostic runs when the DOC intake temperature sensor has been above 150°C (302°F) for 5 seconds while the engine is running.
		Signal (terminal)	NOx sensor signal
		Threshold	Percentage of time spent heating ≥ 5% of a 60 second diagnostic window.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning intake NOx sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1048, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013111800

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes.
3. Check for DTC P2209 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> GO TO 8.

2.CHECK FOR PRIORITY DTC

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Check If any of the following DTCs are present:

- U029D
- P2202
- P220A

Is applicable DTC current?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK FOR OTHER CURRENT DTCS

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Check If any of the following DTCs are present:

- P0544
- P0545
- P0546

Is applicable DTC current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4.INSPECT THE INTAKE NOX SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the intake NOx sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK THE VOLTAGE TO THE INTAKE NOX SENSOR

1. Turn ignition switch ON.
2. Measure the voltage between the voltage supply circuit and the ground circuit at the intake NOx sensor harness connector.

Intake NOx Sensor			Voltage (Approx.)
Connector	Terminal (+)	Terminal (–)	
C31	4	3	Battery voltage

Is the reading within 1 volt of battery voltage?

YES >> • A damaged aftertreatment intake NOx sensor heater has been detected. Replace the intake NOx sensor. Refer to EX-45, "Removal and Installation".
• GO TO 8.
NO >> GO TO 6.

6.CHECK THE BATTERY CONNECTION

1. Turn ignition switch OFF.
2. Check the battery terminals and connections.

Is the battery connection tight and corrosion-free?

YES >> GO TO 7.
NO >> • Tighten any loose connections and clean the terminals.
• GO TO 8.

7. CHECK INTAKE NOX SENSOR VOLTAGE SUPPLY CIRCUIT FOR OPEN

1. Turn ignition switch ON.
2. Measure the voltage between the voltage supply circuit at the intake NOx sensor harness connector and engine block ground.

Intake NOx sensor			Voltage (Approx.)
Connector	Terminal (+)	Terminal (–)	
C31	4	Engine block	Battery voltage

Is the reading within 1 volt of battery voltage?

YES >> • Repair the ground circuit to the intake NOx sensor for open.
• GO TO 8.
NO >> • Repair the power supply to the intake NOx sensor for open.
• GO TO 8.

8. ERASE CURRENT DTC

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT erase ENGINE diagnostic trouble codes.
5. Operate the engine within the "Conditions for setting the DTC".
6. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2209 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1048, "DTC Description".
NO >> Repair complete.

P220A NOX SENSOR 1

DTC Description

INFOID:0000000013083035

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- P0562 present. Refer to EC-670, "DTC Description".
- P0563 present. Refer to EC-673, "DTC Description".

The aftertreatment intake NOx (nitrogen oxides) sensor is a smart device and communicates with the Engine Control Module (ECM) via CAN communication. The aftertreatment intake NOx sensor performs internal diagnostics and reports malfunctions back to the primary ECM using CAN communication. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment intake NOx sensor is used to measure the NOx emissions at the intake of the aftertreatment system.

DTC DETECTION LOGIC

The engine out NOx sensor circuitry has detected an intermittent power supply voltage drop that results in a reset internal to the sensor.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P220A	OUTLET NOX INLET NOX	Diagnosis condition	This diagnostic runs when the DOC intake temperature sensor has been above 150°C (302°F) for 5 seconds while the engine is running.
		Signal (terminal)	NOx sensor signal
		Threshold	The Engine Control Module (ECM) detected the NOx sensor supply voltage is greater than 16.5V or less than 10.8V for 10 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness and connectors.
- System voltage too low or too high.
- Malfunctioning intake NOx sensor.
- Incorrect intake NOx sensor installed.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1051, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013083036

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.

2. Connect CONSULT and check “ENGINE” diagnostic trouble codes.
3. Check for DTC P220A being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FOR PRIORITY DTC

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Check If any of the following DTCs are present:

- P0562
- P0563

Is applicable DTC current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.INSPECT THE INTAKE NOX SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the intake NOx sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THE VOLTAGE TO THE INTAKE NOX SENSOR

1. Turn ignition switch ON.
2. Measure the voltage between the voltage supply circuit and the ground circuit at the intake NOx sensor harness connector.

Intake NOx Sensor			Voltage (Approx.)
Connector	Terminal (+)	Terminal (–)	
C31	4	3	Battery voltage

Is the reading within 1 volt of battery voltage?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK FOR CORRECT INTAKE NOX SENSOR

1. Remove aftertreatment intake NOx sensor.
2. Verify intake NOx sensor is the correct sensor for this engine.

NOTE:
The aftertreatment intake NOx sensor is available in 12V or 24V versions.

Is this intake NOx sensor the correct sensor for this engine?

YES >> GO TO 6.
NO >> • Replace the aftertreatment intake NOx sensor. Refer to EX-45, "Removal and Installation".
• GO TO 9.

6.CHECK CONDITION OF THE INTAKE NOX SENSOR

1. Turn ignition switch OFF.

2. Reinstall the intake NOx sensor and connect all harness connectors.
3. Start the engine.
4. Operate the engine until the diesel oxidation catalyst intake temperature is above 150°C (302°F).
   NOTE:
   The exhaust gas temperature at the aftertreatment intake NOx sensor **must** be above 150°C (302°F) before the sensor can perform its internal diagnostics.
5. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P220A DTC current?

YES >> • Verify the integrity of the intake NOx sensor. Refer to EX-48, "Removal and Installation".
• Replace the intake NOx sensor if necessary.Refer to EX-45, "Removal and Installation".
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 9.

7.CHECK THE BATTERY CONNECTION

1. Turn ignition switch OFF.
2. Check the battery terminals and connections.

Is the battery connection tight and corrosion-free?

YES >> GO TO 8.
NO >> • Tighten any loose connections and clean the terminals.
• GO TO 9.

8.CHECK INTAKE NOX SENSOR VOLTAGE SUPPLY CIRCUIT FOR OPEN

1. Disconnect the intake NOx sensor.
2. Turn ignition switch ON.
3. Measure the voltage between the voltage supply circuit at the intake NOx sensor harness connector and engine block ground.

Intake NOx sensor			Voltage (Approx.)
Connector	Terminal (+)	Terminal (–)	
C31	4	Engine block	Battery voltage

Is the reading within 1 volt of battery voltage?

YES >> • Repair the ground circuit to the intake NOx sensor for open.
• GO TO 9.
NO >> • Repair the power supply to the intake NOx sensor for open.
• GO TO 9.

9.ERASE CURRENT DTC

1. Insure the ignition switch is OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for setting the DTC".
6. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P220A DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1051, "DTC Description".
NO >> Repair complete.

P220B NOX SENSOR 2

DTC Description

INFOID:0000000013082768

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- P0562 present. Refer to EC-670, "DTC Description".
- P0563 present. Refer to EC-673, "DTC Description".

The aftertreatment outlet NOx (nitrogen oxides) sensor is a smart device and communicates with the Engine Control Module (ECM) via CAN communication. The aftertreatment outlet NOx sensor performs internal diagnostics and reports malfunctions back to the primary ECM using CAN communication. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment outlet NOx sensor is used to measure the NOx emissions at the outlet of the aftertreatment system.

DTC DETECTION LOGIC

The engine out NOx sensor circuitry has detected an intermittent power supply voltage drop that results in a reset internal to the sensor.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P220B	OUTLET NOX INLET NOX	Diagnosis condition	This diagnostic runs when the SCR outlet temperature sensor has been above 150°C (302°F) for 5 seconds while the engine is running.
		Signal (terminal)	NOx sensor signal
		Threshold	The Engine Control Module (ECM) detected the NOx sensor supply voltage is greater than 16.5V or less than 10.8V for 10 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness and connectors.
- System voltage too low or too high.
- Malfunctioning outlet NOx sensor.
- Incorrect outlet NOx sensor installed.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1054, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013082769

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.

2. Connect CONSULT and check “ENGINE” diagnostic trouble codes.
3. Check for DTC P220B being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FOR PRIORITY DTC

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Check If any of the following DTCs are present:

- P0562
- P0563

Is applicable DTC current?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.INSPECT THE OUTLET NOX SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the outlet NOx sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THE VOLTAGE TO THE OUTLET NOX SENSOR

1. Turn ignition switch ON.
2. Measure the voltage between the voltage supply circuit and the ground circuit at the outlet NOx sensor harness connector.

outlet NOx Sensor			Voltage (Approx.)
Connector	Terminal (+)	Terminal (–)	
C33	4	3	Battery voltage

Is the reading within 1 volt of battery voltage?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK FOR CORRECT OUTLET NOX SENSOR

1. Remove aftertreatment outlet NOx sensor.
2. Verify outlet NOx sensor is the correct sensor for this engine.

NOTE:
The aftertreatment outlet NOx sensor is available in 12V or 24V versions.

Is this outlet NOx sensor the correct sensor for this engine?

YES >> GO TO 6.
NO >> • Replace the aftertreatment outlet NOx sensor. Refer to EX-48, "Removal and Installation".
• GO TO 9.

6.CHECK CONDITION OF THE OUTLET NOX SENSOR

1. Turn ignition switch OFF.

2. Reinstall the outlet NOx sensor and connect all harness connectors.
3. Start the engine.
4. Operate the engine until the SCR outlet temperature is above 150°C (302°F).
   NOTE:
   The exhaust gas temperature at the aftertreatment outlet NOx sensor **must** be above 150°C (302°F) before the sensor can perform its internal diagnostics.
5. Using CONSULT, check for ENGINE diagnostic trouble codes.

Is P220A DTC current?

YES >> • Verify the integrity of the outlet NOx sensor. Refer to EX-48, "Removal and Installation".
• Replace the outlet NOx sensor if necessary. Refer to EX-48, "Removal and Installation".
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 9.

7.CHECK THE BATTERY CONNECTION

1. Turn ignition switch OFF.
2. Check the battery terminals and connections.

Is the battery connection tight and corrosion-free?

YES >> GO TO 8.
NO >> • Tighten any loose connections and clean the terminals.
• GO TO 9.

8.CHECK OUTLET NOX SENSOR VOLTAGE SUPPLY CIRCUIT FOR OPEN

1. Disconnect the outlet NOx sensor.
2. Turn ignition switch ON.
3. Measure the voltage between the voltage supply circuit at the outlet NOx sensor harness connector and engine block ground.

Outlet NOx sensor			Voltage (Approx.)
Connector	Terminal (+)	Terminal (–)	
C33	4	Engine block	Battery voltage

Is the reading within 1 volt of battery voltage?

YES >> • Repair the ground circuit to the outlet NOx sensor for open.
• GO TO 9.
NO >> • Repair the power supply to the outlet NOx sensor for open.
• GO TO 9.

9.ERASE CURRENT DTC

1. Insure the ignition switch is OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for setting the DTC".
6. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P220A DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1051, "DTC Description".
NO >> Repair complete.

P221A NOX SENSOR 1/2 CORRELATION BANK 1

DTC Description

INFOID:0000000013198576

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- P0562 present. Refer to EC-670, "DTC Description".
- P0563 present. Refer to EC-673, "DTC Description".

The aftertreatment outlet NOx (nitrogen oxides) sensor is a smart device and communicates with the Engine Control Module (ECM) via CAN communication. The aftertreatment outlet NOx sensor performs internal diagnostics and reports malfunctions back to the primary ECM using CAN communication. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment outlet NOx sensor is used to measure the NOx emissions at the outlet of the aftertreatment system.

DTC DETECTION LOGIC

The system has detected aftertreatment outlet NOx sensor oxygen reading within range but reading inappropriately high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P221A	OUTLET NOX INLET NOX	Diagnosis condition	This diagnostic runs when the SCR outlet temperature sensor has been above 150°C (302°F) for 5 seconds while the engine is running.
		Signal (terminal)	NOx sensor signal
		Threshold	The Engine Control Module (ECM) detected the Oxygen readings of the Inlet and Outlet NOx sensor did not match.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning outlet NOx sensor.
- DEF crystallization or deposits.
- Incorrect outlet NOx sensor installed.
- Exhaust system leaks.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 eleven more times.
6. Check 1st trip DTC.

Is P221A DTC detected?

YES >> Proceed to EC-1057, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013198577

1.CHECK FOR CURRENT RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following ″current″ “ENGINE” diagnostic trouble codes:

- P0102
- P0103
- P0106
- P0107
- P0108
- P012B
- P012C
- P012D
- P0237
- P0299

Are any of the above DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. CHECK FOR NOX CURRENT RELATED DIAGNOSTIC TROUBLE CODES

Using CONSULT, check for the following NOx "current" "ENGINE" diagnostic trouble codes:

- U029D
- U029E
- P2201
- P2202
- P2209
- P220A
- P220B
- P229E
- P229F
- P22A7
- P2BAD
- P2BAF

Are any of the above DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. CHECK FOR CURRENT AND PAST FUEL SYSTEM RELATED DIAGNOSTIC TROUBLE CODES

Using CONSULT, check for any fuel system related "current" or "past" "ENGINE" diagnostic trouble codes.

Any fuel pump or fuel injectors related DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4. CHECK FOR CURRENT AND PAST EGR RELATED DIAGNOSTIC TROUBLE CODES

Using CONSULT, check for any EGR related "current" or "past" "ENGINE" diagnostic trouble codes.

Any EGR related DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 5.

5. CHECK THE AIR OR EXHAUST SYSTEM FOR LEAKS

1. Start the engine and let it idle.
2. Check the charge air cooler and charge air plumbing for leaks:

- Check the charge-air cooler connections for leaks between the turbocharger compressor outlet and the charge-air cooler.
- Check the charge-air cooler connections between the charge-air cooler and the intake manifold.
- Inspect the intake manifold gasket for leaks.
- Inspect the charge-air cooler hoses for leaks or loose connections.
- Inspect the charge-air cooler clamps to make sure they are tight.
- Inspect the charge-air plumbing for cracks.

Air leaks present in the charge air system?

YES >> • Repair or replace the leaking component.
• GO TO 7.
NO >> GO TO 6.

6. CHECK THE EXHAUST SYSTEM FOR LEAKS

1. Turn ignition switch OFF.
2. Check the exhaust system plumbing for leaks:

- Check the exhaust transfer tubes for leaks.
- Check the exhaust bypass tubes for leaks.
- Inspect the EGR valve for leaks.
- Leaks can be easily noted by traces of soot.
- Inspect the charge-air cooler clamps to make sure they are tight.
- Inspect the charge-air plumbing for cracks.

Leaks or restrictions present in the exhaust system?

YES >> • Repair or replace the leaking component.
• GO TO 7.

NO >> • Malfunctioning aftertreatment NOx sensors have been detected.
• Replace the aftertreatment intake NOx sensor. Refer to EX-45, "Removal and Installation".
• Replace the outlet NOx sensor. Refer to EX-48, "Removal and Installation".
• GO TO 7.

7. ERASE DTC.

1. Connect all components.
2. Turn ignition switch ON.
3. With CONSULT, erase all DTCs.
4. Operate the engine within the conditions for setting DTC found in the DTC description.
5. Check for existing “ENGINE” diagnostic trouble codes.

Did the P221A DTC return?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-1057, "DTC Description".
NO >> Repair complete.

P2262 TC BOOST PRESSURE NOT DETECTED

DTC Description

INFOID:0000000013102064

The Dual stage turbocharger is electronically activated by the Rotary Turbine Control (RTC) actuator. The actuator is poweredby the battery via the smart power relay. The RTC actuator is a smart device and receives information by CAN communication from the primary engine control module (ECM). The RTC actuator performs its own diagnostics and reports malfunctions back to the primary engine ECM, using CAN communication. The ECM then decodes the error message and converts it to a DTC.

DTC DETECTION LOGIC

The turbine bypass valve smart device actuator has determined itself to be incapable of meeting its desired position. This is communicated to the ECM via a number of status codes.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2262	RTCV ACTUATOR POS RTCV ACTUATOR POS CMD	Diagnosis condition	This diagnostic runs continuously when the key switch is in the ON position.
		Signal (terminal)	Rotary Turbine Control Valve Actuator.
		Threshold	The Rotary Turbine Control (RTC) actuator position could not meet the commanded position for greater than 10 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning Rotary Turbine Control Valve Actuator.
- Harness and connectors.
- Malfunctioning Rotary Turbine Control Valve.
- Loose or damaged linkage.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:

- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1060, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102065

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes.
3. Check for DTC P2262 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2. CHECK THE TURBOCHARGER ROTARY TURBINE CONTROL VALVE ACTUATOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the turbine bypass actuator.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> • Repair or replace error-detected parts.
• Replace the rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".

3. RUN THE TURBINE BYPASS VALVE ACTUATOR HYSTERESIS TEST

1. Turn ignition switch ON.
2. Check the turbine bypass valve actuator operation.
3. Using CONSULT, connect to ENGINE and perform the ″RTCV Hysteresis Test″ active test.

Did the turbine bypass valve actuator Hysteresis test pass?

YES >> GO TO 5.
NO >> GO TO 4.

4. INSPECT THE TURBINE BYPASS VALVE ACTUATOR LINKAGE

1. Disconnect the turbine bypass valve actuator linkage.
2. Inspect the turbine bypass valve actuator linkage.

Is the linkage bent, broken, or damaged?

YES >> Replace the turbocharger turbine actuator linkage. Refer to EM-390, "Exploded View".
NO >> GO TO 5.

5. RUN THE TURBINE BYPASS VALVE ACTUATOR HYSTERESIS TEST WITH LINKAGE REMOVED

Using CONSULT, connect to ENGINE and perform the ″RTCV Hysteresis Test″ Active Test.

Did the turbine bypass valve actuator Hysteresis test pass?

YES >> GO TO 6.
NO >> Replace the rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".

6. RUN THE TURBINE BYPASS VALVE ACTUATOR CALIBRATION

Using CONSULT, connect to “ENGINE” and perform the ″RTCV actuator calibrate″ under Work Support.

RTCV actuator calibration process completed successfully?

YES >> GO TO 7.
NO >> Replace the rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".

7. TEST DRIVE THE VEHICLE

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT erase “ENGINE” diagnostic trouble codes.
5. Start the engine and operate under normal driving conditions for at least 15 minutes.
6. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2262 DTC current?

YES >> A turbocharger mechanical malfunction has been detected. Replace the turbocharger assembly. Refer to EM-391, "Removal and Installation".

NO >> GO TO 8.

8. CHECK FOR PROGRESSIVE DAMAGE TO THE TREATMENT SYSTEM

Perform the following snap acceleration test:
1. Engage the parking brakes
2. Place the shift lever in neutral.
3. start the engine and let it idle to reach normal operating temperature.
4. Rapidly depress the accelerator pedal from 0 to 100% multiple times.
5. Check for black smoke exiting the exhaust as the engine accelerated from low to high idle.

NOTE:
If there is a heavy build up of exhaust residue, and a snap acceleration does not reveal the condition outlined, perform a brief acceleration under partial or full load. White smoke due to condensation in the exhaust system is permissible.

Was visible black or grey smoke seen from the exhaust?

YES >> Replace the damaged aftertreatment system. Refer to EX-42, "Removal and Installation".
NO >> GO TO 9.

9. ERASE CURRENT DTC

1. Turn ignition switch ON (engine OFF).
2. Using CONSULT erase “ENGINE” diagnostic trouble codes.
3. Operate the engine within the "Conditions for setting the DTC".
4. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2262 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1060, "DTC Description".
NO >> Repair complete.

P2263 TC BOOST CONTROL SYSTEM

DTC Description

INFOID:0000000013065648

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- P0101 present. Refer to EC-311, "DTC Description".
- P0102 present. Refer to EC-315, "DTC Description".
- P0103 present. Refer to EC-319, "DTC Description".
- P0106 present. Refer to EC-322, "DTC Description".
- P0107 present. Refer to EC-327, "DTC Description".
- P0108 present. Refer to EC-331, "DTC Description".
- P0111 present. Refer to EC-335, "DTC Description".
- P0112 present. Refer to EC-338, "DTC Description".
- P0113 present. Refer to EC-341, "DTC Description".
- P012B present. Refer to EC-357, "DTC Description".
- P012C present. Refer to EC-360, "DTC Description".
- P012D present. Refer to EC-364, "DTC Description".
- P0299 present. Refer to EC-521, "DTC Description".
- P2580 present. Refer to EC-1224, "DTC Description".

The Engine Control Module (ECM) monitors pressure sensors within the air handling system. Under load, the ECM will adjust engine actuators to meet commanded air and exhaust flow. If adjustment can be no longer made to meet target flows, a fault will be set.

DTC DETECTION LOGIC

EGR flow higher or lower than EGR flow target when EGR flow controller used up all adjustment allowed.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2263	INTAKE MANIFOLD TEMP TURBO PRESS SENSOR	Diagnosis condition	This diagnostic runs continuously when the engine is running.
		Signal (terminal)	Ambient air temperature.
		Threshold	The Engine Control Module (ECM) detected the EGR flow, charge pressure, or exhaust pressure was unable to meet the target pressure commanded by the ECM.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Leak or restriction in charge air plumbing.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to park, and idle for 40 seconds.
5. Repeat steps 2 through 4 two more times.
6. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
7. Check for DTC P2263 being current on the CONSULT screen.

Is P2263 DTC current?

YES >> Go to EC-1064, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065649

1. CHECK FOR CURRENT AND PAST RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following ″current″ and ″past″ “ENGINE” diagnostic trouble codes:

- P0106
- P0107
- P0108
- P0299

Are any of the above DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. CHECK FOR OTHER CURRENT AND PAST RELATED DIAGNOSTIC TROUBLE CODES

Using CONSULT, check for the following ″current″ and ″past″ “ENGINE” diagnostic trouble codes:

- P0101
- P0102
- P0103
- P0111
- P0112
- P0113
- P012B
- P012C
- P012D
- P2280
- P2580

Are any of the above DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. CHECK FOR MORE CURRENT AND PAST RELATED DIAGNOSTIC TROUBLE CODES

Using CONSULT, check for the following ″current″ and ″past″ “ENGINE” diagnostic trouble codes:

- P0471
- P0472
- P0473

Are any of the above DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4. CHECK FOR EGR RELATED DIAGNOSTIC TROUBLE CODES

Using CONSULT, check for any EGR related ″current″ or ″past″ “ENGINE” diagnostic trouble codes.

Any EGR related DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 5.

5. CHECK FOR TURBOCHARGER RELATED DIAGNOSTIC TROUBLE CODES

Using CONSULT, check for any turbocharger related ″current″ or ″past″ “ENGINE” diagnostic trouble codes.

Any turbocharger related DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 6.

6. INSPECT THE TURBINE BYPASS VALVE ACTUATOR LINKAGE

1. Turn the ignition switch OFF.
2. Inspect the turbine bypass valve actuator linkage.

Is the linkage missing, bent, broken, or damaged?

YES >> • Replace the turbocharger turbine actuator linkage. Refer to EM-411, "Exploded View".
• GO TO 7.

NO >> GO TO 7.

7. CHECK THE CHARGE AIR COOLER AND CHARGE AIR PLUMBING FOR LEAKS

1. Start the engine and let it idle.
2. Check the charge air cooler and charge air plumbing for leaks:

- Check the charge-air cooler connections for leaks between the turbocharger compressor outlet and the charge-air cooler.
- Check the charge-air cooler connections between the charge-air cooler and the intake manifold.
- Inspect the intake manifold gasket for leaks.
- Inspect the charge-air cooler hoses for leaks or loose connections.
- Inspect the charge-air cooler clamps to make sure they are tight.
- Inspect the charge-air plumbing for cracks.

Air leaks present in the charge air system?

YES >> • Repair or replace the leaking component.
• GO TO 10.
NO >> GO TO 8.

8. INSPECT FOR LEAKS AND RESTRICTIONS IN THE AIR INTAKE MANIFOLD AND EXHAUST SYSTEM

1. Turn ignition switch OFF.
2. Check for leaks in the Air Intake and Exhaust Systems. Refer to EX-19, "Checking Exhaust System".
3. Check the Air Intake for restriction. Refer to EM-221, "Exploded View".

Air leaks present in the charge air system?

YES >> • Repair or replace the leaking component.
• GO TO 10.
NO >> GO TO 9.

9. CHECK THE EGR SYSTEM FOR LEAKS AND RESTRICTIONS

1. Turn ignition switch OFF.
2. Check the EGR system plumbing for leaks and restrictions:

- Check the exhaust transfer tubes for leaks and restrictions.
- Check the exhaust bypass tubes for leaks and restrictions.
- Inspect the EGR valve for restrictions.
- Leaks can be easily noted by traces of soot.
- Inspect the charge-air cooler clamps to make sure they are tight.
- Inspect the charge-air plumbing for cracks.

Leaks or restrictions present in the EGR system?

YES >> • Repair or replace the malfunctioning component.
• GO TO 10.
NO >> GO TO 10.

10. VERIFY THE COMPRESSOR BYPASS VALVE ACTUATOR

1. Turn ignition switch ON.
2. Verify compressor bypass valve actuator:

- Use a hand pump to provide vacuum to the actuator.
- Verify that the compressor bypass valve moves to both linkage stops. Refer to EM-414, "Exploded View".

Compressor bypass valve linkage moves from stop to stop?

YES >> • Inspect the compressor bypass valve for proper operation. If the compressor bypass valve functions properly, replace the compressor bypass valve actuator. Refer to EM-417, "Removal and Installation".
• GO TO 11.
NO >> GO TO 11.

11. ERASE DTC.

1. Connect all components.
2. Turn ignition switch ON.
3. With CONSULT, erase all DTCs.
4. Operate the engine within the conditions for setting DTC found in the DTC description.
5. Check for existing “ENGINE” diagnostic trouble codes.

Did the P2263 DTC return?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-1063, "DTC Description".
NO >> Repair complete.

P2267 WATER IN FUEL SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013100778

The water in fuel sensor is in the fuel filter. The Engine Control Module (ECM) provides a 5V reference signal to the water in fuel sensor. When the water collected in the fuel filter covers the sensor probes, the water-in-fuel sensor pulls the 5V reference voltage down, indicating high water accumulation in the fuel filter.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the water in fuel sensor signal voltage was out of range high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2267	WATER IN FUEL WATER IN FUEL V	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	Water in fuel sensor signal
		Threshold	Filtered output value of the water in fuel sensor > 4.912 V
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness and connectors
- Water in fuel sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2267 being current on the CONSULT screen.

Is P2267 DTC current?

YES >> Go to EC-1067, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013100779

1.CHECK FOR A CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.
3. Check for DTC P2267 current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT THE WATER-IN-FUEL SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the water-in-fuel sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. INSPECT THE WATER-IN-FUEL SENSOR RESISTANCE

Test the water-in-fuel sensor resistance. Refer to EC-1069, "Component Inspection".

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Replace the water-in-fuel sensor. Refer to FL-52, "Removal and Installation".
• GO TO 10.

4. CHECK THE CIRCUIT RESPONSE

1. Reconnect the water-in-fuel sensor.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2267 DTC current?

YES >> GO TO 5.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 10.

5. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> • Repair or replace error-detected parts.
• GO TO 10.

6. CHECK WATER IN FUEL SENSOR RETURN CIRCUIT FOR OPEN

1. Disconnect the water in fuel sensor.
2. Check water-in-fuel sensor return circuit for continuity between ECM and water-in-fuel sensor connectors.

ECM		Water in fuel sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	41	F225	2	Yes

Is the inspection result normal?

YES >> GO TO 7.
NO >> • Repair open circuit in harness or connectors.
• GO TO 10.

7.CHECK WATER-IN-FUEL SENSOR SIGNAL CIRCUIT FOR OPEN

Check water in fuel sensor signal circuit for continuity between ECM and water in fuel sensor connectors.

ECM		Water in fuel sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	77	F225	1	Yes

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair open circuit in harness or connectors.
• GO TO 10.

8.CHECK WATER-IN-FUEL SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check water-in-fuel sensor signal circuit for continuity between ECM connector terminal 77 and all other terminals.

ECM			Continuity
Connector	Terminal	Terminal	
E93	77	All others	No

Is the inspection result normal?

YES >> GO TO 9.
NO >> • Repair or replace harness for a short circuit.
• GO TO 10.

9.CHECK THE DTC AND VERIFY SENSOR CONDITION

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2267 DTC current?

YES >> • Diagnosis procedure needs to be repeated. Go to EC-1067, "DTC Description".
• GO TO 10.
NO >> The removal and installation of the connector corrected the issue.

10.ERASE CURRENT DTCS

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for Clearing the DTC".
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2267 DTC current?

YES >> Diagnosis procedure needs to be repeated. Go to EC-1067, "DTC Description".
NO >> Repair complete.

Component Inspection

INFOID:0000000013326358

1.CHECK THE WATER IN FUEL SENSOR INTERNAL RESISTANCE

Measure the resistance between the two sensor pins without the presence of water.

NOTE:

Water-in-fuel sensor resistance without the presence of water is normally between 78.9 KΩ and 86.1 KΩ.

Is the resistance between 78.9 KΩ and 86.1 KΩ without the presence of water?

YES >> Inspection End.
NO >> Replace the water in fuel sensor. Refer to FL-52, "Removal and Installation".

P2269 WATER IN FUEL CONDITION

DTC Description

INFOID:0000000013070709

NOTE:
If DTC P2267 is displayed with this DTC, first perform the trouble diagnosis for other DTC.
- P2267 present. Refer to EC-1067, "DTC Description".

The water in fuel sensor is in the fuel filter. The Engine Control Module (ECM) provides a 5V reference signal to the water-in fuel sensor. When the water collected in the fuel filter covers the sensor probes, the water in fuel sensor pulls the 5V reference voltage down, indicating high water accumulation in the fuel filter.

DTC DETECTION LOGIC

Water has been detected in the fuel filter.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2269	WATER IN FUEL WATER IN FUEL V	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	Water in fuel sensor signal.
		Threshold	Filtered output value of the water in fuel sensor ≤ 2.891V
		Diagnosis delay time	—

POSSIBLE CAUSE

- Open return or signal circuit
- Signal circuit is shorted to a voltage source

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2269 being current on the CONSULT screen.

Is P2269 DTC current?

YES >> Go to EC-1070, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013070710

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other current “ENGINE” diagnostic trouble codes.

NOTE:
The following current DTC has priority over this DTC if it exists.
- P2267

Is P2267 DTC current?

YES >> Refer to EC-1067, "DTC Description".
NO >> GO TO 2.

2.CHECK FOR CURRENT AND PAST DTCS

1. Using CONSULT, check for current and past “ENGINE” diagnostic trouble codes.
2. Check for DTC P2269 being current or past on the CONSULT screen.

Is applicable DTC present?

YES >> • Drain the water from the fuel filter.
NOTE:
If DTC P2269 remains present, a malfunction in the sensor and/or connector may have occurred. Repair or replace the sensor and/or connector as necessary.
• GO TO 3.

NO >> GO TO 3.

3.ERASE CURRENT DTCS

1. Using CONSULT, erase ENGINE diagnostic trouble codes.
2. Operate the engine within the "Conditions for Clearing the DTC".
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2269 DTC current?

YES >> Diagnosis procedure needs to be repeated. Go to EC-1070, "DTC Description".
NO >> Repair complete.

P226C TC BOOST CONTROL SLOW RESPONSE

DTC Description

INFOID:0000000013099137

The Dual stage turbocharger is electronically activated by the Rotary Turbine Control (RTC) actuator. The actuator is poweredby the battery via the smart power relay. The RTC actuator is a smart device and receives information by CAN2 communication from the primary Engine Control Module (ECM). The RTC actuator performs its own diagnostics and reports malfunctions back to the primary ECM, using the CAN2 communication. The ECM then decodes the error message and converts it to a DTC.

DTC DETECTION LOGIC

The turbocharger turbine bypass actuator position feedback is failed in range, but not clearly "in range high" or "in range low."

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P226C	RTCV ACTUATOR POS RTCV ACTUATOR POS CMD RTV INSTALL/CALIB STATUS RTCV HYSTERESIS STATUS	Diagnosis condition	When the key switch is in the ON position.
		Signal (terminal)	Rotary Turbine Control Valve Actuator signal.
		Threshold	The Engine Control Module (ECM) detected the difference between actual and commanded turbocharger position is too large.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning Rotary Turbine Control Valve Actuator
- Malfunctioning compressor bypass valve
- Loose or damaged linkage

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CHECK

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P226C being current on the CONSULT screen.

Is P226C DTC current?

YES >> Go to EC-1072, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099138

1.CHECK FOR A CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for current and past “ENGINE” diagnostic trouble codes.
3. Check for DTC P226C ″current″ or ″past″ on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT THE ROTARY TURBINE CONTROL VALVE ACTUATOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the rotary turbine control valve actuator.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.

- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK ROTARY TURBINE CONTROL VALVE ACTUATOR POWER AND GROUND CIRCUITS

1. Start the engine.
2. Measure the voltage at the rotary turbine control valve actuator between power terminal 4 and ground terminal 1.

Rotary turbine control valve actuator			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (–)	
F146	4	1	Battery voltage

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace harness for an open circuit.
• GO TO 7.

4. RUN ROTARY TURBINE CONTROL VALVE ACTUATOR HYSTERESIS TEST

1. Turn ignition switch OFF.
2. Reconnect the rotary turbine control valve actuator.
3. Turn ignition switch ON.
4. Using CONSULT, select ENGINE and perform the ″RTCV Hysteresis Test″ under ″Active Test″.

Did RTCV Hysteresis Test pass?

YES >> GO TO 6.
NO >> GO TO 5.

5. RUN ROTARY TURBINE CONTROL VALVE ACTUATOR HYSTERESIS TEST WITH LINKAGE REMOVED

1. Disconnect the rotary turbine control valve actuator linkage.
2. Using CONSULT, select ENGINE and perform the ″RTCV Hysteresis Test″ under ″Active Test″.

Did RTCV Hysteresis Test pass?

YES >> GO TO 6.
NO >> • Replace the rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".
• GO TO 9.

6. CHECK THE ROTARY TURBINE CONTROL VALVE ACTUATOR LINKAGE

Inspect the rotary turbine control valve actuator linkage.

Is the linkage broken or damaged?

YES >> • Replace the rotary turbine control valve actuator linkage. Refer to EM-412, "Removal and Installation".
• GO TO 7.
NO >> GO TO 8.

7. RUN ROTARY TURBINE CONTROL VALVE ACTUATOR CALIBRATION

1. Connect all components and harness connectors.
2. Using CONSULT, select “ENGINE” and perform the ″RTCV actuator calibrate″ under ″Work Support″.

Did RTCV actuator calibration test pass?

YES >> GO TO 8.
NO >> • Replace the rotary turbine control valve actuator. Refer to EM-410, "Removal and Installation".
• GO TO 9.

8. COMPLETE THE VEHICLE TEST

1. Connect all components and harness connectors.
2. Using CONSULT, erase ENGINE diagnostic trouble codes.

3. Start the engine and operate under normal driving conditions for at least 15 minutes.
4. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P226C DTC current?

YES >> • A turbocharger mechanical malfunction has been detected. Replace the turbocharger assembly. Refer to EM-391, "Removal and Installation".
• GO TO 9.
NO >> GO TO 9.

9. CHECK FOR PROGRESSIVE DAMAGE TO THE TREATMENT SYSTEM

Perform the following snap acceleration test:
1. Connect all components and harness connectors.
2. Engage the parking brakes
3. Place the shift lever in (N) neutral.
4. start the engine and let it idle to reach normal operating temperature.
5. Rapidly depress the accelerator pedal from 0 to 100% multiple times.
6. Check for black smoke exiting the exhaust as the engine accelerated from low to high idle.

NOTE:
If there is a heavy buildup of exhaust residue and a snap acceleration does not reveal the condition outlined, perform a brief acceleration under partial or full load. White smoke due to condensation in the exhaust system is permissible.

Was visible black or gray smoke seen from the exhaust?

YES >> • Replace the damaged aftertreatment system. Refer to EX-42, "Removal and Installation".
• GO TO 10.
NO >> GO TO 10.

10. ERASE CURRENT DTCS

1. Turn the engine OFF.
2. Turn ignition switch ON.
3. Using CONSULT, erase ENGINE diagnostic trouble codes.
4. Operate the engine within the "Conditions for Clearing the DTC".
5. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P226C DTC current?

YES >> Diagnosis procedure needs to be repeated. Go to EC-1072, "DTC Description".
NO >> Repair complete.

P2280 INTAKE AIR SYSTEM

DTC Description

INFOID:0000000013073119

This monitor determines when the air filter has become too restrictive by calculating the air pressure change in the air filter box. The mass air flow and turbocharger compressor inlet pressure sensors are used to calculate pressure drop across the air box. When the air pressure drops faster than a threshold after multiple drive cycles, a DTC is set.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected a rapid decrease in pressure from the inlet air pressure.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2280	MASS AIR FLOW TURBO COMP INLET PRESS	Diagnosis condition	This diagnostic runs continuously when the engine is running.
		Signal (terminal)	Engine air filter differential pressure
		Threshold	When the filtered ambient air pressure rate of change is less than a preset value
		Diagnosis delay time	—

POSSIBLE CAUSE

- Restricted air filter

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:

- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Go to EC-1075, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073120

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2280 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT AIR FILTER

1. Remove the air filter.
2. Inspect the air filter for any damage or restriction.

Is the air filter damaged or restricted?

YES >> • Replace the damaged or restricted air filter. Refer to EM-213, "Removal and Installation".
• GO TO 3.
NO >> GO TO 3.

3.ERASE CURRENT DTC

1. Connect all components.
2. Turn ignition switch ON.
3. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for setting the DTC".
5. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2280 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1075, "DTC Description".
NO >> Repair complete.

P2299 ACCELERATOR/BRAKE PEDAL POSITION INCONSISTENCY

DTC Description

INFOID:0000000013065696

This diagnostic tests for a stuck throttle or throttle position sensor. The algorithm only runs when the throttle is pressed and the brake pedal is pushed during that time. This DTC will not occur if the brake pedal is applied first and then the throttle pedal is engaged.

DTC DETECTION LOGIC

This DTC is intended to detect conditions where both the accelerator pedal and brake pedal were depressed at the same time. When this condition occurs, the accelerator pedal position is defaults to idle. If the DTC occurs when both pedals are NOT depressed, this may indicate that either the accelerator pedal position or brake pedal position are NOT returning to 0%.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2299	ACCEL PEDAL POS BRAKE SWITCH	Diagnosis condition	This diagnostic runs when the vehicle is in motion.
		Signal (terminal)	Accelerator Pedal Position Sensor and Brake Pedal Position Sensor.
		Threshold	ECM detected the brake pedal is depressed when the throttle position sensor > 8% with < 2% deviation for 2 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Misadjusted brake pedal position switch
- Accelerator pedal not fully returning to rest

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:

- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1077, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065697

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing ENGINE diagnostic trouble codes.
3. If there are any ABS related DTCs, perform the confirmation procedure (trouble diagnosis) for these other DTCs first.

Is any applicable ABS related DTC detected?

YES >> Refer to BRC-55, "DTC Index".
NO >> GO TO 2.

2.VERIFY DTC CAUSE

NOTE:

This DTC can trip if the customer is a two-footed driver (customer rests a foot on the brake pedal while using the accelerator pedal).
Determine whether the brake pedal has been depressed while the vehicle is moving and the throttle position is greater than 8% for 2 seconds.

Is the driver a two-footed driver?

YES >> Explain the diagnostic operation to the customer. Repair complete.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P229E NOX SENSOR 2

DTC Description

INFOID:0000000013084600

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- U029E present. Refer to EC-228, "DTC Description".
- P220B present. Refer to EC-1054, "DTC Description".

The aftertreatment outlet NOx (nitrogen oxides) sensor is a smart device and communicates with the Engine Control Module (ECM) via CAN2 communication. The aftertreatment outlet NOx sensor performs internal diagnostics and reports malfunctions back to the primary ECM using CAN2 communication. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment outlet NOx sensor is used to measure the NOx emissions at the outlet of the aftertreatment system.

DTC DETECTION LOGIC

The NOx sensor circuitry has detected a failure affecting the aftertreatment outlet NOx sensor heater circuit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P229E	OUTLET NOX INLET NOX	Diagnosis condition	This diagnostic runs when the SCR outlet temperature sensor has been above 200°C (392°F) for 5 seconds while the engine is running.
		Signal (terminal)	NOx sensor signal.
		Threshold	Outlet NOx sensor circuit voltage below normal or shorted to low source. An internal circuit error has been detected by the outlet NOx sensor.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning outlet NOx sensor
- Malfunctioning outlet NOx sensor heater
- Incorrect outlet NOx sensor installed

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1079, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084601

1.CHECK FOR PRIORITY DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for other “ENGINE” diagnostic trouble codes.
3. Check If any of the following DTCs are present:

- P0562
- P0563

Is applicable DTC current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR CURRENT DTC

1. Using CONSULT, check “ENGINE“ diagnostic trouble codes.
2. Check for DTC P229E being current on the CONSULT screen.

Is applicable DTC current?

YES >> • Replace the aftertreatment outlet NOx sensor. Refer to EX-48, "Removal and Installation".
• GO TO 3.
NO >> GO TO 3.

3.ERASE CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P229E DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1051, "DTC Description".
NO >> Repair complete.

P229F NOX SENSOR 2

DTC Description

INFOID:0000000013083610

NOTE:
If any of the following DTCs are displayed with this DTC, first perform the trouble diagnosis for other DTCs:
- U029E present. Refer to EC-228, "DTC Description".
- P220B present. Refer to EC-1054, "DTC Description".
- P229E present. Refer to EC-1079, "DTC Description".
- P22A7 present. Refer to EC-1083, "DTC Description".

The aftertreatment outlet NOx (nitrogen oxides) sensor is a smart device and communicates with the Engine Control Module (ECM) via CAN2 communication. The aftertreatment outlet NOx sensor performs internal diagnostics and reports malfunctions back to the primary ECM using CAN2 communication. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment outlet NOx sensor is used to measure the NOx emissions at the outlet of the aftertreatment system.

DTC DETECTION LOGIC

Aftertreatment outlet NOx sensor in-range but reading inappropriately high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P229F	OUTLET NOX INLET NOX	Diagnosis condition	This diagnostic runs when the SCR outlet temperature is above 200°C (392°F), and the engine is in a motoring (non-fueling) condition.
		Signal (terminal)	NOx sensor signal
		Threshold	The ECM detected the outlet NOx sensor was not reading zero while in a motoring (non-fueling) condition.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning outlet NOx sensor
- Diesel exhaust fluid crystallization or deposits
- Incorrect outlet NOx sensor installed

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to (P) park, and idle for 40 seconds.
5. Repeat steps 2 through 4 eleven more times.
6. Check 1st trip DTC.

Is P229F DTC detected?

YES >> Proceed to EC-1081, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013083611

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes.

3. Check for DTC P229F being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> GO TO 5.

2.CHECK FOR PRIORITY DTC

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Check if any of the following DTCs are present:

- U029E
- P220B
- P229E
- P22A7

Is applicable DTC current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.VERIFY PROPER INSTALLATION OF THE OUTLET NOX SENSOR

1. Turn ignition switch OFF.
2. Verify proper installation of the aftertreatment outlet NOx sensor.
3. Verify the correct aftertreatment outlet NOx sensor is installed.

Is the correct outlet NOx sensor properly installed?

YES >> GO TO 4.
NO >> Properly install the correct outlet NOx sensor.

4.VERIFY PROPER INSTALLATION OF THE OUTLET NOX SENSOR

1. Disconnect the aftertreatment diesel exhaust fluid decomposition tube.
2. Check for diesel exhaust fluid crystallization.
3. Inspect the decomposition tube for crystallization.

Is there crystallization buildup in the decomposition tube?

YES >> • Remove the crystallization buildup.
• GO TO 5.
NO >> • A damaged aftertreatment outlet NOx sensor has been detected. Replace the aftertreatment outlet NOx sensor. Refer to EX-48, "Removal and Installation".
• GO TO 5.

5.ERASE CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for setting the DTC".
5. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P229F DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1081, "DTC Description".
NO >> Repair complete.

P22A7 NOX SENSOR HEATER SENSE CIRCUIT 1/2

DTC Description

INFOID:0000000013111619

NOTE:

1. If any of the following "current" or "past" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:

- U029E present. Refer to EC-228, "DTC Description".
- P220B present. Refer to EC-1054, "DTC Description".
- P229E present. Refer to EC-1079, "DTC Description".

2. If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:

- P2481 present. Refer to EC-1171, "DTC Description".
- P2482 present. Refer to EC-1173, "DTC Description".
- P2483 present. Refer to EC-1175, "DTC Description".

The aftertreatment outlet NOx (nitrogen oxides) sensor is a smart device and communicates with the Engine Control Module (ECM) via CAN2 communication. The aftertreatment outlet NOx sensor performs internal diagnostics and reports malfunctions back to the primary ECM using CAN2 communication. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment outlet NOx sensor is used to measure the NOx emissions at the outlet of the aftertreatment system.

DTC DETECTION LOGIC

Aftertreatment outlet NOx sensor heater malfunction

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P22A7	OUTLET NOX INLET NOX	Diagnosis condition	This diagnostic runs when the SCR outlet temperature sensor has been above 200°C (392°F) for 5 seconds while the engine is running.
		Signal (terminal)	NOx sensor signal
		Threshold	The ECM detected the NOx sensor heater was unable to maintain its normal operating temperature.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning outlet NOx sensor
- Intermittent power connection to the outlet NOx sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:

- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1084, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013111620

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes.
3. Check for DTC P22A7 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> GO TO 8.

2.CHECK FOR PRIORITY DTC

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Check if any of the following DTCs are ″current″ or ″past″:

- U029E
- P220B
- P229E

Is applicable DTC current or past?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK FOR PRIORITY DTC

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Check if any of the following DTCs are ″current″:

- P2481
- P2482
- P2483

Is applicable DTC current?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

4.INSPECT THE OUTLET NOX SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the outlet NOx sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> • Repair or replace error-detected parts.
• GO TO 8.

5.CHECK THE VOLTAGE TO THE OUTLET NOX SENSOR

1. Turn ignition switch ON.
2. Measure the voltage between the voltage supply circuit and the ground circuit at the outlet NOx sensor harness connector.

Outlet NOx sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (–)	
C33	4	3	Battery voltage

Is the reading within 1V of battery voltage?

YES >> • A damaged aftertreatment outlet NOx sensor heater has been detected. Replace the aftertreatment outlet NOx sensor. Refer to EX-48, "Removal and Installation".
• GO TO 8.

NO >> GO TO 6.

6. CHECK THE BATTERY CONNECTION

1. Turn ignition switch OFF.
2. Check the battery terminals and connections.

Is the battery connection tight and corrosion-free?

YES >> GO TO 7.

NO >> • Tighten any loose connections and clean the terminals.
• GO TO 8.

7. CHECK OUTLET NOX SENSOR VOLTAGE SUPPLY CIRCUIT FOR OPEN

Measure the voltage between the voltage supply circuit at the outlet NOx sensor harness connector and engine block ground.

Outlet NOx sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (–)	
C33	4	Engine block	Battery voltage

Is the reading within 1V of battery voltage?

YES >> • Repair the ground circuit to the outlet NOx sensor for open.
• GO TO 8.

NO >> • Repair the power supply to the outlet NOx sensor for open.
• GO TO 8.

8. ERASE CURRENT DTC

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for setting the DTC".
6. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P22A7 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1084, "Diagnosis Procedure".

NO >> Repair complete.

P22CB TC OUTLET SWITCHING VALVE CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013111611

The compressor bypass solenoid allows the vacuum produced by the belt driven vacuum pump to pass through to compressor bypass actuator when the ECM applies a Pulse Width Modulation (PWM) duty cycle to the compressor bypass solenoid. The ECM commands a duty cycle of 100% to the compressor bypass solenoid when the engine speed and load is such that is required for the compressor bypass valve to open. This allows vacuum to pass through to actuate compressor bypass valve.

DTC DETECTION LOGIC

This monitor detects if the compressor bypass valve discrete output actuator device command line is shorted low.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P22CB	COMPRESSOR BYPASS VALVE	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	Compressor Bypass Valve Actuator
		Threshold	The ECM detected the Compressor bypass actuator circuit is shorted low.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness shorted to ground.
- Malfunctioning compressor bypass valve solenoid.
- ECM

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P22CB current on the CONSULT screen.

Is P22CB DTC current?

YES >> Go to EC-1086, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013111612

1.CHECK FOR DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for ″current″ “ENGINE” diagnostic trouble codes.
3. Check for current DTC P22CB on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT COMPRESSOR BYPASS VALVE AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.

2. Disconnect the compressor bypass actuator connector.
3. Inspect connector for the following:
- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P22CC become current and P22CB become past?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK DTC AND VERIFY VALVE CONDITION

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON and wait 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P22CB DTC current?

YES >> • Replace the compressor bypass valve. Refer to EM-415, "Removal and Installation".
• GO TO 8.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 8.

5.INSPECT ECM AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the ECM connector F101.
3. Inspect the connector for the following:
- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> • Repair or replace error-detected parts.
• GO TO 8.

6.CHECK THE ECM RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P22CC become current and P22CB become past?

YES >> GO TO 7.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 8.

7. CHECK FOR CURRENT DTC

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P22CB DTC current?

YES >> • Repair or replace the engine harness for a short.
• GO TO 8.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 8.

8. ERASE CURRENT DTCS

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for Clearing DTC".
3. Using CONSULT, check for current ENGINE” diagnostic trouble codes.

Is P22CB DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1086, "DTC Description".
NO >> Repair complete.

P22CC TC OUTLET SWITCHING VALVE CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013111613

The compressor bypass solenoid allows the vacuum produced by the belt driven vacuum pump to pass through to compressor bypass actuator when the ECM applies a pulse width modulation (PWM) duty cycle to the compressor bypass solenoid. The ECM commands a duty cycle of 100% to the compressor bypass solenoid when the engine speed and load is such that is required for the compressor bypass valve to open. This allows vacuum to pass through to actuate compressor bypass valve.

DTC DETECTION LOGIC

This monitor detects if the compressor bypass valve discrete output actuator device command line is shorted high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P22CC	COMPRESSOR BYPASS VALVE	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	Compressor Bypass Valve Actuator
		Threshold	The ECM detected the Compressor bypass actuator circuit is shorted high or open.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness shorted to battery.
- Compressor bypass valve solenoid.
- Harness open circuit.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P22CC being current on the CONSULT screen.

Is P22CC DTC current?

YES >> Go to EC-1089, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013111614

1.CHECK FOR DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for ″current″ “ENGINE” diagnostic trouble codes.
3. Check for current DTC P22CC being on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT COMPRESSOR BYPASS VALVE AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.

2. Disconnect the compressor bypass actuator connector.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK THE CIRCUIT RESPONSE

1. Connect a jumper wire between the signal and return circuits at the compressor bypass valve connector.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P22CB become current and P22CC become past?

YES >> GO TO 4.
NO >> GO TO 5.

4. CHECK DTC AND VERIFY VALVE CONDITION

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect all harness connectors.
4. Turn ignition switch ON and wait 30 seconds.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P22CC DTC current?

YES >> • Replace the compressor bypass valve. Refer to EM-415, "Removal and Installation".
• GO TO 8.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 8.

5. INSPECT ECM AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the ECM engine side connector F101.
3. Inspect the connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> • Repair or replace error-detected parts.
• GO TO 8.

6. CHECK THE ECM RESPONSE

CAUTION:

Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
- **Not to bend and damage pins and terminals.**
- **Not to probe or short unintended circuits and potentially damaging the control unit.**

1. Connect a jumper wire between ECM connector F101 pins 137 and 139.
2. Turn ignition switch ON.
3. Wait for 30 seconds.
4. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did DTC P22CB become current and DTC P22CC become past?

YES >> GO TO 7.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 8.

7. CHECK FOR CURRENT DTC

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect all harness connectors.
4. Turn ignition switch ON.
5. Wait 30 seconds.
6. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P22CC become current?

YES >> • Repair or replace the engine harness for open.
• GO TO 8.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 8.

8. ERASE CURRENT DTCS

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for Clearing DTC".
3. Using CONSULT check for current ENGINE diagnostic trouble codes.

Is P22CC DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1089, "DTC Description".
NO >> Repair complete.

P22CD TC OUTLET SWITCHING VALVE STUCK OPEN

DTC Description

INFOID:0000000013100780

NOTE:

1. If any of the following "current" or "past" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:

- P0237 present. Refer to EC-434, "DTC Description".
- P0238 present. Refer to EC-438, "DTC Description".
- P1191 present. Refer to EC-843, "DTC Description".
- P1192 present. Refer to EC-846, "DTC Description".
- P1193 present. Refer to EC-849, "DTC Description".
- P22CB present. Refer to EC-1086, "DTC Description".
- P22CC present. Refer to EC-1089, "DTC Description".

2. If there are any additional "current" turbocharger related DTCs displayed with this DTC, first perform the diagnosis procedure for the turbocharger related DTC.

The compressor bypass solenoid allows the vacuum produced by the belt driven vacuum pump to pass through to compressor bypass actuator when the ECM applies a pulse width modulation (PWM) duty cycle to the compressor bypass solenoid. The ECM commands a duty cycle of 100% to the compressor bypass solenoid when the engine speed and load is such that is required for the compressor bypass valve to open. This allows vacuum to pass through to actuate compressor bypass valve.

DTC DETECTION LOGIC

Detects when the air flow fails to pass through the compressor when the compressor bypass valve commanded position is "default" or "closed".

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P22CD	Compressor bypass valve	Diagnosis condition	This diagnostic runs when the ignition switch is ON or when the engine is running.
		Signal (terminal)	Compressor bypass valve
		Threshold	Maximum pressure ratio observed across the high pressure compressor after the enable conditions are true for 500 msec is < 1.1 (ratio).
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning compressor bypass valve
- Malfunctioning compressor bypass solenoid

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:

- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1093, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013100781

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check If any of the following DTCs are ″current″ or ″past″:

- P0237
- P0238
- P1191
- P1192
- P1193
- P22CB
- P22CC

Is applicable DTC current or past?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR TURBOCHARGER RELATED DTC

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Look for ″current″″

Any applicable DTC current or past?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.VERIFY VACUUM PUMP OUTPUT

1. Start the engine.
2. Connect a hand pump or a vacuum gauge to the vacuum pump inlet.
3. Verify the vacuum pump output is sufficient:

Minimum required vacuum	
mm	inch
40	5.8

Is the vacuum supply sufficient?

YES >> GO TO 4.
NO >> • Refer to EM-478, "Removal and Installation".
• GO TO 6.

4.VERIFY THE COMPRESSOR BYPASS VALVE ACTUATOR

1. Stop the engine.
2. Turn ignition switch ON.
3. Using CONSULT, monitor the compressor bypass valve actuator.
4. Use a hand pump to provide vacuum to the compressor bypass valve actuator.
5. Verify that the compressor bypass valve moves to both linkage stops.

Compressor bypass valve linkage moves from stop to stop?

YES >> GO TO 5.
NO >> • Refer to EM-415, "Removal and Installation".
• GO TO 6.

5.VERIFY LOW PRESSURE TURBOCHARGER BOOST PRESSURE SENSOR ACCURACY

1. Verify the low-pressure turbocharger boost speed sensor.
2. Using CONSULT, monitor and log the following:

- Engine speed.
- Low-pressure turbocharger boost pressure.
- Charge-air cooler outlet pressure.
- Compressor bypass valve.

3. Start the engine.
4. Override compressor bypass valve to OPEN.

5. Use the accelerator pedal to raise the engine speed to 2,000 rpm and hold for 20 seconds.
6. Return the engine speed to idle.
7. Repeat above steps with compressor bypass valve override set to CLOSED.
8. Compare low-pressure turbocharger boost pressure values at 2,000 rpm with valve OPEN vs. CLOSED.

From open to closed valve, turbocharger boost pressure increased by 5 kPa (0.73 psi) or more at 2,000 RPM?

YES >> GO TO 6.
NO >> • Replace the low-pressure turbocharger boost pressure sensor. Refer to EM-245, "Removal and Installation".
• GO TO 6.

6. ERASE CURRENT DTC

1. Stop the engine.
2. Connect all components.
3. Turn ignition switch ON
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes
5. Operate the engine within the "Conditions for setting the DTC"
6. Using CONSULT, check for “ENGINE” diagnostic trouble codes

Is P22CD DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1092, "DTC Description".
NO >> Repair complete.

P22CE TC OUTLET SWITCHING VALVE STUCK CLOSED

DTC Description

INFOID:0000000013099962

NOTE:

1. If any of the following "current" or "past" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:

- P007B present. Refer to EC-281, "DTC Description".
- P0107 present. Refer to EC-327, "DTC Description".
- P0108 present. Refer to EC-331, "DTC Description".
- P0237 present. Refer to EC-434, "DTC Description".
- P0238 present. Refer to EC-438, "DTC Description".
- P1191 present. Refer to EC-843, "DTC Description".
- P1192 present. Refer to EC-846, "DTC Description".
- P1193 present. Refer to EC-849, "DTC Description".

2. If there are any additional "current" turbocharger related DTCs displayed with this DTC, first perform the diagnosis procedure for the turbocharger related DTC.

The compressor bypass solenoid allows the vacuum produced by the belt driven vacuum pump to pass through to compressor bypass actuator when the ECM applies a Pulse Width Modulation (PWM) duty cycle to the compressor bypass solenoid. The ECM commands a duty cycle of 100% to the compressor bypass solenoid when the engine speed and load is such that is required for the compressor bypass valve to open. This allows vacuum to pass through to actuate compressor bypass valve.

DTC DETECTION LOGIC

Detects when the air flow fails to pass through the compressor when the compressor bypass valve commanded position is "default" or "closed".

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P22CE	TURBO COMP INLET PRESS TURBO COMP INLET PRESS V	Diagnosis condition	This diagnostic runs when the ignition switch is ON or when the engine is running.
		Signal (terminal)	Compressor bypass valve
		Threshold	Maximum pressure ratio observed across the high pressure compressor after the enable conditions are true for 500 msec is 0.85 (ratio) ≥ value ≥ 1.3 (ratio).
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning compressor bypass valve
- Malfunctioning compressor bypass solenoid

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Perform coast down event from 88 km/h (55 MPH) to 72 km/h (45 MPH) for 2 minutes.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Check 1st trip DTC.

Is P2032 DTC detected?

YES >> Proceed to EC-1096, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099963

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check if any of the following DTCs are ″current″ or ″past″:

- P007B
- P0107
- P0108
- P0237
- P0238
- P1191
- P1192
- P1193

Is applicable DTC current or past?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR TURBOCHARGER RELATED DTC

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Look for ″current″ DTCs related to turbocharger.

Is any applicable current DTC?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.VERIFY THE BAROMETRIC PRESSURE SENSOR ACCURACY

1. Using CONSULT, access “ENGINE” and check ″TURBO COMP INLET PRESS″ under ″Data Monitor″.
2. Compare turbocharger compressor intake pressure to the local barometric pressure.

Is measured reading within ± 2 kPa (0.3 psi) of local barometric pressure reading?

YES >> GO TO 4.
NO >> • Replace the turbocharger compressor intake pressure/temperature sensor. Refer to EM-214, "Removal and Installation".
• GO TO 18.

4.VERIFY VACUUM PUMP OUTPUT

1. Start the engine.
2. Connect a hand pump or a vacuum gauge to the vacuum pump inlet.
3. Verify the vacuum pump output is sufficient:

Minimum required vacuum	
mm	inch
40	5.8

Is the vacuum supply sufficient?

YES >> GO TO 5.
NO >> • Replace the vacuum pump. Refer to EM-478, "Removal and Installation".
• GO TO 18.

5.VERIFY THE COMPRESSOR BYPASS VALVE ACTUATOR

1. Stop the engine.
2. Turn ignition switch ON.
3. Using CONSULT, monitor the compressor bypass valve actuator.
4. Use a hand pump to provide vacuum to the compressor bypass valve actuator.
5. Verify that the compressor bypass valve moves to both linkage stops.

Does the compressor bypass valve linkage move from stop to stop?

YES >> GO TO 6.

NO >> • Remove the obstruction or replace the compressor bypass valve. Refer to EM-415, "Removal and Installation".
• GO TO 18.

6. VERIFY CHARGE-AIR COOLER OUTLET PRESSURE DURING ENGINE OPERATION

1. Verify the charge-air cooler outlet pressure.
2. Using CONSULT, monitor and log the following:
- Engine speed
- Charge-air cooler outlet pressure
- Compressor bypass valve
3. Start the engine
4. Override compressor bypass valve to OPEN.
5. Use the accelerator pedal to raise the engine speed to 2,000 rpm and hold for 20 seconds.
6. Return the engine speed to idle.
7. Repeat above steps with compressor bypass valve override set to CLOSED.
8. Compare charge-air cooler outlet pressure values at 2,000 rpm with valve OPEN vs. CLOSED.

Charge-air cooler outlet pressure increased by 50 kPa (7.25 psi) or more at 2,000 RPM?

YES >> GO TO 7.
NO >> GO TO 9.

7. VERIFY THE TURBOCHARGER SPEED SENSOR ACCURACY

1. Verify the turbocharger speed sensor.
2. Using CONSULT, monitor and log the following:
- Engine speed.
- Turbocharger speed.
- Compressor bypass valve.
3. Start the engine.
4. Override compressor bypass valve to OPEN.
5. Use the accelerator pedal to raise the engine speed to 2,000 rpm and hold for 20 seconds.
6. Return the engine speed to idle.
7. Repeat above steps with compressor bypass valve override set to CLOSED.
8. Compare turbocharger speed at 2,000 rpm with valve OPEN vs. CLOSED.

Turbocharger speed increased from less than 130,000 rpm to between 140,000 and 160,000 rpm?

YES >> GO TO 8.
NO >> • Replace the malfunctioning turbocharger speed sensor. Refer to EM-399, "Removal and Installation".
• GO TO 18.

8. VERIFY LOW PRESSURE TURBOCHARGER BOOST PRESSURE SENSOR ACCURACY

1. Verify the low-pressure turbocharger boost speed sensor.
2. Using CONSULT, monitor and log the following:
- Engine speed.
- Low-pressure turbocharger boost pressure.
- Charge-air cooler outlet pressure.
- Compressor bypass valve.
3. Start the engine.
4. Override compressor bypass valve to OPEN.
5. Use the accelerator pedal to raise the engine speed to 2,000 rpm and hold for 20 seconds.
6. Return the engine speed to idle.
7. Repeat above steps with compressor bypass valve override set to CLOSED.
8. Compare low-pressure turbocharger boost pressure values at 2,000 rpm with valve OPEN vs. CLOSED.

From open to closed valve, does turbocharger boost pressure increased by 5 kPa (0.73 psi) or more at 2,000 RPM?

YES >> GO TO 9.
NO >> • Replace the Low-Pressure Turbocharger Boost Pressure Sensor. Refer to EM-245, "Removal and Installation".
• GO TO 18.

9. INSPECT THE ENGINE CHARGE-AIR COOLER OUTLET PRESSURE/TEMPERATURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the engine charge-air cooler outlet pressure/temperature sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 10.
NO >> • Repair or replace error-detected parts.
• GO TO 18.

10. VERIFY THE CHARGE-AIR COOLER OUTLET PRESSURE SENSOR ACCURACY AT KEY ON

1. Reconnect the charge-air cooler outlet pressure/temperature sensor.
2. Verify the charge-air cooler outlet pressure sensor accuracy.
3. Turn ignition switch ON.
4. Using CONSULT, select “ENGINE” and read the “Data Monitor” of the charge-air cooler outlet pressure.

Using CONSULT is charge-air cooler outlet pressure 0±10.3 kPa (0±1.5 psi)?

YES >> GO TO 16.
NO >> GO TO 11.

11. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the engine charge-air cooler outlet pressure/temperature sensor.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P0107 DTC current?

YES >> GO TO 12.
NO >> GO TO 13.

12. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between the engine charge air cooler outlet pressure/temperature sensor connector F140 pressure signal circuit terminal 1 and power circuit terminal 2.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P0108 DTC current?

YES >> • Replace the engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".
• GO TO 18.
NO >> GO TO 13.

13. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM connector F101.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.

- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 14.
NO >> • Repair or replace error-detected parts.
• GO TO 18.

14. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P0107 DTC current?

YES >> GO TO 15.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 18.

15. CHECK THE CIRCUIT RESPONSE

CAUTION:
Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
• Not to bend and damage pins and terminals.
• Not to probe or short unintended circuits and potentially damaging the control unit.

1. Turn ignition switch OFF.
2. Connect a jumper wire between ECM connector F101 pins 1 and 2.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P0108 DTC current?

YES >> • Repair or replace the engine harness for high resistance or short circuit.
• GO TO 18.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 18.

16. CHECK THE AIR INTAKE FOR LEAKS

1. Remove the jumper wire.
2. Connect all harness connectors.
3. Start the engine.
4. Check for air leaks in connections and hoses between the turbocharger outlet and charge-air cooler inlet.

Is air leak present?

YES >> • Repair or replace the leaking component.
• GO TO 18.
NO >> GO TO 17.

17. CHECK THE INTAKE AND EXHAUST FOR RESTRICTIONS

Inspect the intake and the exhaust system for restrictions.

Is exhaust or intake restriction found?

YES >> • Repair or replace the restricted component.
• GO TO 18.
NO >> • An in-range malfunction of the charge-air cooler outlet pressure/temperature sensor has been detected. Replace the engine charge air cooler outlet pressure/temperature sensor. Refer to EM-225, "Removal and Installation".
• GO TO 18.

18. ERASE CURRENT DTCS

1. Turn ignition switch ON (engine OFF).
2. Using CONSULT, erase ENGINE diagnostic trouble codes.
