3. Operate the engine within the "Conditions for Clearing DTC".
4. Using CONSULT check for current ENGINE diagnostic trouble codes.

Is P22CE DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1096, "Diagnosis Procedure".
NO >> Repair complete.

P2413 EGR SYSTEM

DTC Description

INFOID:0000000013065703

NOTE:
If any other "current" DTC is displayed with this DTC, first perform the trouble diagnosis for all other DTCs.

The Exhaust Gas Recirculation (EGR) temperature sensor is a variable resistor sensor and is used to measure the temperature of the EGR gas flow after it exits the EGR cooler. The engine control module (ECM) supplies 5V to the EGR temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the EGR flow temperature.

DTC DETECTION LOGIC

EGR Orifice Temperature above normal engine operating range.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2413	EGR ORIFICE TEMP	Diagnosis condition	This diagnostic runs when the ignition switch is ON or the engine is running.
		Signal (terminal)	EGR temperature sensor signal
		Threshold	The Engine Control Module (ECM) detected the EGR temperature was greater than 250°C (482°F) for more than 5 seconds.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning EGR valve
- Low reading for the EGR valve position sensor
- High exhaust temperature
- Low coolant level
- High coolant temperature
- Incorrect coolant/water mixture
- Fouled EGR cooler

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1101, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065704

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for other current DTCs on the CONSULT screen.

Are there any other current DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. CHECK THE EGR TEMPERATURE SENSOR ACCURACY

1. Turn ignition switch OFF.
2. Remove the EGR temperature sensor from the EGR plumbing.
3. Turn ignition switch ON.
4. Using CONSULT, select ”ENGINE” and check “Data Monitor” of “EGR ORIFICE TEMP”.
5. Compare the EGR temperature sensor reading to ambient air temperature.

NOTE:
Allow the EGR temperature sensor enough time to cool down to ambient temperature before comparing the reading.

Is EGR temperature within 10°C (18°F) of ambient air temperature?

YES >> GO TO 3.
NO >>
- Malfunctioning EGR temperature sensor has been detected. Replace the EGR temperature sensor. Refer to EM-228, "Removal and Installation".
- GO TO 6.

3. CHECK THE ENGINE COOLANT MIXTURE

1. Turn ignition switch OFF.
2. Check the engine coolant mixture.
3. Check the freeze point of the engine coolant to be sure of a proper mixture.

NOTE:
Incorrect coolant mixture will cause high EGR temperatures due to inefficient cooling.

Engine coolant is proper mixture?

YES >> GO TO 4.
NO >>
- Drain the coolant and fill the cooling system with the proper mixture. Refer to CO-41, "Changing Engine Coolant".
- GO TO 6.

4. CHECK THE ENGINE COOLANT LEVEL

Check for proper engine coolant level.

NOTE:
Low engine coolant level can cause erratic coolant flow through the engine and EGR cooler, in turn, causing the EGR temperatures to rise.

Is engine coolant level is at proper level?

YES >> GO TO 5.
NO >>
- Replenish the cooling system and troubleshoot for loss of coolant, if necessary.
- GO TO 6.

5. CHECK THE EGR COOLER FOR LEAKS OR FOULING

1. Remove the EGR cooler.
2. Inspect and pressure test the EGR cooler.

Is EGR cooler pressure check within specification?

YES >>
- Clean the EGR cooler.
- GO TO 6.

NO >>
- Replace the EGR cooler. Refer to EM-268, "Removal and Installation".
- GO TO 6.

6. ERASE CURRENT DTC

1. Connect all harness components and connectors.
2. Turn ignition switch ON.
3. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for setting the DTC".
5. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2413 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1101, "DTC Description".

NO >> Repair complete.

P242B EGT SENSOR 3

DTC Description

INFOID:0000000013073104

NOTE:

1. If any of the following ″current″ DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:

- U1611 present. Refer to EC-258, "DTC Description".
- P1614 present. Refer to EC-859, "DTC Description".
- P1615 present. Refer to EC-862, "DTC Description".
- P1616 present. Refer to EC-865, "DTC Description".
- P1623 present. Refer to EC-867, "DTC Description".

The aftertreatment diesel particulate filter temperature sensor module is a smart device that communicates with the engine control module via CAN2 communication. The aftertreatment diesel particulate filter temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using the CAN2 communication. The aftertreatment diesel particulate filter temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature, and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the aftertreatment diesel particulate filter temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Aftertreatment DPF outlet gas temperature is in-range but not rational.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P242B	DOC INLET TEMP DPF INLET TEMP DPF OUTLET TEMP	Diagnosis condition	This diagnostic runs when the ignition is ON and the engine is running.
		Signal (terminal)	DOC and DPF temperature sensor signals.
		Threshold	-85°C (-121°F) < Average temperature drop across PDF<°C (185°F).
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning DPF intake temperature sensor.
- A malfunctioning DPF outlet temperature sensor.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Perform coast down event from 88 km/h (55 MPH) to 72 km/h (45 MPH) for 2 minutes.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Check 1st trip DTC.

Is P242B DTC detected?

YES >> Proceed to EC-1104, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073105

1.CHECK FOR PRIORITY DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for other ENGINE diagnostic trouble codes.
3. Check If any of the following DTCs are ″current″:

- U1611

- P1614
- P1615
- P1616
- P1623

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> • A malfunctioning aftertreatment Diesel Particulate Filter (DPF) temperature sensor module has been detected. Replace the aftertreatment DPF temperature sensor module. Refer to EX-52, "Removal and Installation".
• GO TO 2.

2.ERASE CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P242B DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1104, "DTC Description".
NO >> Repair complete.

P242C EXHAUST GAS TEMPERATURE SENSOR CIRCUIT LOW 1/3

DTC Description

INFOID:0000000013100515

NOTE:

1. If any of the following ″current″ DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:

- U1611 present. Refer to EC-258, "DTC Description".
- P1614 present. Refer to EC-859, "DTC Description".
- P1615 present. Refer to EC-862, "DTC Description".
- P1616 present. Refer to EC-865, "DTC Description".
- P1623 present. Refer to EC-867, "DTC Description".

The aftertreatment diesel particulate filter temperature sensor module is a smart device that communicates with the engine control module via CAN2 communication. The aftertreatment diesel particulate filter temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using the CAN2 communication. The aftertreatment diesel particulate filter temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature, and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the aftertreatment diesel particulate filter temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The Smart Exhaust Gas Temperature Module has detected a sensor short to ground that causes too low of an input voltage condition in the outlet DPF thermocouple sensor circuit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P242C	DPF OUTLET TEMP	Diagnosis condition	This diagnostic runs when the ignition is ON and the engine is running.
		Signal (terminal)	DPF outlet temperature sensor signal
		Threshold	Aftertreatment outlet DPF gas temperature sensor input voltage ≤ 1 V [-40°C (-40°F)]
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning DPF outlet temperature sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P242C being current on the CONSULT screen.

Is P242C DTC current?

YES >> Go to EC-1107, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013100516

1.CHECK FOR PRIORITY DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for other “ENGINE” diagnostic trouble codes.
3. Check If any of the following DTCs are ″current″:

- U1611
- P1614
- P1615
- P1616
- P1623

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".

NO >> • A malfunctioning aftertreatment Diesel Particulate Filter (DPF) temperature sensor module has been detected. Replace the aftertreatment DPF temperature sensor module. Refer to EX-52, "Removal and Installation".
• GO TO 2.

2.ERASE CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P242C DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1106, "DTC Description".

NO >> Repair complete.

P242D EXHAUST GAS TEMPERATURE SENSOR CIRCUIT HIGH 1/3

DTC Description

INFOID:0000000013100421

NOTE:

1. If any of the following ″current″ DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:

- U1611 present. Refer to EC-258, "DTC Description".
- P1614 present. Refer to EC-859, "DTC Description".
- P1615 present. Refer to EC-862, "DTC Description".
- P1616 present. Refer to EC-865, "DTC Description".
- P1623 present. Refer to EC-867, "DTC Description".

The aftertreatment diesel particulate filter temperature sensor module is a smart device that communicates with the engine control module via CAN2 communication. The aftertreatment diesel particulate filter temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using the CAN2 communication. The aftertreatment diesel particulate filter temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature, and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the aftertreatment diesel particulate filter temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The smart exhaust gas temperature module has detected a sensor short to ground that causes too low of an input voltage condition in the outlet DPF thermocouple sensor circuit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P242D	DPF OUTLET TEMP	Diagnosis condition	This diagnostic runs when the ignition is ON and the engine is running.
		Signal (terminal)	DPF outlet temperature sensor signal
		Threshold	The aftertreatment temperature sensor module has detected a sensor short to battery or open circuit condition that causes a high input voltage.
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning DPF outlet temperature sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P242D being current on the CONSULT screen.

Is P242D DTC current?

YES >> Go to EC-1109, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013100422

1.CHECK FOR PRIORITY DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for other “ENGINE” diagnostic trouble codes.
3. Check If any of the following DTCs are ″current″:

- U1611
- P1614
- P1615
- P1616
- P1623

Is applicable DTC detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".

NO >>
- A malfunctioning aftertreatment Diesel Particulate Filter (DPF) temperature sensor module has been detected. Replace the aftertreatment DPF temperature sensor module. Refer to EX-52, "Removal and Installation".
- GO TO 2.

2.ERASE CURRENT DTC

1. Using CONSULT erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P242D DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1108, "DTC Description".

NO >> Repair complete.

P242F DIESEL PARTICULATE FILTER

DTC Description

INFOID:0000000013084578

The engine aftertreatment system monitors the soot load in the aftertreatment diesel particulate filter. Under normal operating conditions, the aftertreatment diesel particulate filter is self cleaning, where soot is converted to carbon dioxide, nitrogen, and water. Under light load operating conditions, it can be necessary to perform a stationary regeneration of the aftertreatment diesel particulate filter. The soot load in the aftertreatment diesel particulate filter is estimated, using the aftertreatment differential pressure sensor and the calculated soot output of the engine.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the soot load of the aftertreatment diesel particulate filter had exceeded the maximum operating limits.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P242F	(Aftertreatment Diesel Particulate Filter Differential Pressure - Data Valid But Above Normal Operating Range - Most Severe Level)	Diagnosis condition	Engine is running.
		Signal (terminal)	—
		Threshold	Soot load estimate > 10 g/L
		Diagnosis delay time	Diagnostic runs continuously when the engine is running.

POSSIBLE CAUSE

- Harness or connector.
- Engine has been operating in a light load condition that prevents exhaust temperatures from being high enough to actively regenerate the aftertreatment diesel particulate filter.
- Base engine malfunction that causes excessive black soot to be generated.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine.
2. Using CONSULT perform Aftertreatment Diesel Particulate Filter Regeneration Test.
3. Check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P242F being current on the CONSULT screen.

Is DTC P242F current?

YES >> Go to EC-315, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084579

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.

Is DTC P242F current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2459 or P242A being current on the CONSULT screen.

Is applicable DTC detected as current?

YES >> Refer to EC-135, "DTC Index".

NO >> GO TO 3.

3. CHECK THE AFTERTREATMENT DUTY CYCLE

1. Turn ignition switch ON.
2. Using CONSULT, monitor “DEF PUMP DUTY CYCLE” in “Data Monitor” of “ENGINE”.
3. Determine if the duty cycle of the application needs to change in order to increase the temperature of the exhaust gases entering the aftertreatment system.

Duty cycle of the application needs to be increased?

YES >> Change the duty cycle of the application to increase the temperature of the exhaust gases entering the aftertreatment system.
NO >> GO TO 4.

4. PERFORM AFTERTREATMENT DPF PROCEDURE

1. Turn ignition switch ON.
2. Using CONSULT, perform “AFT maintenance” in “” of “ENGINE”.
   NOTE:
   After clicking the reset button, it can take several minutes for DTC P242F to go past and DTC P2463 to go current.

NOTE:
- DTC P242F must be current before the aftertreatment maintenance reset procedure can be performed.
- DTC P242F will go past and DTC P2463 will become current after completing this procedure.

Aftertreatment maintenance reset procedure completed?

YES >> GO TO 5.
NO >> GO TO 4.

5. PERFORM STATIONARY REGENERATION PROCEDURE

1. Turn ignition switch ON.
2. Start and idle engine.
3. Using CONSULT, perform “DPF Regeneration” in “Active Test” of “ENGINE”.

NOTE:
- If stationary regeneration will not activate, see Stationary Regeneration - Will Not Activate troubleshooting.
- DTC P1451 will become current during the regeneration procedure. This is normal operation as the soot is removed from the aftertreatment DPF.

Is DTC P242F current after stationary regeneration completed?

YES >> GO TO 6.
NO >> GO TO 7.

6. INSPECT AFTERTREATMENT DPF

Inspect the aftertreatment DPF.

NOTE:
If the aftertreatment DPF required replacement for excessive ash and had not reached the normal ash cleaning interval, further troubleshooting is required. Check for lubricating oil consumption, coolant consumption, or previous repairs that may have corrected an issue resulting in lubricating oil or coolant consumption

Aftertreatment DPF meet reuse guidelines?

YES >> Clean the aftertreatment DPF.
NO >> Replace the aftertreatment DPF. Refer to EX-41, "Exploded View".

7. INPECT EXHAUST FOR EXCESSIVE BLACK SMOKE

1. Disconnect exhaust pipe from aftertreatment inlet.
2. Start the engine.
3. Perform the Snap Acceleration - Aftertreatment Disconnected procedure to check for excessive black smoke.

Is the inspection result normal?

YES >> Inspection End.
NO >> Refer to appropriate engine performance symptom table.

P244A DIESEL PARTICULATE FILTER DIFFERENTIAL PRESSURE

DTC Description

INFOID:0000000013084611

NOTE:
If any of the following ″current″ DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- U1611 present. Refer to EC-258, "DTC Description".
- P0544 present. Refer to EC-662, "DTC Description".
- P0545 present. Refer to EC-664, "DTC Description".
- P0546 present. Refer to EC-665, "DTC Description".
- P1613 present. Refer to EC-857, "DTC Description".
- P1614 present. Refer to EC-859, "DTC Description".
- P1615 present. Refer to EC-862, "DTC Description".
- P1616 present. Refer to EC-865, "DTC Description".
- P1623 present. Refer to EC-867, "DTC Description".
- P2031 present. Refer to EC-908, "DTC Description".
- P2032 present. Refer to EC-910, "DTC Description".
- P2033 present. Refer to EC-867, "DTC Description".

The engine aftertreatment system monitors the soot load in the aftertreatment diesel particulate filter. Under normal operating conditions, the aftertreatment diesel particulate filter is self cleaning, where soot is converted to carbon dioxide, nitrogen, and water. Under light load operating conditions, it can be necessary to perform a stationary regeneration of the aftertreatment diesel particulate filter. The soot load in the aftertreatment diesel particulate filter is estimated, using the aftertreatment differential pressure sensor and the calculated soot output of the engine.

DTC DETECTION LOGIC

Aftertreatment DPF differential pressure sensor key OFF check indicates signal in-range but not rational.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P244A	DPF OUTLET PRESS DPF DELTA PRESS DPF SOOT LOAD	Diagnosis condition	This diagnostic runs when the engine is running and exhaust flow is above a minimum level.
		Signal (terminal)	DPF pressure sensor signals
		Threshold	Absolute value of averaged DPF delta pressure measured by the delta P sensor > 1.5 kPa (gauge)
		Diagnosis delay time	—

POSSIBLE CAUSE

- The DPF has been removed from the vehicle.
- The DPF is cracked or broken.
- The DPF differential tubes are installed incorrectly, broken, loose, or have been tampered with.
- The DPF differential tubes are installed backward.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1113, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084612

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check If any of the following DTCs are ″current″:

- U1611
- P0544
- P0545
- P0546
- P1613
- P1614
- P1615
- P1616
- P1623
- P2031
- P2032
- P2033

Is applicable DTC current?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR THE PRESENCE OF DOC

1. Turn ignition switch OFF.
2. Check for the presence of the DOC/DPF assembly.

Is DOC/DPF assembly present?

YES >> GO TO 3.
NO >> • Properly install the DOC/DPF assembly.
• GO TO 3.

3.ERASE CURRENT DTC

1. Turn ignition switch ON.
2. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
3. Operate the engine within the "Conditions for setting the DTC".
4. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P244A DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1112, "DTC Description".
NO >> Repair complete.

P244D EXHAUST TEMPERATURE TOO HIGH FOR PF REGENERATION

DTC Description

INFOID:0000000013100299

NOTE:
If any of the following ″current″ DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- U1611 present. Refer to EC-258, "DTC Description".
- P1613 present. Refer to EC-857, "DTC Description".
- P1614 present. Refer to EC-859, "DTC Description".
- P1623 present. Refer to EC-867, "DTC Description".

The aftertreatment diesel particulate filter temperature sensor module is a smart device that communicates with the engine control module via CAN2 communication. The aftertreatment diesel particulate filter temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using CAN2 communication. The aftertreatment diesel particulate filter temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature, and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the aftertreatment diesel particulate filter temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Persistent temperature overshoots the aftertreatment DPF outlet gas temperature during active regeneration of the DPF.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P244D	DPF INLET TEMP DPF OUTLET TEMP SCR INLET TEMP SCR OUTLET TEMP	Diagnosis condition	This diagnostic runs continuously when the ignition switch is in the ON position and the engine is running.
		Signal (terminal)	SCR outlet temperature sensor signal
		Threshold	The DPF outlet temperature sensor was greater than 650°C (1202°F) for 5 seconds on five separate occasions.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Excessive engine oil or diesel fuel being introduced into the exhaust system from the engine
- A damaged fuel injector causing unburned diesel fuel to enter the exhaust system
- A face plugged aftertreatment diesel oxidation catalyst

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Start the engine and let it idle.
2. Connect CONSULT, select “ENGINE” and perform the “DPF Regeneration” in the “Active Test” menu.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P244D being current on the CONSULT screen.

Is P244D DTC current?

YES >> Go to EC-1115, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013100300

1. CHECK FOR OTHER RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current ENGINE diagnostic trouble codes:

- U1611
- P1613
- P1614
- P1623

Are any of the above DTCs current?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. CHECK FOR INJECTOR MISFIRE

1. Start the engine and run it at low idle.
2. Determine if a cylinder misfire is noticed when the engine is running at low idle.
3. Using CONSULT, select “ENGINE” and perform the ″Cylinder Cutout Test″ Active Test to check for a cylinder misfire.

Was an engine misfire detected?

YES >>
- Replace malfunctioning injector if necessary. Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
- Inspect the aftertreatment system for possible damage, and repair if necessary.
- GO TO 5.

NO >> GO TO 3.

3. INSPECT TURBOCHARGER EXHAUST OUTLET FOR OIL OR FUEL

1. Turn ignition switch OFF.
2. Remove the exhaust plumbing from the turbocharger outlet.
3. Look for signs of moisture in the turbocharger exhaust outlet.
4. Inspect the turbocharger exhaust outlet for signs of oil or fuel being introduced into the aftertreatment system from the engine.

Was engine oil or fuel contamination found in the turbocharger exhaust outlet?

YES >>
- Locate the cause of possible diesel fuel or engine oil being carried from the engine into the aftertreatment system and repair or replace any components that caused the engine oil or diesel fuel contamination. Inspect the aftertreatment system for possible damage.
- GO TO 5.

NO >> GO TO 4.

4. CHECK AFTERTREATMENT DIESEL OXIDATION CATALYST FOR SOOT ACCUMULATION

1. Remove the aftertreatment Diesel Oxidation Catalyst (DOC) and Diesel Particulate Filter (DPF) assembly.
2. Inspect the aftertreatment DOC.
3. Check the intake face of the aftertreatment DOC for damage, soot accumulation and/or face plugging.

Are more than 50% of the cells on the intake face completely blocked by soot?

YES >>
- Replace the DOC and DPF assembly. Refer to EX-36, "Removal and Installation".
- GO TO 5.

NO >> GO TO 5.

5. ERASE DTC

1. Connect all components.
2. With CONSULT, erase all DTCs.
3. Operate the engine within the conditions for setting DTC.
4. Check for current ENGINE diagnostic trouble codes.

Did the P244D DTC return?

YES >> Troubleshooting procedure needs to be repeated. Go to EC-1114, "DTC Description".
NO >> Repair complete.

P2453 PARTICULATE FILTER PRESSURE SENSOR A RANGE/PERFORMANCE

DTC Description

INFOID:0000000013099337

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- P2454 present. Refer to EC-1120, "DTC Description".
- P2455 present. Refer to EC-1124, "DTC Description".

The engine control module (ECM) provides a 5V supply to the aftertreatment diesel particulate filter outlet pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The aftertreatment diesel particulate filter outlet pressure sensor provides a signal to the ECM on the aftertreatment diesel particulate filter outlet pressure sensor signal circuit. This sensor signal voltage changes based on the pressure at the outlet of the aftertreatment diesel particulate filter.

DTC DETECTION LOGIC

Aftertreatment DPF outlet pressure sensor signal stuck in-range.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2453	DPF OUTLET PRESS	Diagnosis condition	• Part 1: Runs 1 minute after key OFF, and DPF temperature sensors are still > 200°C (392°F). • Part 2: Runs when the engine is operating.
		Signal (terminal)	DPF outlet pressure sensor
		Threshold	Range of DPF outlet pressure since last decision in current key cycle until the enable conditions are met < 0.1 kPa
		Diagnosis delay time	—

POSSIBLE CAUSE

- Stuck in-range aftertreatment diesel particulate filter outlet pressure sensor reading
- High resistance in the aftertreatment diesel particulate filter outlet pressure sensor signal or return wires
- Higher than expected diesel particulate filter outlet pressure
- Excessive diesel exhaust fluid (DEF) deposits in the aftertreatment decomposition tube.
- Plugged outlet pressure sensor ports could cause this DTCs if pressure is held in the port after the engine is turned OFF.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1117, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099338

1. CHECK FOR OTHER RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current “ENGINE” diagnostic trouble codes:

- P2454
- P2455

Are any of the above DTCs detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. CHECK THE DPF DIFFERENTIAL PRESSURE SENSOR TUBES FOR BLOCKAGE

1. Turn ignition switch OFF.
2. Disconnect the aftertreatment DPF differential pressure sensor tubes.
3. Inspect the aftertreatment DPF differential pressure sensor tubes for blockage.

Differential pressure sensor tubes blocked?

YES >> • Repair or replace the aftertreatment DPF differential pressure sensor tubes.
• GO TO 14.
NO >> GO TO 3.

3. MONITOR THE DPF OUTLET PRESSURE SENSOR WITH CONSULT

1. Connect all components and connectors.
2. Turn ignition switch ON.
3. Using CONSULT, select ENGINE and check Data Monitor of the DPF outlet pressure sensor.

NOTE:
An exhaust ventilation system connected to the exhaust can cause the outlet pressure sensor to read incorrectly. Be sure to remove any ventilation or vacuum equipment from the exhaust before reading the outlet pressure sensor value.

Does DPF outlet pressure sensor read 0± 3 kPa?

YES >> GO TO 4.
NO >> • Replace the aftertreatment DPF differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 14.

4. CHECK THE DEPOSITS IN THE DECOMPOSITION TUBE

1. Turn ignition switch OFF.
2. Remove the aftertreatment decomposition tube from the vehicle.
3. Inspect the tube for excessive DEF deposits.

Are excessive DEF deposits found inside the decomposition tube?

YES >> • Clean and install the decomposition tube.
• GO TO 14.
NO >> GO TO 5.

5. INSPECT THE DPF OUTLET PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DPF outlet pressure sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> • Repair or replace error-detected parts.
• GO TO 14.

6.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current ENGINE diagnostic trouble codes.

NOTE:
DTC P2460 will also be current.

Is P2454 DTC current?

YES >> GO TO 7.
NO >> GO TO 8.

7.INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DPF differential pressure sensor.
3. Connect a jumper wire between the DPF differential pressure sensor connector C28 power terminal 4 and signal terminal 2.
4. Turn ignition switch ON.
5. Wait 30 seconds.

NOTE:
DTC P2460 will also be current.

Is P2455 DTC current?

YES >> GO TO 13.
NO >> GO TO 8.

8.INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM.
3. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 9.
NO >> • Repair or replace error-detected parts.
• GO TO 14.

9.CHECK THE SENSOR SIGNAL CIRCUIT FOR OPEN

Check the signal circuit for continuity between the ECM connector and the DPF differential pressure sensor connector.

ECM		DPF differential pressure sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	7	C28	2	Yes

Is the inspection result normal?

YES >> GO TO 10.
NO >> • Repair open circuit in harness or connectors.
• GO TO 14.

10. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

Check the continuity between DPF differential pressure sensor signal circuit and ground.

ECM		Ground	Continuity
Connector	Terminal		
E93	7	—	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair or replace harness for a short to ground.
• GO TO 14.

11. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DPF differential pressure sensor signal and all other circuits at the ECM connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	7	All others	No

Is the inspection result normal?

YES >> GO TO 12.
NO >> • Repair short circuit in harness or connectors.
• GO TO 14.

12. CHECK THE DPF DIFFERENTIAL PRESSURE SENSOR VOLTAGE VALUE

1. Connect all harness connectors.
2. Start the engine.
3. Using CONSULT, select “ENGINE” and check “Data Monitor” of the ″DPF OUTLET PRESS SENS V″.
4. Perform a “Snap Acceleration Test” while looking for a change in voltage value.

Did the value changed?

YES >> GO TO 13.
NO >> • Replace the aftertreatment DPF differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 14.

13. CHECK EXHAUST SYSTEM FOR RESTRICTIONS

Inspect the exhaust system for restrictions.

Is exhaust restriction found?

YES >> • Repair or replace the restricted component.
• GO TO 14.
NO >> • Replace the aftertreatment DPF differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 14.

14. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing DTC".
6. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2453 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1116, "DTC Description".
NO >> Repair complete.

P2454 DIESEL PARTICULATE FILTER DIFFERENTIAL PRESSURE SENSOR

DTC Description

INFOID:0000000013065719

NOTE:
If the following "current" DTC is displayed with this DTC, first perform the trouble diagnosis for this other DTC:
• P06D3 present. Refer to EC-825, "DTC Description".

The engine control module (ECM) provides a 5V supply to the aftertreatment diesel particulate filter differential pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The aftertreatment diesel particulate filter differential pressure sensor provides a signal to the ECM on the aftertreatment diesel particulate filter differential pressure sensor signal circuit. This sensor signal voltage changes based on the pressure at the differential of the aftertreatment diesel particulate filter.

DTC DETECTION LOGIC

Aftertreatment DPF differential pressure sensor reading less than specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2454	DPF OUTLET PRESS	Diagnosis condition	This diagnostic runs continuously when the key switch is in the ON position or when the engine is running.
		Signal (terminal)	DPF differential pressure sensor
		Threshold	Aftertreatment DPF differential pressure sensor value < 0.25 V (-6.245 kPa)
		Diagnosis delay time	—

POSSIBLE CAUSE

• Signal circuit open or shorted to ground in the engine harness or sensor
• Supply wire open or shorted to ground

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2454 being current on the CONSULT screen.

Is P2454 DTC current?

YES >> Go to EC-1120, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065720

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P06D3 is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Refer to EC-825, "DTC Description".
NO >> GO TO 2.

2. CHECK FOR CURRENT SENSOR DTC

Check for DTC P2454 being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DPF differential pressure sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

4. CHECK THE PRESSURE SENSOR POWER SUPPLY AND GROUND CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between DPF differential pressure sensor supply voltage and return circuit terminals.

DPF differential pressure sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
C28	4	1	5

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between DPF differential pressure sensor connector C28 power supply terminal 4 and signal circuit terminal 2.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P2455 become current?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Reconnect the DPF differential pressure sensor.
4. Turn ignition switch ON and wait 30 seconds.
5. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did P2454 DTC become current?

YES >> • A damaged sensor has been detected. Replace the aftertreatment diesel particulate filter differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 13.

NO >> • The removal and installation of the connector corrected the issue.
• GO TO 13.

7. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM.
3. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.

NO >> • Repair or replace error-detected parts.
• GO TO 13.

8. CHECK THE SENSOR POWER CIRCUIT FOR OPEN

Check the power circuit for continuity between the ECM connector and the DPF differential pressure sensor connector.

ECM		DPF differential pressure sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	32	C28	4	Yes

Is the inspection result normal?

YES >> GO TO 9.

NO >> • Repair open circuit in harness or connectors.
• GO TO 13.

9. CHECK THE SENSOR SIGNAL CIRCUIT FOR OPEN

Check the signal circuit for continuity between the ECM connector and the DPF differential pressure sensor connector.

ECM		DPF differential pressure sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	7	C28	2	Yes

Is the inspection result normal?

YES >> GO TO 10.

NO >> • Repair open circuit in harness or connectors.
• GO TO 13.

10. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DPF differential pressure sensor signal and all other circuits at the ECM connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	7	All others	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair short circuit in harness or connectors.
• GO TO 13.

11. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

Check the continuity between DPF differential pressure sensor signal circuit and ground.

ECM		Ground	Continuity
Connector	Terminal		
E93	7	—	No

Is the inspection result normal?

YES >> GO TO 12.
NO >> • Repair or replace harness for a short to ground.
• GO TO 13.

12. CHECK FOR PAST DTCS

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Using CONSULT check for current “ENGINE” diagnostic trouble codes.

Is P2454 DTC past?

YES >> • The removal and installation of the connector corrected the issue.
• GO TO 13.
NO >> Return to Diagnosis Procedure. Refer to EC-1120, "DTC Description".

13. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing DTC".
6. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2454 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1120, "DTC Description".
NO >> Repair complete.

P2455 DIESEL PARTICULATE FILTER DIFFERENTIAL PRESSURE SENSOR

DTC Description

INFOID:0000000013065711

NOTE:
If the following "current" DTC is displayed with this DTC, first perform the trouble diagnosis for this other DTC:
• P06D4 present. Refer to EC-828, "DTC Description".

The Engine Control Module (ECM) provides a 5V supply to the aftertreatment diesel particulate filter differential pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The aftertreatment diesel particulate filter differential pressure sensor provides a signal to the ECM on the aftertreatment diesel particulate filter differential pressure sensor signal circuit. This sensor signal voltage changes based on the pressure at the outlet of the aftertreatment diesel particulate filter.

DTC DETECTION LOGIC

Aftertreatment DPF differential pressure sensor reading is greater than specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2455	DPF OUTLET PRESS	Diagnosis condition	This diagnostic runs continuously when the key switch is in the ON position or when the engine is running.
		Signal (terminal)	DPF differential pressure sensor
		Threshold	Aftertreatment DPF differential pressure sensor value > 4.75 V (36.733 kPa)
		Diagnosis delay time	—

POSSIBLE CAUSE

• Sensor ground circuit open in the engine harness or sensor
• Sensor signal circuit shorted to power circuit or battery supply

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2455 being current on the CONSULT screen.

Is P2455 DTC current?

YES >> Go to EC-1124, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065712

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If DTC P06D4 is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Refer to EC-828, "DTC Description".
NO >> GO TO 2.

2. CHECK FOR CURRENT SENSOR DTC

Check for DTC P2455 current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DPF differential pressure sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace error-detected parts.
• GO TO 12.

4. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P2454 become current?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE PRESSURE SENSOR POWER SUPPLY AND GROUND CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between DPF differential pressure sensor supply voltage and return circuit terminals.

DPF differential pressure sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
C28	4	1	5

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Reconnect the DPF differential pressure sensor.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2455 DTC current?

YES >> • A damaged sensor has been detected. Replace the aftertreatment diesel particulate filter differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 12.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 12.

7. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM.
3. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 12.

8. CHECK THE SENSOR GROUND CIRCUIT FOR OPEN

Check the sensor ground circuit for continuity between the ECM connector and the DPF differential pressure sensor connector.

ECM		DPF differential pressure sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	15	C28	1	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> • Repair open circuit in harness or connectors.
• GO TO 12.

9. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DPF differential pressure sensor signal and all other circuits at the ECM connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	7	All others	No

Is the inspection result normal?

YES >> GO TO 10.
NO >> • Repair short circuit in harness or connectors.
• GO TO 12.

10. CHECK THE SENSOR POWER CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DPF differential pressure sensor power and all other circuits at the ECM connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	32	All others	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair short circuit in harness or connectors.
• GO TO 12.

11. CHECK FOR PAST DTCS

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2455 DTC past?

YES >> • The removal and installation of the connector corrected the issue.
• GO TO 12.
NO >> Refer to EC-1124, "DTC Description".

12. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase ENGINE diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing DTC".
6. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2455 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1124, "DTC Description".
NO >> Repair complete.

P2456 PARTICULATE FILTER PRESSURE SENSOR A INTERMITTENT

DTC Description

INFOID:0000000013098745

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- P2454 present. Refer to EC-1120, "DTC Description".
- P2455 present. Refer to EC-1124, "DTC Description".

The Engine Control Module (ECM) provides a 5V supply to the aftertreatment diesel particulate filter differential pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The aftertreatment diesel particulate filter differential pressure sensor provides a signal to the ECM on the aftertreatment diesel particulate filter differential pressure sensor signal circuit. This sensor signal voltage changes based on the pressure at the outlet of the aftertreatment diesel particulate filter.

DTC DETECTION LOGIC

Aftertreatment DPF differential pressure sensor signal is in-range but reading is not rational or inappropriately high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2456	DPF OUTLET PRESS	Diagnosis condition	• Part 1: Runs 1 minute after key OFF, and DPF temperature sensors are still > 200°C (392°F). • Part 2: Runs when the engine is operating.
		Signal (terminal)	DPF differential pressure sensor.
		Threshold	Range of DPF differential pressure since last decision in current key cycle until the enable conditions are met < 0.1 kPa.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Stuck in-range aftertreatment diesel particulate filter differential pressure sensor reading.
- High resistance in the aftertreatment diesel particulate filter differential pressure sensor signal or return wires.
- Higher than expected diesel particulate filter differential pressure.
- Excessive Diesel Exhaust Fluid (DEF) deposits in the aftertreatment decomposition tube.
- Plugged differential pressure sensor ports could cause this DTC if pressure is held in the port after the engine is turned OFF.

NOTE:
It is possible to set this DTC in a shop environment by performing a key cycle with the tailpipe connected to an exhaust ventilation system.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1129, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013098746

1. CHECK FOR OTHER RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current ENGINE diagnostic trouble codes:

- P2454
- P2455

Are any of the above DTCs detected?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. CHECK THE DPF DIFFERENTIAL PRESSURE SENSOR TUBES FOR BLOCKAGE

1. Turn ignition switch OFF.
2. Disconnect the aftertreatment DPF differential pressure sensor tubes.
3. Inspect the aftertreatment DPF differential pressure sensor tubes for blockage.

Differential pressure sensor tubes blocked?

YES >> • Repair or replace the aftertreatment DPF differential pressure sensor tubes. Refer to EM-293, "Removal and Installation".
• GO TO 14.
NO >> GO TO 3.

3. MONITOR THE DPF DIFFERENTIAL PRESSURE SENSOR WITH CONSULT

1. Connect all components and connectors.
2. Turn ignition switch ON.
3. Using CONSULT, select ENGINE and check Data Monitor of the DPF differential pressure sensor.

NOTE:
An exhaust ventilation system connected to the exhaust can cause the differential pressure sensor to read incorrectly. Be sure to remove any ventilation or vacuum equipment from the exhaust before reading the differential pressure sensor value.

DPF differential pressure sensor reads 0± 1.5 kPa (0± 0.44 in Hg)?

YES >> GO TO 4.
NO >> • Replace the aftertreatment DPF differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 14.

4. INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DPF differential pressure sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> • Repair or replace error-detected parts.
• GO TO 14.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

NOTE:
DTC P2460 will also be current.

Is P2454 DTC current?

YES >> GO TO 6.
NO >> GO TO 7.

6. INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DPF differential pressure sensor.
3. Connect a jumper wire between the DPF differential pressure sensor connector C28 power terminal 32 and signal terminal 24.
4. Turn ignition switch ON.
5. Wait 30 seconds.

NOTE:
DTC P2460 will also be current.

Is P2455 DTC current?

YES >> GO TO 12.
NO >> GO TO 7.

7. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Disconnect the ECM.
4. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 14.

8. CHECK THE SENSOR SIGNAL CIRCUIT FOR OPEN

Check the signal circuit for continuity between the ECM connector and the DPF differential pressure sensor connector.

ECM		DPF differential pressure sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	24	C28	3	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> • Repair open circuit in harness or connectors.
• GO TO 14.

9. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

Check the continuity between DPF differential pressure sensor signal circuit and ground.

ECM		Ground	Continuity
Connector	Terminal		
E93	24	—	No

Is the inspection result normal?

YES >> GO TO 10.
NO >> • Repair or replace harness for a short to ground.
• GO TO 14.

10. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DPF differential pressure sensor signal and all other circuits at the ECM connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	24	All others	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair short circuit in harness or connectors.
• GO TO 14.

11. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Reconnect the DPF differential pressure sensor.
4. Turn ignition switch ON and wait 30 seconds.
5. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did P2456 DTC become current?

YES >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 14.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 14.

12. CHECK THE DEPOSITS IN THE DECOMPOSITION TUBE

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Remove the aftertreatment decomposition tube from the vehicle.
4. Inspect the tube for excessive DEF deposits.

Were excessive DEF deposits found inside the decomposition tube?

YES >> • Clean and install the decomposition tube.
• GO TO 14.
NO >> GO TO 13.

13. CHECK EXHAUST SYSTEM FOR RESTRICTIONS

Inspect the exhaust system for restrictions.

Is exhaust restriction found?

YES >> • Repair or replace the restricted component.
• GO TO 14.
NO >> • Replace the aftertreatment DPF differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 14.

14. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.

4. Using CONSULT, erase ENGINE diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing DTC".
6. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2456 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1128, "DTC Description".
NO >> Repair complete.

P2457 EGR COOLER

DTC Description

INFOID:0000000013073125

The Exhaust Gas Recirculation (EGR) temperature sensor is a variable resistor sensor and is used to measure the temperature of the EGR gas flow after it exits the EGR cooler. The Engine Control Module (ECM) supplies 5V to the EGR temperature signal circuit. The ECM monitors the change in voltage caused by changes in the resistance of the sensor to determine the EGR flow temperature.

DTC DETECTION LOGIC

EGR orifice temperature above normal engine operating range.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2457	EGR ORIFICE TEMP	Diagnosis condition	This diagnostic runs when the engine is running.
		Signal (terminal)	EGR temperature sensor signal
		Threshold	The Engine Control Module (ECM) detected the EGR temperature was greater than 260°C (500°F).
		Diagnosis delay time	—

POSSIBLE CAUSE

- Malfunctioning EGR temperature sensor
- Malfunctioning EGR cooler

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CHECK

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2457 being current on the CONSULT screen.

Is P2457 DTC current?

YES >> Go to EC-1133, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073126

1.CHECK FOR OTHER CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check “ENGINE” diagnostic trouble codes.
3. Check for other current DTCs on the CONSULT screen.

Are there any other current DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR CURRENT DTC

1. Using CONSULT, check for “ENGINE” diagnostic trouble codes.
2. Check for P2457 being current DTCs on the CONSULT screen.

Is P2457 current DTC detected?

YES >> GO TO 3.

NO >> Refer to GI-43, "Intermittent Incident".

3. CHECK THE ENGINE COOLANT MIXTURE

1. Turn ignition switch OFF.
2. Check the engine coolant mixture.
3. Check the freeze point of the engine coolant to be sure of a proper mixture.

NOTE:
Incorrect coolant mixture will cause high EGR temperatures due to inefficient cooling.

Is engine coolant mixed correctly?

YES >> GO TO 4.
NO >> • Drain the coolant and fill the cooling system with the proper mixture. Refer to CO-41, "Changing Engine Coolant".
• GO TO 13.

4. CHECK THE ENGINE COOLANT LEVEL

Check for proper engine coolant level.

NOTE:
Low engine coolant level can cause erratic coolant flow through the engine and EGR cooler, in turn, causing the EGR temperatures to rise.

Is Engine coolant level at proper level?

YES >> GO TO 5.
NO >> • Replenish the cooling system and troubleshoot for loss of coolant if necessary.
• GO TO 13.

5. CHECK THE EGR TEMPERATURE SENSOR ACCURACY

1. Remove the EGR temperature sensor from the EGR plumbing.
2. Turn ignition switch ON.
3. Using CONSULT, select ENGINE and check Data Monitor of EGR ORIFICE TEMP.
4. Compare the EGR temperature sensor reading to ambient air temperature.

NOTE:
Allow the EGR temperature sensor enough time to cool down to ambient temperature before comparing the reading.

Is EGR temperature within 10°C (18°F) of ambient air temperature?

YES >> GO TO 6.
NO >> GO TO 7.

6. CHECK THE EGR COOLER FOR LEAKS OR FOULING

1. Turn ignition switch OFF.
2. Remove the EGR cooler.
3. Inspect and pressure test the EGR cooler.

Is EGR cooler pressure check within specification?

YES >> • Clean the EGR cooler.
• GO TO 13.
NO >> • Replace the EGR cooler. Refer to EM-268, "Removal and Installation".
• GO TO 13.

7. INSPECT THE EGR TEMPERATURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the EGR temperature sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.

- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

8. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P040D DTC current?

YES >> GO TO 9.
NO >> GO TO 10.

9. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between the EGR temperature sensor connector F142 signal terminal 154 and return terminal 170.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P040C DTC current?

YES >> • A malfunctioning EGR temperature sensor has been detected. Replace the EGR temperature sensor. Refer to EM-228, "Removal and Installation".
• GO TO 13.
NO >> GO TO 10.

10. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Disconnect the ECM connector F101.
4. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

11. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P040D DTC current?

YES >> GO TO 12.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 13.

12. CHECK THE ECM RESPONSE

CAUTION:

Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
- **Not to bend and damage pins and terminals.**
- **Not to probe or short unintended circuits and potentially damaging the control unit.**

1. Turn ignition switch OFF.
2. Connect a jumper wire between ECM connector F101 pins 154 and 170.
3. Turn ignition switch ON.
4. Wait for 30 seconds.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P040C DTC current?

YES >> GO TO 13.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 13.

13. ERASE CURRENT DTC

1. Turn ignition switch OFF.
2. Disconnect jumper wire.
3. Connect all harness components and connectors.
4. Turn ignition switch ON.
5. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
6. Operate the engine within the "Conditions for setting the DTC".
7. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2457 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1133, "DTC Description".
NO >> Repair complete.

P2459 REGENERATION FREQUENCY OF DIESEL PARTICULATE FILTER

DTC Description

INFOID:0000000013073242

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- P0101 present. Refer to EC-311, "DTC Description".
- P0106 present. Refer to EC-322, "DTC Description".
- P0299 present. Refer to EC-521, "DTC Description".
- P2263 present. Refer to EC-1063, "DTC Description".
- P2454 present. Refer to EC-1120, "DTC Description".
- P2455 present. Refer to EC-1124, "DTC Description".
- P2456 present. Refer to EC-1128, "DTC Description".
- P2460 present. Refer to EC-1151, "DTC Description".
- P2461 present. Refer to EC-1155, "DTC Description".
- P2462 present. Refer to EC-1159, "DTC Description".

The ECM records the time from the completion of an active regeneration of the aftertreatment diesel particulate filter until the ECM requests another active regeneration of the diesel particulate filter.

DTC DETECTION LOGIC

Aftertreatment DPF system active regeneration is occurring more frequently than intended.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2459	DPF OUTLET PRESS DPF DELTA PRESS DPF DELTA PRESS SENS V DPF INLET TEMP DPF OUTLET TEMP SCR INLET TEMP SCR OUTLET TEMP	Diagnosis condition	This diagnostic only runs after successful completion of an active regeneration of the aftertreatment diesel particulate filter
		Signal (terminal)	Outlet pressure and temperature sensor signals.
		Threshold	The system detects that the DPF is no longer new, or "green". New DPF temporarily exhibits high back pressure during their first hours of use which can lead to a false high estimation of soot load.
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning fuel injector causing unburned diesel fuel to enter the exhaust system
- A face plugged aftertreatment diesel oxidation catalyst
- A malfunctioning aftertreatment diesel particulate filter differential pressure sensor
- An engine malfunction resulting in high engine out soot

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CHECK

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2459 being current on the CONSULT screen.

Is P2459 DTC current?

YES >> Go to EC-1137, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073243

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.

Is P2459 DTC current?

YES >> GO TO 2.

NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK FOR OTHER RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Using CONSULT, check for the following current or past ENGINE diagnostic trouble codes:

- P0101
- P0106
- P0299
- P2263
- P2454
- P2455
- P2456
- P2460
- P2461
- P2462

Are any of the above current or past DTCs present?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK FOR CURRENT OR PAST FUEL SYSTEM RELATED DTCS

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Look for fuel system related DTCs.

Any applicable DTC current or past?

YES >> Perform diagnosis of applicable DTCs first, then return to this DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4.CHECK FOR CURRENT OR PAST AIR HANDLING SYSTEM RELATED DTCS

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Look for air handling system DTCs.

Is any of P0101, P0106, P0299 or P2263 DTCs current or past?

YES >> Perform diagnosis of applicable DTCs first, then return to this DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 5.

5.CHECK FOR CURRENT OR PAST EGR OR TURBOCHARGER SYSTEM RELATED DTCS

1. Using CONSULT, check for other ENGINE diagnostic trouble codes.
2. Look for EGR and turbocharger system related DTCs.

Are any applicable current or past DTCs?

YES >> Perform diagnosis of applicable DTCs first, then return to this DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 6.

6.CHECK FOR CURRENT OR PAST AFTERTREATMENT SYSTEM RELATED DTCS

1. Using CONSULT, check for other ENGINE diagnostic trouble codes.
2. Look for aftertreatment system related DTCs.

Is P0420, P0421, P0544, P2031, P242B or P24A0 DTCs current or past?

YES >> Perform diagnosis of applicable DTCs first, then return to this DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 7.

7.CHECK FOR CURRENT OR PAST AFTERTREATMENT DPF SYSTEM RELATED DTCS

1. Using CONSULT, check for other ENGINE diagnostic trouble codes.
2. Look for air handling system DTCs.

Is P1451, P242F or P2463 DTCs current or past?

YES >>
- Without the presence of DTC P24A2: Perform diagnosis of applicable DTCs first, then return to this DTC. Refer to EC-135, "DTC Index".
- With DTC P24A2 present: GO TO 9.

NO >> GO TO 8.

8. CHECK FOR DEBRIS IN THE FUEL TANK

1. Turn ignition switch OFF.
2. Remove the fuel tank filter cap.
3. Check for debris in the fuel tank.

Is any debris found in the tank?

YES >> • Remove the debris from the tank.
• GO TO 9.
NO >> GO TO 9.

9. MONITOR AFTERTREATMENT DPF DIFFERENTIAL PRESSURE SENSOR WITH CONSULT

1. Turn ignition switch ON.
2. Using CONSULT, select ENGINE, Data Monitor and verify the "DPF DELTA PRESS SENS V".
3. Expected voltage reading is 0.69V ± 0.1V at ≤ 25°C (77°) or 0.69V± 0.06V at ≥ 26°C (78°F).

Is DPF differential pressure sensor voltage reading within specification?

YES >> GO TO 10.
NO >> • An issue with the DPF differential pressure sensor or associated wiring has been found:
- Check for a short between the signal pin and other pins at the sensor harness.
- Check for high resistance in the return pin circuit of the sensor harness.
- Replace the DPF differential pressure sensor if the wiring checks OK. Refer to EX-58, "Removal and Installation".
• GO TO 10.

10. CHECK AFTERTREATMENT DPF DIFFERENTIAL PRESSURE SENSOR TUBES FOR BLOCKAGE

1. Turn ignition switch OFF.
2. Inspect the DPF differential pressure sensor tubes for blockage, kinking or leaking.

Is any blockage, kinking or leaking found?

YES >> • Clean, repair or replace the DPF differential pressure sensor tubes as necessary.
• GO TO 11.
NO >> GO TO 11.

11. CHECK THE CIRCUIT RESPONSE

1. Disconnect the DPF differential pressure sensor.
2. Turn ignition switch ON.
3. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Are both P2454 and P2460 DTCs current?

YES >> GO TO 12.
NO >> • An issue with the DPF differential pressure sensor or associated wiring has been found. Check harness for proper location between the ECM and the sensor.
• GO TO 12.

12. CHECK THE DPF DIFFERENTIAL PRESSURE SENSOR WIRING

1. Turn ignition switch OFF.
2. Connect a jumper wire between DPF differential pressure sensor connector C28 power supply terminal 4 and delta pressure signal circuit terminal 2.
3. Turn ignition switch ON.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Are both P2455 and P2461 DTCs current?

YES >> GO TO 13.
NO >> • An issue with the DPF differential pressure sensor or associated wiring has been found. Check harness for proper location between the ECM and the sensor.
• GO TO 13.

13. INSPECT THE HIGH PRESSURE FUEL SYSTEM FOR LEAKS

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Inspect for fuel leaks:

- Fuel supply line from the Stage 2 fuel filter and high-pressure fuel pump

- Fuel rail supply lines
- Injector supply lines

Is a leak detected?

YES >> • Repair or replace the leaky component.
• GO TO 17.
NO >> GO TO 14.

14. CHECK FUEL PUMP ACTUATOR AND FUEL PRESSURE RELIEF VALVE

1. Turn ignition switch ON.
2. Using CONSULT, select “ENGINE”, perform the “HPCR Fuel Act Override”/ “Active Test”.

Are actuators within specifications?

YES >> GO TO 15.
NO >> • If the fuel pump actuator is **not** within specifications, replace the fuel pump actuator. Refer to EM-476, "Removal and Installation".
• If the pressure relief valve is **not** within specifications, replace the fuel rail pressure relief valve. Refer to EM-474, "Removal and Installation".
• GO TO 17.

15. CHECK FUEL INJECTOR RETURN FLOW

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Use SST J-54421 to perform the next step.
4. Using CONSULT, select “ENGINE” and perform the ″Fuel Injector Drain Flow Test″ on bank 2.

NOTE:
The purpose of this test is to check for excessive fuel drain from each injector.

- Disconnect the fuel drain lines from the bank of injectors being tested.
- Plug injector drain lines with the plug provided in the kit.
- Connect the piezo adapter line drain tool connection to each of the injectors.
- Start the engine until top mark is reached or crank for 30 seconds if the engine does not start.
- The maximum permissible drain is 3 times the lowest measured drain quantity.
- A failed injector will have a higher flow and exhibit 3 times the lowest measured drain quantity.

Filling quantity up to:	Engine cranks but does not start (small diameter)		Engine starts (large diameter)	
	ml	oz	ml	oz
1	1.8	0.06	6	0.2
2	2.4	0.08	13	0.44
3	3.2	0.11	21	0.71
4	4	0.14	29	0.98
5	—	—	37	1.25
6	—	—	45	1.52
7	—	—	53	1.79

Does each fuel injector meet the specification in injector drain flow test?

YES >> GO TO 16.
NO >> • Replace the malfunctioning injector(s). Refer to (cylinder 1 or 3) EM-428, "Removal and Installation (CYLINDER 1 and CYLINDER 3)", (cylinder 2 or 4) EM-431, "Removal and Installation (CYLINDER 2 and CYLINDER 4)", (cylinder 5 or 7) EM-434, "Removal and Installation (CYLINDER 5 and CYLINDER 7)", (cylinder 6 or 8) EM-438, "Removal and Installation (CYLINDER 6 and CYLINDER 8)".
• GO TO 17.

16. CHECK THE EXHAUST FOR EXCESSIVE SMOKE

1. Disconnect the exhaust from the aftertreatment inlet.
2. Start the engine.
3. Perform two “Snap Acceleration Test” from low to high idle. Hold the engine at high idle for 5 seconds.

NOTE:
A small puff of black smoke upon acceleration that clears at a steady high idle speed is normal.

Excessive black smoke during acceleration or constant black smoke at high idle?

YES >> Refer to the appropriate diagnosis procedure to correct the cause of excessive smoke.
NO >>
- Replace the DOC/DPF assembly. Refer to EX-42, "Removal and Installation".
- If the aftertreatment DPF requires replacement for excessive ash and has **not** reached the normal ash cleaning interval, further troubleshooting is required.
- Check for lubricating oil consumption, coolant consumption, or previous repairs that may have corrected an issue resulting in lubricating oil or coolant consumption.
- GO TO 17.

17. ERASE CURRENT DTC

1. Connect all harness components and connectors.
2. Turn ignition switch ON.
3. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for setting the DTC".
5. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2459 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1137, "DTC Description".
NO >> Repair complete.

P245C EGR COOLER BYPASS CONTROL CIRCUIT LOW

DTC Description

INFOID:0000000013102058

The Exhaust Gas Recirculation Cooler Bypass Valve (EBV) is used to redirect the EGR gases around the cooler when the engine is under certain operating conditions. The Engine Control Module (ECM) opens and close the EBV based on engine conditions. The EBV sends the valve position status back to the ECM.

DTC DETECTION LOGIC

The ECM has detected that EGR Bypass Valve (EBV) driver is short to low source.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P245C	EGR BYPASS VLV POS V EGR BYPASS VLV CMD	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	EGR bypass valve position sensor signal
		Threshold	The ECM detected the EGR cooler bypass actuator circuit is shorted to ground.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Short to ground in the wiring harness
- Malfunctioning EGR bypass valve

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P245C being current on the CONSULT screen.

Is P245C DTC current?

YES >> Go to EC-1142, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102059

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.

Is P245C DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT EGR BYPASS VALVE ACTUATOR AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the EGR bypass valve actuator connector.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.

- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> • Repair or replace error-detected parts.
• GO TO 8.

3. CHECK EGR BYPASS MOTOR RETURN CIRCUIT FOR SHORT TO GROUND

1. Disconnect the ECM.
2. Check for continuity between EGR bypass valve connector F145 motor return circuit signal terminal 5 and ground.

EGR bypass valve		Ground	Continuity
Connector	Terminal		
F145	5	—	No

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace harness for a short to ground.
• GO TO 8.

4. CHECK THE EGR BYPASS MOTOR RETURN CIRCUIT FOR OPEN OR HIGH RESISTANCE

Check the return circuit for continuity between the ECM connector and the EGR bypass valve connector.

ECM		EGR bypass valve		Continuity
Connector	Terminal	Connector	Terminal	
F101	159	F145	5	Yes

Is the inspection result normal?

YES >> GO TO 5.
NO >> • Repair open circuit in harness or connectors.
• GO TO 8.

5. CHECK EGR BYPASS MOTOR POWER CIRCUIT FOR SHORT TO GROUND

Check for continuity between EGR bypass valve connector F145 motor power circuit terminal 1 and ground.

EGR bypass valve		Ground	Continuity
Connector	Terminal		
F145	1	—	No

Is the inspection result normal?

YES >> GO TO 6.
NO >> • Repair or replace harness for a short to ground.
• GO TO 8.

6. CHECK THE EGR BYPASS MOTOR POWER CIRCUIT FOR OPEN OR HIGH RESISTANCE

Check the power circuit for continuity between the ECM connector and the EGR bypass valve connector.

ECM		EGR bypass valve		Continuity
Connector	Terminal	Connector	Terminal	
F101	180	F145	1	Yes

Is the inspection result normal?

YES >> GO TO 7.
NO >> • Repair open circuit in harness or connectors.
• GO TO 8.

7.CHECK FOR CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P245C DTC current?

YES >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 8.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 8.

8.ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase ENGINE diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing DTC".
6. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P245C DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1142, "DTC Description".
NO >> Repair complete.

P245D EGR COOLER BYPASS CONTROL CIRCUIT HIGH

DTC Description

INFOID:0000000013101508

The Exhaust Gas Recirculation Cooler Bypass Valve (EBV) is used to redirect the EGR gases around the cooler when the engine is under certain operating conditions. The Engine Control Module (ECM) opens and closes the EBV based on engine conditions. The EBV sends the valve position status back to the ECM.

DTC DETECTION LOGIC

The ECM has detected that EGR Bypass Valve (EBV) driver has an open circuit or shorted to a voltage source.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P245D	EGR BYPASS VLV POS V EGR BYPASS VLV CMD	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	EGR bypass valve position sensor signal.
		Threshold	The ECM detected the EGR cooler bypass actuator circuit is shorted to battery.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Short to voltage in the wiring harness
- Malfunctioning EGR bypass valve

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P245D being current on the CONSULT screen.

Is P245D DTC current?

YES >> Go to EC-1145, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013101509

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.

Is P245D DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT EGR BYPASS VALVE ACTUATOR AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the EGR bypass valve actuator connector.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.

- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 3.
NO >> • Repair or replace error-detected parts.
• GO TO 5.

3. CHECK THE EGR BYPASS MOTOR RETURN CIRCUIT FOR A SHORT TO VOLTAGE

1. Disconnect the ECM.
2. Check the voltage between EGR bypass motor return circuit and ground at the EGR bypass valve connector.

EGR bypass valve		Terminal (-)	Voltage (V) (Approx.)
Connector	Terminal (+)		
F145	5	Ground	0

Is the inspection result normal?

YES >> • A damaged EGR bypass valve has been detected. Replace the EGR bypass valve.
• GO TO 5.
NO >> • Repair or replace harness for a short to a voltage source.
• GO TO 5.

4. CHECK FOR CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Using CONSULT check for current “ENGINE” diagnostic trouble codes.

Is P245D DTC current?

YES >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 5.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 5.

5. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing DTC".
6. Using CONSULT check for current “ENGINE” diagnostic trouble codes.

Is P245D DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1145, "DTC Description".
NO >> Repair complete.

P245F PARTICULATE FILTER PRESSURE SENSOR B RANGE/PERFORMANCE

DTC Description

INFOID:0000000013099918

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- P2460 present. Refer to EC-1151, "DTC Description".
- P2461 present. Refer to EC-1155, "DTC Description".

The Engine Control Module (ECM) provides a 5V supply to the aftertreatment diesel particulate filter differential pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The aftertreatment diesel particulate filter differential pressure sensor provides a signal to the ECM on the aftertreatment diesel particulate filter differential pressure sensor signal circuit. This sensor signal voltage changes based on the differential pressure across the aftertreatment diesel particulate filter.

DTC DETECTION LOGIC

Aftertreatment DPF differential pressure sensor signal is stuck in-range.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P245F	DPF OUTLET PRESS	Diagnosis condition	• Part 1: Runs 1 minute after key OFF, and DPF temperature sensors are still > 200°C (392°F). • Part 2: Runs when the engine is operating.
		Signal (terminal)	DPF differential/outlet pressure sensor
		Threshold	ECM detected the DPF differential pressure was greater than 1.5 kpa (0.44 in HG) at key OFF, or is not changing with engine conditions
		Diagnosis delay time	—

POSSIBLE CAUSE

- Stuck in-range aftertreatment diesel particulate filter outlet pressure sensor reading
- High resistance in the aftertreatment diesel particulate filter differential pressure sensor signal or return wires.
- Disconnected or damaged diesel exhaust fluid (DEF) differential pressure sensor tubes
- Plugged differential pressure sensor ports could cause this DTC if pressure is held in the port after the engine is turned OFF.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1148, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099919

1. CHECK FOR OTHER RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current ENGINE diagnostic trouble codes:

- P2460
- P2461

Are any of the above DTCs detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR TUBES

1. Turn ignition switch OFF.
2. Inspect the aftertreatment DPF differential pressure sensor tubes.
3. Make sure the tubes are installed correctly (**not** reversed).
4. Make sure both ends of the tubes are securely connected.
5. Inspect the tubes for leaks or damage.
6. Inspect the tubes for blockage.

Are DPF differential pressure sensor tubes damaged, disconnected or blocked?

YES >> • Repair or replace the aftertreatment DPF differential pressure sensor tubes.
• GO TO 12.
NO >> GO TO 3.

3. MONITOR THE DPF DIFFERENTIAL PRESSURE SENSOR WITH CONSULT

1. Connect all components and connectors.
2. Turn ignition switch ON.
3. Using CONSULT, select ENGINE and check Data Monitor of the DPF differential pressure sensor.

NOTE:
An exhaust ventilation system connected to the exhaust can cause the outlet pressure sensor to read incorrectly. Be sure to remove any ventilation or vacuum equipment from the exhaust before reading the outlet pressure sensor value.

Does DPF outlet pressure sensor read 0± 3 kPa?

YES >> GO TO 4.
NO >> • Replace the aftertreatment DPF differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 12.

4. INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DPF differential pressure sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> • Repair or replace error-detected parts.
• GO TO 12.

5. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.

2. Wait 30 seconds.
3. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2460 DTC current?

YES >> GO TO 6.
NO >> GO TO 7.

6. INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Connect a jumper wire between the DPF differential pressure sensor connector C28 power terminal 4 and signal terminal 3.
3. Turn ignition switch ON.
4. Wait 30 seconds.

Is P2461 DTC current?

YES >> GO TO 12.
NO >> GO TO 7.

7. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM.
3. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 12.

8. CHECK THE SENSOR SIGNAL CIRCUIT FOR OPEN

Check the signal circuit for continuity between the ECM connector and the DPF differential pressure sensor connector.

ECM		DPF differential pressure sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	7	C28	2	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> • Repair open circuit in harness or connectors.
• GO TO 12.

9. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

Check the continuity between DPF differential pressure sensor signal circuit and ground.

ECM		Ground	Continuity
Connector	Terminal		
E93	7	—	No

Is the inspection result normal?

YES >> GO TO 10.
NO >> • Repair or replace harness for a short to ground.

- GO TO 12.

10. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DPF differential pressure sensor signal and all other circuits at the ECM connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	7	All others	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair short circuit in harness or connectors.
• GO TO 12.

11. CHECK THE DPF DIFFERENTIAL PRESSURE SENSOR VOLTAGE VALUE

1. Connect all harness connectors.
2. Start the engine.
3. Using CONSULT, select “ENGINE” and check Data Monitor of the ″DPF OUTLET PRESS SENS V″.
4. Perform a “Snap Acceleration Test” while looking for a change in voltage value.

Did the value change?

YES >> GO TO 12.
NO >> • Replace the aftertreatment DPF differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 12.

12. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase ENGINE diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing DTC".
6. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P245F DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1147, "DTC Description".
NO >> Repair complete.

P2460 PARTICULATE FILTER PRESSURE SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013104198

NOTE:
If the following "current" DTC is displayed with this DTC, first perform the trouble diagnosis for this other DTC:
- P06D3 present. Refer to EC-825, "DTC Description".

The Engine Control Module (ECM) provides a 5V supply to the aftertreatment diesel particulate filter differential pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The aftertreatment diesel particulate filter differential pressure sensor provides a signal to the ECM on the aftertreatment diesel particulate filter differential pressure sensor signal circuit. This sensor signal voltage changes based on the pressure at the outlet of the aftertreatment diesel particulate filter.

DTC DETECTION LOGIC

Aftertreatment DPF differential pressure sensor reading is less than specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2460	DPF OUTLET PRESS	Diagnosis condition	This diagnostic runs continuously when the key switch is in the ON position or when the engine is running.
		Signal (terminal)	DPF differential pressure sensor
		Threshold	Aftertreatment DPF differential pressure sensor value < 0.25 V (-6.245 kPa)
		Diagnosis delay time	—

POSSIBLE CAUSE

- Signal circuit open or shorted to ground in the engine harness or sensor
- Supply wire open or shorted to ground

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2460 current on the CONSULT screen.

Is P2460 DTC current?

YES >> Go to EC-1151, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013104199

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE diagnostic trouble codes.

If DTC P06D3 is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Refer to EC-825, "DTC Description".
NO >> GO TO 2.

2.CHECK FOR CURRENT SENSOR DTC

Check for DTC P2460 being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DPF differential pressure sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

4.CHECK THE PRESSURE SENSOR POWER SUPPLY AND GROUND CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between DPF differential pressure sensor supply voltage and return circuit terminals.

DPF differential pressure sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
C28	4	1	5

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between DPF differential pressure sensor connector C28 power supply terminal 4 and signal circuit terminal 2.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P2461 become current?

YES >> GO TO 6.
NO >> GO TO 7.

6.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Reconnect the DPF differential pressure sensor.
4. Turn ignition switch ON and wait 30 seconds.
5. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did P2460 DTC become current?

YES >> • A damaged sensor has been detected. Replace the aftertreatment diesel particulate filter differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 13.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 13.

7. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM.
3. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

8. CHECK THE SENSOR POWER CIRCUIT FOR OPEN

Check the power circuit for continuity between the ECM connector and the DPF differential pressure sensor connector.

ECM		DPF differential pressure sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	32	C28	4	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> • Repair open circuit in harness or connectors.
• GO TO 13.

9. CHECK THE SENSOR SIGNAL CIRCUIT FOR OPEN

Check the signal circuit for continuity between the ECM connector and the DPF differential pressure sensor connector.

ECM		DPF differential pressure sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	7	C28	2	Yes

Is the inspection result normal?

YES >> GO TO 10.
NO >> • Repair open circuit in harness or connectors.
• GO TO 13.

10. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DPF differential pressure sensor signal and all other circuits at the ECM connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	7	All others	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair short circuit in harness or connectors.
• GO TO 13.

11. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

Check the continuity between DPF differential pressure sensor signal circuit and ground.

ECM		Ground	Continuity
Connector	Terminal		
E93	7	—	No

Is the inspection result normal?

YES >> GO TO 12.
NO >> • Repair or replace harness for a short to ground.
• GO TO 13.

12. CHECK FOR PAST DTCS

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2460 DTC past?

YES >> • The removal and installation of the connector corrected the issue.
• GO TO 13.
NO >> Return to Diagnosis Procedure. Refer to EC-1151, "DTC Description".

13. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase ENGINE diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing DTC".
6. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2460 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1151, "DTC Description".
NO >> Repair complete.

P2461 PARTICULATE FILTER PRESSURE SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013104749

NOTE:
If the following "current" DTC is displayed with this DTC, first perform the trouble diagnosis for this other DTC:
• P06D4 present. Refer to EC-828, "DTC Description".

The engine control module (ECM) provides a 5V supply to the aftertreatment diesel particulate filter differential pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The aftertreatment diesel particulate filter differential pressure sensor provides a signal to the ECM on the aftertreatment diesel particulate filter differential pressure sensor signal circuit. This sensor signal voltage changes based on the pressure at the outlet of the aftertreatment diesel particulate filter.

DTC DETECTION LOGIC

Aftertreatment DPF differential pressure sensor reading is greater than specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2461	DPF OUTLET PRESS	Diagnosis condition	This diagnostic runs continuously when the key switch is in the ON position or when the engine is running.
		Signal (terminal)	DPF differential and differential pressure sensor
		Threshold	Aftertreatment DPF differential pressure sensor value > 4.75 V (36.733 kPa)
		Diagnosis delay time	—

POSSIBLE CAUSE

• Sensor ground circuit open in the engine harness or sensor
• Sensor signal circuit shorted to power circuit or battery supply

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2461 current on the CONSULT screen.

Is P2461 DTC current?

YES >> Go to EC-1155, "DTC Description".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013104750

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing ENGINE diagnostic trouble codes.

If DTC P06D4 is present, perform the confirmation procedure (trouble diagnosis) for this other DTC first.

Is applicable DTC detected?

YES >> Refer to EC-828, "DTC Description".
NO >> GO TO 2.

2.CHECK FOR CURRENT SENSOR DTC

Check for DTC P2461 being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DPF differential pressure sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace error-detected parts.
• GO TO 12.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.

Did DTC P2460 become current?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE DPF DIFFERENTIAL PRESSURE SENSOR POWER SUPPLY AND GROUND CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between DPF differential pressure sensor supply voltage and return circuit terminals.

DPF differential pressure sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
C28	4	1	5

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 7.

6.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Reconnect the DPF differential pressure sensor.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2461 DTC current?

YES >> • A damaged sensor has been detected. Replace the aftertreatment diesel particulate filter differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 12.

NO >> • The removal and installation of the connector corrected the issue.
• GO TO 12.

7. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM.
3. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 12.

8. CHECK THE SENSOR GROUND CIRCUIT FOR OPEN

Check the sensor ground circuit for continuity between the ECM connector and the DPF differential pressure sensor connector.

ECM		DPF differential pressure sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	15	C28	1	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> • Repair open circuit in harness or connectors.
• GO TO 12.

9. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DPF differential pressure sensor signal and all other circuits at the ECM connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	7	All others	No

Is the inspection result normal?

YES >> GO TO 10.
NO >> • Repair short circuit in harness or connectors.
• GO TO 12.

10. CHECK THE SENSOR POWER CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DPF differential pressure sensor power and all other circuits at the ECM connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	32	All others	No

Is the inspection result normal?

YES >> GO TO 11.

NO >> • Repair short circuit in harness or connectors.
• GO TO 12.

11. CHECK FOR PAST DTCS

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2461 DTC past?

YES >> • The removal and installation of the connector corrected the issue.
• GO TO 12.
NO >> Return to Diagnosis Procedure. Refer to EC-1155, "DTC Description".

12. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing DTC".
6. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2461 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1155, "DTC Description".
NO >> Repair complete.

P2462 PARTICULATE FILTER PRESSURE SENSOR CIRCUIT INTERMITTENT

DTC Description

INFOID:0000000013103723

NOTE:
If the following "current" DTC is displayed with this DTC, first perform the trouble diagnosis for this other DTC:
- P2460 present. Refer to EC-1151, "DTC Description".
- P2461 present. Refer to EC-1155, "DTC Description".

The Engine Control Module (ECM) provides a 5V supply to the aftertreatment diesel particulate filter outlet pressure sensor on the sensor supply circuit. The ECM also provides a ground on the sensor return circuit. The aftertreatment diesel particulate filter outlet pressure sensor provides a signal to the ECM on the aftertreatment diesel particulate filter outlet pressure sensor signal circuit. This sensor signal voltage changes based on the pressure at the outlet of the aftertreatment diesel particulate filter.

DTC DETECTION LOGIC

Aftertreatment DPF Outlet pressure sensor reading less than specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2462	DPF OUTLET PRESS DPF DELTA PRESS DPF DELTA PRESS SENS V	Diagnosis condition	Part 1: One minute after key OFF and DPF temperature sensor > 200°C (392°F). Part 2: Continuously while the engine is running.
		Signal (terminal)	DPF differential pressure sensor
		Threshold	Aftertreatment DPF differential pressure sensor value > 1.5 kPa (0.44 in Hg) at key OFF or not changing with engine condition.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Stuck in-range aftertreatment diesel particulate filter differential pressure sensor reading
- High resistance in the aftertreatment diesel particulate filter differential pressure sensor signal or return wires
- Disconnected or damaged aftertreatment diesel particulate filter differential pressure sensor tubes
- Plugged aftertreatment differential pressure sensor ports could cause this DTC if pressure is held in the port after the engine is turned OFF

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it reach normal operating temperature.
3. Turn ignition switch OFF.
4. Keep the ignition switch OFF for 1 minute.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P2462 current on the CONSULT screen.

Is P2462 DTC current?

YES >> Go to EC-1160, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013103724

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for other existing “ENGINE” diagnostic trouble codes.

If either DTC P2460 or P2461 is present, perform the confirmation procedure (trouble diagnosis) for these other DTCs first.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR TUBES

1. Turn ignition switch OFF.
2. Inspect the aftertreatment DPF differential pressure sensor tubes.
3. Make sure the tubes are installed correctly (**not** reversed).
4. Make sure both ends of the tubes are securely connected.
5. Inspect the tubes for leaks or damage.
6. Inspect the tubes for blockage.

Are DPF differential pressure sensor tubes damaged, disconnected or blocked?

YES >> • Repair or replace the aftertreatment DPF differential pressure sensor tubes.
• GO TO 12.
NO >> GO TO 3.

3.MONITOR THE DPF DIFFERENTIAL PRESSURE SENSOR WITH CONSULT

1. Connect all components and connectors.
2. Turn ignition switch ON.
3. Using CONSULT, select ENGINE and check Data Monitor of the DPF differential pressure sensor.

NOTE:
An exhaust ventilation system connected to the exhaust can cause the outlet pressure sensor to read incorrectly. Be sure to remove any ventilation or vacuum equipment from the exhaust before reading the outlet pressure sensor value.

Does DPF outlet pressure sensor read 0± 3 kPa?

YES >> GO TO 4.
NO >> • Replace the aftertreatment DPF differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 12.

4.INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the DPF differential pressure sensor.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> • Repair or replace error-detected parts.
• GO TO 12.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.

2. Wait 30 seconds.
3. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2460 DTC current?

YES >> GO TO 6.
NO >> GO TO 7.

6. INSPECT THE DPF DIFFERENTIAL PRESSURE SENSOR AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Connect a jumper wire between the DPF differential pressure sensor connector C28 power terminal 4 and signal terminal 3.
3. Turn ignition switch ON.
4. Wait 30 seconds.

Is P2461 DTC current?

YES >> GO TO 12.
NO >> GO TO 7.

7. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM.
3. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 12.

8. CHECK THE SENSOR SIGNAL CIRCUIT FOR OPEN

Check the signal circuit for continuity between the ECM connector and the DPF differential pressure sensor connector.

ECM		DPF differential pressure sensor		Continuity
Connector	Terminal	Connector	Terminal	
E93	7	C28	2	Yes

Is the inspection result normal?

YES >> GO TO 9.
NO >> • Repair open circuit in harness or connectors.
• GO TO 12.

9. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

Check the continuity between DPF differential pressure sensor signal circuit and ground.

ECM		Ground	Continuity
Connector	Terminal		
E93	7	—	No

Is the inspection result normal?

YES >> GO TO 10.
NO >> • Repair or replace harness for a short to ground.

• GO TO 12.

10. CHECK THE SENSOR SIGNAL CIRCUIT FOR SHORT TO OTHER CIRCUITS

Check the continuity between DPF differential pressure sensor signal and all other circuits at the ECM connector.

ECM			Continuity
Connector	Terminal	Terminal	
E93	7	All others	No

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair short circuit in harness or connectors.
• GO TO 12.

11. CHECK THE DPF DIFFERENTIAL PRESSURE SENSOR VOLTAGE VALUE

1. Connect all harness connectors.
2. Start the engine.
3. Using CONSULT, select “ENGINE” and check “Data Monitor” of the ″DPF OUTLET PRESS SENS V″ sensor.
4. Perform a “Snap Acceleration Test” while looking for a change in voltage value.

Does this value change?

YES >> GO TO 12.
NO >> • Replace the aftertreatment DPF differential pressure sensor. Refer to EX-58, "Removal and Installation".
• GO TO 12.

12. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing DTC".
6. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2462 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1159, "DTC Description".
NO >> Repair complete.

P2463 DIESEL PARTICULATE FILTER

DTC Description

INFOID:0000000013084596

NOTE:
If the following ″current″ DTC is displayed with this DTC, first perform the trouble diagnosis for this other DTC:
• P06D3 present. Refer to EC-825, "DTC Description".

The engine aftertreatment system monitors the soot load in the aftertreatment diesel particulate filter. Under normal operating conditions, the aftertreatment diesel particulate filter is self-cleaning, where soot is converted to carbon dioxide, nitrogen, and water. Under light load operating conditions, it can be necessary to perform a stationary regeneration of the aftertreatment diesel particulate filter. The soot load in the aftertreatment diesel particulate filter is estimated using the aftertreatment differential pressure sensor and the calculated soot output of the engine.

DTC DETECTION LOGIC

Aftertreatment DPF soot load estimate has increased above the moderate severe level.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2463	DPF OUTLET PRESS	Diagnosis condition	This diagnostic runs continuously when the engine is running.
		Signal (terminal)	DPF differential pressure sensor
		Threshold	Soot load estimate > 9 g/L
		Diagnosis delay time	—

POSSIBLE CAUSE

• The engine has been operating in a light load condition that prevents exhaust temperatures from being high enough to actively regenerate the aftertreatment diesel particulate filter.
• Possible engine damage that causes excessive black soot to be generated

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.
1. Start the engine.
2. Connect CONSULT, select “ENGINE” and perform the ″Stationary Regeneration″ Active Test.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2463 being current on the CONSULT screen.

Is P2463 DTC current?

YES >> Go to EC-1163, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013084597

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.

Is P2463 DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK THE AFTERTREATMENT DUTY CYCLE

1. Interview the driver to determine if the driving duty cycle is enough to raise exhaust termperatures.
2. Determine if the duty cycle of the application needs to change in order to increase the exhaust temperatures entering the aftertreatment system.

Does the duty cycle of the application need to be increased?

YES >> Change the duty cycle of the application in order to increase the exhaust temperatures entering the aftertreatment system.
NO >> GO TO 3.

3. ERASE CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2463 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1163, "DTC Description".
NO >> Repair complete.

P2470 EXHAUST GAS TEMPERATURE SENSOR 4

DTC Description

INFOID:0000000013065634

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- U4152 present. Refer to EC-311, "DTC Description".
- P1625 present. Refer to EC-322, "DTC Description".
- P1626 present. Refer to EC-521, "DTC Description".
- P1627 present. Refer to EC-1063, "DTC Description".
- P1628 present. Refer to EC-1120, "DTC Description".

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the engine control module via CAN2 communication. The aftertreatment SCR temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using CAN2 communication. The aftertreatment SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the aftertreatment SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The SCR temperature sensor module has detected a sensor short to ground condition that causes too low of an input voltage condition in the intake/mid-bed SCR thermocouple sensor circuit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2470	SCR INLET TEMP SCR OUTLET TEMP DPF DELTA PRESS DPF DELTA PRESS SENS V	Diagnosis condition	This diagnostic runs continuously when the key switch is in the ON position or when the engine is running.
		Signal (terminal)	SCR pressure and temperature sensor signals
		Threshold	Aftertreatment intake/mid-bed SCR gas temperature sensor input voltage ≤ 1 V (-40°C)
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning aftertreatment SCR intermediate temperature sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P2470 being current on the CONSULT screen.

Is P2470 DTC current?

YES >> Go to EC-1166, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065635

1.CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current “ENGINE” diagnostic trouble codes:

- U1612
- P1625
- P1626
- P1627
- P1628

Are any of the above DTCs current?

YES >> Refer to EC-135, "DTC Index".
NO >>
- A malfunctioning aftertreatment selective catalytic reduction temperature sensor module has been detected. Replace the SCR temperature sensor module. Refer to EX-55, "Removal and Installation".
- GO TO 2.

2.ERASE CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2470 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1165, "DTC Description".
NO >> Repair complete.

P2471 EXHAUST GAS TEMPERATURE SENSOR 4

DTC Description

INFOID:0000000013065628

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- U4152 present. Refer to EC-311, "DTC Description".
- P1625 present. Refer to EC-322, "DTC Description".
- P1626 present. Refer to EC-521, "DTC Description".
- P1627 present. Refer to EC-1063, "DTC Description".
- P1628 present. Refer to EC-1120, "DTC Description".

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the engine control module via CAN communication. The aftertreatment SCR temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using CAN communication. The aftertreatment SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the aftertreatment SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The aftertreatment SCR temperature sensor module reported the aftertreatment SCR intermediate temperature signal was out of range high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2471	SCR INLET TEMP SCR OUTLET TEMP DPF DELTA PRESS DPF DELTA PRESS SENS V	Diagnosis condition	This diagnostic runs continuously when the key switch is in the ON position or when the engine is running.
		Signal (terminal)	SCR pressure and temperature sensor signals
		Threshold	Aftertreatment intake/mid-bed SCR gas temperature sensor input voltage out of range high.
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning aftertreatment SCR intermediate temperature sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2471 being current on the CONSULT screen.

Is P2471 DTC current?

YES >> Go to EC-1168, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065629

1.CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current “ENGINE” diagnostic trouble codes:

- U1612
- P1625
- P1626
- P1627
- P1628

Are any of the above DTCs current?

YES >> Refer to EC-135, "DTC Index".
NO >>
- A malfunctioning aftertreatment selective catalytic reduction temperature sensor module has been detected. Replace the SCR temperature sensor module. Refer to EX-55, "Removal and Installation".
- GO TO 2.

2.ERASE CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2471 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1167, "DTC Description".
NO >> Repair complete.

P2472 EXHAUST GAS TEMPERATURE SENSOR CIRCUIT INTERMITTENT 1/4

DTC Description

INFOID:0000000013102068

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- U4152 present. Refer to EC-311, "DTC Description".
- P1625 present. Refer to EC-322, "DTC Description".
- P1626 present. Refer to EC-521, "DTC Description".
- P1627 present. Refer to EC-1063, "DTC Description".
- P1628 present. Refer to EC-1120, "DTC Description".

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the engine control module via CAN2 communication. The aftertreatment SCR temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using CAN2 communication. The aftertreatment SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the aftertreatment SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Aftertreatment SCR catalyst gas temperature measurement is in-range but not rational.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2472	SCR INLET TEMP SCR OUTLET TEMP DPF DELTA PRESS DPF DELTA PRESS SENS V	Diagnosis condition	This diagnostic runs when the engine is running and exhaust flow is above a minimum level.
		Signal (terminal)	SCR pressure and temperature sensor signals
		Threshold	The Engine Control Module (ECM) detected the aftertreatment SCR intermediate temperature sensor signal was irrational for more than 5 minutes.
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning aftertreatment SCR intermediate temperature sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:
1. Start vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Perform coast down event from 88 km/h (55 MPH) to 72 km/h (45 MPH) for 2 minutes.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Check 1st trip DTC.

Is P2472 DTC detected?

YES >> Proceed to EC-1169, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102069

1.CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current ENGINE diagnostic trouble codes:

- U1612
- P1625
- P1626
- P1627
- P1628

Are any of the above DTCs current?

YES >> Refer to EC-135, "DTC Index".
NO >>
- A malfunctioning aftertreatment selective catalytic reduction temperature sensor module has been detected. Replace the SCR temperature sensor module. Refer to EX-55, "Removal and Installation".
- GO TO 2.

2. ERASE CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2472 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1169, "DTC Description".
NO >> Repair complete.

P2481 EXHAUST GAS TEMPERATURE SENSOR CIRCUIT LOW 1/5

DTC Description

INFOID:0000000013099916

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- U4152 present. Refer to EC-311, "DTC Description".
- P1625 present. Refer to EC-322, "DTC Description".
- P1626 present. Refer to EC-521, "DTC Description".
- P1627 present. Refer to EC-1063, "DTC Description".
- P1628 present. Refer to EC-1120, "DTC Description".

The aftertreatment selective catalytic reduction (SCR) temperature sensor module is a smart device that communicates with the engine control module via CAN2 communication. The aftertreatment SCR temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using CAN2 communication. The aftertreatment SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the aftertreatment SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The SCR temperature sensor module has detected a sensor short to ground condition that causes too low of an input voltage condition in the outlet SCR thermocouple sensor circuit.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2470	SCR INLET TEMP SCR OUTLET TEMP DPF DELTA PRESS DPF DELTA PRESS SENS V	Diagnosis condition	This diagnostic runs continuously when the key switch is in the ON position or when the engine is running.
		Signal (terminal)	SCR pressure and temperature sensor signals
		Threshold	Aftertreatment outlet SCR gas temperature sensor input voltage ≤ 1 V (-40°C)
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning aftertreatment SCR outlet temperature sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current "ENGINE" diagnostic trouble codes.
4. Check for DTC P2470 being current on the CONSULT screen.

Is P2481 DTC current?

YES >> Go to EC-1172, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099917

1.CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current “ENGINE” diagnostic trouble codes:

- U1612
- P1625
- P1626
- P1627
- P1628

Are any of the above DTCs current?

YES >> Perform diagnosis of applicable DTC. Refer to EC-135, "DTC Index".
NO >>
- A malfunctioning aftertreatment selective catalytic reduction temperature sensor module has been detected. Replace the SCR temperature sensor module. Refer to EX-55, "Removal and Installation".
- GO TO 2.

2.ERASE CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2481 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1171, "DTC Description".
NO >> Repair complete.

P2482 EXHAUST GAS TEMPERATURE SENSOR CIRCUIT HIGH 1/5

DTC Description

INFOID:0000000013099339

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- U4152 present. Refer to EC-311, "DTC Description".
- P1625 present. Refer to EC-322, "DTC Description".
- P1626 present. Refer to EC-521, "DTC Description".
- P1627 present. Refer to EC-1063, "DTC Description".
- P1628 present. Refer to EC-1120, "DTC Description".

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the engine control module via CAN2 communication. The aftertreatment SCR temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using CAN2 communication. The aftertreatment SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the aftertreatment SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The aftertreatment SCR temperature sensor module reported the aftertreatment SCR outlet temperature signal was out of range high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2482	SCR INLET TEMP SCR OUTLET TEMP DPF DELTA PRESS DPF DELTA PRESS SENS V	Diagnosis condition	This diagnostic runs continuously when the key switch is in the ON position or when the engine is running
		Signal (terminal)	SCR pressure and temperature sensor signals
		Threshold	Aftertreatment outlet SCR gas temperature sensor input voltage is out of range (high)
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning aftertreatment SCR outlet temperature sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2482 being current on the CONSULT screen.

Is P2482 DTC current?

YES >> Go to EC-1174, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099340

1.CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current “ENGINE” diagnostic trouble codes:

- U1612
- P1625
- P1626
- P1627
- P1628

Are any of the above DTCs current?

YES >> Refer to EC-135, "DTC Index".
NO >>
- A malfunctioning aftertreatment selective catalytic reduction temperature sensor module has been detected. Replace the SCR temperature sensor module. Refer to EX-55, "Removal and Installation".
- GO TO 2.

2.ERASE CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2482 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1173, "DTC Description".
NO >> Repair complete.

P2483 EXHAUST GAS TEMPERATURE SENSOR CIRCUIT INTERMITTENT 1/5

DTC Description

INFOID:0000000013099920

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- U4152 present. Refer to EC-311, "DTC Description".
- P1625 present. Refer to EC-322, "DTC Description".
- P1626 present. Refer to EC-521, "DTC Description".
- P1627 present. Refer to EC-1063, "DTC Description".
- P1628 present. Refer to EC-1120, "DTC Description".

The aftertreatment Selective Catalytic Reduction (SCR) temperature sensor module is a smart device that communicates with the engine control module via CAN2 communication. The aftertreatment SCR temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using CAN2 communication. The aftertreatment SCR temperature sensor module is used to measure the aftertreatment SCR intermediate temperature and aftertreatment SCR outlet temperature. The temperature probes are permanently attached to the aftertreatment SCR temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

Aftertreatment SCR catalyst gas temperature measurement is in-range but not rational.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2483	SCR INLET TEMP SCR OUTLET TEMP DPF DELTA PRESS DPF DELTA PRESS SENS V	Diagnosis condition	This diagnostic runs when the engine is running and exhaust flow is above a minimum level
		Signal (terminal)	SCR pressure and temperature sensor signals.
		Threshold	The Engine Control Module (ECM) detected the aftertreatment SCR outlet temperature sensor signal was irrational for more than 5 minutes.
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning aftertreatment SCR outlet temperature sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:
1. Start vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Perform coast down event from 88 km/h (55 MPH) to 72 km/h (45 MPH) for 2 minutes.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Check 1st trip DTC.

Is P2483 DTC detected?

YES >> Proceed to EC-1175, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099921

1.CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

1. Turn ignition switch ON.
2. Connect CONSULT and check for the following current “ENGINE” diagnostic trouble codes:

- U1612
- P1625
- P1626
- P1627
- P1628

Are any of the above DTCs current?

YES >> Refer to EC-135, "DTC Index".
NO >> • A malfunctioning aftertreatment selective catalytic reduction temperature sensor module has been detected. Replace the SCR temperature sensor module. Refer to EX-55, "Removal and Installation".
• GO TO 2.

2.ERASE CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P2483 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1175, "DTC Description".
NO >> Repair complete.

P2493 EGR COOLER BYPASS POSITION SENSOR INTERMITTENT

DTC Description

INFOID:0000000013100562

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- P0652 present. Refer to EC-721, "DTC Description".
- P0653 present. Refer to EC-729, "DTC Description".
- P245C present. Refer to EC-1142, "DTC Description".
- P245D present. Refer to EC-1145, "DTC Description".
- P2494 present. Refer to EC-1181, "DTC Description".
- P2495 present. Refer to EC-1185, "DTC Description".

The Exhaust Gas Recirculation Cooler Bypass Valve (EBV) is used to redirect the EGR gases around the cooler when the engine is under certain operating conditions. The Engine Control Module (ECM) opens and closes the EBV based on engine conditions. The EBV sends the valve position status back to the ECM.

DTC DETECTION LOGIC

The EGR bypass valve position feedback value is in range high.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2493	EGR BYPASS VLV POS V EGR BYPASS VLV CMD	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	EGR bypass valve position sensor signal.
		Threshold	The ECM detected the EGR bypass valve is stuck or not meeting commanded position.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Engine harness high resistance
- Malfunctioning EGR bypass valve

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

NOTE:
- Checking the vehicle speed with GST is advised.
- When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

Is 1st trip DTC detected?

YES >> Proceed to EC-1177, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013100563

1.CHECK DTC PRIORITY

1. Start the engine and let it idle for 1 minute.
2. Turn engine OFF.
3. Turn ignition switch ON.
4. Connect CONSULT and check for existing ENGINE diagnostic trouble codes:

- P0652

- P0653
- P245C
- P245D
- P2494
- P2495

Are any of the above current DTCs present?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. INSPECT EGR BYPASS VALVE ACTUATOR AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the EGR bypass valve actuator connector.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> • Repair or replace error-detected parts.
• GO TO 10.

3. CHECK THE EGR BYPASS SENSOR SUPPLY AND RETURN CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between EGR bypass actuator position sensor supply and return circuits at the EGR bypass valve connector.

EGR bypass valve			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
F145	2	3	5

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 6.

4. CHECK THE CIRCUIT RESPONSE

1. Wait 30 seconds.
2. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2495 DTC current?

YES >> GO TO 5.
NO >> GO TO 6.

5. CHECK THE CIRCUIT RESPONSE

1. Connect a jumper wire between the EGR bypass actuator position sensor RETURN circuit terminal 3 and the SIGNAL circuit terminal 4 at the EGR bypass actuator connector.
2. Wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2494 DTC current?

YES >> • A malfunctioning EGR bypass valve actuator position sensor has been detected. Replace the EGR bypass valve actuator. Refer to EM-282, "Removal and Installation".
• GO TO 10.
NO >> GO TO 6.

6. INSPECT ECM AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Disconnect the ECM F101 connector.
4. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 7.
NO >> • Repair or replace error-detected parts.
• GO TO 10.

7. CHECK THE ECM RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2495 DTC current?

YES >> GO TO 8.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 10.

8. CHECK THE ECM RESPONSE

CAUTION:
Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
• Not to bend and damage pins and terminals.
• Not to probe or short unintended circuits and potentially damaging the control unit.

1. Connect a jumper wire between ECM connector F101 return circuit pin 127 and signal circuit pin 172.
2. Turn ignition switch ON.
3. Wait for 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P2494 become current?

YES >> GO TO 9.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 10.

9. CHECK FOR CURRENT DTC

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect all harness connectors.
4. Start the engine and let it idle for 1 minute.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P2493 become current?

YES >> • High resistance has been detected in the engine harness. Repair or replace the engine harness.
• GO TO 10.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 10.

10. ERASE CURRENT DTCS

1. Turn ignition switch OFF.

2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
5. Operate the engine within the "Conditions for Clearing DTC".
6. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2493 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1177, "DTC Description".
NO >> Repair complete.

P2494 EGR COOLER BYPASS POSITION SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013102939

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- P0652 present. Refer to EC-721, "DTC Description".
- P0653 present. Refer to EC-729, "DTC Description".

The Exhaust Gas Recirculation Cooler Bypass Valve (EBV) is used to redirect the EGR gases around the cooler when the engine is under certain operating conditions. The Engine Control Module (ECM) opens and closes the EBV based on engine conditions. The EBV sends the valve position status back to the ECM.

DTC DETECTION LOGIC

EGR bypass valve position is less than specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2494	EGR BYPASS VLV POS V EGR BYPASS VLV CMD	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	EGR bypass valve position sensor signal
		Threshold	The ECM detected the EGR bypass valve position signal voltage is less than 0.3V.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Signal circuit shorted to ground in the harness
- Malfunctioning EGR bypass valve

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P2494 current on the CONSULT screen.

Is P2494 DTC current?

YES >> Go to EC-1181, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102940

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing "ENGINE" diagnostic trouble codes:

- P0652
- P0653

Are any of the above current DTCs present?

YES >> Refer to EC-135, "DTC Index".

NO >> GO TO 2.

2.CHECK FOR CURRENT DTC

1. Start the engine and let it idle for 1 minute.
2. Turn engine OFF.
3. Turn ignition switch ON.
4. Using CONSULT, check for existing “ENGINE” diagnostic trouble codes.

Is P2494 DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT EGR COOLER BYPASS VALVE ACTUATOR AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the EGR cooler bypass valve actuator connector.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

4.CHECK THE CIRCUIT RESPONSE

1. Connect a jumper wire between the EGR cooler bypass actuator position sensor POWER circuit terminal 2 and the SIGNAL circuit terminal 4 at the EGR bypass actuator connector.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2495 DTC current and P2494 DTC past?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE EGR BYPASS SENSOR POWER SUPPLY AND RETURN CIRCUITS

1. Disconnect the jumper wire.
2. Check the voltage between EGR bypass actuator position sensor supply and return circuits at the EGR bypass valve connector.

EGR bypass valve			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
F145	2	3	5

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 10.

6.CHECK THE DTC AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2494 DTC current?

YES >> • Replace the EGR cooler bypass valve actuator. Refer to EM-282, "Removal and Installation".
• GO TO 13.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 13.

7. INSPECT ECM AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Disconnect the ECM F101 connector.
4. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

8. CHECK THE ECM RESPONSE

CAUTION:
Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
• Not to bend and damage pins and terminals.
• Not to probe or short unintended circuits and potentially damaging the control unit.

1. Connect a jumper wire between ECM connector F101 return circuit pin 127 and signal circuit pin 172.
2. Turn ignition switch ON.
3. Wait for 30 seconds.
4. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did DTC P2494 become current and DTC P2495 past?

YES >> GO TO 9.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 13.

9. CHECK FOR PAST DTC

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect all harness connectors.
4. Turn ignition switch ON.
5. Wait 30 seconds.
6. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2494 DTC current?

YES >> • A pin-to-pin short circuit has been detected on the SIGNAL wire of the engine harness. Repair or replace the engine harness.
• GO TO 13.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 13.

10. INSPECT ECM AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the ECM F101 connector.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

11. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUITS

CAUTION:
Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
• Not to bend and damage pins and terminals.
• Not to probe or short unintended circuits and potentially damaging the control unit.

1. Turn ignition switch ON.
2. Check the voltage between EGR bypass actuator position sensor supply pin 106 and return circuit pin 127 at the ECM.

Is the voltage approximately 5V?

YES >> GO TO 12.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 13.

12. CHECK FOR PAST DTC

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2494 DTC current?

YES >> • An open return circuit has been detected in the engine harness. Repair or replace the engine harness.
• GO TO 13.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 13.

13. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect all harness connectors.
4. Turn ignition switch ON.
5. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
6. Operate the engine within the "Conditions for Clearing DTC".
7. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2494 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1181, "DTC Description".
NO >> Repair complete.

P2495 EGR COOLER BYPASS POSITION SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013103718

NOTE:
If any of the following "current" DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- P0652 present. Refer to EC-721, "DTC Description".
- P0653 present. Refer to EC-729, "DTC Description".

The Exhaust Gas Recirculation Cooler Bypass Valve (EBV) is used to redirect the EGR gases around the cooler when the engine is under certain operating conditions. The Engine Control Module (ECM) open and close the EBV based on engine conditions. The EBV sends the valve position status back to the ECM.

DTC DETECTION LOGIC

EGR bypass valve position greater than specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2495	EGR BYPASS VLV POS V EGR BYPASS VLV CMD	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	EGR bypass valve position sensor signal
		Threshold	The ECM detected the EGR bypass valve position signal voltage is greater than 4.7V.
		Diagnosis delay time	—

POSSIBLE CAUSE

- A short circuit to voltage source in the engine harness
- An open circuit in the engine harness
- Malfunctioning EGR bypass valve

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2495 being current on the CONSULT screen.

Is P2495 DTC current?

YES >> Go to EC-1185, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013103720

1.CHECK DTC PRIORITY

1. Start the engine and let it idle for 1 minute.
2. Turn engine OFF.
3. Turn ignition switch ON.
4. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes:

- P0652
- P0653

Are any of the above current DTCs present?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2. CHECK FOR CURRENT DTC

Using CONSULT, check for existing “ENGINE” diagnostic trouble codes.

Is P2495 DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT EGR COOLER BYPASS VALVE ACTUATOR AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the EGR cooler bypass valve actuator connector.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

4. CHECK THE CIRCUIT RESPONSE

1. Connect a jumper wire between the EGR cooler bypass actuator position sensor RETURN circuit terminal 3 and the SIGNAL circuit terminal 4 at the EGR bypass actuator connector.
2. Turn ignition switch ON.
3. Wait 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2494 DTC current and P2495 DTC past?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK THE EGR BYPASS SENSOR POWER SUPPLY AND RETURN CIRCUITS

1. Disconnect the jumper wire.
2. Check the voltage between EGR bypass actuator position sensor supply and return circuits at the EGR bypass valve connector.

EGR bypass valve			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
F145	2	3	5

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 10.

6. CHECK THE DTC AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2495 DTC current?

YES >> • Replace the EGR cooler bypass valve actuator. Refer to EM-282, "Removal and Installation".
• GO TO 13.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 13.

7. INSPECT ECM AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Disconnect the ECM F101 connector.
4. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

8. CHECK THE ECM RESPONSE

CAUTION:
Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
• Not to bend and damage pins and terminals.
• Not to probe or short unintended circuits and potentially damaging the control unit.

1. Connect a jumper wire between ECM connector F101 return circuit pin 127 and signal circuit pin 172.
2. Turn ignition switch ON.
3. Wait for 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did DTC P2494 become current and DTC P2495 past?

YES >> GO TO 9.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 13.

9. CHECK FOR PAST DTC

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect all harness connectors.
4. Turn ignition switch ON.
5. Wait 30 seconds.
6. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2495 DTC current?

YES >> • A pin-to-pin short circuit has been detected on the SIGNAL wire of the engine harness. Repair or replace the engine harness.
• GO TO 13.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 13.

10. INSPECT ECM AND ELECTRICAL CONNECTIONS

1. Turn ignition switch OFF.
2. Disconnect the ECM F101 connector.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

11. CHECK THE SENSOR SUPPLY VOLTAGE AND RETURN CIRCUITS

CAUTION:
Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
• Not to bend and damage pins and terminals.
• Not to probe or short unintended circuits and potentially damaging the control unit.

1. Turn ignition switch ON.
2. Check the voltage between EGR bypass actuator position sensor power supply pin 106 and return circuit pin 127 at the ECM.

Is the voltage approximately 5V?

YES >> GO TO 12.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 13.

12. CHECK FOR PAST DTC

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2495 DTC current?

YES >> • An open return circuit has been detected in the engine harness. Repair or replace the engine harness.
• GO TO 13.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 13.

13. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect all harness connectors.
4. Turn ignition switch ON.
5. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
6. Operate the engine within the "Conditions for Clearing DTC".
7. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Is P2495 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1185, "DTC Description".
NO >> Repair complete.

P249E CLOSED LOOP REDUCTANT INJECTION FLOW TOO HIGH

DTC Description

INFOID:0000000013098808

The SCR dosing system is an in-tank system with a DEF control module that controls the dosing pump and monitors Urea heating, level, quality, pressure and temperature. This dosing system is powered by battery voltage and an initialization signal from the Urea heater relay. The DEF control module activates priming, dosing, heating and purging of Urea using data provided by the Engine Control Module (ECM) via CAN communication. The DEF control module performs its own diagnostics and reports malfunctions back to the ECM. The ECM then decodes the error and converts it to a DTC.

DTC DETECTION LOGIC

Aftertreatment SCR feedback control status - Mechanical system not responding or out of adjustment. The maximum dosing adjustment has been reached.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P249E	DEF PUMP DOSING RATE DEF PUMP DOSING VOLUME DEF PUMP STATUS DEF PUMP TIME DEF LINE PRESS DEF DOSING VALVE POS CMD	Diagnosis condition	This diagnostic has to meet specific engine and aftertreatment conditions to run and complete.
		Signal (terminal)	DEF pump dosing command signal
		Threshold	The ECM detected the adjusted aftertreatment DEF dosing command has reached a maximum limit.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Damaged generator causing low voltage
- Weak or damaged battery

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CHECK

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P249E being current on the CONSULT screen.

Is P249E DTC current?

YES >> Go to EC-1189, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013098809

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Using CONSULT, check for other “ENGINE“ diagnostic trouble codes.
3. Look for DEF dosing, NOx sensor, SCR temperature, or EGR related DTCs, and perform the confirmation procedure (diagnosis procedure) for these other DTCs first.

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DEF QUALITY

1. Turn ignition switch OFF.
2. Check the DEF quality by visually inspecting the DEF in the tank for signs of debris or contamination.
3. Using a refractometer [SST: J-54466], measure the concentration of the DEF in the tank.

Is DEF free from contamination and concentration within 32.5 Â± 1.5 %?

YES >> GO TO 3.
NO >> Drain the DEF tank, rinse with water, and refill with pure DEF.

3. PERFORM DEF DOSING UNIT OVERRIDE TEST

1. Remove the aftertreatment DEF dosing valve from the decomposition tube.
2. Place the DEF dosing valve in a measuring container having greater than a 1.5 liter [50 oz] capacity.
3. Turn ignition switch ON.
4. Using CONSULT, access “ENGINE” and select ″DEF Dosing Unit Override Test″ active test.

Did the DEF dosing unit operate according to specifications?

YES >> GO TO 4.
NO >>
- Replace the DEF supply pump assembly. Refer to EX-64, "Exploded View".
- GO TO 4.

4. PERFORM SCR PERFORMANCE TEST

1. Connect all components and harness connectors.
2. Start the engine.
3. Using CONSULT, access “ENGINE” and select ″SCR Performance Test″ active test.

Did the SCR performance test complete?

YES >> GO TO 6.
NO >> GO TO 5.

5. CHECK DEF DEPOSITS IN THE DECOMPOSITION TUBE

1. Turn ignition switch OFF (do not operate the engine).
2. Inspect the decomposition tube for deposits.
3. Remove the decomposition tube from the vehicle.
4. Inspect for excessive DEF deposits.

Are excessive DEF deposits found inside the decomposition tube?

YES >>
- Clean and install the decomposition tube.
- GO TO 6.

NO >>
- Repeat the SCR Performance Test again.
- GO TO 6.

6. CHECK THE STATUS OF THE SCR CATALYST OUTLET NOX SENSOR TEST

1. Stop the engine.
2. Turn ignition switch ON.
3. With CONSULT, check the results of the SCR Performance Test.
4. Check the status of the SCR Catalyst Outlet NOx Sensor Test portion of the SCR Performance Test.

Did SCR catalyst outlet NOx sensor test pass?

YES >> GO TO 7.
NO >>
- An in-range malfunction has been detected in the aftertreatment outlet NOx sensor. Replace the aftertreatment outlet NOx sensor. Refer to EX-48, "Removal and Installation".
- GO TO 8.

7. CHECK THE STATUS OF THE SCR CATALYST TEST

1. With CONSULT, check the results of the SCR Performance Test.
2. Check the result of the SCR Performance Test.

Did SCR catalyst test pass?

YES >> GO TO 8.
NO >>
- A malfunctioning SCR catalyst has been detected. Replace the aftertreatment SCR catalyst. Refer to EX-42, "Removal and Installation".
- GO TO 8.

8. ERASE CURRENT DTC

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for setting the DTC".
5. Check for ENGINE diagnostic trouble codes.

Is P249E DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1189, "DTC Description".

NO >> Repair complete.

P24A0 DPF REGENERATION TEMPERATURE TOO LOW

DTC Description

INFOID:0000000013101348

The aftertreatment diesel particulate filter temperature sensor module is a smart device that communicates with the engine control module via CAN communication. The aftertreatment diesel particulate filter temperature sensor module performs its own internal diagnostics and reports malfunctions back to the engine control module using the CAN communication. The aftertreatment diesel particulate filter temperature sensor module is used to measure the aftertreatment diesel oxidation catalyst intake temperature, aftertreatment diesel particulate filter intake temperature, and aftertreatment diesel particulate filter outlet temperature. The temperature probes are permanently attached to the aftertreatment diesel particulate filter temperature sensor module and cannot be replaced individually.

DTC DETECTION LOGIC

The engine control module is unable to begin closed loop control of active regeneration of DPF due to low DOC temperature.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P24A0	DOC INLET TEMP DPF INLET TEMP DPF OUTLET TEMP CAC OUT TEMP SCR INLET TEMP SCR OUTLET TEMP	Diagnosis condition	This diagnostic runs continuously when the engine is running and the ECM is requesting active regeneration of the aftertreatment diesel particulate filter.
		Signal (terminal)	DPF aftertreatment temperature sensors
		Threshold	DOC Bed Temperature < 280°C (536°F)
		Diagnosis delay time	—

POSSIBLE CAUSE

- DOC temperature not warm enough to inject fuel for active regeneration of the diesel particulate filter

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Start the engine.
2. Connect CONSULT, select “ENGINE” and perform the ″Stationary Regeneration″ Active Test.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P24A0 being current on the CONSULT screen.

Is P24A0 DTC current?

YES >> Go to EC-1192, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013101349

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.

Is P24A0 DTC current?

YES >> GO TO 2.
NO >> GO TO 3.

2.CHECK THE AFTERTREATMENT DUTY CYCLE

1. Start the engine and allow it to idle.
2. Using CONSULT, select ENGINE, and perform “DPF Regeneration” under “Active Test”.
3. If new DTCs become current during the regeneration test, abort the procedure and diagnose the new DTCs.

Is DTC P24A0 is current or the regeneration did not complete?

YES >> • P24A0 is current: GO TO 3.
• Other DTCs are current: Refer to EC-135, "DTC Index".

NO >> GO TO 3.

3. ERASE CURRENT DTC

1. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
2. Operate the engine within the "Conditions for setting the DTC".
3. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P24A0 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1192, "DTC Description".
NO >> Repair complete.

P24A2 PARTICULATE FILTER REGENERATION INCOMPLETE

DTC Description

INFOID:0000000013100983

NOTE:
If any of the following ″current″ DTCs are displayed with this DTC, first perform the trouble diagnosis for these other DTCs:
- P2454 present. Refer to EC-1120, "DTC Description".
- P2455 present. Refer to EC-1124, "DTC Description".
- P2456 present. Refer to EC-1128, "DTC Description".
- P2460 present. Refer to EC-1151, "DTC Description".
- P2461 present. Refer to EC-1155, "DTC Description".
- P2462 present. Refer to EC-1159, "DTC Description".

The engine aftertreatment system monitors the soot load in the aftertreatment diesel particulate filter. Under normal operating conditions, the aftertreatment diesel particulate filter is self cleaning, where soot is converted to carbon dioxide, nitrogen, and water. Under light load operating conditions, it can be necessary to perform a stationary regeneration of the aftertreatment diesel particulate filter. The soot load in the aftertreatment diesel particulate filter is estimated using the aftertreatment differential pressure sensor and the calculated soot output of the engine.

DTC DETECTION LOGIC

Aftertreatment Diesel Particulate Filter Incomplete Regeneration - Condition Exists. The system has detected that the aftertreatment diesel particulate filter differential pressure is too high following an active regeneration.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P24A2	DPF OUTLET PRESS DPF DELTA PRESS DPF DELTA PRESS SENS V DPF INLET TEMP DPF OUTLET TEMP SCR INLET TEMP SCR OUTLET TEMP	Diagnosis condition	This diagnostic only runs after successful completion of an active regeneration of the aftertreatment diesel particulate filter
		Signal (terminal)	Outlet pressure and temperature sensor signals
		Threshold	The Engine Control Module (ECM) detected the DPF differential pressure is higher than expected after regeneration
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning aftertreatment temperature sensors
- A face plugged aftertreatment diesel oxidation catalyst
- A malfunctioning aftertreatment diesel particulate filter differential pressure sensor
- An engine malfunction resulting in high engine out soot
- A damaged or malfunctioning OEM wiring harness to the differential pressure sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CHECK

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P24A2 being current on the CONSULT screen.

Is P24A2 DTC current?

YES >> Go to EC-1194, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013100984

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing ENGINE diagnostic trouble codes.

Is P24A2 DTC current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2. CHECK FOR OTHER RELATED DIAGNOSTIC TROUBLE CODES

Using CONSULT, check for the following current or past ENGINE diagnostic trouble codes:
- P2454
- P2455
- P2456
- P2460
- P2461
- P2462

Are any of the above current or past DTCs present?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. CHECK FOR CURRENT OR PAST FUEL SYSTEM RELATED DTCS

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Look for fuel system related DTCs.

Is any applicable DTC current or past?

YES >> Perform diagnosis of applicable DTCs first, then return to this DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 4.

4. CHECK FOR CURRENT OR PAST AIR HANDLING SYSTEM RELATED DTCS

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Look for air handling system DTCs.

Is any of P0106 or P0299 DTCs current or past?

YES >> Perform diagnosis of applicable DTCs first, then return to this DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 5.

5. CHECK FOR CURRENT OR PAST EGR OR TURBOCHARGER SYSTEM RELATED DTCS

1. Using CONSULT, check for other ENGINE diagnostic trouble codes.
2. Look for EGR and turbocharger system related DTCs.

Are any applicable current or past DTCs?

YES >> Perform diagnosis of applicable DTCs first, then return to this DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 6.

6. CHECK FOR CURRENT OR PAST AFTERTREATMENT SYSTEM RELATED DTCS

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Look for aftertreatment system related DTCs.

Any of P0420, P0544, P2031 or P242B DTCs current or past?

YES >> Perform diagnosis of applicable DTCs first, then return to this DTC. Refer to EC-135, "DTC Index".
NO >> GO TO 7.

7. CHECK FOR CURRENT OR PAST AFTERTREATMENT DPF SYSTEM RELATED DTCS

1. Using CONSULT, check for other “ENGINE” diagnostic trouble codes.
2. Look for aftertreatment system related DTCs.

Are any of P1451, P242F or P2463 DTCs current or past?

YES >>
- Without the presence of DTC P24A2: Perform diagnosis of applicable DTCs first, then return to this DTC. Refer to EC-135, "DTC Index".
- With DTC P24A2 present: GO TO 8.

NO >> GO TO 8.

8. MONITOR AFTERTREATMENT DPF DIFFERENTIAL PRESSURE SENSOR WITH CONSULT

1. Using CONSULT, select ENGINE, Data Monitor and verify the "DPF DELTA PRESS SENS V".

2. Expected voltage reading is 0.69V ± 0.1V at ≤ 25°C (77°) or 0.69V± 0.06V at ≥ 26°C (78°F).

Is DPF differential pressure sensor voltage reading within specification?

YES >> GO TO 9.
NO >> • An issue with the DPF differential pressure sensor or associated wiring has been found:
- Check for a short between the SIGNAL pin and other pins at the sensor harness.
- Check for high resistance in the RETURN pin circuit of the sensor harness.
- Replace the DPF differential pressure sensor if the wiring checks OK. Refer to EX-58, "Removal and Installation".
• GO TO 9.

9. CHECK AFTERTREATMENT DPF DIFFERENTIAL PRESSURE SENSOR TUBES FOR BLOCKAGE

1. Turn ignition switch OFF.
2. Inspect the DPF differential pressure sensor tubes for blockage, kinking or leaking.

Are any blockage, kinking or leaking found?

YES >> • Clean, repair or replace the DPF differential pressure sensor tubes as necessary. Refer to EX-36, "Removal and Installation".
• GO TO 10.
NO >> GO TO 10.

10. CHECK THE DPF DIFFERENTIAL PRESSURE SENSOR CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect the DPF differential pressure sensor.
3. Turn ignition switch ON.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Are both P2454 and P2460 DTCs current?

YES >> GO TO 11.
NO >> • An issue with the DPF differential pressure sensor or associated wiring has been found. Check harness for proper location between the ECM and the sensor.
• GO TO 11.

11. CHECK THE DPF DIFFERENTIAL PRESSURE SENSOR WIRING

1. Turn ignition switch OFF.
2. Connect a jumper wire between DPF differential pressure sensor connector C28 power supply terminal 4 and delta pressure signal circuit terminal 2.
3. Turn ignition switch ON.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Are both P2455 and P2461 DTCs current?

YES >> GO TO 12.
NO >> • An issue with the DPF differential pressure sensor or associated wiring has been found. Check harness for proper pin to pin location between the ECM and the sensor.
• GO TO 12.

12. CHECK FOR DEBRIS IN THE FUEL TANK

1. Turn ignition switch OFF.
2. Remove the jumper wire.
3. Remove the fuel tank filter cap.
4. Check for debris in the fuel tank.

Are any debris found in the tank?

YES >> • Remove the debris from the tank.
• GO TO 13.
NO >> GO TO 13.

13. INSPECT THE AFTERTREATMENT DPF

1. Remove the aftertreatment Diesel Oxidation Catalyst (DOC) and Diesel Particulate Filter (DPF) assembly.
2. Inspect the aftertreatment DOC.
3. Check the intake face of the aftertreatment DOC for damage, soot accumulation and/or face plugging.

Are more than 50% of the cells on the intake face completely blocked by soot?

YES >> • If the aftertreatment DPF required replacement for excessive ash and has **not** reached the normal ash cleaning interval, further troubleshooting is required. Check for lubricating oil consumption, coolant consumption, or previous repairs that may have corrected an issue resulting in lubricating oil or coolant consumption.
• Replace the DOC and DPF assembly. Refer to EX-42, "Removal and Installation".
• GO TO 14.

NO >> GO TO 14.

14. INSPECT THE EXHAUST FOR EXCESSIVE SMOKE

1. Disconnect the exhaust from the aftertreatment inlet.
2. Start the engine.
3. Perform two “Snap Acceleration Tests” from low to high idle. Hold the engine at high idle for 5 seconds.

NOTE:
A small puff of black smoke upon acceleration that clears at a steady high idle speed is normal.

Is Excessive black smoke during acceleration or constant black smoke at high idle?

YES >> Refer to the appropriate diagnosis procedure to correct the cause of excessive smoke. Refer to EC-1246, "Symptom Table".

NO >> • Replace the DOC/DPF assembly. Refer to EX-42, "Removal and Installation".
• If the aftertreatment DPF requires replacement for excessive ash and has not reached the normal ash cleaning interval, further troubleshooting is required.
• Check for lubricating oil consumption, coolant consumption, or previous repairs that may have corrected an issue resulting in lubricating oil or coolant consumption.
• GO TO 15.

15. ERASE CURRENT DTC

1. Connect all harness components and connectors.
2. Turn ignition switch ON.
3. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
4. Operate the engine within the "Conditions for setting the DTC".
5. Using CONSULT, check for “ENGINE” diagnostic trouble codes.

Is P24A2 DTC current?

YES >> Return to Diagnosis Procedure. Refer to EC-1194, "DTC Description".

NO >> Repair complete.

P2509 ECM POWER INPUT SIGNAL INTERMITTENT

DTC Description

INFOID:0000000013102548

The Engine Control Module (ECM) receives constant voltage from the batteries through the unswitched battery wires that are connected directly to the positive (+) battery post. The ECM receives switched battery input through the ignition switch wire when the ignition switch is turned ON. At ignition switch OFF, the Engine Control Module (ECM) stays powered for a short period of time. During this time, the ECM will begin to save important data into memory. If the ECM is wired improperly, maintenance and DTC data could be corrupted or inaccurate.

DTC DETECTION LOGIC

RAM image storage has not completed for every time that it has started.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2509	BATTERY VOLTAGE ACC POS SENS V ACC POS SENS 2 V	Diagnosis condition	Ignition switch ON or the engine is running.
		Signal (terminal)	Supply voltage to the ECM signal
		Threshold	ECM detected the ECM power supply was removed before power-down parameters could be saved. The DTC will be active when the ignition switch is turned ON following the incomplete power-down event.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Loose battery connection
- High resistance in harness or connectors

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2509 being current on the CONSULT screen.

Is P2509 DTC current?

YES >> Go to EC-1198, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102549

1.CHECK FOR CURRENT DTC

1. Turn ignition switch ON.
2. Connect CONSULT and check for existing “ENGINE” diagnostic trouble codes.

Is DTC P2509 current?

YES >> GO TO 2.
NO >> • If past DTC P2509 is found in the ECM, check the battery disconnect devices in the vehicle. If ignition switch and ECM power are disconnected at the same time, DTC P2509 will be logged.
• GO TO 12.

2.CHECK BATTERIES AND POWER CONNECTOR

1. Turn ignition switch OFF.
2. Check battery connections.
3. Check battery terminal connections.

Are connections tight and corrosion-free?

YES >> GO TO 3.
NO >> • Tighten the loose connections, and clean the terminals.
• GO TO 12.

3.CHECK BATTERY VOLTAGE

1. Turn ignition switch ON.
2. Check battery voltage.
3. Place the positive (+) probe of the multimeter on the positive battery terminal and touch the negative (-) probe to the negative battery terminal while trying to start the engine.

Does the normal condition exists of approximately battery voltage and > 6.2V during cranking?

YES >> GO TO 4.
NO >> • Charge or replace the battery.
• GO TO 12.

4.INSPECT THE HARNESS AND ECM CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM.
3. Inspect connector for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> • Repair or replace error-detected parts.
• GO TO 12.

5.CHECK FOR AN OPEN CIRCUIT IN THE BATTERY POWER CIRCUIT

Using a multimeter, measure the voltage between the ECM battery supply and engine block ground.

ECM			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
E93	83	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 9.
NO >> GO TO 6.

6.VERIFY THE FUSE IS INSTALLED CORRECTLY

1. Turn ignition switch OFF.
2. Inspect fuse #68 (5A) for correct installation.

Is the fuse installed correctly?

YES >> GO TO 7.
NO >> • Install the fuse correctly.
• GO TO 12.

7. CHECK FOR A BLOWN FUSE

1. Turn ignition switch OFF.
2. Check the ECM battery fuse #68 for open.

Is the fuse open?

YES >> • Locate and repair short in the harness.
• Replace the blown fuse.
• GO TO 12.
NO >> GO TO 8.

8. CHECK ADD-ON ACCESSORY WIRING AT BOTH BATTERY POSITIVE TERMINALS

1. Check for add-on or the accessory wiring at the (+) terminal of the batteries.
2. Examine wiring for damaged insulation or an installation error that can cause the supply wire to be shorted to the engine block.

Are there any damaged wires?

YES >> • Locate and repair the damaged wiring.
• GO TO 12.
NO >> • Repair or replace the wiring harness between the ECM and the battery.
• GO TO 12.

9. CHECK THE RESISTANCE OF THE BATTERY SUPPLY CIRCUIT

1. Disconnect the positive terminals from both batteries.
2. Use a digital multimeter, set it to low resistance mode and calibrate it to zero.
3. Measure the resistance between the ECM battery SUPPLY (+) terminal 83 and the positive battery connector.
4. Measure the resistance between the ECM battery SUPPLY (-) terminals 1, 2, 4 and the negative battery connector.

ECM		Battery post cable	Continuity
Connector	Terminal		
E93	83	Positive battery terminal	< 1.0 Ω
	1	Positive negative terminal	
	2		
	4		

Is the resistance less than 1.0 ohm?

YES >> GO TO 10.
NO >> • Repair or replace the wiring harness for high resistance.
• GO TO 12.

10. CHECK THE IGNITION SWITCH CIRCUIT TO THE ECM FOR RESISTANCE

Measure the resistance of the ignition circuit between the ECM terminal 65 and the IPDM E/R fuse #40 (15A).

ECM		IPDM E/R	Continuity
Connector	Terminal	Terminal	
E93	65	Fuse #40	< 5.0 Ω

Is the resistance less than 5.0 ohms?

YES >> GO TO 11.
NO >> • Repair or replace the wiring harness for high resistance.
• GO TO 12.

11. CHECK THE IGNITION SWITCH INPUT CIRCUIT FOR RESISTANCE

Measure the resistance of the power circuit between the battery positive terminal and the IPDM E/R.

Battery post cable	IPDM E/R	Continuity
Positive battery terminal	Battery supply	< 5.0 Ω

Is the resistance less than 5.0 ohms?

YES >> GO TO 12.
NO >> • Repair or replace the wiring harness for high resistance.
• GO TO 12.

12. ERASE THE DIAGNOSTIC TROUBLE CODES

1. Connect all harness connectors.
2. Turn ignition switch ON.
3. Using CONSULT, erase “ENGINE” DTCs.
4. Operate the engine within the "Conditions for Clearing the DTC".
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2509 DTC current?

YES >> Return to diagnostic procedure. Refer to EC-1198, "DTC Description".
NO >> Repair complete.

P2540 LOW FUEL PRESSURE SENSOR

DTC Description

INFOID:0000000013087570

NOTE:
If any of the following DTCs is displayed with this DTC, first perform the trouble diagnosis for other DTC:
- P008A present. Refer to EC-295, "DTC Description".
- P0252 present. Refer to EC-442, "DTC Description".
- P0253 present. Refer to EC-445, "DTC Description".
- P0254 present. Refer to EC-448, "DTC Description".
- P2541 present. Refer to EC-1206, "DTC Description".
- P2542 present. Refer to EC-1210, "DTC Description".

The Engine Control Module (ECM) provides a 5V supply and ground to the fuel pressure sensor on the sensor supply circuit.The fuel pressure sensor provides a signal to the ECM on the fuel pressure sensor signal circuit. This sensor monitors the fuel pressure from the low fuel pressure system (lift pump to the Stage 2 filter).

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the fuel pressure is greater than or equal to 7 bar.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2540	FUEL SPLY PRESS FUEL SPLY PRESS V TURBO COMP INLET PRESS TURBO COMP INLET PRESS V	Diagnosis condition	Continuously when the engine is running
		Signal (terminal)	Stage 1 fuel pressure sensor signal
		Threshold	Fuel Pump Inlet Pressure ≥ 7 bar for 1 second at the expiration of a sensor rationality check delay time of 10 seconds
		Diagnosis delay time	—

POSSIBLE CAUSE

- A malfunctioning fuel lift pump
- A malfunctioning fuel pressure sensor

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:
1. Turn ignition switch OFF.
2. Turn ignition switch ON and wait 2 minutes.
3. Start the engine and let it idle for 1 minute.
4. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2540 being current on the CONSULT screen.

Is P2540 DTC current?

YES >> Go to EC-1202, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013087571

1.CHECK DTC PRIORITY

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.

3. Are any of the following displayed as current or do they have high past counts on the CONSULT screen:
- P008A
- P0252
- P0253
- P0254
- P2541
- P2542

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR CURRENT DTC

Check for DTC P2540 being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.MONITOR THE FUEL PRESSURE SENSOR

1. Turn ignition switch OFF.
2. Disconnect the lift pump (Stage 1 fuel pump).
3. Turn ignition switch ON and wait 30 seconds.
4. Using CONSULT, select “ENGINE” and check the ″FUEL SPLY PRESS″ and ″TURBO COMP INLET PRESS″.

Is the fuel pressure sensor reading within ±0.5 bar of the compressor intake pressure?

YES >> GO TO 4.
NO >> • Replace the fuel pressure sensor. Refer to FL-56, "Removal and Installation".
• GO TO 10.

4.INSPECT FUEL PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the fuel pressure sensor.
3. Inspect the harness connector for the following:
- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 5.
NO >> • Repair or replace error-detected parts.
• GO TO 10.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is DTC P2541 current?

YES >> GO TO 6.
NO >> GO TO 7.

6.CHECK THE CIRCUIT RESPONSE

1. Connect a jumper wire between the fuel pressure sensor SIGNAL terminal 3 and POWER terminal 1 of the fuel pressure sensor connector F197.
2. Wait 30 seconds.

3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is DTC P2542 current?

YES >> • Replace the fuel pressure sensor. Refer to FL-56, "Removal and Installation".
• GO TO 10.
NO >> GO TO 7.

7. INSPECT ECM AND HARNESS CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector F101.
3. Inspect the ECM connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 10.

8. CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is DTC P2541 current?

YES >> GO TO 9.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 10.

9. CHECK THE ECM RESPONSE

CAUTION:
Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
• Not to bend and damage pins and terminals.
• Not to probe or short unintended circuits and potentially damaging the control unit.

1. Connect a jumper wire between ECM pins 127 and 130 at the ECM.
2. Wait for 30 seconds.
3. With CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2542 DTC current?

YES >> • High resistance or short circuit has been detected in the engine harness. Repair or replace the engine harness.
• GO TO 10.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 10.

10. CHECK FOR CURRENT DTC

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Connect all harness connectors.
4. Turn ignition switch ON.
5. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
6. Operate the engine within the ″Conditions for clearing the DTC″.
7. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Is P2540 DTC current?

YES >> Troubleshooting procedure need to be repeated. Go to EC-1202, "DTC Description".
NO >> The removal and installation of the connector corrected the issue. Repair complete.

P2541 FUEL PRESSURE SENSOR

DTC Description

INFOID:0000000013073100

NOTE:
Repair any existing DTCs related to power sensor supply circuit before performing diagnosis procedure for this DTC.

The Engine Control Module (ECM) provides a 5V supply and ground to the fuel pressure sensor on the sensor supply circuit.The fuel pressure sensor provides a signal to the ECM on the fuel pressure sensor signal circuit. This sensor monitors the fuel pressure from the low fuel pressure system (lift pump to the Stage 2 filter).

DTC DETECTION LOGIC

Fuel supply pressure sensor reading is less than specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2541	FUEL SPLY PRESS FUEL SPLY PRESS V	Diagnosis condition	Continuously when the ignition switch is in the ON position
		Signal (terminal)	Stage 1 fuel pressure sensor signal
		Threshold	The ECM detected the fuel pressure signal voltage is less than 0.2 V for 3 seconds
		Diagnosis delay time	—

POSSIBLE CAUSE

- Signal circuit open or shorted to ground in the engine harness or sensor
- A malfunctioning fuel pressure sensor
- A malfunctioning ECM

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2541 being current on the CONSULT screen.

Is P2541 DTC current?

YES >> Go to EC-1206, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073101

1.CHECK DTC PRIORITY

1. Repair DTCs related to power sensor supply circuit before performing diagnosis procedure for this DTC.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.

Are any power sensor supply related DTCs detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR CURRENT DTC

Check for DTC P2541 being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT FUEL PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the fuel pressure sensor.
3. Inspect the harness connector for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

4.CHECK THE PRESSURE SENSOR POWER SUPPLY AND GROUND CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between fuel pressure sensor supply voltage and return circuit terminals.

Fuel pressure sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
F197	1	2	5

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch OFF.
2. Connect a jumper wire between the fuel pressure sensor connector F197 power supply terminal 1 and signal circuit terminal 3.
3. Turn ignition switch ON and wait 30 seconds.
4. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.

Did DTC P2542 become current and DTC P2541 past?

YES >> GO TO 6.
NO >> GO TO 10.

6.CHECK THE DTC AND VERIFY FUEL PRESSURE SENSOR CONDITION

1. Turn ignition switch OFF.
2. Disconnect the jumper wire.
3. Reconnect the fuel pressure sensor.
4. Turn ignition switch ON and wait 30 seconds.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did P2541 DTC become current?

YES >> • A damaged sensor has been detected. Replace the fuel pressure sensor. Refer to FL-56, "Removal and Installation".
• GO TO 13.

NO >> • The removal and installation of the connector corrected the issue.
• GO TO 13.

7. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM connector F101.
3. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

8. CHECK THE ECM RESPONSE

CAUTION:
Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
• Not to bend and damage pins and terminals.
• Not to probe or short unintended circuits and potentially damaging the control unit.

1. Turn ignition switch ON.
2. Measure the voltage between ECM pins 106 (-) and 127 (+) at the ECM.

Is the voltage reading approximately 5V?

YES >> GO TO 9.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 13.

9. CHECK FOR CURRENT DTC

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON and wait 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did P2541 DTC become past?

YES >> • The removal and installation of the connector corrected the issue. Repair complete.
• GO TO 13.
NO >> • An open or shorted fuel pressure sensor 5V supply circuit has been detected in the engine harness. Isolate all harnesses connected in series to determine which contains the open or pin-to-pin short. Repair as necessary.
• GO TO 13.

10. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM connector F101.
3. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.

- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

11. CHECK THE ECM RESPONSE

CAUTION:
Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
• Not to bend and damage pins and terminals.
• Not to probe or short unintended circuits and potentially damaging the control unit.

1. Connect a jumper wire between ECM pins 106 and 130 at the ECM.
2. Wait for 30 seconds.
3. With CONSULT, check for current ENGINE diagnostic trouble codes.

Did DTC P2542 become current and DTC P2541 past?

YES >> GO TO 12.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 13.

12. CHECK FOR CURRENT DTC

1. Turn ignition switch OFF.
2. Disconnect jumper wire.
3. Connect all harness connectors.
4. Turn ignition switch ON and wait 30 seconds.
5. Using CONSULT, check for current ENGINE diagnostic trouble codes.

Did P2541 DTC become past?

YES >> • An open or shorted fuel pressure sensor 5V supply circuit has been detected in the engine harness. Isolate all harnesses connected in series to determine which contains the open or pin-to-pin short. Repair as necessary.
• GO TO 13.
NO >> • The removal and installation of the connector corrected the issue. Repair complete.
• GO TO 13.

13. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2541 DTC past?

YES >> GO TO 14.
NO >> Return to Diagnosis Procedure. Refer to EC-1206, "DTC Description".

14. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did all DTCs get erased with none remaining?

YES >> Repair complete.
NO >> Go to the appropriate Diagnosis Procedure. Refer to EC-135, "DTC Index".

P2542 FUEL PRESSURE SENSOR

DTC Description

INFOID:0000000013073003

NOTE:
Repair any existing DTCs related to power sensor supply circuit before performing diagnosis procedure for this DTC.

The engine control module (ECM) provides a 5V supply and ground to the fuel pressure sensor on the sensor supply circuit.The fuel pressure sensor provides a signal to the ECM on the fuel pressure sensor signal circuit. This sensor monitors the fuel pressure from the low fuel pressure system (lift pump to the stage 2 filter).

DTC DETECTION LOGIC

Fuel supply pressure sensor reading is greater than specified operating range for a calibrated amount of time.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2542	FUEL SPLY PRESS FUEL SPLY PRESS V	Diagnosis condition	Continuously when the ignition switch is in the ON position.
		Signal (terminal)	Stage 1 fuel pressure sensor signal
		Threshold	The ECM detected the fuel pressure signal voltage is greater than 4.8 V for 3 seconds
		Diagnosis delay time	—

POSSIBLE CAUSE

- Signal circuit shorted to voltage source
- Open return circuit in the engine harness, connector, or sensor
- A malfunctioning fuel pressure sensor
- A malfunctioning ECM

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch OFF.
2. Start the engine and let it idle for 1 minute.
3. Turn ignition switch OFF.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Check 1st trip DTC.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2542 being current on the CONSULT screen.

Is P2542 DTC current?

YES >> Go to EC-1210, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073004

1.CHECK DTC PRIORITY

1. Repair DTCs related to power sensor supply circuit before performing diagnosis procedure for this DTC.
2. Turn ignition switch ON.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.

Are there any power sensor supply related DTCs detected?

YES >> Refer to EC-135, "DTC Index".

NO >> GO TO 2.

2.CHECK FOR CURRENT DTC

Check for DTC P2542 being current on the CONSULT screen.

Is applicable DTC current?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3.INSPECT FUEL PRESSURE SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the fuel pressure sensor.
3. Inspect the harness connector for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

4.CHECK THE CIRCUIT RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is DTC P2541 current and DTC P2542 past?

YES >> GO TO 5.
NO >> GO TO 7.

5.CHECK THE PRESSURE SENSOR POWER SUPPLY AND GROUND CIRCUITS

1. Turn ignition switch ON.
2. Check the voltage between fuel pressure sensor supply voltage and return circuit terminals.

Fuel pressure sensor			Voltage (V) (Approx.)
Connector	Terminal (+)	Terminal (-)	
F197	1	2	5

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 10.

6.CHECK THE DTC AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Wait 30 seconds.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is DTC P2542 current?

YES >> • A damaged sensor has been detected. Replace the fuel pressure sensor. Refer to FL-56, "Removal and Installation".
• GO TO 13.
NO >> GO TO 13.

7. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM connector F101.
3. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 8.
NO >> • Repair or replace error-detected parts.
• GO TO 13.

8. CHECK THE ECM RESPONSE

1. Turn ignition switch ON.
2. Wait 30 seconds.
3. With CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is DTC P2541 current and DTC P2542 past?

YES >> GO TO 9.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 13.

9. CHECK FOR CURRENT DTC

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON and wait 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2542 DTC current?

YES >> • A pin-to-pin short circuit has been detected on the SIGNAL wire of the engine harness. Isolate all harnesses connected in series to determine which contains the open or pin-to-pin short. Repair as necessary.
• GO TO 13.
NO >> • The removal and installation of the connector corrected the issue.
• GO TO 13.

10. INSPECT ECM AND ELECTRICAL CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect the ECM connector F101.
3. Inspect connectors for the following:

- Loose connector.
- Corroded pins.
- Bent or broken pins.
- Pushed back or expanded pins.
- Moisture in or on the connector.
- Missing or damaged connector seals.
- Dirt or debris on or in the connector pins.
- Connector shell broken.
- Wire insulation damage.
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 11.
NO >> • Repair or replace error-detected parts.

• GO TO 13.

11. CHECK THE ECM SENSOR SUPPLY VOLTAGE AND RETURN CIRCUIT

CAUTION:
Never bend pins or terminals. Extreme care should be taken when using a probe or a jumper into the pin side of a connector for the following reasons:
• Not to bend and damage pins and terminals.
• Not to probe or short unintended circuits and potentially damaging the control unit.

1. Turn ignition switch ON.
2. Measure the voltage between ECM pins 106 and 127 at the ECM.

Is the voltage reading approximately 5V?

YES >> GO TO 12.
NO >> • Replace the ECM. Refer to EC-1254, "Removal and Installation".
• GO TO 13.

12. CHECK FOR CURRENT DTC

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON and wait 30 seconds.
4. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did P2542 DTC become past?

YES >> • The removal and installation of the connector corrected the issue.
• GO TO 13.
NO >> • An open fuel pressure sensor RETURN circuit has been detected in the engine harness. Repair as necessary.
• GO TO 13.

13. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Is P2542 DTC past?

YES >> GO TO 14.
NO >> Return to Diagnosis Procedure. Refer to EC-1210, "DTC Description".

14. ERASE CURRENT DTCS

1. Turn ignition switch OFF.
2. Connect all harness connectors.
3. Turn ignition switch ON.
4. Using CONSULT, erase “ENGINE” diagnostic trouble codes.
5. Using CONSULT, check for current “ENGINE” diagnostic trouble codes.

Did all DTCs get erased with none remaining?

YES >> Repair complete.
NO >> Go to the appropriate Diagnosis Procedure. Refer to EC-135, "DTC Index".

P2558 ENGINE COOLANT LEVEL SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013099941

The coolant level sensor is a switch and is used to measure the level of the engine coolant in the radiator top tank. The coolant level sensor is immersed in the coolant and returns a different signal voltage when immersed in coolant verses being out of coolant. The Engine Control Module (ECM) monitors the change in the signal voltage to determine the level of the engine coolant.

DTC DETECTION LOGIC

The ECM detected the coolant level sensor signal voltage was less than 0.58 V for more than 10 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P2558	Engine Coolant Level Sensor/ Switch Circuit Low (Coolant level sensor 1 circuit - voltage below normal or shorted to low source)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Coolant level sensor value < 0.371 V
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Coolant level sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2558 being current on the CONSULT screen.

Is DTC P2558 current?

YES >> Go to EC-1214, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099942

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2558 being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT COOLANT LEVEL SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect coolant level sensor connector E91.
3. Inspect the harness and sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken

- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK CIRCUIT RESPONSE

1. Coolant level sensor connector E91 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P2559 being current and P2558 being past on the CONSULT screen after 1 minute.

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect coolant level sensor connector E91.
3. Turn ignition switch ON.
4. Check for DTC P2558 being current on the CONSULT screen after 30 seconds.

Is the inspection result normal?

YES >> Replace the engine coolant level sensor. Refer to CO-46, "Exploded View".
NO >> The removal and installation of the connector corrected the fault.

5.INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector E93.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FOR AN OPEN SIGNAL CIRCUIT

1. Disconnect ECM connector E93 and coolant level sensor connector E91.
2. Check resistance between ECM connector E93 and coolant level sensor connector E91.

ECM		Coolant level sensor		Resistance
Connector	Terminal	Connector	Terminal	
E93	75	E91	2	< 10 Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> An open signal circuit has been detected in the engine harness. Repair or replace the engine harness.

7.CHECK FOR AN OPEN RETURN CIRCUIT

1. Disconnect ECM connector E93 and coolant level sensor connector E91.
2. Check resistance between ECM connector E93 and coolant level sensor connector E91.

ECM		Coolant level sensor		Resistance
Connector	Terminal	Connector	Terminal	
E93	41	E91	1	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> An open signal circuit has been detected in the engine harness. Repair or replace the engine harness.

8.CHECK FOR A PIN TO PIN SHORT CIRCUIT

Check resistance between the terminals of ECM connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	75	E93	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> A pin to pin short circuit has been detected on the signal circuit in the engine harness. Repair or replace the engine harness.

9.CHECK FOR A SHORT CIRCUIT TO GROUND

Check resistance between ECM connector E93 and ground.

ECM		Ground	Resistance
Connector	Terminal		
E93	75	—	> 100k Ω

Is the inspection result normal?

YES >> GO TO 10.
NO >> A short to ground on the signal circuit has been detected in the engine harness. Repair or replace the engine harness.

10.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect all components.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P2558 being past on the CONSULT screen after 30 seconds.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the fault.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P2559 ENGINE COOLANT LEVEL SENSOR CIRCUIT HIGH

DTC Description

INFOID:0000000013099939

The coolant level sensor is a switch and is used to measure the level of the engine coolant in the radiator top tank. The coolant level sensor is immersed in the coolant and returns a different signal voltage when immersed in coolant verses being out of coolant. The Engine Control Module (ECM) monitors the change in the signal voltage to determine the level of the engine coolant.

DTC DETECTION LOGIC

The ECM detected the coolant level sensor signal voltage was greater than 4.4 V for more than 10 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P2559	Engine Coolant Level Sensor/ Switch Circuit High (Coolant level sensor 1 circuit - voltage above normal or shorted to high source)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Coolant level sensor value > 4.629 V
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Coolant level sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2559 being current on the CONSULT screen.

Is DTC P2559 current?

YES >> Go to EC-1217, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099940

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2559 being current on the CONSULT screen.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT COOLANT LEVEL SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect coolant level sensor connector E91.
3. Inspect the harness and sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken

- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK CIRCUIT RESPONSE

1. Coolant level sensor connector E91 remains disconnected.
2. Connect a jumper wire between terminals 1 and 2 of the coolant level sensor connector E91.
3. Turn ignition switch ON.
4. Check for DTC P2559 being current and P2558 being past on the CONSULT screen after 30 seconds.

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 5.

4. CHECK DTCS AND VERIFY SENSOR CONDITION

1. Turn ignition switch OFF.
2. Connect coolant level sensor connector E91.
3. Turn ignition switch ON.
4. Check for DTC P2559 being current on the CONSULT screen after 30 seconds.

Is the inspection result normal?

YES >> Replace the engine coolant level sensor. Refer to EM-339, "Removal and Installation".
NO >> The removal and installation of the connector corrected the fault.

5. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector E93.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK FOR AN OPEN RETURN CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect jumper wire between terminals 1 and 2 of the coolant level sensor connector E91.
3. Check resistance between ECM connector E93 and coolant level sensor connector E91.

ECM		Coolant level sensor		Resistance
Connector	Terminal	Connector	Terminal	
E93	41	E91	1	< 10 Ω

Is the inspection result normal?

YES >> GO TO 7.
NO >> An open return circuit has been detected in the engine harness. Repair or replace the engine harness.

7. CHECK FOR AN OPEN SIGNAL CIRCUIT

1. Disconnect ECM connector E93 and coolant level sensor connector E91.

2. Check resistance between ECM connector E93 and coolant level sensor connector E91.

ECM		Coolant level sensor		Resistance
Connector	Terminal	Connector	Terminal	
E93	75	E91	2	< 10 Ω

Is the inspection result normal?

YES >> GO TO 8.
NO >> An open signal circuit has been detected in the engine harness. Repair or replace the engine harness.

8. CHECK FOR A SHORT CIRCUIT

Check resistance between the terminals of ECM connector E93.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
E93	75	E93	All	> 100k Ω

Is the inspection result normal?

YES >> GO TO 9.
NO >> A short circuit has been detected on the signal circuit in the engine harness. Repair or replace the engine harness.

9. CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect all components.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P2559 being past on the CONSULT screen after 30 seconds.

Is the inspection result normal?

YES >> The removal and installation of the connector corrected the fault.
NO >> Replace ECM. Refer to EC-1254, "Removal and Installation".

P2560 ENGINE COOLANT LEVEL LOW

DTC Description

INFOID:0000000013099139

The coolant level sensor is a switch and is used to measure the level of the engine coolant in the radiator top tank. The coolant level sensor is immersed in the coolant and returns a different signal voltage when immersed in coolant verses being out of coolant. The Engine Control Module (ECM) monitors the change in the signal voltage to determine the level of the engine coolant.

DTC DETECTION LOGIC

- The ECM detected the coolant level sensor signal voltage is between 1.75 V and 3.0 V for more than 30 seconds.
- The ECM detected the coolant level sensor signal voltage was higher than 3.0 V for more than 30 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0169	Engine Coolant Level Low (Coolant level - data valid but below normal operating range - least severe level)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	Coolant level sensor voltage: • ≥ 2.953 V • < 3.75 V • ≥ 3.75 V
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Low coolant level
- Coolant level sensor
- Harness and connectors

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2560 being current on the CONSULT screen.

Is DTC P2560 current?

YES >> Go to EC-1220, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099140

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2560 being current or past on the CONSULT screen.

Is applicable DTC detected?

YES >> Check coolant level and add coolant if necessary. If DTC P2560 is current and coolant level is not low, replace coolant level sensor. Refer to CO-46, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

P2579 TC SPEED SENSOR CIRCUIT RANGE/PERFORMANCE

DTC Description

INFOID:0000000013098749

The turbocharger speed sensor is a hall effect type sensor. The Engine Control Module (ECM) provides a 5V supply to the position sensor and a return circuit. As the blades of the turbocharger spin past the speed sensor, a signal is generated on the position sensor signal circuit. The ECM interprets this signal and converts it to a turbo speed.

DTC DETECTION LOGIC

The ECM detected the turbocharger shaft is stuck.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2579	Turbocharger Speed Sensor “A” Circuit Range/Performance (Turbocharger 1 speed - mechanical system not responding or out of adjustment)	Diagnosis condition	Diagnostic runs continuously when the engine is running
		Signal (terminal)	—
		Threshold	Cumulative sum of error (15k rpm turbo speed) in a 30 second period is > 4k rpm, which is equivalent to average of error ≥ 13.333k rpm
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Turbocharger speed sensor
- Turbocharger

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady state driving is performed again even after it is interrupted, each diagnosis can be conducted.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P2579 being current on the CONSULT screen.

Is DTC P2579 current?

YES >> Proceed to EC-1221, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013098750

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTCs P00AF, P1A62, P2262, P226C or P2580 being current on the CONSULT screen.

Are applicable DTCs detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.

2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTCs P0103, P0107, P0108, P012B, P0652, P1191, P22CD or P22CE being current on the CONSULT screen.

Are applicable DTCs detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Drive the vehicle or interview the customer.
3. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
4. Check for DTC P2579 being current on the CONSULT screen.

Is applicable DTC detected with engine symptoms?

YES >> Replace the turbocharger assembly. Refer to EM-391, "Removal and Installation".
NO >> GO TO 4.

4.INSPECT TURBOCHARGER SPEED SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect turbocharger speed sensor connector F126.
3. Inspect the harness and sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK SENSOR SUPPLY VOLTAGE

1. Turbocharger speed sensor connector F126 remains disconnected.
2. Turn ignition switch ON.
3. Check voltage between the terminals of the turbocharger speed sensor connector F126.

Turbocharger speed sensor connector F126		Condition	Voltage (Approx.)
Terminal	Terminal		
1	2	Ignition switch ON	4.75 – 5.25 V

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 8.

6.CHECK FOR AN OPEN SIGNAL CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Check resistance between ECM connector F101 and turbocharger speed sensor connector F126.

ECM		Turbocharger speed sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	188	F126	3	< 10 Ω

Is the inspection result normal?

YES >> GO TO 7.

NO >> An open signal circuit has been detected in the engine harness. Repair or replace the engine harness.

7.CHECK FOR A SHORT CIRCUIT

Check resistance between the terminals of ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	188	F101	All	> 100k Ω

Is the inspection result normal?

YES >> Replace the turbocharger speed sensor. Refer to EM-399, "Removal and Installation".
NO >> A short circuit has been detected on the signal circuit in the engine harness. Repair or replace the engine harness.

8.INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace error-detected parts.

9.CHECK SENSOR SUPPLY VOLTAGE

1. ECM connector F101 remains disconnected.
2. Turn ignition switch ON.
3. Check voltage between the terminals of the ECM connector F101.

ECM connector F101		Condition	Voltage (Approx.)
Terminal	Terminal		
106	127	Ignition switch ON	4.75 – 5.25 V

Is the inspection result normal?

YES >> An open circuit has been detected in the engine harness. Repair or replace the engine harness.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P2580 TC SPEED SENSOR CIRCUIT LOW

DTC Description

INFOID:0000000013102060

The turbocharger speed sensor is a hall effect type sensor. The Engine Control Module (ECM) provides a 5V supply to the position sensor and a return circuit. As the blades of the turbocharger spin past the speed sensor, a signal is generated on the position sensor signal circuit. The ECM interprets this signal and converts it to a turbo speed.

DTC DETECTION LOGIC

The ECM detected the turbocharger speed was less than 15,000 rpm for more than 5 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2580	Turbocharger Speed Sensor “A” Circuit Low (Turbocharger 1 speed - data valid but below normal operating range - moderately severe level)	Diagnosis condition	Diagnostic runs continuously when the engine is running
		Signal (terminal)	—
		Threshold	Raw turbo speed < 250 Hz (10k rpm) for 5 seconds
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Turbocharger speed sensor
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 90 km/h (56 MPH), then release accelerator pedal and keep it released for more than 10 seconds.
   CAUTION:
   Always drive vehicle at safe speed.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
   NOTE:
   - Checking the vehicle speed with GST is advised.
   - When steady state driving is performed again even after it is interrupted, each diagnosis can be conducted.
3. Connect CONSULT and check for current ENGINE diagnostic trouble codes.
4. Check for DTC P2580 being current on the CONSULT screen.

Is DTC P2580 current?

YES >> Proceed to EC-1224, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013102061

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for ENGINE diagnostic trouble codes.
3. Check for DTCs P0103, P0107, P0108, P012C, P012D, P0652, P1192, P1193, P22CD or P22CE being current on the CONSULT screen.

Are applicable DTCs detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC PRIORITY

1. Erase DTCs.

2. Start the engine.
3. Accelerate the engine speed to 1,500 rpm and hold for at least 20 seconds.
4. Return engine speed to idle.
5. Check for ENGINE diagnostic trouble codes.
6. Check for DTC P2580 being current on the CONSULT screen.

Does DTC P2580 become current during engine operation?

YES >> GO TO 3.
NO >> Refer to GI-43, "Intermittent Incident".

3. INSPECT TURBOCHARGER SPEED SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect turbocharger speed sensor connector F126.
3. Inspect the harness and sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4. CHECK SENSOR SUPPLY VOLTAGE

1. Turbocharger speed sensor connector F126 remains disconnected.
2. Turn ignition switch ON.
3. Check voltage between the terminals of the turbocharger speed sensor connector F126.

Turbocharger speed sensor connector F126		Condition	Voltage (Approx.)
Terminal	Terminal		
1	2	Ignition switch ON	4.75 – 5.25 V

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 7.

5. CHECK FOR AN OPEN SIGNAL CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Check resistance between ECM connector F101 and turbocharger speed sensor connector F126.

ECM		Turbocharger speed sensor		Resistance
Connector	Terminal	Connector	Terminal	
F101	188	F126	3	< 10 Ω

Is the inspection result normal?

YES >> GO TO 6.
NO >> An open signal circuit has been detected in the engine harness. Repair or replace the engine harness.

6. CHECK FOR A SHORT CIRCUIT

Check resistance between the terminals of ECM connector F101.

ECM		ECM		Resistance
Connector	Terminal	Connector	Terminal	
F101	188	F101	All	> 100k Ω

Is the inspection result normal?

YES >> Replace the turbocharger speed sensor. Refer to EM-399, "Removal and Installation".
NO >> A short circuit has been detected on the signal circuit in the engine harness. Repair or replace the engine harness.

7. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8. CHECK SENSOR SUPPLY VOLTAGE

1. ECM connector F101 remains disconnected.
2. Turn ignition switch ON.
3. Check voltage between the terminals of the ECM connector F101.

ECM connector F101		Condition	Voltage (Approx.)
Terminal	Terminal		
106	127	Ignition switch ON	4.75 – 5.25 V

Is the inspection result normal?

YES >> An open circuit has been detected in the engine harness. Repair or replace the engine harness.
NO >> Replace the ECM. Refer to EC-1254, "Removal and Installation".

P262A FUEL INJECTOR - PILOT INJECTION NOT LEARNED

DTC Description

INFOID:0000000013387417

The Engine Control Module (ECM) can detect when inaccurate fuel injection occurs by monitoring fuel rail pressure and engine speed. During certain engine conditions, the ECM looks at injection on time and engine speed to determine if the injector is meeting the proper fuel quantity. If the fuel quantity is outside the set limits, a DTC will be set.

DTC DETECTION LOGIC

The ECM has diagnosed that the closed loop fueling control has reached the limit of adjustment within the calibration.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P262A	Fuel Injector - Pilot Injection Not Learned (Engine emissions closed loop fueling adjustment - data erratic, intermittent, or incorrect)	1	Diagnosis condition	Ignition is ON or engine is running
			Signal (terminal)	—
			Threshold	—
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Fuel injector

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 20 seconds.
2. Accelerate lightly and drive at 40 km/h (25 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at a safe speed.
3. Accelerate lightly and drive at 88 km/h (55 MPH) for 4 minutes.
4. Decelerate using as little braking as possible, return to "P" park, and idle for 40 seconds.
5. Repeat steps 2 through 4 eleven more times.
6. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
7. Check for DTC P262A being current on the CONSULT screen.

Is DTC P262A current?

YES >> Go to EC-1227, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013387418

1.CHECK DTC PRIORITY

1. Start and idle the engine.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P262A being current on the CONSULT screen.

Is applicable DTC detected?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Refer to GI-43, "Intermittent Incident".

P262D SENSOR REFERENCE VOLTAGE CIRCUIT LOW

DTC Description

INFOID:0000000013099226

The mass air flow sensor is a frequency based device. A constant voltage is applied to a heated wire. This wire is positioned in the air stream and is heated by the electrical current that the voltage produces. As air flows across it, it cools down. The heated wire is a Positive Temperature Coefficient (PTC) resistor. This means that the resistance drops when the temperature drops. The drop in resistance allows more current to flow through it in order to maintain the programmed temperature. This current is changed to a frequency which is sent to the ECM and interpreted as air flow. Adjustments for air temperature and humidity are taken into consideration since they also affect the temperature of the heated wire. The mass air flow sensor receives a 12V power supply from the ECM.

DTC DETECTION LOGIC

The ECM detected the mass air flow sensor supply was shorted to ground for 0.5 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P262D	Sensor Reference Voltage “G” Circuit Low (Switched output #1 - voltage below normal or shorted to low source)	1	Diagnosis condition	Continuously when key is ON, or engine is running
			Signal (terminal)	—
			Threshold	The power supply < 8 V
			Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness or connectors
- Mass air flow sensor
- ECM

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn the ignition switch ON.
2. Start the engine and let it idle for 1 minute.
3. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
4. Check for DTC P262D being current on the CONSULT screen.

Is DTC P262D current?

YES >> Go to EC-1228, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099227

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P262D being current on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.INSPECT MASS AIR FLOW SENSOR AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor connector F104.
3. Inspect the harness and sensor connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins

- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK DTC PRIORITY

1. Mass air flow sensor connector F104 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P262D being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> GO TO 4.
NO >> Replace the mass air flow sensor. Refer to EM-216, "Removal and Installation".

4. INSPECT ECM AND CONNECTOR PINS

1. Turn ignition switch OFF.
2. Disconnect ECM connector F101.
3. Inspect the harness and module connector pins for the following:

- Loose connector
- Corroded pins
- Bent or broken pins
- Pushed back or expanded pins
- Moisture in or on the connector
- Missing or damaged connector seals
- Dirt or debris on or in the connector pins
- Connector shell broken
- Wire insulation damage
- Damaged connector locking tab

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5. CHECK DTC PRIORITY

1. ECM connector F101 remains disconnected.
2. Turn ignition switch ON.
3. Check for DTC P262D being current on the CONSULT screen after 30 seconds.

Is applicable DTC detected?

YES >> Replace the ECM. Refer to EC-1254, "Removal and Installation".
NO >> Repair or replace error-detected parts.

P263E GLOW PLUG CONTROL MODULE OVER TEMPERATURE

DTC Description

INFOID:0000000013099923

The glow plug control module controls the timing and intensity of the glow plug outputs on the engine using data provided by the ECM through the CAN2 communication lines. The glow plug control module will not activate the glow plugs if the glow plug module reads a temperature greater than a calibrated amount. The glow plug control module receives fused power directly from the battery and switches power through the smart power relay.

DTC DETECTION LOGIC

This DTC is triggered when the glow plug control module internal temperature is greater than 125°C for more than 3 seconds.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P263E	(Glow Plug Control Module 1 Over Temperature)	Diagnosis condition	Ignition switch is ON or engine is running
		Signal (terminal)	—
		Threshold	• Glow plug control module ASIC temperature > 150°C for 2 seconds. OR • Glow plug control module PCB temperature > 125°C for 2.5 seconds.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

- Harness and connectors
- Glow plug control module
- Dirt and debris that could lead to overheating

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P263E being current on the CONSULT screen.

Is DTC P263E current?

YES >> Go to EC-1230, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099924

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P263E being current or more than 3 past counts on the CONSULT screen.

Is applicable DTC detected?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK THE GLOW PLUG CONTROL MODULE INSTALLATION

1. Turn ignition switch OFF.
2. Verify that the glow plug control module is properly mounted. Refer to EC-1256, "Removal and Installation".

Is the inspection result normal?

YES >> GO TO 3.

NO >> Properly install the glow plug control module. Refer to EC-1256, "Exploded View".

3. CHECK FOR OBSTRUCTED OR RESTRICTED AIR FLOW TO THE GLOW PLUG CONTROL MODULE

Check the glow plug control module mounting area for air flow obstructions:
- Debris on or around the temperature sensor module.
- Aftermarket shields, flaps, or brackets mounted too close to the module.
- Exhaust leaks allowing exhaust to overheat the temperature sensor module.

Is the inspection result normal?

YES >> Replace the glow plug control module. Refer to EC-1256, "Removal and Installation".
NO >> Check the following:
- Remove any debris accumulated near the glow plug control module
- Relocate any aftermarket accessories that might be restricting air flow
- Repair any causes of excessive heat to the temperature sensor module

P268C FUEL INJECTOR 1 INJECTION QUANTITY ADJUSTMENT VALUE

DTC Description

INFOID:0000000013065588

Each fuel injector has a specific barcode. This barcode data contains information specific to each individual injector. The ECM uses this information to adjust fueling and allow the engine to run more smoothly

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector barcode value for cylinder 1 has not been entered correctly into the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P268C	(Cylinder 1 Injector Data Incompatible)	Diagnosis condition	Ignition is ON.
		Signal (terminal)	(-)
		Threshold	Invalid injector barcode information has been entered or has not been entered at all.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Invalid injector barcode information

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P268C being current on the CONSULT screen.

Is DTC P268C current?

YES >> Go to EC-1232, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065589

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P268C being current on the CONSULT screen.

Is DTC P268C detected as current?

YES >> Using CONSULT, perform “ENTER INJECTOR CODES” in “Work support” of “ENGINE”.
NO >> Inspection End.

P268D FUEL INJECTOR 2 INJECTION QUANTITY ADJUSTMENT VALUE

DTC Description

INFOID:0000000013065590

Each fuel injector has a specific barcode. This barcode data contains information specific to each individual injector. The ECM uses this information to adjust fueling and allow the engine to run more smoothly

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector barcode value for cylinder 2 has not been entered correctly into the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P268D	(Cylinder 2 Injector Data Incompatible)	Diagnosis condition	Ignition is ON.
		Signal (terminal)	(-)
		Threshold	Invalid injector barcode information has been entered or has not been entered at all.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Invalid injector barcode information

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P268D being current on the CONSULT screen.

Is DTC P268D current?

YES >> Go to EC-1233, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065591

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P268D being current on the CONSULT screen.

Is DTC P268D detected as current?

YES >> Using CONSULT, perform “ENTER INJECTOR CODES” in “Work support” of “ENGINE”.
NO >> Inspection End.

P268E FUEL INJECTOR 3 INJECTION QUANTITY ADJUSTMENT VALUE

DTC Description

INFOID:0000000013065594

Each fuel injector has a specific barcode. This barcode data contains information specific to each individual injector. The ECM uses this information to adjust fueling and allow the engine to run more smoothly

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector barcode value for cylinder 3 has not been entered correctly into the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P268E	(Cylinder 3 Injector Data Incompatible)	Diagnosis condition	Ignition is ON.
		Signal (terminal)	(-)
		Threshold	Invalid injector barcode information has been entered or has not been entered at all.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Invalid injector barcode information

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P268E being current on the CONSULT screen.

Is DTC P268E current?

YES >> Go to EC-1234, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065595

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P268E being current on the CONSULT screen.

Is DTC P268E detected as current?

YES >> Using CONSULT, perform “ENTER INJECTOR CODES” in “Work support” of “ENGINE”.
NO >> Inspection End.

P268F FUEL INJECTOR 4 INJECTION QUANTITY ADJUSTMENT VALUE

DTC Description

INFOID:0000000013065596

Each fuel injector has a specific barcode. This barcode data contains information specific to each individual injector. The ECM uses this information to adjust fueling and allow the engine to run more smoothly

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector barcode value for cylinder 4 has not been entered correctly into the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P268F	(Cylinder 4 Injector Data Incompatible)	Diagnosis condition	Ignition is ON.
		Signal (terminal)	(-)
		Threshold	Invalid injector barcode information has been entered or has not been entered at all.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Invalid injector barcode information

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P268F being current on the CONSULT screen.

Is DTC P268F current?

YES >> Go to EC-1235, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013065597

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P268F being current on the CONSULT screen.

Is DTC P268F detected as current?

YES >> Using CONSULT, perform “ENTER INJECTOR CODES” in “Work support” of “ENGINE”.
NO >> Inspection End.

P2690 INJECTOR SOLENOID DRIVER CYLINDER 5

DTC Description

INFOID:0000000013099133

Each fuel injector has a specific barcode. This barcode data contains information specific to each individual injector. The ECM uses this information to adjust fueling and allow the engine to run more smoothly

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector barcode value for cylinder 5 has not been entered correctly into the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2690	(Cylinder 5 Injector Data Incompatible)	Diagnosis condition	Ignition is ON.
		Signal (terminal)	(-)
		Threshold	Invalid injector barcode information has been entered or has not been entered at all.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Invalid injector barcode information

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P2690 being current on the CONSULT screen.

Is DTC P2690 current?

YES >> Go to EC-1236, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099134

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2690 being current on the CONSULT screen.

Is DTC P2690 detected as current?

YES >> Using CONSULT, perform “ENTER INJECTOR CODES” in “Work support” of “ENGINE”.
NO >> Inspection End.

P2691 INJECTOR SOLENOID DRIVER CYLINDER 6

DTC Description

INFOID:0000000013099135

Each fuel injector has a specific barcode. This barcode data contains information specific to each individual injector. The ECM uses this information to adjust fueling and allow the engine to run more smoothly

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector barcode value for cylinder 6 has not been entered correctly into the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2691	(Cylinder 6 Injector Data Incompatible)	Diagnosis condition	Ignition is ON.
		Signal (terminal)	(-)
		Threshold	Invalid injector barcode information has been entered or has not been entered at all.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Invalid injector barcode information

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P2691 being current on the CONSULT screen.

Is DTC P2691 current?

YES >> Go to EC-1237, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013099136

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2691 being current on the CONSULT screen.

Is DTC P2691 detected as current?

YES >> Using CONSULT, perform “ENTER INJECTOR CODES” in “Work support” of “ENGINE”.
NO >> Inspection End.

P2692 INJECTOR SOLENOID DRIVER CYLINDER 7

DTC Description

INFOID:0000000013101039

Each fuel injector has a specific barcode. This barcode data contains information specific to each individual injector. The ECM uses this information to adjust fueling and allow the engine to run more smoothly

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector barcode value for cylinder 7 has not been entered correctly into the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2692	(Cylinder 7 Injector Data Incompatible)	Diagnosis condition	Ignition is ON.
		Signal (terminal)	(-)
		Threshold	Invalid injector barcode information has been entered or has not been entered at all.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Invalid injector barcode information

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P2692 being current on the CONSULT screen.

Is DTC P2692 current?

YES >> Go to EC-1238, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013101040

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2692 being current on the CONSULT screen.

Is DTC P2692 detected as current?

YES >> Using CONSULT, perform “ENTER INJECTOR CODES” in “Work support” of “ENGINE”.
NO >> Inspection End.

P2693 INJECTOR SOLENOID DRIVER CYLINDER 8

DTC Description

INFOID:0000000013100981

Each fuel injector has a specific barcode. This barcode data contains information specific to each individual injector. The ECM uses this information to adjust fueling and allow the engine to run more smoothly

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the injector barcode value for cylinder 8 has not been entered correctly into the ECM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2693	(Cylinder 8 Injector Data Incompatible)	Diagnosis condition	Ignition is ON.
		Signal (terminal)	(-)
		Threshold	Invalid injector barcode information has been entered or has not been entered at all.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Invalid injector barcode information

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P2693 being current on the CONSULT screen.

Is DTC P2693 current?

YES >> Go to EC-1239, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013100982

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2693 being current on the CONSULT screen.

Is DTC P2693 detected as current?

YES >> Using CONSULT, perform “ENTER INJECTOR CODES” in “Work support” of “ENGINE”.
NO >> Inspection End.

P2BA7 UREA TANK LEVEL

DTC Description

INFOID:0000000013073943

The Diesel Exhaust Fluid (DEF) tank level sensor measures the level of the fluid inside the DEF Tank. The DEF controller unit provides a 5V source and monitors the voltage that determines the fluid level in the tank. DEF Tank Level Sensor is integrated in the DEF dosing unit. It must be replaced with the DEF supply pump assembly.

DTC DETECTION LOGIC

The diesel exhaust fluid tank was critically low.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2BA7	NOx Exceedence - Empty Reagent Tank (Aftertreatment Diesel Exhaust Fluid Tank Empty - Condition Exists)	Diagnosis condition	Ignition is ON or engine is running
		Signal (terminal)	(-)
		Threshold	DTCs P203B, P203C, P203D, P203F and U010E all current.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

Diesel Exhaust Fluid (DEF) level is critically low.

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Turn ignition switch ON.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P2BA7 being current on the CONSULT screen.

Is DTC P2BA7 current?

YES >> Go to EC-1240, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013073944

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2BA7 being current on the CONSULT screen.

Is DTC P2BA7 detected as current?

YES >> Add Diesel Exhaust Fluid (DEF) to the DEF tank.
NO >> Inspection End.

P2BAC NOX CONCENTRATION

DTC Description

INFOID:0000000013081258

The Engine Control Module (ECM) monitors the engine operation for critical current DTCs. If the DTCs are current for an extended period of time and no repair action has been taken, the ECM will limit the engine torque. This DTC indicates engine torque has been reduced.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected certain critical DTCs related to engine operation were current and the engine continued to operate.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2BAC	NOx Exceedence - Deactivation of EGR (Engine Protection Torque Derate - Condition Exists)	Diagnosis condition	Engine is running
		Signal (terminal)	(-)
		Threshold	One or more conditions exist requiring moderate driver inducement.
		Diagnosis delay time	Diagnostic runs continuously when the engine is running

POSSIBLE CAUSE

—

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the engine and let it idle for 1 minute.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P2BAC being current on the CONSULT screen.

Is DTC P2BAC current?

YES >> Go to EC-1241, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013081259

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2BAC being current on the CONSULT screen.

Is DTC P2BAC detected as current?

YES >> This is an information only DTC. Troubleshoot all other current DTCs. Refer to EC-135, "DTC Index".
NO >> Inspection End.

P2BAD NOX CONCENTRATION EXCEEDED

DTC Description

INFOID:0000000013386546

The aftertreatment intake NOx (nitrogen oxides) sensor is a smart device and communicates with the Engine Control Module (ECM) via the CAN2 communication lines. The aftertreatment intake NOx sensor performs internal diagnostics and reports malfunctions back to the primary ECM using the CAN2 communication lines. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment intake NOx sensor is used to measure the NOx emissions at the intake of the aftertreatment system.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the NOx reading was higher or lower than what was expected for the engine operating conditions.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2BAD	NOx Exceedence - Root Cause Unknown (Aftertreatment 1 Intake NOx Sensor - Root Cause Not Known)	Diagnosis condition	Engine is running and aftertreatment diesel oxidation catalyst intake temperature sensor has been above 150° C (302°F) for 5 seconds.
		Signal (terminal)	(–)
		Threshold	NOx reading was higher or lower than what was expected
		Diagnosis delay time	Diagnostic has to meet specific engine and aftertreatment conditions to run and complete

POSSIBLE CAUSE

Intake NOx sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test:

1. Start the vehicle and accelerate to 88 km/h (55 MPH) for 2 minutes.
   CAUTION:
   Always drive vehicle at safe speed.
2. Decelerate to 73 km/h (45 MPH) by releasing the accelerator pedal completely.
3. Accelerate to 88 km/h (55 MPH) for 20 seconds.
4. Repeat steps 2 and 3 for 21 times.
5. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
6. Check for DTC P021A being current on the CONSULT screen.

Is DTC P2BAD current?

YES >> Go to EC-1242, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013386547

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2BAD being current on the CONSULT screen.

Is DTC P2BAD detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.

3. Are any of the following displayed as current on the CONSULT screen:
- P2201
- P2202
- P2209
- P220A
- U029D

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. INSPECT INTAKE NOX SENSOR

1. Turn ignition switch OFF.
2. Inspect the intake NOx sensor installation.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Properly install the intake NOx sensor. Refer to EX-45, "Removal and Installation".

4. CHECK EXHAUST SYSTEM FOR LEAKS

1. Turn ignition switch OFF.
2. Inspect the exhaust system for the following:
- Loose connections.
- Leaking connections and broken exhaust system component.

Is the inspection result normal?

YES >> Replace the intake NOx sensor. Refer to EX-45, "Removal and Installation".
NO >> Repair or replace error-detected parts.

P2BAF NOX SYSTEM DRIVER INDUCEMENT ACTIVE

DTC Description

INFOID:0000000013112933

The aftertreatment outlet NOx (nitrogen oxides) sensor is a smart device and communicates with the Engine Control Module (ECM) via the CAN2 communication lines. The aftertreatment outlet NOx sensor performs its own internal diagnostics and reports malfunctions back to the primary ECM using the CAN2 communication lines. The NOx sensor is permanently attached to the NOx control module. They are serviced as a single component and cannot be replaced individually. The aftertreatment outlet NOx sensor is used to measure the NOx emissions at the outlet of the aftertreatment system.

DTC DETECTION LOGIC

The Engine Control Module (ECM) detected the power supply to the outlet NOx sensor was above or below a calibrated threshold.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2BAF	NOx System Driver Inducement Active (Aftertreatment 1 Outlet NOx Sensor - Root Cause Not Known)	Diagnosis condition	Engine is running and aftertreatment SCR outlet temperature has been above 200° C (392°F) for calibrated period of time.
		Signal (terminal)	(–)
		Threshold	NOx reading was higher or lower than what was expected
		Diagnosis delay time	Diagnostic runs continuously when engine is running.

POSSIBLE CAUSE

- Harness and connectors
- Outlet NOx sensor

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Connect CONSULT and check for current “ENGINE” diagnostic trouble codes.
3. Check for DTC P2BAF being current on the CONSULT screen.

Is DTC P2BAF current?

YES >> Go to EC-1244, "Diagnosis Procedure".
NO >> Inspection End.

Diagnosis Procedure

INFOID:0000000013112934

1.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Check for DTC P2BAF being current on the CONSULT screen.

Is DTC P2BAF detected as current?

YES >> GO TO 2.
NO >> Refer to GI-43, "Intermittent Incident".

2.CHECK DTC PRIORITY

1. Turn ignition switch ON.
2. Connect CONSULT and check for “ENGINE” diagnostic trouble codes.
3. Are any of the following displayed as current on the CONSULT screen.

- P220B
- P229E
- P229F
- P22A7
- U029E

Is applicable DTC detected?

YES >> Refer to EC-135, "DTC Index".
NO >> GO TO 3.

3. INSPECT OUTLET NOX SENSOR

1. Turn ignition switch OFF.
2. Inspect the outlet NOx sensor installation. Refer to EX-48, "Exploded View".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Properly install the outlet NOx sensor. Refer to EX-48, "Removal and Installation".

4. CHECK EXHAUST SYSTEM FOR LEAKS

1. Turn ignition switch OFF.
2. Inspect the exhaust system for the following:

- Loose connections.
- Leaking connections and broken exhaust system component.

Is the inspection result normal?

YES >> Replace the outlet NOx sensor. Refer to EX-48, "Removal and Installation".
NO >> Repair or replace error-detected parts.

SYMPTOM DIAGNOSIS

ENGINE CONTROL SYSTEM SYMPTOMS

Symptom Table

PERIODIC MAINTENANCE

IDLE SPEED

Inspection

INFOID:0000000013790786

1.CHECK IDLE SPEED

With CONSULT
Check “CKPS·RPM (TDC)” in “DATA MONITOR” mode with CONSULT.
With GST
Check idle speed with Service $01 of GST.

>> INSPECTION END

EXHAUST SYSTEM

Exhaust System Diagnostics

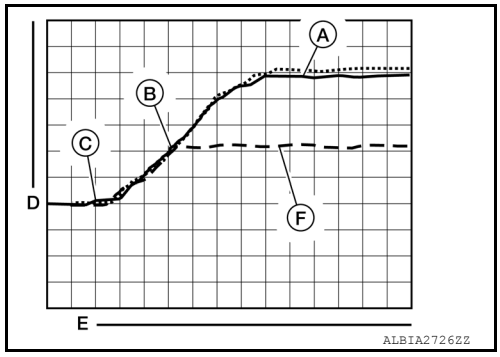
INFOID:0000000012543815

General Information

- The following procedure contains troubleshooting steps and information regarding the aftertreatment system.
- Leaks in the exhaust system can cause exhaust odor or white smoke.
- Inspect the exhaust piping for leaks, cracks, and loose connections. Refer to EX-25, "Removal and Installation"
- Tighten the clamps, if necessary. Refer to EX-24, "Exploded View".
- It may be necessary to perform a stationary (parked) regeneration to locate exhaust leaks. Refer to "DPF REGENERATION TEST"
- The ambient temperature affects the length of time it will take to perform a stationary (parked) regeneration, because the engine must work harder to increase the exhaust temperatures to the appropriate levels in cold ambient temperatures.
- In cold ambient temperatures (approximately -18°C [0°F] or colder), stationary (parked) regeneration may take longer to complete. In extremely cold ambient temperatures, stationary (parked) regeneration may **not** complete.
- In these cases, it may be necessary to warm the engine to operating temperature before starting the stationary (parked) regeneration, or to move the vehicle to a location with higher ambient temperatures.

Stationary Regeneration (Parked)

- When performing a stationary (parked) regeneration, monitor the exhaust temperatures in the aftertreatment system to determine why a stationary (parked) regeneration will **not** complete.
- Possible causes for stationary (parked) regenerations that will **not** complete include:
- Mis-assembled aftertreatment wiring harness.
- Aftertreatment exhaust gas temperature sensors installed in the wrong locations.
- Plugged diesel oxidation catalyst (DOC).
- Malfunctioning turbocharger.
- Exhaust leaks between the engine and the aftertreatment.
- Very low ambient temperatures (less than -18°C [0°F]).
- A normal stationary (parked) regeneration will follow the pattern shown.

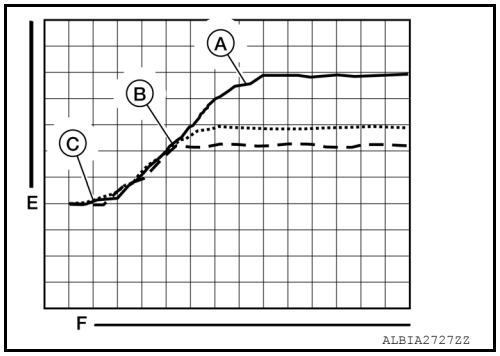


(D) : Temperature
(E) : Time

- The dashed line is for the DOC inlet temperature sensor (F).
- The dotted line is for the diesel particulate filter (DPF) inlet temperature sensor (B).
- The solid line is for the DPF outlet temperature sensor (A).
- When the stationary (parked) regeneration begins (C), all three temperatures should be approximately the same, and should increase at the same rate.
- The wiring to the aftertreatment temperature sensors appears to be correct in this example, because they all read approximately the same temperature at the beginning of the stationary (parked) regeneration and increase at the same rate.
- The DPF inlet and outlet temperatures will increase over approximately 10 minutes to 482 to 649°C [900 to 1200°F]. The temperatures may vary during the stationary (parked) regeneration, as the amount of fuel injected during aftertreatment injection is changed to maintain a constant temperature.
- The DPF inlet and outlet temperatures will remain at this temperature for the duration of the stationary (parked) regeneration.

Stationary Regeneration (DOC and DPF Assembly Blocked)

- This graph illustrates a stationary (parked) regeneration where the inlet of the DOC is blocked.

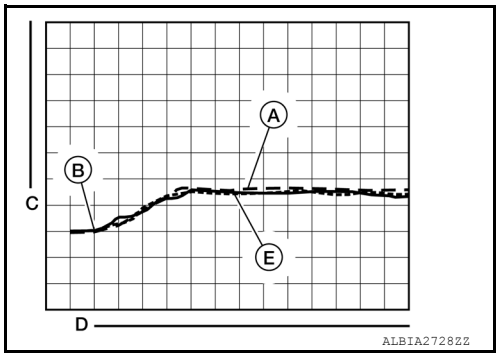


(E) : Temperature
(F) : Time

- The dashed line is for the DOC inlet temperature sensor (B).
- The dotted line is for the DPF inlet temperature sensor (C).
- The solid line is for the DPF outlet temperature sensor (A).
- In this condition, the engine speed will increase to the stationary (parked) regeneration speed of 1000 to 1100 rpm.
- The wiring to the aftertreatment temperature sensors appears to be correct in this example, because they all read approximately the same temperature at the beginning of the stationary (parked) regeneration and they increase at the same rate.
- The possible cause of this condition is a plugged DOC. Use the following procedure to inspect the DOC. Inspect the exhaust and aftertreatment system for leaks. Tighten clamps as necessary. Reference the appropriate procedure for torque specifications.

Stationary Regeneration (Cold Engine)

- This graph illustrates a stationary (parked) regeneration where the engine can **not** build enough heat to start aftertreatment injection.

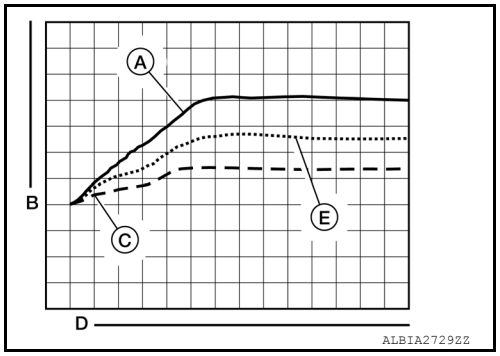


(C) : Temperature
(D) : Time

- The dashed line is for the DOC inlet temperature sensor (A).
- The dotted line is for the DPF inlet temperature sensor (E).
- The solid line is for the DPF outlet temperature sensor (B).
- The engine speed will likely increase to the stationary (parked) regeneration speed of 1000 to 1100 rpm, but because the aftertreatment temperatures do **not** increase enough to start aftertreatment injection, the stationary (parked) regeneration will **not** complete.
- The wiring to the aftertreatment temperature sensor appears to be correct in this example, because they all read approximately the same temperature for the same conditions.
- Possible causes of this issue include:
- A malfunctioning turbocharger.
- Low ambient temperatures. Move the vehicle to a location with higher ambient temperatures.

Stationary Regeneration (Incorrect Wire Routing)

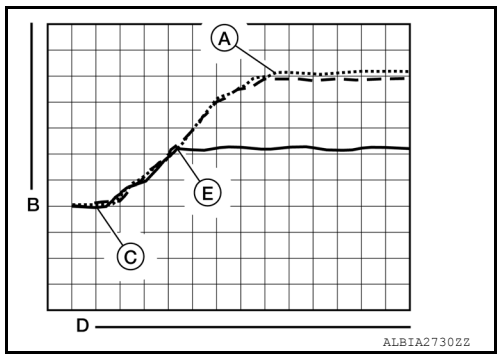
- This graph illustrates a stationary (parked) regeneration where the wiring to the aftertreatment temperature sensors is incorrect.



(B) : Temperature
(D) : Time

- The dashed line is for the DOC inlet temperature sensor (C).
- The dotted line is for the DPF inlet temperature sensor (E).
- The solid line is for the DPF outlet temperature sensor (A).
- In this condition, the engine speed will increase to the stationary (parked) regeneration speed of 1000 to 1100 rpm.
- Aftertreatment injection will **not** occur in this condition because the DOC inlet temperature does **not** reach the required temperature. Because aftertreatment injection is **not** occurring, the aftertreatment temperatures should **not** read differently.
- The possible cause of this condition is an incorrectly assembled aftertreatment wiring harness. See the aftertreatment exhaust gas temperature sensor wiring information in this procedure.

- This graph illustrates a stationary (parked) regeneration where the connectors to the DOC inlet temperature sensor and the DPF outlet temperature sensor are reversed.



(B) : Temperature
(D) : Time

- The dashed line is for the DOC inlet temperature sensor (C).
- The dotted line is for the DPF inlet temperature sensor (A).
- The solid line is for the DPF outlet temperature sensor (E).
- In this condition, the engine speed will increase to the stationary (parked) regeneration speed of 1000 to 1100 rpm.
- Aftertreatment injection may occur in this condition. However, the DOC inlet temperature increases after aftertreatment injection begins, while the DPF outlet temperature remains constant.
- The possible cause of this condition is that the connectors to the DOC inlet temperature sensor and the DPF outlet temperature sensor are reversed. See the aftertreatment exhaust gas temperature sensor wiring information in this procedure.

TEST

CAUTION:
It is unlawful to tamper with or remove any component of the aftertreatment system. It is also unlawful to use a diesel exhaust fluid (DEF) that does not meet the specifications provided or to operate the vehicle/equipment without DEF.

CAUTION:
Never add water or any other fluid besides what is specified to the DEF tank. The aftertreatment system may be damaged.

CAUTION:
Having the correct concentration of DEF is critical to the engine and aftertreatment system performing correctly.

CAUTION:
Cummins Inc. is not responsible for malfunctions or damage resulting from what Cummins Inc. determines to be abuse or neglect, including, but not limited to: operation without correctly specified diesel exhaust fluid, lack of maintenance of the aftertreatment system, improper storage or shutdown practices, or unauthorized modifications of the engine and aftertreatment system. Cummins Inc. is also not responsible for malfunctions caused by incorrect diesel exhaust fluid, water, dirt, or other contaminants in the diesel exhaust fluid. Follow the instructions provided with the service tool.

- To test the concentration of the DEF, use tool.

Tool number : — (J-54466)

NOTE:
The concentration of the DEF **must** be 32.5 ± 0.7 percent by weight. When measuring concentration with tool, the acceptable DEF measurement specification is 32.5 ± 1.5 percent. This specification takes into consideration the tool tolerances, variability and calibration when measuring DEF concentration.

- If the DEF concentration is found to be outside of this specification, drain the DEF tank, flush with distilled water, and fill with new and/or known good DEF. Check the DEF concentration.
- Concentration of the DEF should be checked when:
- The vehicle has been stored for an extended period of time.
- It is suspected that water has been added to the DEF tank.

CONTAMINATION/INCORRECT FLUID

1. DEF can become contaminated by the following situations:
   - The DEF tank cap is missing/damaged, or the tank vent malfunctions.
   - Filling the DEF tank with the incorrect fluid.

   In the event that the DEF becomes contaminated, inspect the DEF to determine the most likely source. Obtain a sample from the DEF tank and pour the sample into an appropriate container. Make sure to get a sample from the highest fluid level.
2. Inspect for petroleum base liquids, such as, but **not** limited to:
   - Diesel fuel.
   - Hydraulic fluid.
   - Brake fluid.

DEF is comprised largely of water. Petroleum based liquids will separate from the DEF and rise to the top. Check for separation of the fluids, as well as their characteristics.
If contaminated, reference the steps detailed later in this procedure.

3. Inspect for non-petroleum base liquids, such as, but **not** limited to:
   - Water.
   - Coolant.
   - Windshield washer fluid.

   If water has been added, the DEF will remain clear. As a result, the DEF will become diluted, reducing the concentration level.
   NOTE:
   If **only** water has been added to the DEF tank, drain the DEF tank, flush with distilled water, and fill the tank with new and/or known good DEF. Check the DEF concentration after completing the refill. Reference the Test Section of this procedure.
   For other non-petroleum based liquids that may have been added to the DEF, typically those fluids have coloring and will mix with DEF. If the DEF has a color tint to it, look for other fluids used on the vehicle that may match, such as coolant or windshield washer fluid.
   If contaminated, reference the steps detailed later in this procedure.
4. If the DEF has been contaminated, remove the DEF dosing pump module. Inspect the filter for signs that the contaminated fluid went through the dosing system. If the DEF has been contaminated, replace the aftertreatment DEF dosing pump module.Refer to EX-73, "Removal and Installation".
   After the DEF tank has been cleaned, fill the tank with new and/or known good DEF. Check the DEF concentration after completing the refill. Reference the Test section of this procedure.
   NOTE:
   Make sure to view and troubleshoot any fault codes that occur during the following steps with CONSULT. Reference the appropriate fault code troubleshooting manual.
5. If the contaminated fluid passed through the dosing system:
   NOTE:
   Any discarded contaminated fluids and/or parts **must** be disposed of according to local area ordinances.
   - Drain the DEF tank, flush with several fills of water until it is clean and clear of contamination. Replace the DEF dosing pump. Refer to EX-75, "Removal and Installation".
   - Fill the DEF tank with distilled water.
   - Perform CONSULT DEF Dosing Unit Override Test. Repeat the test until the distilled water runs clear. Use tool to check the concentration of the distilled water after being sprayed out of the dosing system. If the system is free of contaminants, distilled water will register zero percent concentration. Refer to EX-68, "DEF Dosing Unit Override Test".

     Tool number : — (J-54466)

   - Drain the distilled water from the DEF tank and fill with new and/or known good DEF. Check the DEF concentration after completing the refill, reference the Test section of this procedure.
   - Use the following procedure to test the performance and spray pattern of the DEF dosing valve and perform CONSULT DEF Dosing Unit Override Test. Residual water in the dosing system can possibly lower the DEF concentration being sprayed. Continue to run the DEF Dosing Unit Override Test until DEF is sprayed out of the dosing system. Use tool to check for proper concentration of the DEF. Refer to EX-68, "DEF Dosing Unit Override Test"

     Tool number : — (J-54466)

   - Road test the vehicle for 30 minutes to verify system operation.

REMOVAL AND INSTALLATION

ECM

Removal and Installation

INFOID:0000000013051187

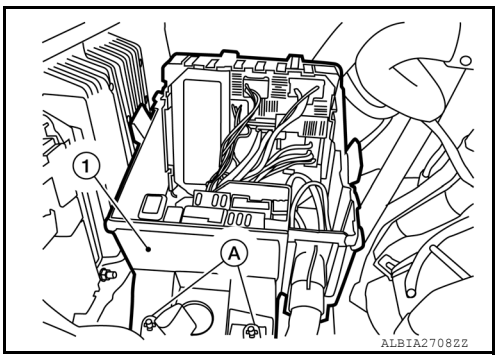
INSPECTION BEFORE REMOVAL

- Turn the ignition switch to the ON position while monitoring the malfunction indicator lamps (MIL). The malfunction indicator lamps (MIL) must illuminate for 2 to 3 seconds.
  NOTE:
  If the lamps do not illuminate, check for burned out bulbs.
- Before removing the Engine Control Module (ECM) from the vehicle, note the injector trim codes and match them to the correct cylinder number. Failure to do so could result in DTCs or could negatively affect engine performance. Refer to the following procedure to identify the cylinder number for each bank. Refer to EC-187, "Work Procedure".
  CAUTION:
  Make sure the injector trim codes match the correct cylinder number. Failure to do so could result in DTCs or could negatively affect engine performance.
- Press the keyswitch button to the OFF position.
- Connect CONSULT to the vehicle data link.
- Turn the ignition switch to the ON position.
- Select the monitor mode on CONSULT. The electronic service tool must be able to communicate with the ECM.
- Record the engine serial number and the injector trim codes before removing the ECM. The engine serial number is located on the engine dataplate on the front of the intake manifold.
- The injector trim codes are a 7-digit alphanumeric code that can be found printed on the injector head or can be accessed with the electronic service tool under "High Pressure Common Rail Injector Setup".

REMOVAL

CAUTION:
Perform ADDITIONAL SERVICE WHEN REPLACING ECM. Refer to EC-179, "Work Procedure".

1. After keying the engine OFF, wait for 1 minute to allow the ECM to completely power down before disconnecting the batteries.
2. Disconnect the battery or batteries. Refer to PG-174, "Battery Disconnect".
   WARNING:
   Battery acid and battery acid fumes are extremely dangerous and can cause severe burns and explosion. To help reduce the risk of personal injury;
   - **Wear appropriate goggles and protective clothing.**
   - **Always properly ventilate the area where the service is being performed.**
   - **Never allow battery fluid to come in contact with skin, eyes, fabrics or painted surfaces.**
   - **To avoid arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.**
   - **If acid contacts eyes, skin or clothing, immediately flush with water for 15 minutes and seek medical attention.**
3. Release harness clips (A) from studs, then remove nuts and reposition the Intelligent Power Distribution Module [IPDM E/R (1)].



4. Disconnect the harness connectors from the ECM.
5. Remove the bolts that secure ECM to vehicle body.
6. Remove the ECM.

INSPECTION AFTER REMOVAL

- Inspect the engine harness connector for the following:
  - Cracked or broken connector shell
  - Missing or damaged connector seals
  - Dirt, debris, or moisture in or on the connector pins
  - Corroded, bent, broken, pushed back, or expanded pins
- Repair or replace parts as necessary.

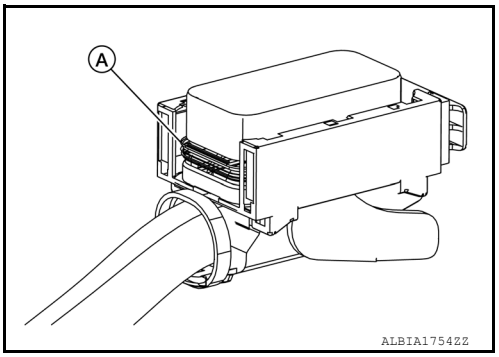
INSTALLATION

1. Install the new ECM to the ECM bracket on the vehicle body, then tighten bolts.
   CAUTION:
   Make sure no grease or dirt is between the ECM and the mounting plate.
   NOTE:
   Make sure **all** four bolts are installed. These ground the ECM body/casing.

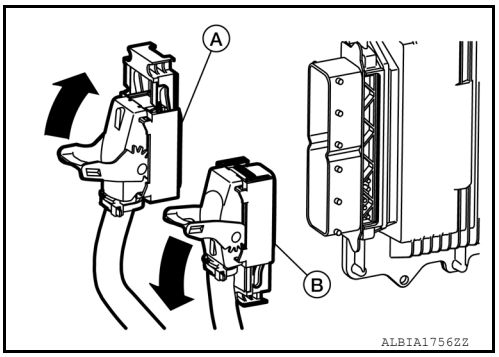
   ECM bolts : 11 N·m (1.1 kg-m, 8 ft-lb)

2. Use a suitable tool to remove all dirt and moisture from the ECM connector ports and the harness connectors.
   CAUTION:
   Do not blow compressed air into the ECM ports or connectors. Compressed air can contain moisture due to condensation.

3. Make sure the orange seal (A) in the ECM connectors is properly seated in its cavity. Otherwise, water intrusion to the electrical connectors could occur, which could cause shorts or intermittent connections.



4. Connect the harness connectors (A/B) to the ECM by placing the harness connectors into the ECM header and pulling back on the locking lever until the connectors are fully seated and the lever locking tab is engaged.

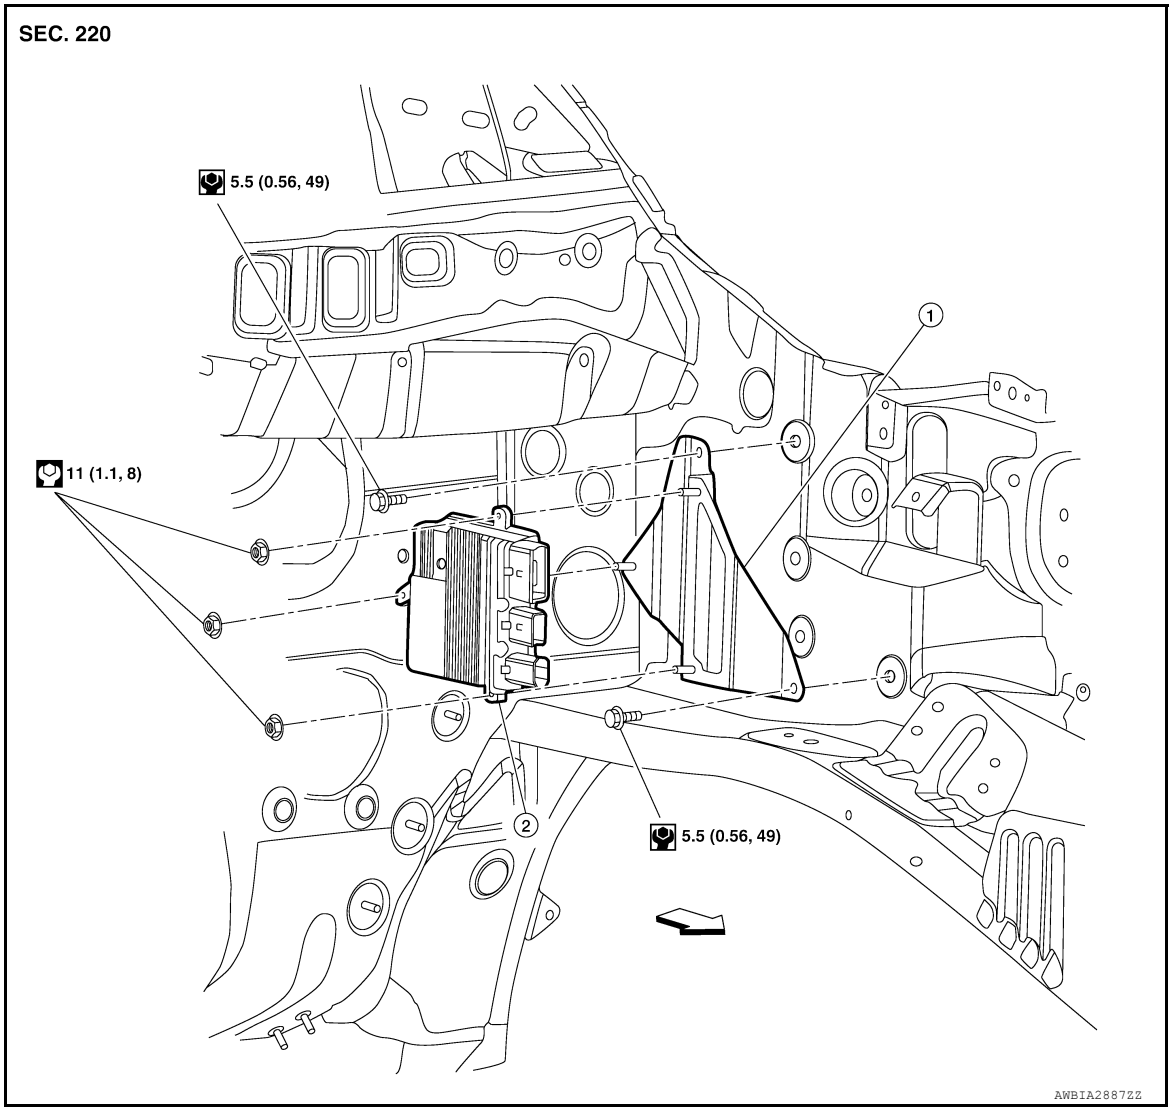


5. When the ECM is replaced, the new ECM must be calibrated. Refer to EC-179, "Work Procedure".
6. Connect the battery or batteries. Refer to PG-174, "Battery Disconnect".
   WARNING:
   Battery acid and battery acid fumes are extremely dangerous and can cause severe burns and explosion. To help reduce the risk of personal injury:
   - **Wear appropriate goggles and protective clothing.**
   - **Always properly ventilate the area where the service is being performed.**
   - **Never allow battery fluid to come in contact with skin, eyes, fabrics or painted surfaces.**
   - **To avoid arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.**
   - **If acid contacts eyes, skin or clothing, immediately flush with water for 15 minutes and seek medical attention.**
7. Operate the engine and check for loose components.

GLOW CONTROL UNIT

Exploded View

INFOID:0000000013051189



1. Glow control unit bracket
2. Glow control unit
⇦ Front

Removal and Installation

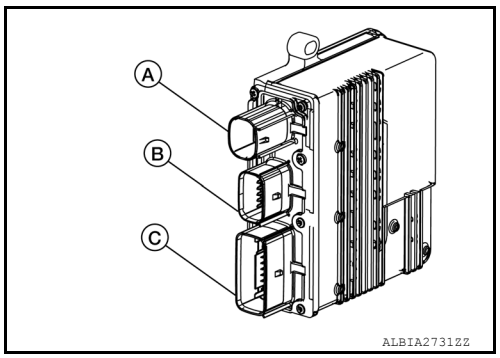
INFOID:0000000013051190

GENERAL INFORMATION

- The glow plug control unit is mounted on the driver side of the engine compartment close to the air filter box. The glow plug control unit communicates to the Engine Control Unit (ECM) via a J1939 (250k baud) data link. The glow timing and intensity are calculated inside the glow plug control unit on the basis of controller area network signals provided by the ECM (engine speed, engine torque, engine coolant temperature, intake air temperature, air pressure, keyswitch, and engine state).

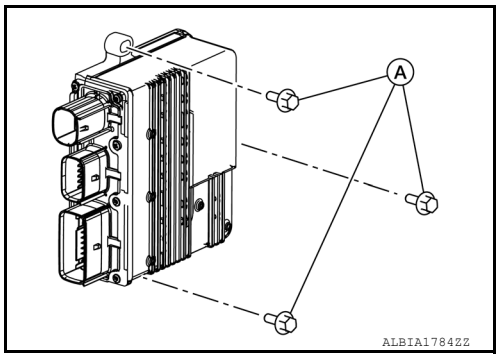
- The glow plug control unit has three connections:

(A) : J1939 data link, ground and smart power connector
(B) : Glow plug current supply connector
(C) : Constant battery power connector



REMOVAL

1. Disconnect the battery or batteries. Refer to PG-174, "Battery Disconnect".
   WARNING:
   Battery acid and battery acid fumes are extremely dangerous and can cause severe burns and explosion. To help reduce the risk of personal injury:
   - **Wear appropriate goggles and protective clothing.**
   - **Always properly ventilate the area where the service is being performed.**
   - **Never allow battery fluid to come in contact with skin, eyes, fabrics or painted surfaces.**
   - **To avoid arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.**
   - **If acid contacts eyes, skin or clothing, immediately flush with water for 15 minutes and seek medical attention.**
2. Remove air cleaner and air duct assembly. Refer to EM-213, "Removal and Installation".
3. Disconnect the connectors from the glow plug control unit by pressing the connector latch and pulling outward.
4. Remove the bolts (A) that secure the glow plug control unit to the vehicle chassis.
   Remove the glow plug control unit.

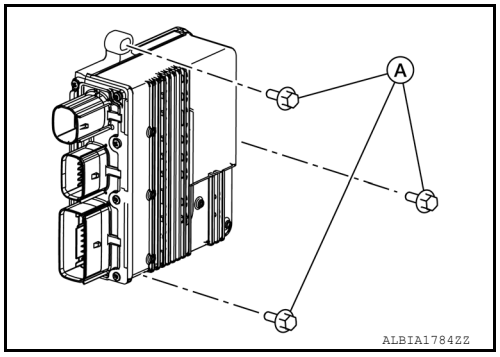


INSPECTION AFTER REMOVAL

- Inspect the glow plug control unit connectors for the following:
- Cracked or broken connector shells
- Missing or damaged connector seals
- Dirt, debris, or moisture in or on the connector pins
- Corroded, bent, broken, pushed back, or expanded pins
- Repair or replace parts as necessary.

INSTALLATION

1. Install the new glow plug control unit to the vehicle chassis.
   CAUTION:
   - **Make sure no grease or dirt is between the glow plug control unit and the mounting plate.**
   - **Over-tightening the bolts will result in damaging the glow plug control unit.**
2. Tighten the bolts (A).



3. Use a suitable tool to remove all dirt and moisture from the glow plug control unit connector ports and the harness connectors.
4. Connect the harness connectors to glow plug control unit by pushing them into their corresponding connector cavities.
   NOTE:
   An audible click should be heard when the connection is made.
5. Install the air cleaner and air duct assembly. Refer to EM-213, "Removal and Installation".
6. Connect the battery or batteries. Refer to PG-174, "Battery Disconnect".

   WARNING:
   Battery acid and battery acid fumes are extremely dangerous and can cause severe burns and explosion. To help reduce the risk of personal injury;
   - **Wear appropriate goggles and protective clothing.**
   - **Always properly ventilate the area where the service is being performed.**
   - **Never allow battery fluid to come in contact with skin, eyes, fabrics or painted surfaces.**
   - **To avoid arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.**
   - **If acid contacts eyes, skin or clothing, immediately flush with water for 15 minutes and seek medical attention.**
7. Operate the engine and check for loose components.

Removal and Installation

INFOID:0000000013147344

REMOVAL

1. Disconnect the battery or batteries. Refer to PG-174, "Battery Disconnect".

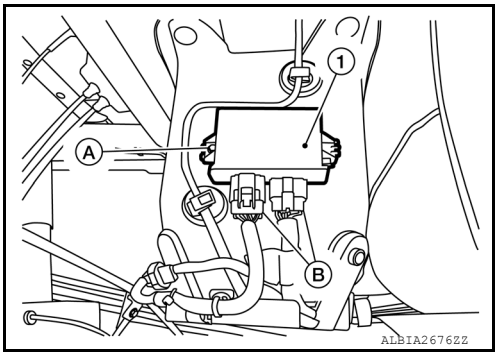
WARNING:

Battery acid and battery acid fumes are extremely dangerous and can cause severe burns and explosion. To help reduce the risk of personal injury:

- **Wear appropriate goggles and protective clothing.**
- **Always properly ventilate the area where the service is being performed.**
- **Never allow battery fluid to come in contact with skin, eyes, fabrics or painted surfaces.**

- **To avoid arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.**
- **If acid contacts eyes, skin or clothing, immediately flush with water for 15 minutes and seek medical attention.**

2. Disconnect the SCR control unit harness connectors (B) and remove the bolt (A) from the SCR control unit (1).



3. Remove the SCR control unit.

INSTALLATION

Installation is in the reverse order of removal.

- Connect the battery or batteries. Refer to PG-174, "Battery Disconnect".

SERVICE DATA AND SPECIFICATIONS (SDS)

SERVICE DATA AND SPECIFICATIONS (SDS)

Fuel Pressure

INFOID:0000000012543822

Fuel pressure at idling kPa (kg/cm^2, psi)	Approximately 350 (3.57, 51)

Fuel Rail Pressure

INFOID:0000000013188986

Operating Range kPa (kg/cm^2, psi)	Minimum	: 25,000 (255, 3625)
	Maximum	: 200,000 (2,040, 29,000)

Engine Coolant Temperature Sensor

INFOID:0000000012543827

Temperature °C (°F)	Resistance kΩ
20 (68)	2.1 - 2.9
50 (122)	0.68 - 1.00
90 (194)	0.236 - 0.260

Crankshaft Position Sensor

INFOID:0000000012543830

Refer to EC-570, "Component Inspection".

Camshaft Position Sensor

INFOID:0000000012543831

Refer to EC-40, "Camshaft Position Sensor".

Exhaust Restriction

INFOID:0000000013189036

Maximum Restriction kPa (kg/m^2, psi)	Clean	: 26.0 (0.27, 3.8)
	Dirty	: 40.7 (0.415, 5.9)

DEF

Fluid capacity	17.65L (4-5/8 US gal, 3-7/8 Imp gal)
Urea concentration	32.5 ± 1.5%

*: Only use Diesel Exhaust Fluid meeting ISO 22241-1 standard..

PRECAUTION

PRECAUTIONS

Precaution for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

INFOID:0000000013798040

The Supplemental Restraint System such as “AIR BAG” and “SEAT BELT PRE-TENSIONER”, used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. Information necessary to service the system safely is included in the “SRS AIR BAG” and “SEAT BELT” of this Service Manual.

WARNING:

Always observe the following items for preventing accidental activation.

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision that would result in air bag inflation, it is recommended that all maintenance and repair be performed by an authorized NISSAN/INFINITI dealer.**
- **Improper repair, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see “SRS AIR BAG”.**
- **Never use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.**

PRECAUTIONS WHEN USING POWER TOOLS (AIR OR ELECTRIC) AND HAMMERS

WARNING:

Always observe the following items for preventing accidental activation.

- **When working near the Air Bag Diagnosis Sensor Unit or other Air Bag System sensors with the ignition ON or engine running, never use air or electric power tools or strike near the sensor(s) with a hammer. Heavy vibration could activate the sensor(s) and deploy the air bag(s), possibly causing serious injury.**
- **When using air or electric power tools or hammers, always switch the ignition OFF, disconnect the battery or batteries, and wait at least 3 minutes before performing any service.**

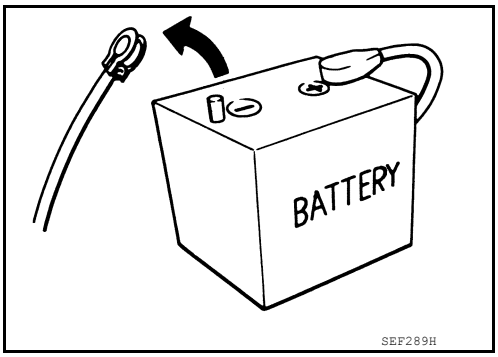
Precautions for Removing Battery Terminal

INFOID:0000000013798041

When disconnecting the battery terminal, pay attention to the following.

- Always use a 12V battery as power source.
- Never disconnect battery terminal while engine is running.
- When removing the 12V battery terminal, turn OFF the ignition switch and wait at least 30 seconds.
- For vehicles with the engine listed below, remove the battery terminal after a lapse of the specified time:

BR08DE	: 4 minutes	YD25DDTi	: 2 minutes
D4D engine	: 20 minutes	YS23DDT	: 4 minutes
HRA2DDT	: 12 minutes	YS23DDTT	: 4 minutes
K9K engine	: 4 minutes	ZD30DDTi	: 60 seconds
M9R engine	: 4 minutes	ZD30DDTT	: 60 seconds
R9M engine	: 4 minutes		
V9X engine	: 4 minutes		



NOTE:

ECU may be active for several tens of seconds after the ignition switch is turned OFF. If the battery terminal is removed before ECU stops, then a DTC detection error or ECU data corruption may occur.

- After high-load driving, if the vehicle is equipped with the V9X engine, turn the ignition switch OFF and wait for at least 15 minutes to remove the battery terminal.

NOTE:

- Turbocharger cooling pump may operate in a few minutes after the ignition switch is turned OFF.
- Example of high-load driving
  - Driving for 30 minutes or more at 140 km/h (86 MPH) or more.

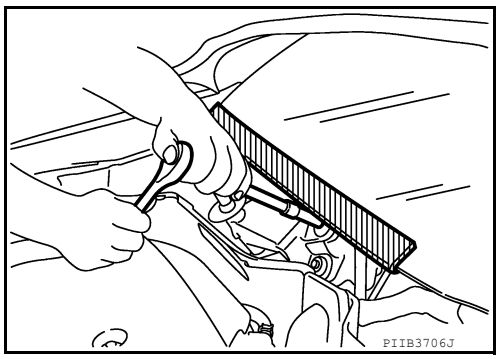
- Driving for 30 minutes or more on a steep slope.

- For vehicles with the 2-batteries, be sure to connect the main battery and the sub battery before turning ON the ignition switch.
  NOTE:
  If the ignition switch is turned ON with any one of the terminals of main battery and sub battery disconnected, then DTC may be detected.
- After installing the 12V battery, always check "Self Diagnosis Result" of all ECUs and erase DTC.
  NOTE:
  The removal of 12V battery may cause a DTC detection error.

Precaution for Procedure without Cowl Top Cover

INFOID:0000000013798042

When performing the procedure after removing cowl top cover, cover the lower end of windshield with urethane, etc to prevent damage to windshield.



On Board Diagnostic (OBD) System of Engine and A/T

INFOID:0000000013798043

The ECM has an on board diagnostic system. It will illuminate the malfunction indicator lamp (MIL) to warn the driver of a malfunction causing emission deterioration.

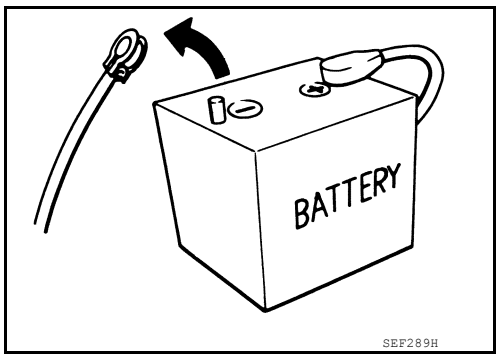
CAUTION:

- **Always turn the ignition switch OFF and disconnect the negative battery cable before any repair or inspection work. The open/short circuit of related switches, sensors, solenoid valves, etc. will cause the MIL to illuminate.**
- **Always connect and lock the connectors securely after work. A loose (unlocked) connector will cause the MIL to illuminate due to the open circuit. (Be sure the connector is free from water, grease, dirt, bent terminals, etc.)**
- **Certain systems and components, especially those related to OBD, may use a new style slide-locking type harness connector. For description and how to disconnect, refer to EC-1314, "Diagnosis Description".**
- **Always route and secure the harnesses properly after work. The interference of the harness with a bracket, etc. may cause the MIL to illuminate due to the short circuit.**
- **Always connect rubber tubes properly after work. A misconnected or disconnected rubber tube may cause the MIL to illuminate due to the malfunction of the EVAP system or fuel injection system, etc.**
- **Always erase the unnecessary malfunction information (repairs completed) from the ECM and TCM (Transmission control module) before returning the vehicle to the customer.**

General Precautions

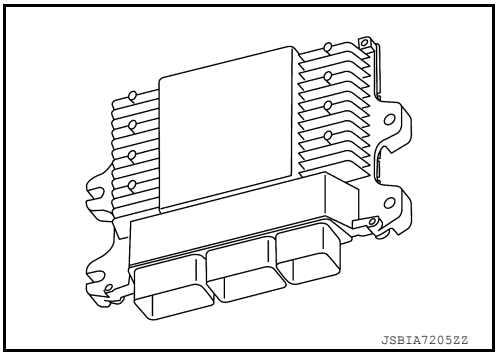
INFOID:0000000013798044

- **Always use a 12 volt battery as power source.**
- **Never attempt to disconnect battery cables while engine is running.**
- **Before connecting or disconnecting the ECM harness connector, turn ignition switch OFF and disconnect negative battery cable. Failure to do so may damage the ECM because battery voltage is applied to ECM even if ignition switch is turned OFF.**
- **Before removing parts, turn ignition switch OFF and then disconnect battery ground cable.**

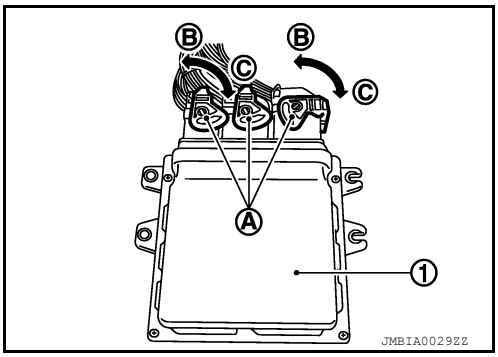


- **Never disassemble ECM.**
- **If a battery cable is disconnected, the memory will return to the ECM value.**
  The ECM will now start to self-control at its initial value. Thus, engine operation can vary slightly in this case. However, this is not an indication of a malfunction. Never replace parts because of a slight variation.
- **If the battery is disconnected, the following emission-related diagnostic information will be lost within 24 hours.**

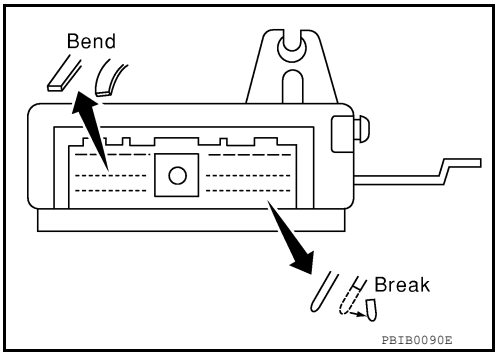
- **Diagnostic trouble codes**
- **1st trip diagnostic trouble codes**
- **Freeze frame data**
- **1st trip freeze frame data**
- **System readiness test (SRT) codes**
- **Test values**

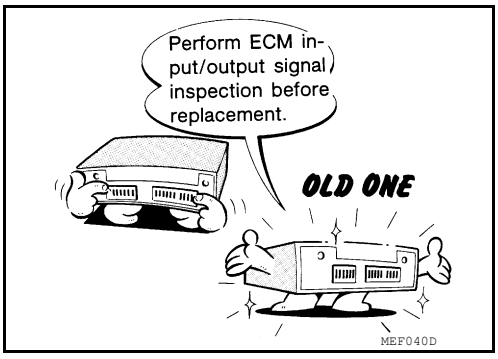


- **When connecting ECM harness connector (A), fasten (B) it securely with a lever as far as it will go as shown in the figure.**
- ECM (1)
- Loosen (C)

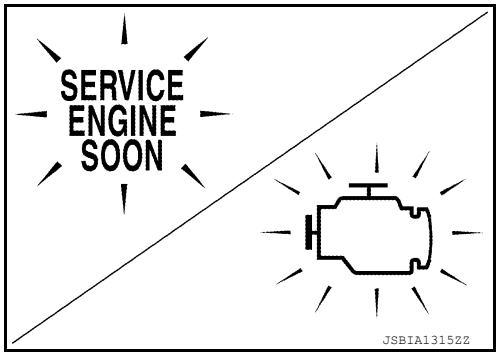


- **When connecting or disconnecting pin connectors into or from ECM, never damage pin terminals (bends or break).**
  Check that there are not any bends or breaks on ECM pin terminal, when connecting pin connectors.
- **Securely connect ECM harness connectors.**
  A poor connection can cause an extremely high (surge) voltage to develop in coil and condenser, thus resulting in damage to ICs.
- **Keep engine control system harness at least 10 cm (4 in) away from adjacent harness, to prevent engine control system malfunctions due to receiving external noise, degraded operation of ICs, etc.**
- **Keep engine control system parts and harness dry.**
- **Before replacing ECM, perform ECM Terminals and Reference Value inspection and check that ECM functions properly. Refer to EC-1337, "Reference Value".**
- **Handle mass air flow sensor carefully to avoid damage.**
- **Never clean mass air flow sensor with any type of detergent.**
- **Never disassemble electric throttle control actuator.**
- **Even a slight leakage in the air intake system can cause serious incidents.**
- **Never shock or jar the camshaft position sensor, crankshaft position sensor.**

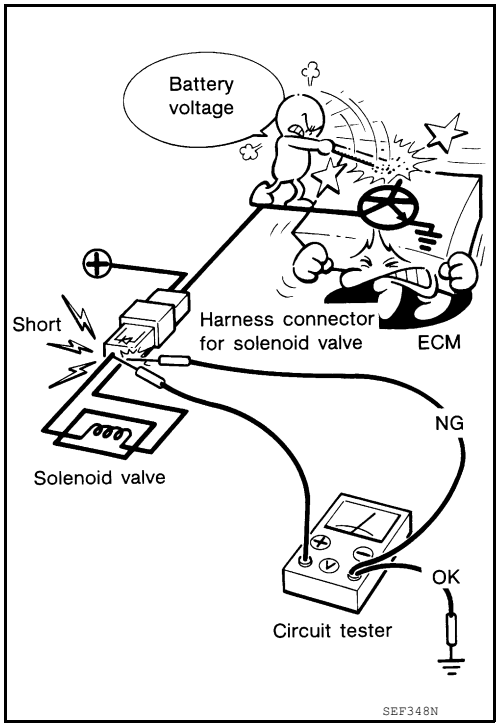




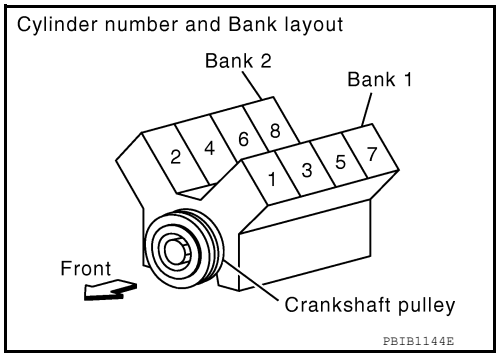
- **After performing each TROUBLE DIAGNOSIS, perform DTC Confirmation Procedure or Component Function Check.**
  The DTC should not be displayed in the DTC Confirmation Procedure if the repair is completed. The Component Function Check should be a good result if the repair is completed.



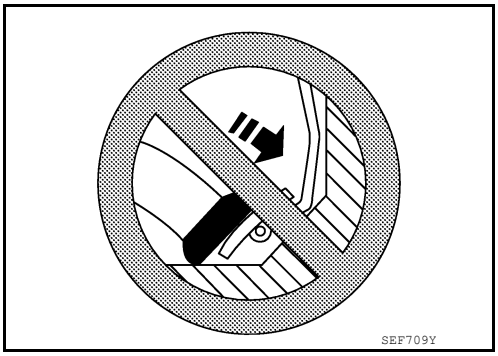
- **When measuring ECM signals with a circuit tester, never allow the two tester probes to contact.**
  Accidental contact of probes will cause a short circuit and damage the ECM power transistor.



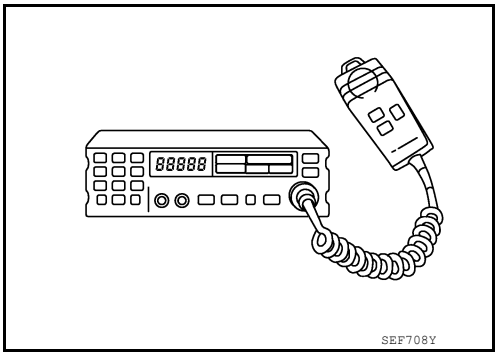
- **B1 indicates bank 1, B2 indicates bank 2 as shown in the figure.**
- **Never operate fuel pump when there is no fuel in lines.**
- **Tighten fuel hose clamps to the specified torque.**



- **Never depress accelerator pedal when starting.**
- **Immediately after starting, never rev up engine unnecessarily.**
- **Never rev up engine just prior to shutdown.**



- **When installing C.B. ham radio or a mobile phone, be sure to observe the following as it may adversely affect electronic control systems depending on installation location.**
  - **Keep the antenna as far as possible from the electronic control units.**
  - **Keep the antenna feeder line more than 20 cm (8 in) away from the harness of electronic controls.**
    Never let them run parallel for a long distance.
  - **Adjust the antenna and feeder line so that the standing-wave ratio can be kept smaller.**
  - **Be sure to ground the radio to vehicle body.**



PREPARATION

PREPARATION

Special Service Tools

INFOID:0000000013798045

Tool number (TechMate No.) Tool name	Description
KV10118400 (—) Fuel tube adapter  PBIB3043E	Measures fuel pressure

Commercial Service Tools

INFOID:0000000013798046

Tool name (TechMate No.)	Description
Leak detector i.e.: (J-41416)  S-NT703	Locates the EVAP leak
EVAP service port adapter i.e.: (J-41413-OBD)  S-NT704	Applies positive pressure through EVAP service port
Fuel filler cap adapter i.e.: (J-42909)  ALBIA1353ZZ	Checks fuel tank vacuum relief valve opening pressure
Socket wrench  S-NT705	Removes and installs engine coolant temperature sensor

Tool name (TechMate No.)		Description
Oxygen sensor thread cleaner i.e.: (J-43897-18) (J-43897-12)		Reconditions the exhaust system threads before installing a new oxygen sensor. Use with anti-seize lubricant shown below. **a: 18 mm diameter with pitch 1.5 mm for Zirconia Oxygen Sensor** **b: 12 mm diameter with pitch 1.25 mm for Titania Oxygen Sensor**
Anti-seize lubricant i.e.: (Permatex™ 133AR or equivalent meeting MIL specification MIL-A-907)		Lubricates oxygen sensor thread cleaning tool when reconditioning exhaust system threads.

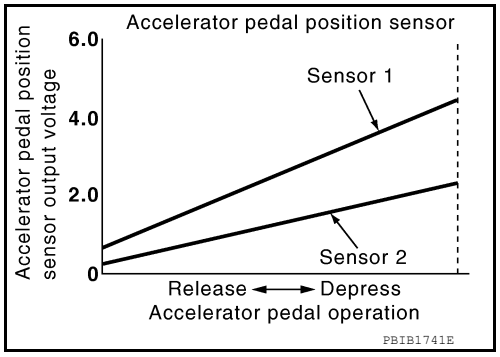
Accelerator Pedal Position Sensor

INFOID:0000000013798049

The accelerator pedal position (APP) sensor is installed on the accelerator pedal assembly. The sensor detects the accelerator position and sends a signal to the ECM.
Accelerator pedal position sensor has two sensors. These sensors are a kind of potentiometer which transform the accelerator pedal position into output voltage, and emit the voltage signals to the ECM. The ECM judges the current opening angle of the accelerator pedal from these signals and controls the throttle control motor based on these signals.
Idle position of the accelerator pedal is determined by the ECM receiving the signal from the accelerator pedal position sensor. The ECM uses this signal for engine operations such as fuel cut.

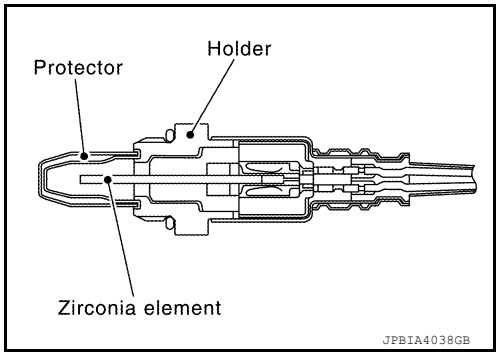


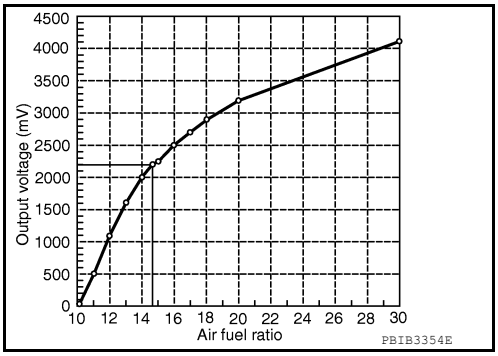
Air Fuel Ratio (A/F) Sensor 1

INFOID:0000000013798050

Description

The A/F sensor 1 is mounted on the exhaust manifold, and transmits the signal of detected oxygen concentration in the exhaust gas to ECM.
While O2 sensor changes output voltage by ON/OFF (rich/lean) mode within a narrow range of the stoichiometric ratio, the A/F sensor changes output voltage between 0 - 4 V for a wide range of air fuel ratio.
ECM judges the state of air fuel ratio with this signal, and precisely controls air fuel ratio to match the stoichiometric ratio.Also, the sensor is equiped with heater for maintaining the activated state.





A/F SENSOR 1 HEATER

A/F sensor 1 heater is integrated in the sensor.
The ECM performs ON/OFF duty control of the A/F sensor 1 heater corresponding to the engine operating condition to keep the temperature of A/F sensor 1 element within the specified range.

ASCD Indicators

INFOID:0000000013798052

ASCD operation status is indicated by CRUISE indicator in combination meter.
ECM transmits the ASCD status signal to the combination meter via CAN communication according to ASCD operation.

ASCD Steering Switch

INFOID:0000000013798053

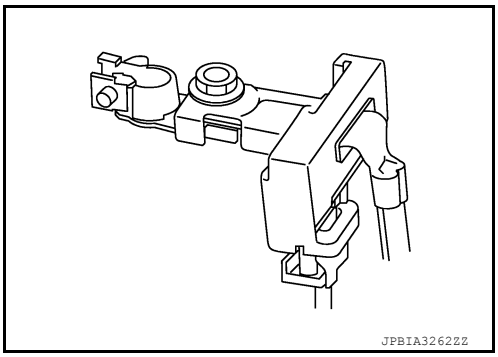
ASCD steering switch has variant values of electrical resistance for each button. ECM reads voltage variation of switch, and determines which button is operated.

Battery Current Sensor (With Battery Temperature Sensor)

INFOID:0000000013798054

OUTLINE

The power generation voltage variable control enables fuel consumption to be decreased by reducing the engine load which is caused by the power generation of the generator.
Based on sensor signals, ECM judges whether or not the power generation voltage variable control is performed. When performing the power generation voltage variable control, ECM calculates the target power generation voltage based on the sensor signal. And ECM sends the calculated value as the power generation command value to IPDM E/R. For the details of the power generation voltage variable control, refer to CHG-10, "CHARGING SYSTEM : System Description- with VK56VD".



CAUTION:
Never connect the electrical component or the ground wire directly to the battery terminal. The connection causes the malfunction of the power generation voltage variable control, and then the battery discharge may occur.

BATTERY CURRENT SENSOR

The battery current sensor is installed to the battery cable at the negative terminal. The sensor measures the charging/discharging current of the battery.

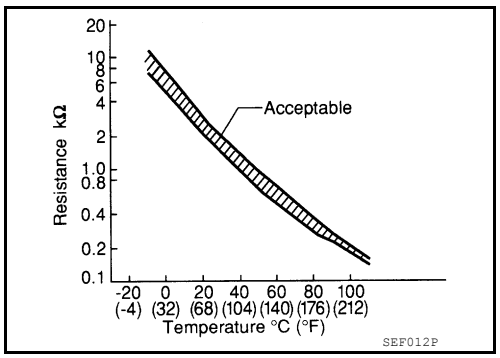
BATTERY TEMPERATURE SENSOR

Battery temperature sensor is integrated in battery current sensor.
The sensor measures ambient temperature around the battery.
The electrical resistance of the thermistor decreases as temperature increases.

<Reference data>

Temperature [°C (°F)]	Voltage* (V)	Resistance (kΩ)
25 (77)	3.333	1.9 - 2.1
90 (194)	0.969	0.222 - 0.258

*: These data are reference values and are measured between ECM terminals.



Brake Pedal Position Switch & Stop Lamp Switch

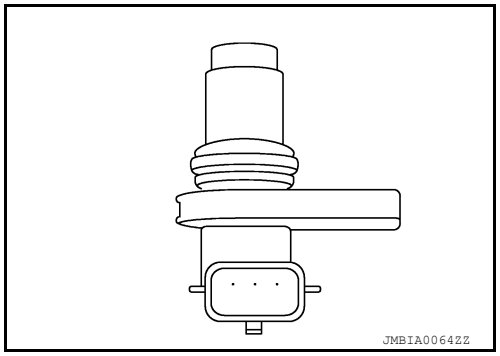
INFOID:0000000013798051

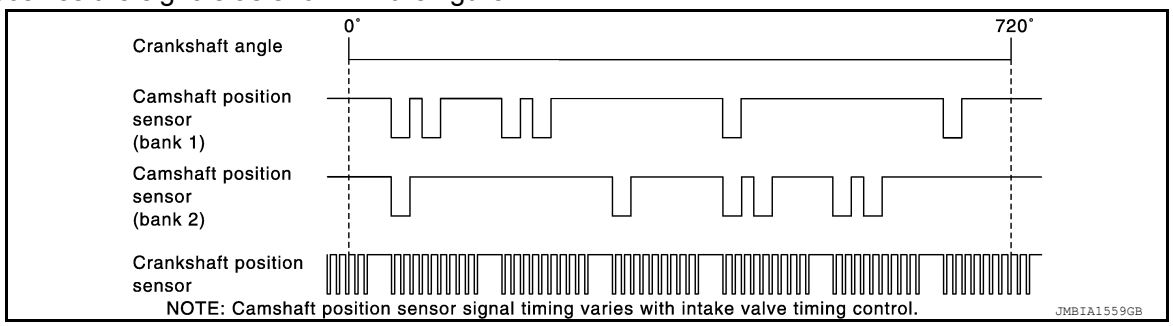
Stop lamp switch and brake pedal position switch are installed to brake pedal bracket.
When the brake pedal is depressed, brake pedal position switch is turned OFF and stop lamp switch is turned ON.
ECM detects the state of the brake pedal by those two types of input (ON/OFF signal).

Camshaft Position Sensor

INFOID:0000000013798055

The camshaft position (CMP) sensor senses the protrusion of the signal plate installed to the camshaft (INT) front end to identify a particular cylinder. The camshaft position sensor senses the piston position.
The sensor consists of a permanent magnet and Hall IC.
When engine is running, the high and low parts of the teeth cause the gap with the sensor to change.
The changing gap causes the magnetic field near the sensor to change.
Due to the changing magnetic field, the voltage from the sensor changes.
When the crankshaft position sensor system becomes inoperative, the camshaft position sensor provides various controls of engine parts instead, utilizing timing of cylinder identification signals.
ECM receives the signals as shown in the figure.

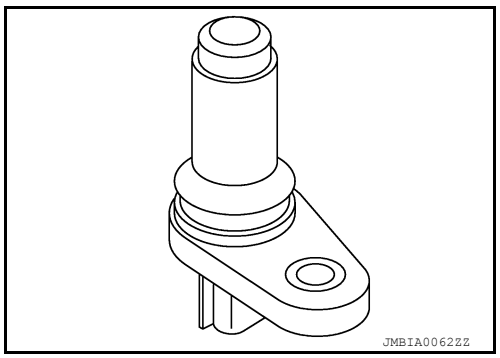




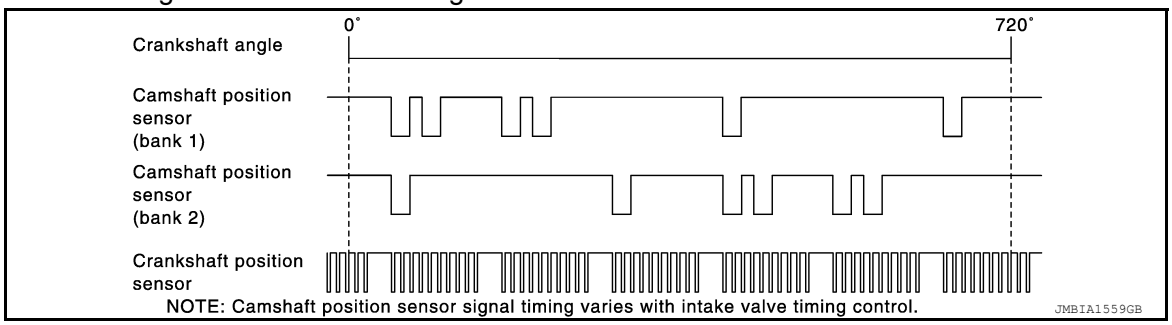
Crankshaft Position Sensor

INFOID:0000000013798056

The crankshaft position (CKP) sensor senses the protrusion of the signal plate installed to the drive plate to identify fluctuation of the engine revolution.
The sensor consists of a permanent magnet and Hall IC.
When the engine is running, the high and low parts of the teeth cause the gap with the sensor to change.
The changing gap causes the magnetic field near the sensor to change.
Due to the changing magnetic field, the voltage from the sensor changes.
The ECM receives the voltage signal and detects the fluctuation of the engine revolution.



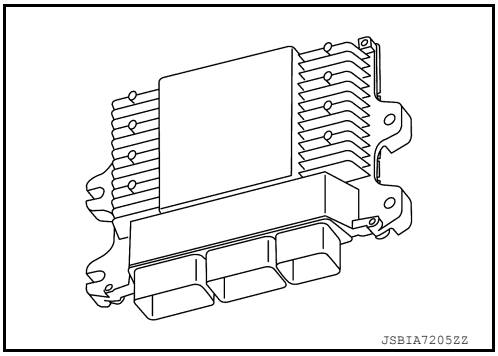
ECM receives the signals as shown in the figure.



ECM

INFOID:0000000013798057

- ECM (Engine Control Module) controls the engine.
- The ECM consists of a microcomputer and connectors for transmitting/receiving signals and for supplying power. Furthermore, the ECM is equipped with an injector driver unit and actuates the fuel injector at a high voltage (approximately 70 V at the maximum).
- ECM is equipped with ECM temperature sensors. If ECM is overheated, ECM controls output torque to prevent damage to itself.
- Battery voltage is supplied to the ECM even when the ignition switch is turned OFF for the ECM memory function of the DTC memory, the air-fuel ratio feedback compensation value memory, the idle air volume learning value memory, etc.

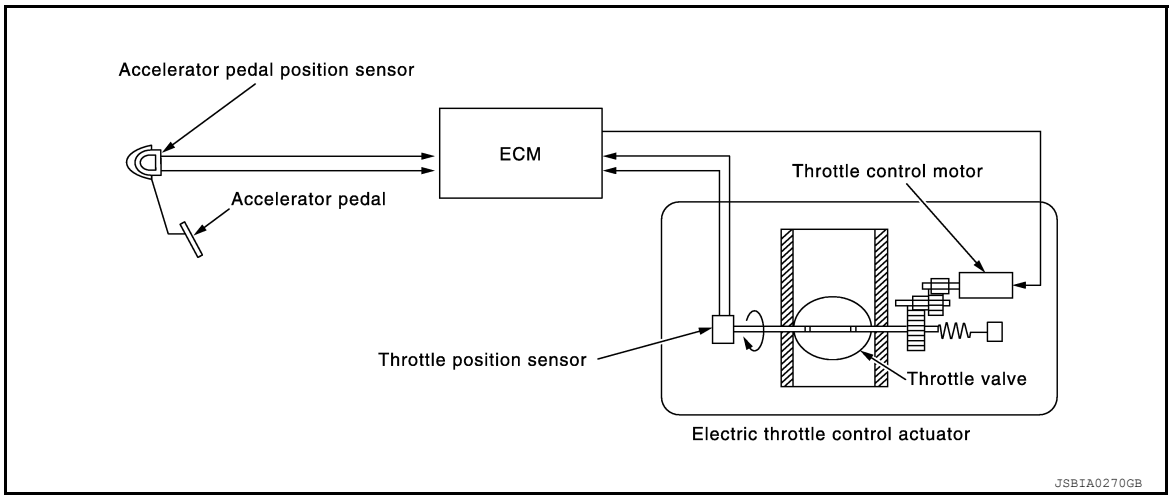


Electric Throttle Control Actuator

INFOID:0000000013798058

OUTLINE

Electric throttle control actuator consists of throttle body, throttle valve, throttle control motor and throttle position sensor.

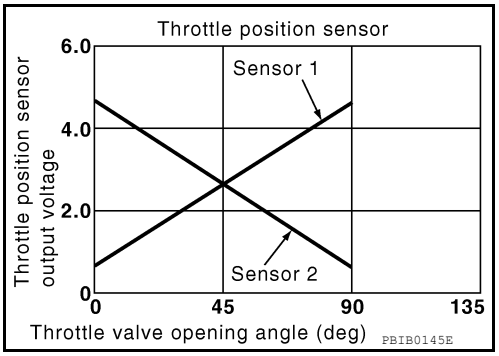


THROTTLE CONTROL MOTOR

The throttle control motor is operated by the ECM and it opens and closes the throttle valve.
The current opening angle of the throttle valve is detected by the throttle position sensor. The throttle position sensor provides feedback to the ECM, when opens/closes the throttle valve in response to driving conditions via the throttle control motor.

THROTTLE POSITION SENSOR

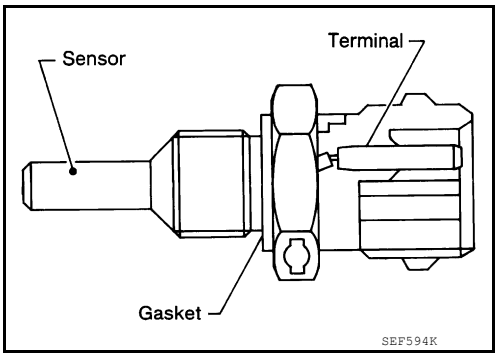
The throttle position (TP) sensor responds to the throttle valve movement.
The throttle position sensor has two sensors. These sensors are a kind of potentiometer which transform the throttle valve position into output voltage, and emit the voltage signal to the ECM. The ECM judges the current opening angle of the throttle valve from these signals and controls the throttle valve opening angle in response to driving conditions via the throttle control motor.



Engine Coolant Temperature Sensor 1

INFOID:0000000013798060

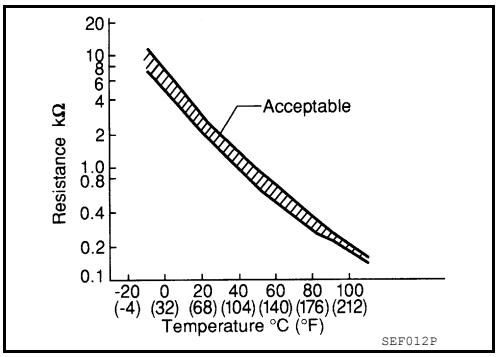
The engine coolant temperature (ECT) sensor 1 is used to detect the engine coolant temperature. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the engine coolant temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.



<Reference data>

Engine coolant temperature [°C (°F)]	Voltage* (V)	Resistance (kΩ)
−10 (14)	4.4	7.0 - 11.4
20 (68)	3.5	2.35 - 2.73
50 (122)	2.2	0.68 - 1.00
90 (194)	1.0	0.236 - 0.260

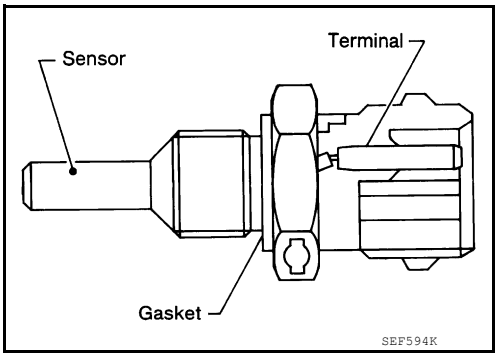
*: These data are reference values and are measured between ECM terminals.



Engine Coolant Temperature Sensor 2

INFOID:0000000013798061

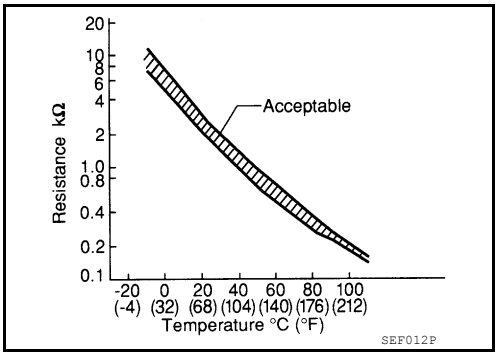
The engine coolant temperature (ECT) sensor 2 is used to detect the engine coolant temperature. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the engine coolant temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.



<Reference data>

Engine coolant temperature [°C (°F)]	Voltage* (V)	Resistance (kΩ)
−10 (14)	4.4	7.0 - 11.4
20 (68)	3.5	2.35 - 2.73
50 (122)	2.2	0.68 - 1.00
90 (194)	1.0	0.236 - 0.260

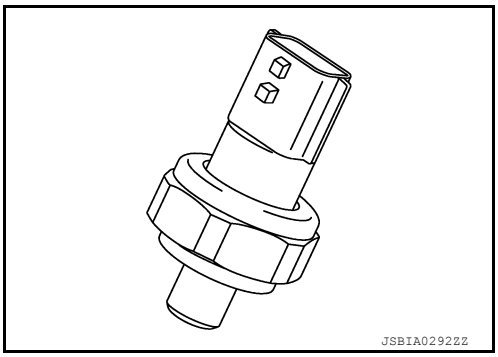
*: These data are reference values and are measured between ECM terminals.



Engine Oil Pressure Sensor

INFOID:0000000013798062

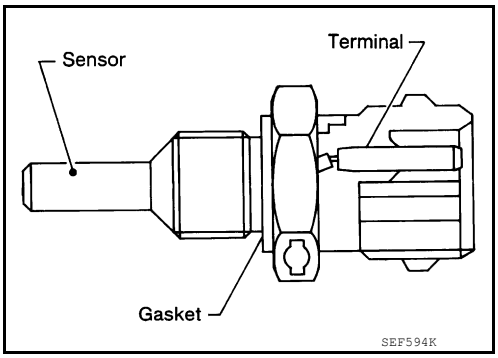
The engine oil pressure (EOP) sensor is detects engine oil pressure and transmits a voltage signal to the ECM.



Engine Oil Temperature Sensor

INFOID:0000000013798063

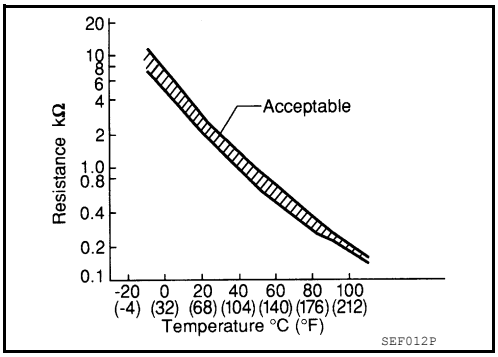
The engine oil temperature sensor is used to detect the engine oil temperature. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the engine oil temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.



<Reference data>

Engine oil temperature [°C (°F)]	Voltage* (V)	Resistance (kΩ)
–10 (14)	4.4	7.0 - 11.4
20 (68)	3.5	2.35 - 2.73
50 (122)	2.2	0.68 - 1.00
90 (194)	0.9	0.236 - 0.260
110 (230)	0.6	0.143 - 0.153

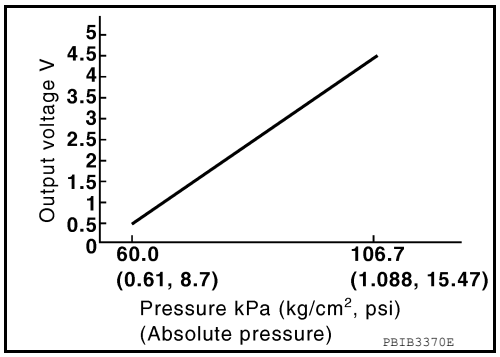
*: These data are reference values and are measured between ECM terminals.



EVAP Control System Pressure Sensor

INFOID:0000000013798064

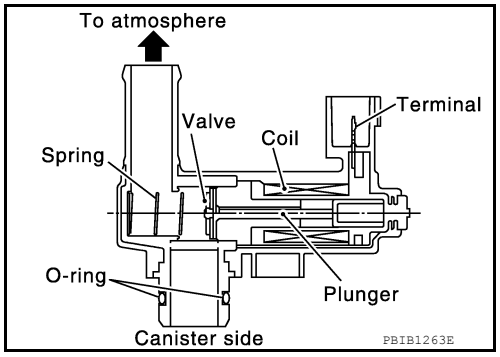
The EVAP control system pressure sensor detects pressure in the purge line. The sensor output voltage to the ECM increases as pressure increases.



EVAP Canister Vent Control Valve

INFOID:0000000013798065

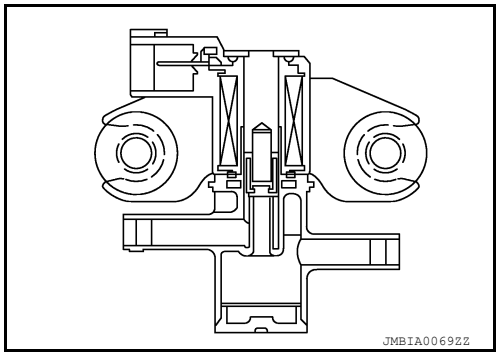
The EVAP canister vent control valve is located on the EVAP canister and is used to seal the canister vent.
This solenoid valve responds to signals from the ECM. When the ECM sends an ON signal, the coil in the solenoid valve is energized. A plunger will then move to seal the canister vent. The ability to seal the vent is necessary for the on board diagnosis of other evaporative emission control system components.
This solenoid valve is used only for diagnosis, and usually remains opened.
When the vent is closed, under normal purge conditions, the evaporative emission control system is depressurized and allows “EVAP Control System” diagnosis.



EVAP Canister Purge Volume Control Solenoid Valve

INFOID:0000000013798066

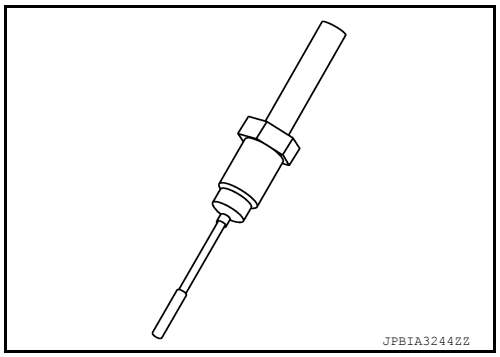
The EVAP canister purge volume control solenoid valve is used to control the flow rate of fuel vapor from the EVAP canister. The EVAP canister purge volume control solenoid valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of fuel vapor that will flow through the valve.



Exhaust Gas Temperature Sensor

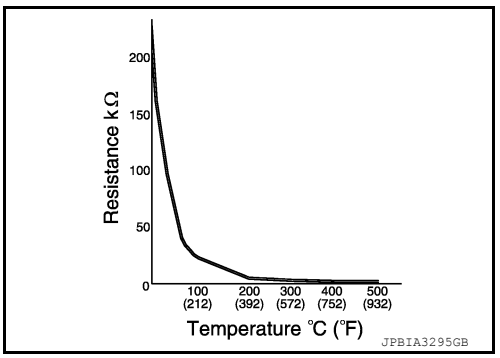
INFOID:0000000013798067

Exhaust gas temperature sensor (EGT sensor) is installed exhaust manifold. Exhaust gas temperature sensor uses a thermistor which is sensitive to the change in temperature. Electrical resistance of the thermistor decreases in response to the temperature rises.



<Reference data>

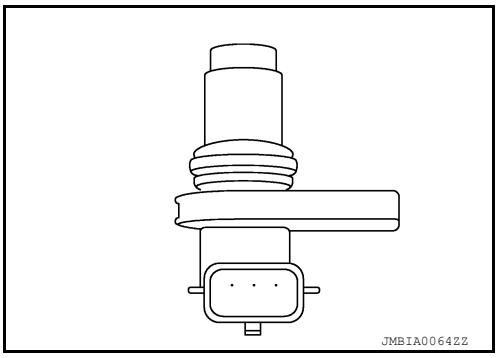
Exhaust gas temperature	Voltage	Resistance
100°C (212°F)	4.74 V	18.25 kΩ
200°C (392°F)	4.00 V	4.00 kΩ
400°C (752°F)	1.96 V	0.64 kΩ
600°C (1112°F)	0.85 V	0.20 kΩ



Exhaust Valve Timing Control Position Sensor

INFOID:0000000013798068

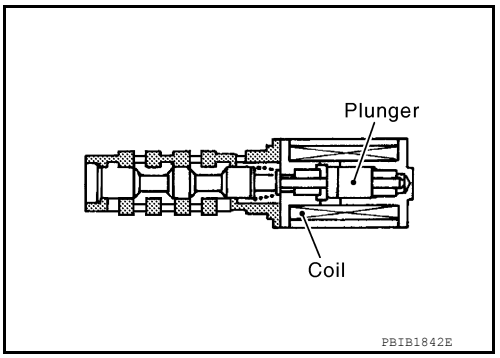
Exhaust valve timing control position sensor detects the protrusion of the signal plate installed to the exhaust camshaft front end.
This sensor signal is used for sensing a position of the exhaust camshaft.
This sensor uses a Hall IC.
Based on the position of the exhaust camshaft, ECM controls exhaust valve timing control solenoid valve to optimize the shut/open timing of exhaust valve for the driving condition.



Exhaust Valve Timing Control Solenoid Valve

INFOID:0000000013798069

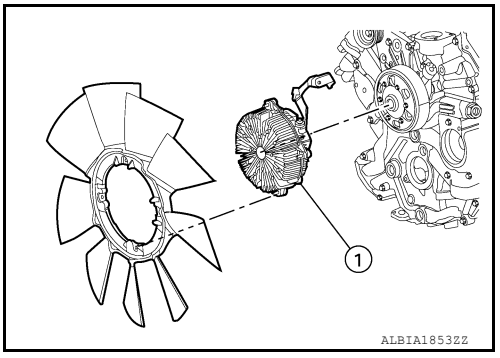
Exhaust valve timing control solenoid valve is activated by ON/OFF pulse duty (ratio) signals from the ECM.
The exhaust valve timing control solenoid valve changes the oil amount and direction of flow through exhaust valve timing control unit or stops oil flow.
The longer pulse width retards valve angle.
The shorter pulse width advances valve angle.
When ON and OFF pulse widths become equal, the solenoid valve stops oil pressure flow to fix the exhaust valve angle at the control position.



Fan Clutch Assembly

INFOID:0000000013927733

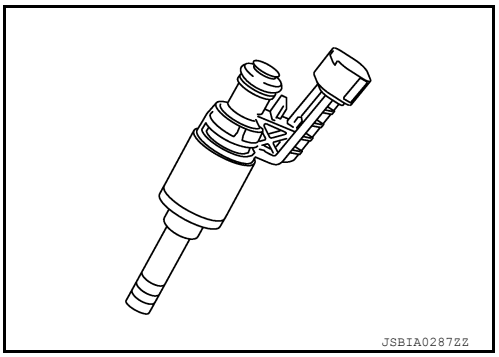
- A cooling fan clutch (1) is utilized to control cooling fan operation. This fan clutch is controlled by the ECM. The ECM monitors coolant temperature and intake manifold temperature to determine when to engage the cooling fan. There are also additional sensors monitored by the ECM for fan control (for example, air conditioner pressure). The fan clutch is an electro-viscous fan clutch.



Fuel Injector

INFOID:0000000013798070

For the fuel injector, a high pressure fuel injector is used and this enables a high-pressure fuel injection at a high voltage within a short time. The ECM is equipped with an injector driver unit and actuates the fuel injector at a high voltage (approximately 65 V at the maximum).



Fuel Level Sensor

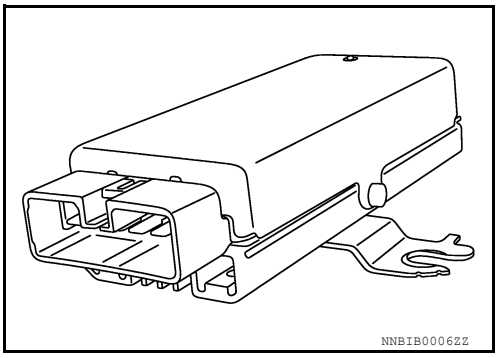
INFOID:0000000013798071

The fuel level sensor is mounted in the fuel level sensor unit.
The sensor detects a fuel level in the fuel tank and transmits a signal to the combination meter. The combination meter sends the fuel level sensor signal to the ECM via the CAN communication line.
It consists of two parts, one is mechanical float and the other is variable resistor. Fuel level sensor output voltage changes depending on the movement of the fuel mechanical float.

Fuel Pump Control Module

INFOID:0000000013798072

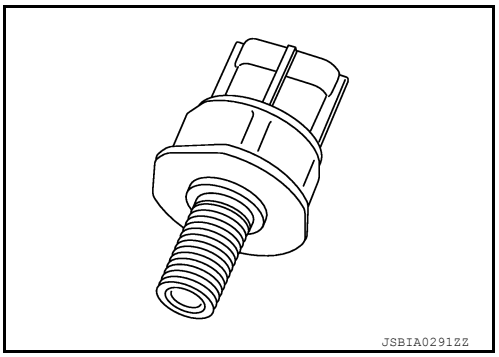
The fuel pump control module (FPCM) controls the discharging volume of the fuel pump by transmitting the FPCM control signals (Low/Mid/High) depending on driving conditions.



Fuel Rail Pressure Sensor

INFOID:0000000013798073

The fuel rail pressure (FRP) sensor is placed to the fuel rail and measures fuel pressure in the fuel rail. The sensor transmits voltage signal to the ECM. As the pressure increases, the voltage rises. The ECM controls the fuel pressure in the fuel rail by operating high pressure fuel pump. The ECM uses the signal from fuel rail pressure sensor as a feedback signal.

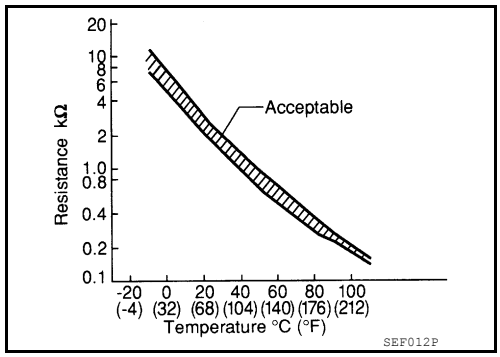


Fuel Tank Temperature Sensor

INFOID:0000000013798074

The fuel tank temperature sensor is used to detect the fuel temperature inside the fuel tank. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the fuel temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

<Reference data>



Fuel temperature [°C (°F)]	Voltage* (V)	Resistance (kΩ)
20 (68)	3.5	2.3 - 2.7
50 (122)	2.2	0.79 - 0.90

*: These data are reference values and are measured between ECM terminals.

Heated Oxygen Sensor 2

INFOID:0000000013798075

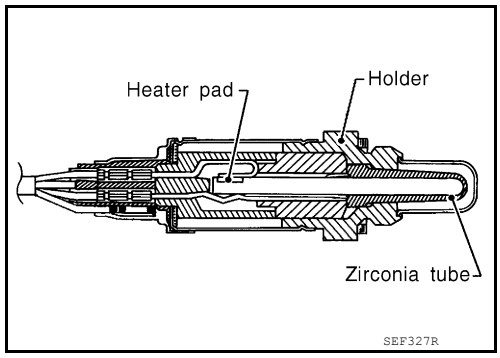
DESCRIPTION

The heated oxygen sensor 2, after three way catalyst (manifold), monitors the oxygen level in the exhaust gas on each bank.

Even if switching characteristics of the air fuel ratio (A/F) sensor 1 are shifted, the air fuel ratio is controlled to stoichiometric, by the signal from the heated oxygen sensor 2.

This sensor is made of ceramic zirconia. The zirconia generates voltage from approximately 1 V in richer conditions to 0 V in leaner conditions.

Under normal conditions the heated oxygen sensor 2 is not used for engine control operation.



HEATED OXYGEN SENSOR 2 HEATER

Heated oxygen sensor 2 heater is integrated in the sensor.

The ECM performs ON/OFF control of the heated oxygen sensor 2 heater corresponding to the engine speed, amount of intake air and engine coolant temperature.

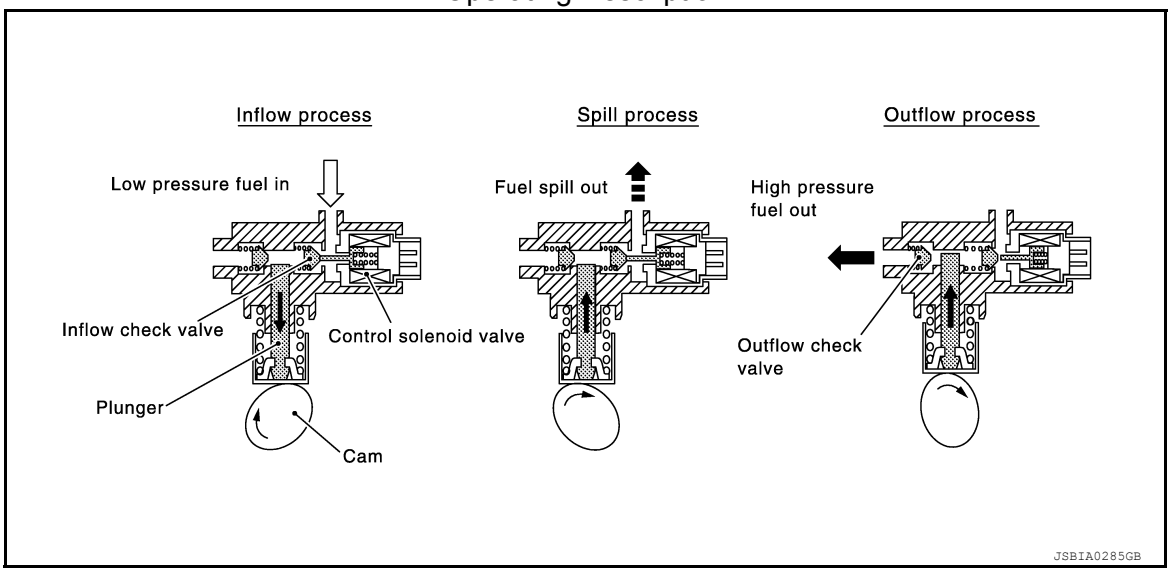
Engine speed	Heated oxygen sensor 2 heater
Above 3,600 rpm	OFF
Below 3,600 rpm after the following conditions are met. • Engine: After warming up • Keeping the engine speed between 3,500 and 4,000 rpm for 1 minute and at idle for 1 minute under no load	ON

High Pressure Fuel Pump

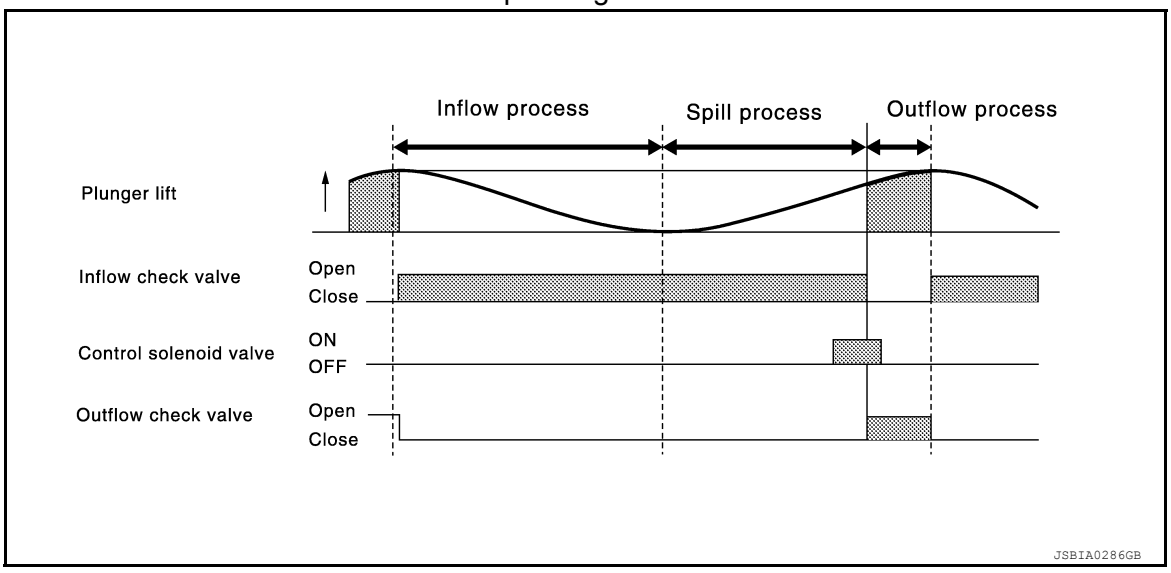
INFOID:0000000013798076

The high pressure fuel pump is installed at the front of the engine bank 2 side and activated by the camshaft. ECM controls the high pressure fuel pump control solenoid valve built into the high pressure fuel pump and adjusts the amount of discharge by changing the suction timing of the low pressure fuel.

Operating Description



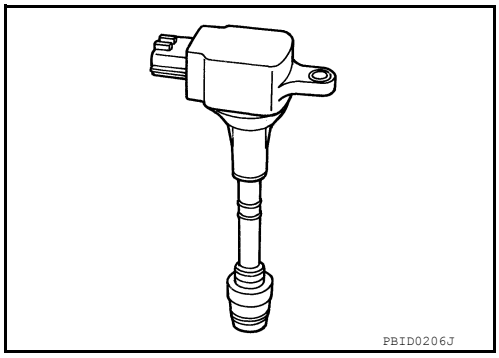
Operating Chart



Ignition Coil With Power Transistor

INFOID:0000000013798079

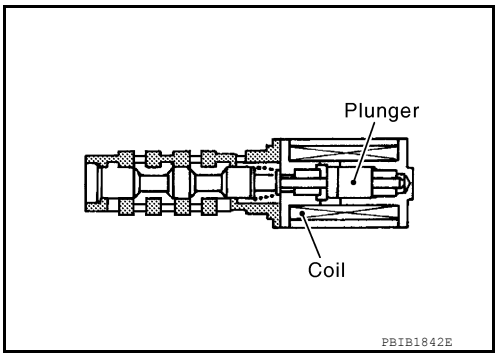
The ignition signal from the ECM is sent to and amplified by the power transistor. The power transistor turns ON and OFF the ignition coil primary circuit. This ON/OFF operation induces the proper high voltage in the coil secondary circuit.



Intake Valve Timing Control Solenoid Valve

INFOID:0000000013798080

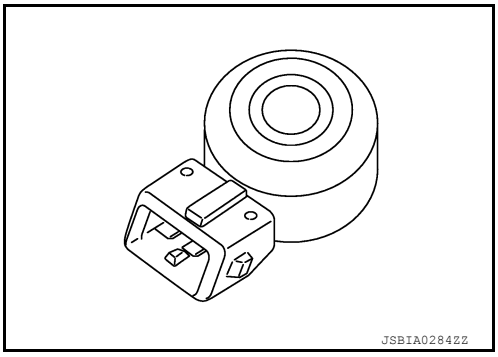
Intake valve timing control solenoid valve is activated by ON/OFF pulse duty (ratio) signals from the ECM.
The intake valve timing control solenoid valve changes the oil amount and direction of flow through intake valve timing control unit or stops oil flow.
The longer pulse width advances valve angle.
The shorter pulse width retards valve angle.
When ON and OFF pulse widths become equal, the solenoid valve stops oil pressure flow to fix the intake valve angle at the control position.



Knock Sensor

INFOID:0000000013798081

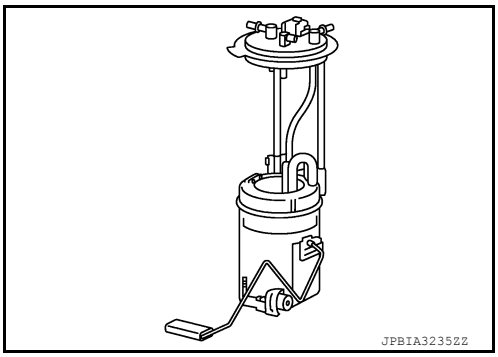
The knock sensor is attached to the cylinder block. It senses engine knocking using a piezoelectric element. A knocking vibration from the cylinder block is sensed as vibrational pressure. This pressure is converted into a voltage signal and sent to the ECM.



Low Pressure Fuel Pump

INFOID:0000000013798082

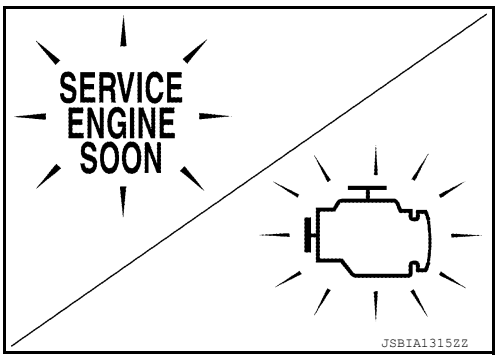
The low pressure fuel pump is integrated with a fuel pressure regulator and a fuel filter. This pump is build into the fuel tank.
ECM controls the low pressure fuel pump via FPCM.



Malfunction Indicator Lamp (MIL)

INFOID:0000000013798083

The Malfunction Indicator Lamp (MIL) is located on the combination meter.
The MIL will illuminate when the ignition switch is turned ON without the engine running. This is a bulb check.
When the engine is started, the MIL should turn off. If the MIL remains illuminated, the on board diagnostic system has detected an engine system malfunction.
For details, refer to EC-1314, "Diagnosis Description".

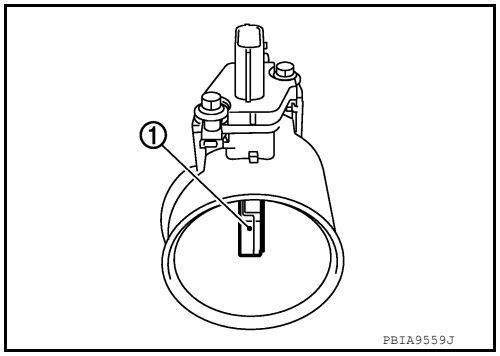


Mass Air Flow Sensor (With Intake Air Temperature Sensor)

INFOID:0000000013798084

MASS AIR FLOW SENSOR

The mass air flow (MAF) sensor (1) is placed in the stream of intake air. It measures the intake flow rate by measuring a part of the entire intake flow. The mass air flow sensor controls the temperature of the hot wire to a certain amount. The heat generated by the hot wire is reduced as the intake air flows around it. The greater air flow, the greater the heat loss.
Therefore, the electric current supplied to hot wire is changed to maintain the temperature of the hot wire as air flow increases. The ECM detects the air flow by means of this current change.



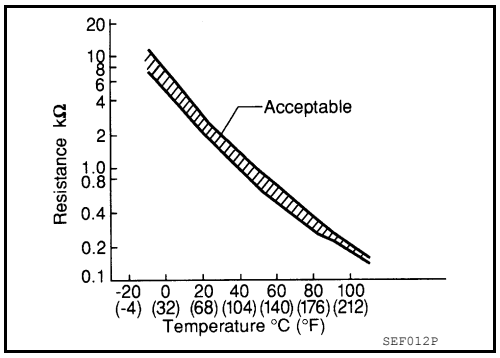
INTAKE AIR TEMPERATURE SENSOR

The intake air temperature (IAT) sensor is built-into the mass air flow sensor. The sensor detects intake air temperature and transmits a signal to the ECM.
The temperature sensing unit uses a thermistor which is sensitive to the change in temperature. Electrical resistance of the thermistor decreases in response to the rise in temperature.

<Reference data>

Intake air temperature [°C (°F)]	Voltage* (V)	Resistance (kΩ)
25 (77)	3.3	1.94 - 2.06
80 (176)	1.2	0.293 - 0.349

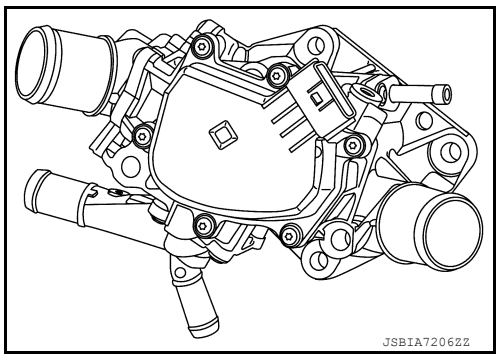
*: These data are reference values and are measured between ECM terminals.



Multi-way Control Valve

INFOID:0000000013798085

The multi-way control valve changes flow paths to Heater, Oil cooler, and Radiator, according to coolant temperature and driving conditions.



Power Steering Pressure (PSP) Sensor

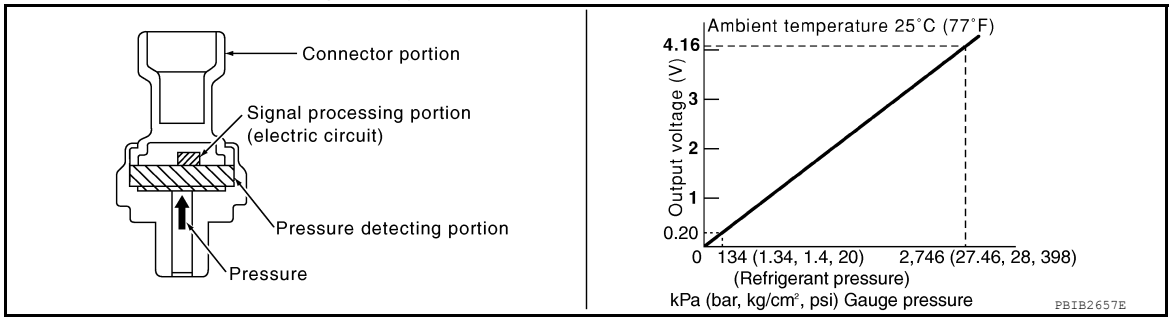
INFOID:0000000013798086

Power steering pressure (PSP) sensor is installed to the power steering high-pressure tube and detects a power steering load.
This sensor is a potentiometer which transforms the power steering load into output voltage, and emits the voltage signal to the ECM. The ECM controls the electric throttle control actuator and adjusts the throttle valve opening angle to increase the engine speed and adjusts the idle speed for the increased load.

Refrigerant Pressure Sensor

INFOID:0000000013798087

The refrigerant pressure sensor is installed at the condenser of the air conditioner system. The sensor uses an electrostatic volume pressure transducer to convert refrigerant pressure to voltage. The voltage signal is sent to ECM, and ECM controls cooling fan system.



VVEL Actuator Motor

INFOID:0000000013798088

The VVEL actuator motor rotates the control shaft according to the control signal from the VVEL control module. The VVEL control module judges whether the VVEL actuator motor controls the angle properly by the VVEL control shaft position sensor signal.

VVEL Actuator Motor Relay

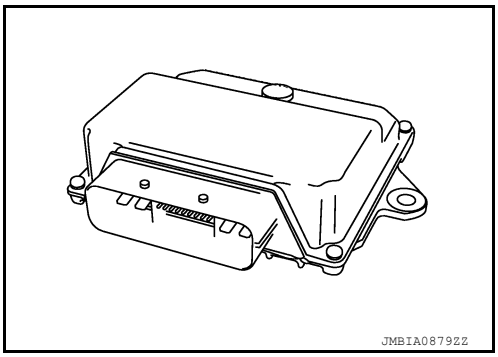
INFOID:0000000013798089

Power supply for the VVEL actuator motor is provided to the VVEL control module via VVEL actuator motor relay. VVEL actuator motor relay is ON/OFF controlled by the VVEL control module. In addition, when the VVEL actuator motor relay cannot be controlled by the VVEL control module for some reason, it ON/OFF controlled by ECM.

VVEL Control Module

INFOID:0000000013798090

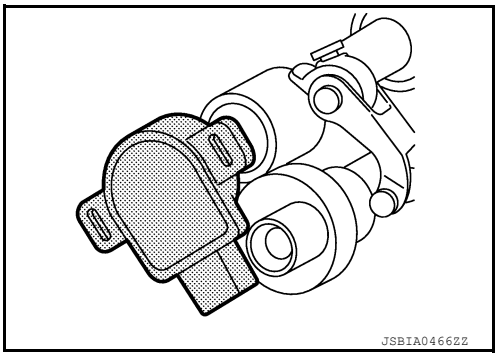
The VVEL control module consists of a microcomputer and connectors for signal input and output and for power supply. The VVEL control module controls VVEL system.



VVEL Control Shaft Position Sensor

INFOID:0000000013798091

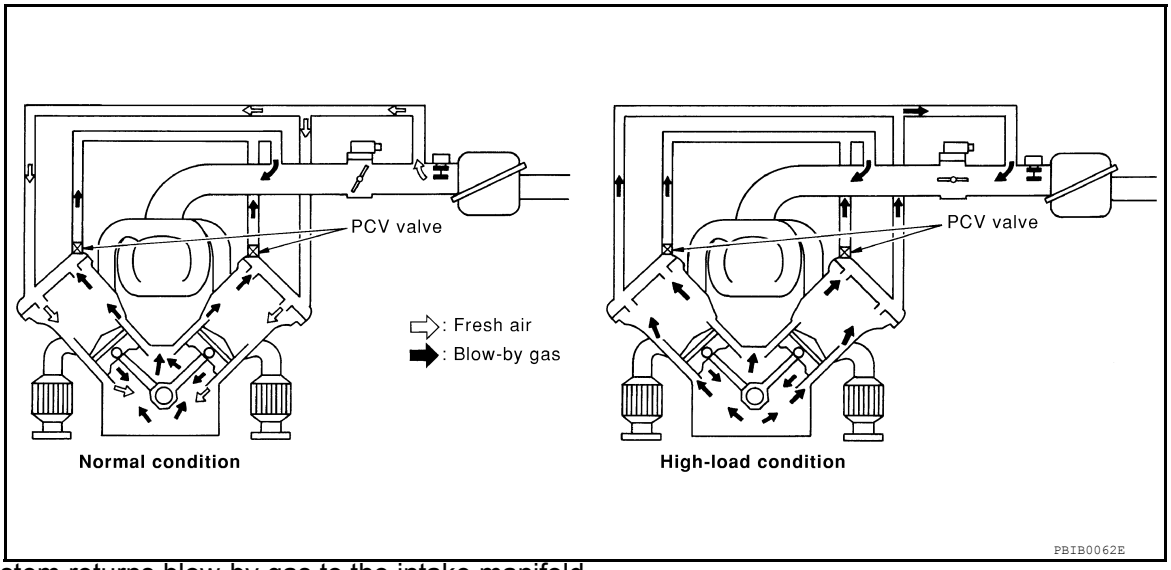
VVEL control shaft position sensor detects the control shaft position angle.
A magnet is installed to the tip of the control shaft.
The magnetic field changes as the control shaft rotates. This changes output voltage of the VVEL control shaft position sensor.
VVEL control module detects the actual position angle through the voltage change and sends the signal to ECM.



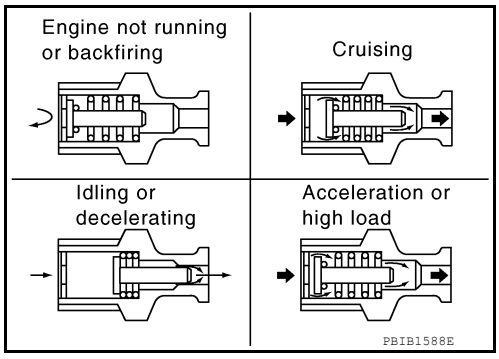
STRUCTURE AND OPERATION

Positive Crankcase Ventilation

INFOID:0000000013798092

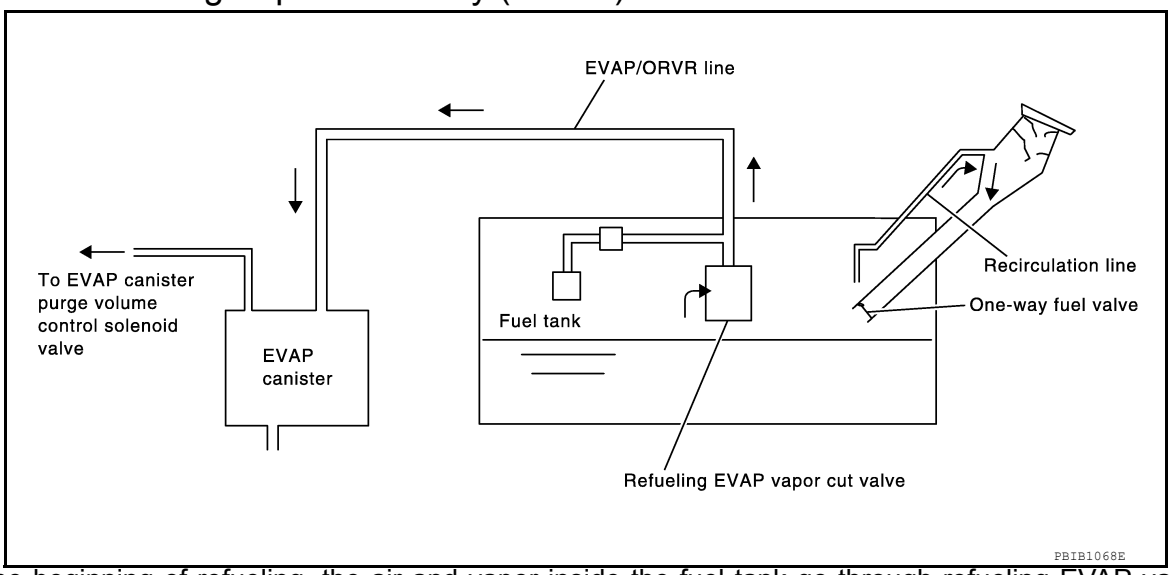


This system returns blow-by gas to the intake manifold.
The positive crankcase ventilation (PCV) valve is provided to conduct crankcase blow-by gas to the intake manifold.
During partial throttle operation of the engine, the intake manifold sucks the blow-by gas through the PCV valve.
Normally, the capacity of the valve is sufficient to handle any blow-by and a small amount of ventilating air.
The ventilating air is drawn from the air inlet tubes into the crankcase. In this process the air passes through the hose connecting air inlet tubes to rocker cover.
Under full-throttle condition, the manifold vacuum is insufficient to draw the blow-by flow through the valve. The flow goes through the hose connection in the reverse direction.
On vehicles with an excessively high blow-by, the valve does not meet the requirement. This is because some of the flow will go through the hose connection to the air inlet tubes under all conditions.



On Board Refueling Vapor Recovery (ORVR)

INFOID:0000000013798093



From the beginning of refueling, the air and vapor inside the fuel tank go through refueling EVAP vapor cut valve and EVAP/ORVR line to the EVAP canister. The vapor is absorbed by the EVAP canister and the air is released to the atmosphere.

When the refueling has reached the full level of the fuel tank, the refueling EVAP vapor cut valve is closed and refueling is stopped because of auto shut-off. The vapor which was absorbed by the EVAP canister is purged during driving.

WARNING:

When conducting inspections below, be sure to observe the following:

- **Put a "CAUTION: FLAMMABLE" sign in workshop.**
- **Never smoke while servicing fuel system. Keep open flames and sparks away from work area.**
- **Always furnish the workshop with a CO_2 fire extinguisher.**

CAUTION:

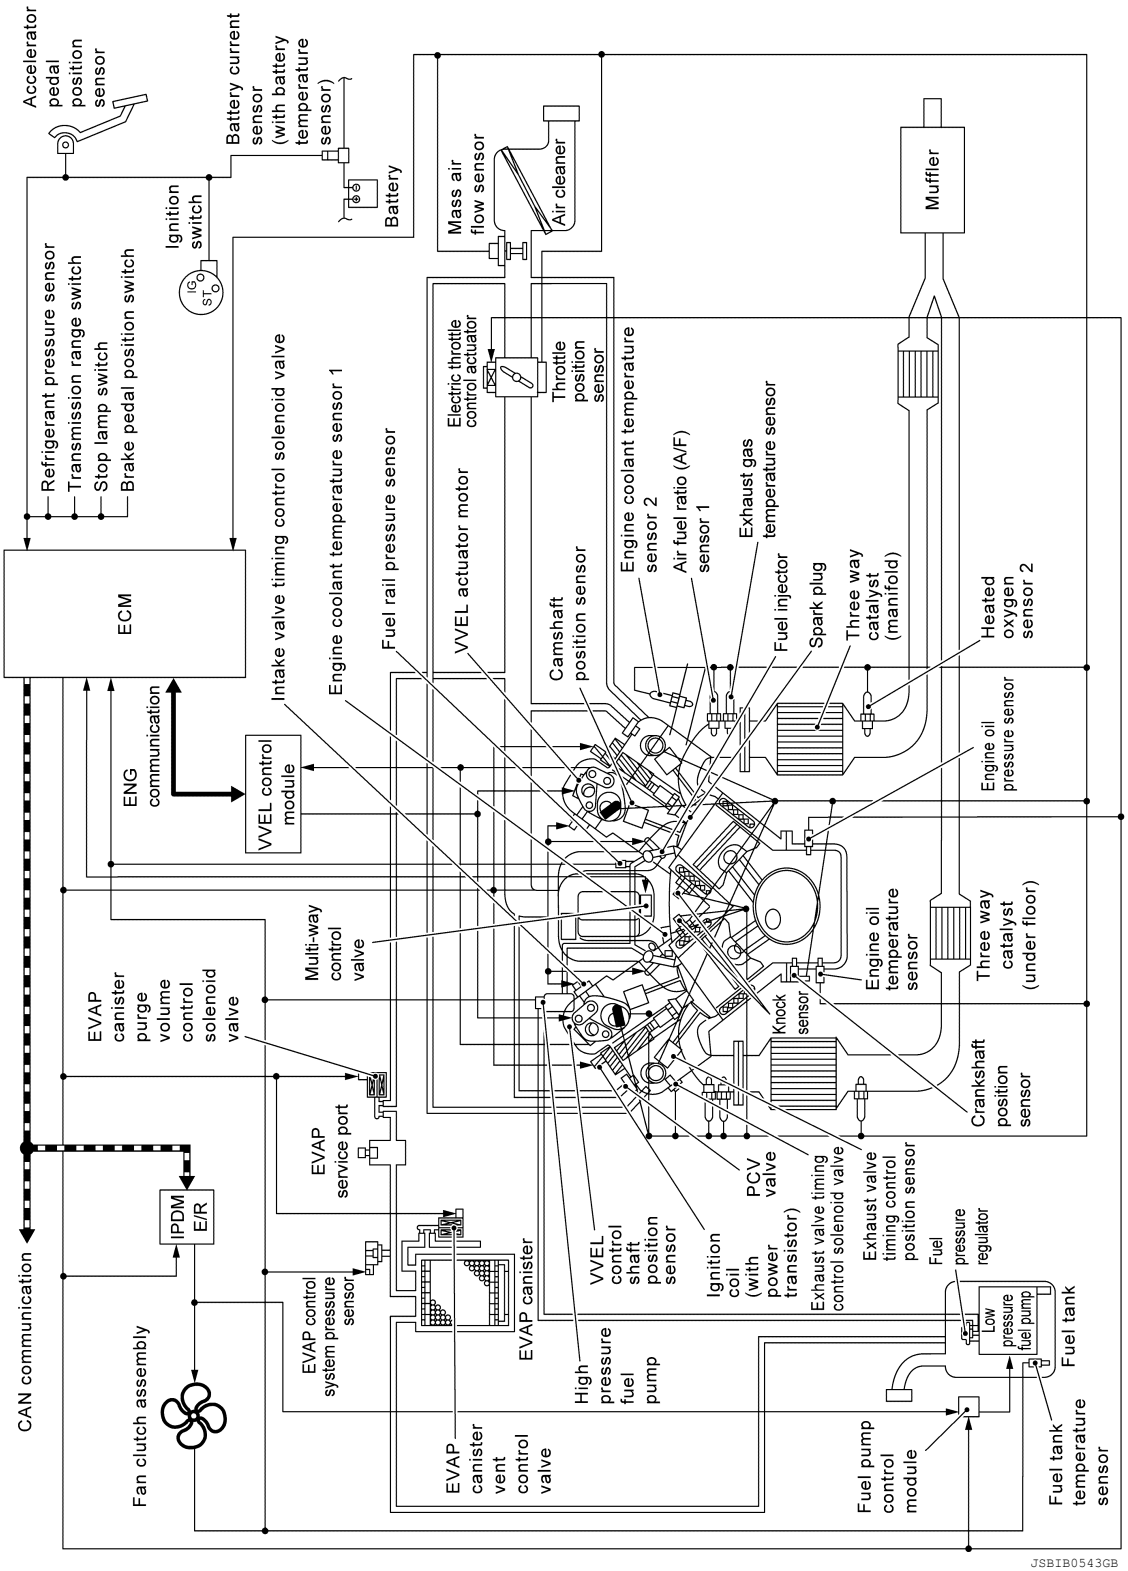
- **Before removing fuel line parts, carry out the following procedures:**
  - **Put drained fuel in an explosion-proof container and put lid on securely.**
  - **Release fuel pressure from fuel line. Refer to EC-1435, "Work Procedure".**
  - **Disconnect battery ground cable.**
- **Always replace O-ring when the fuel gauge retainer is removed.**
- **Never kink or twist hose and tube when they are installed.**
- **Never tighten hose and clamps excessively to avoid damaging hoses.**
- **After installation, run engine and check for fuel leaks at connections.**
- **Never attempt to top off the fuel tank after the fuel pump nozzle shuts off automatically. Continued refueling may cause fuel overflow, resulting in fuel spray and possibly a fire.**

SYSTEM

ENGINE CONTROL SYSTEM

ENGINE CONTROL SYSTEM : System Diagram

INFOID:0000000013798094



ENGINE CONTROL SYSTEM : System Description

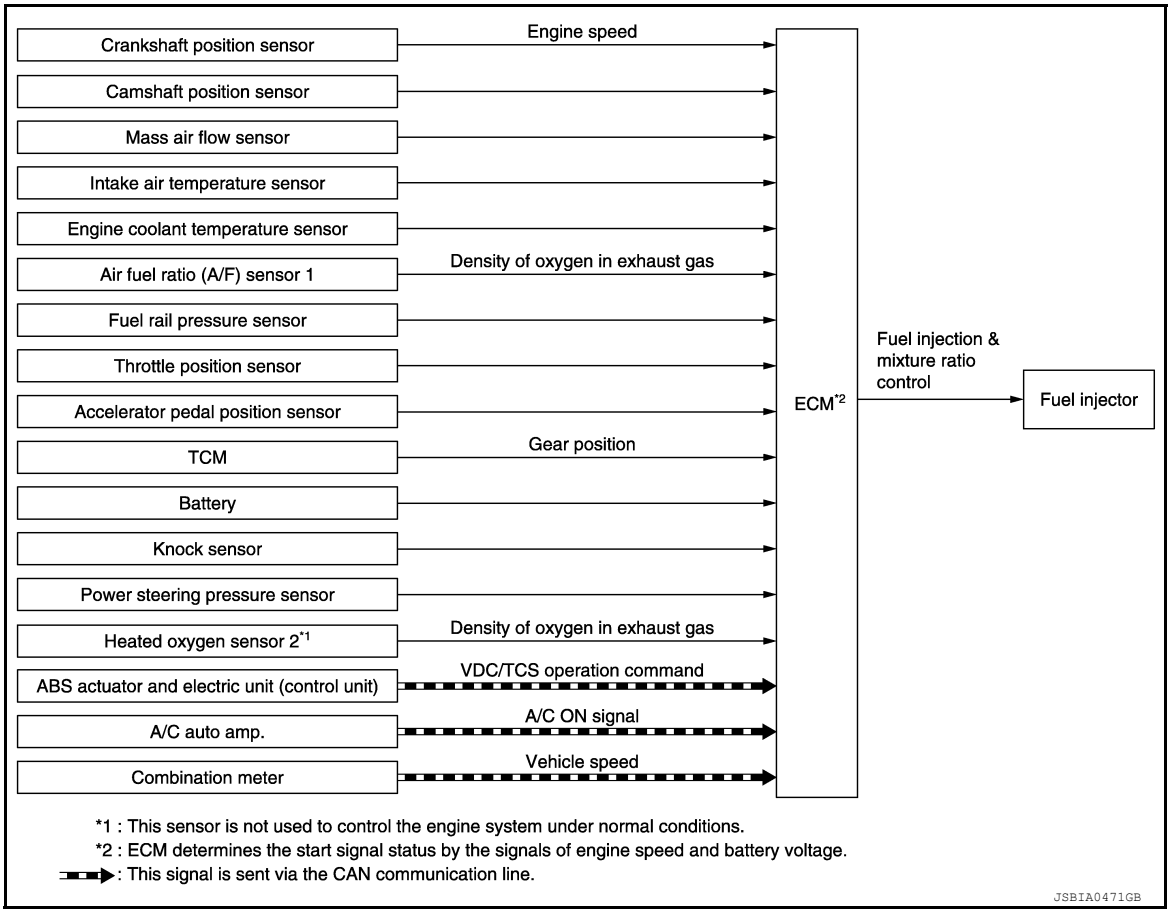
DIRECT INJECTION GASOLINE SYSTEM

DIRECT INJECTION GASOLINE SYSTEM : System Diagram

INFOID:0000000013798096



NOTE:
Both “Engine coolant temperature sensor” and “Engine coolant temperature sensor 1” are used in this manual. These indicate the same part.

DIRECT INJECTION GASOLINE SYSTEM : System Description

INFOID:0000000013798097

INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator
Crankshaft position sensor	Engine speed*2	Fuel injection & mixture ratio control	Fuel injector
Camshaft position sensor	Camshaft position		
Mass air flow sensor	Amount of intake air		
Intake air temperature sensor	Intake air temperature		
Engine coolant temperature sensor 1	Engine coolant temperature		
Air fuel ratio (A/F) sensor 1	Density of oxygen in exhaust gas		
Fuel rail pressure sensor	Fuel rail pressure		
Throttle position sensor	Throttle position		
Accelerator pedal position sensor	Accelerator pedal position		
TCM	Gear position		
Battery	Battery voltage*2		
Knock sensor	Engine knocking condition		
Power steering pressure sensor	Power steering operation		
Heated oxygen sensor 2*1	Density of oxygen in exhaust gas		
ABS actuator and electric unit (control unit)	VDC/TCS operation command		
A/C auto amp.	A/C ON signal		
Combination meter	Vehicle speed		

*1: This sensor is not used to control the engine system under normal conditions.

*2: ECM determines the start signal status by the signals of engine speed and battery voltage.

SYSTEM DESCRIPTION

The adoption of the direct fuel injection method enables more accurate adjustment of fuel injection quantity by injecting atomized high-pressure fuel directly into the cylinder. This method allows high-powered engine, low fuel consumption, and emissions-reduction.
The amount of fuel injected from the fuel injector is determined by the ECM. The ECM controls the length of time the valve remains open (injection pulse duration). The amount of fuel injected is a program value in the ECM memory. The program value is preset by engine operating conditions. These conditions are determined by input signals (for engine speed and intake air and fuel rail pressure) from the crankshaft position sensor, camshaft position sensor, mass air flow sensor and the fuel rail pressure sensor.

VARIOUS FUEL INJECTION INCREASE/DECREASE COMPENSATION

In addition, the amount of fuel injected is compensated to improve engine performance under various operating conditions as listed below.

<Fuel increase>
- During warm-up
- When starting the engine
- During acceleration
- Hot-engine operation
- When selector lever position is changed from N to D
- High-load, high-speed operation

<Fuel decrease>
- During deceleration
- During high engine speed operation

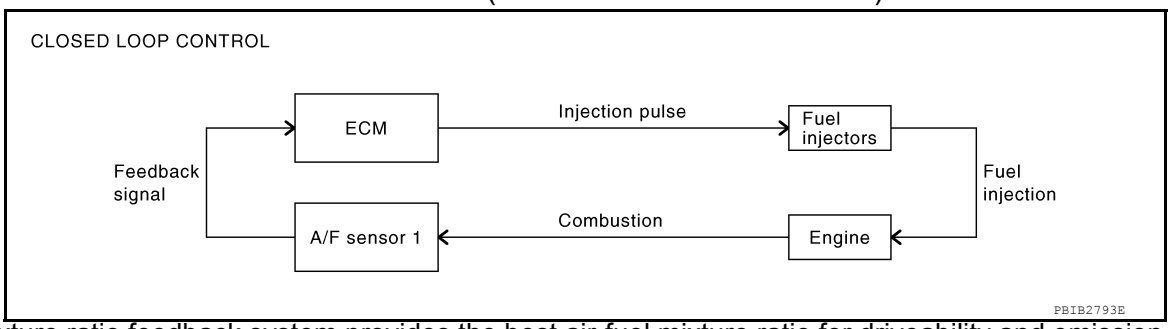
FUEL INJECTION CONTROL

Stratified-charge Combustion
Stratified-charge combustion is a combustion method which enables extremely lean combustion by injecting fuel in the latter half of a compression process, collecting combustible air-fuel around the spark plug, and forming fuel-free airspace around the mixture.
Right after a start with the engine cold, the catalyst warm-up is accelerated by stratified-charge combustion.

Homogeneous Combustion

Homogeneous combustion is a combustion method that fuel is injected during intake process so that combustion occurs in the entire combustion chamber, as is common with conventional methods.
As for a start except for starts with the engine cold, homogeneous combustion occurs.

MIXTURE RATIO FEEDBACK CONTROL (CLOSED LOOP CONTROL)

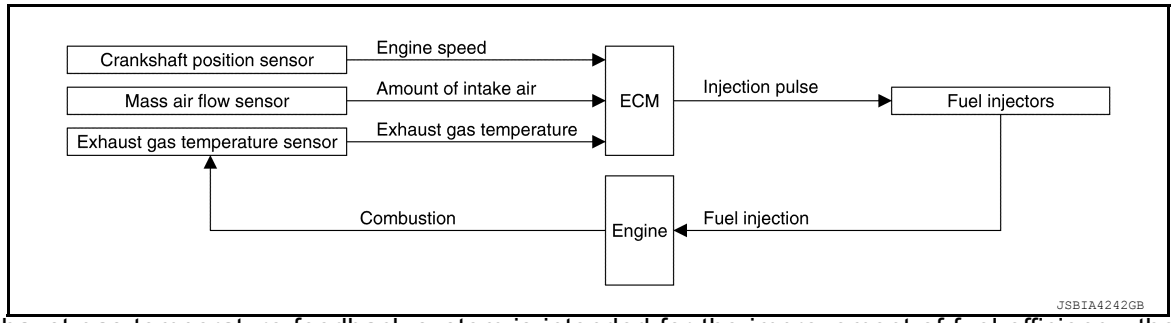


The mixture ratio feedback system provides the best air-fuel mixture ratio for driveability and emission control. The three way catalyst (manifold) can better reduce CO, HC and NOx emissions. This system uses A/F sensor 1 in the exhaust manifold to monitor whether the engine operation is rich or lean. The ECM adjusts the injection pulse width according to the sensor voltage signal. For more information about A/F sensor 1, refer to EC-1273, "Air Fuel Ratio (A/F) Sensor 1". This maintains the mixture ratio within the range of stoichiometric (ideal air-fuel mixture).
This stage is referred to as the closed loop control condition.
Heated oxygen sensor 2 is located downstream of the three way catalyst (manifold). Even if the switching characteristics of A/F sensor 1 shift, the air-fuel ratio is controlled to stoichiometric by the signal from heated oxygen sensor 2.

- Open Loop Control
  The open loop system condition refers to when the ECM detects any of the following conditions. Feedback control stops in order to maintain stabilized fuel combustion.

- Deceleration and acceleration
- High-load, high-speed operation
- Malfunction of A/F sensor 1 or its circuit
- Insufficient activation of A/F sensor 1 at low engine coolant temperature
- High engine coolant temperature
- During warm-up
- After shifting from N to D
- When starting the engine

EXHAUST GAS TEMPERATURE FEEDBACK CONTROL



The exhaust gas temperature feedback system is intended for the improvement of fuel efficiency, the reduction in exhaust gas (CO and HC), and the protection of parts.This system monitors the upstream temperature of catalyst by using an exhaust gas temperature sensor and lowers the combustion temperature to prevent damage to the exhaust system related parts by increasing fuel injection when exhaust gas becomes hot.

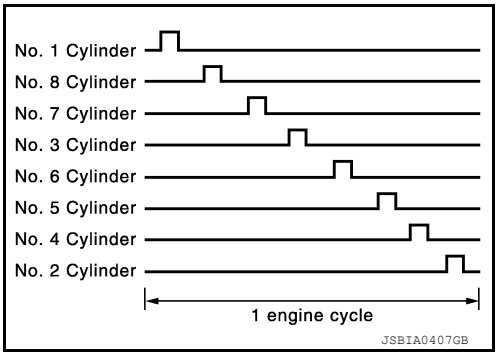
MIXTURE RATIO SELF-LEARNING CONTROL

The mixture ratio feedback control system monitors the mixture ratio signal transmitted from A/F sensor 1. This feedback signal is then sent to the ECM. The ECM controls the basic mixture ratio as close to the theoretical mixture ratio as possible. However, the basic mixture ratio is not necessarily controlled as originally designed. Both manufacturing differences (i.e., mass air flow sensor hot wire) and characteristic changes during operation (i.e., fuel injector clogging) directly affect mixture ratio.
Accordingly, the difference between the basic and theoretical mixture ratios is monitored in this system. This is then computed in terms of “injection pulse duration” to automatically compensate for the difference between the two ratios.

"Fuel trim" refers to the feedback compensation value compared against the basic injection duration. Fuel trim includes "short-term fuel trim" and "long-term fuel trim".
"Short term fuel trim" is the short-term fuel compensation used to maintain the mixture ratio at its theoretical value. The signal from A/F sensor 1 indicates whether the mixture ratio is RICH or LEAN compared to the theoretical value. The signal then triggers a reduction in fuel volume if the mixture ratio is rich, and an increase in fuel volume if it is lean.
"Long-term fuel trim" is overall fuel compensation carried out over time to compensate for continual deviation of the "short-term fuel trim" from the central value. Continual deviation will occur due to individual engine differences, wear over time and changes in the usage environment.

FUEL INJECTION TIMING

Sequential Direct Injection Gasoline System
Fuel is injected into each cylinder during each engine cycle according to the ignition order.



STRATIFIED-CHARGE START CONTROL

The use of the stratified-charge combustion method enables emissions-reduction when starting the engine with engine coolant temperature between 5°C (41°F) and 40°C (104°F).

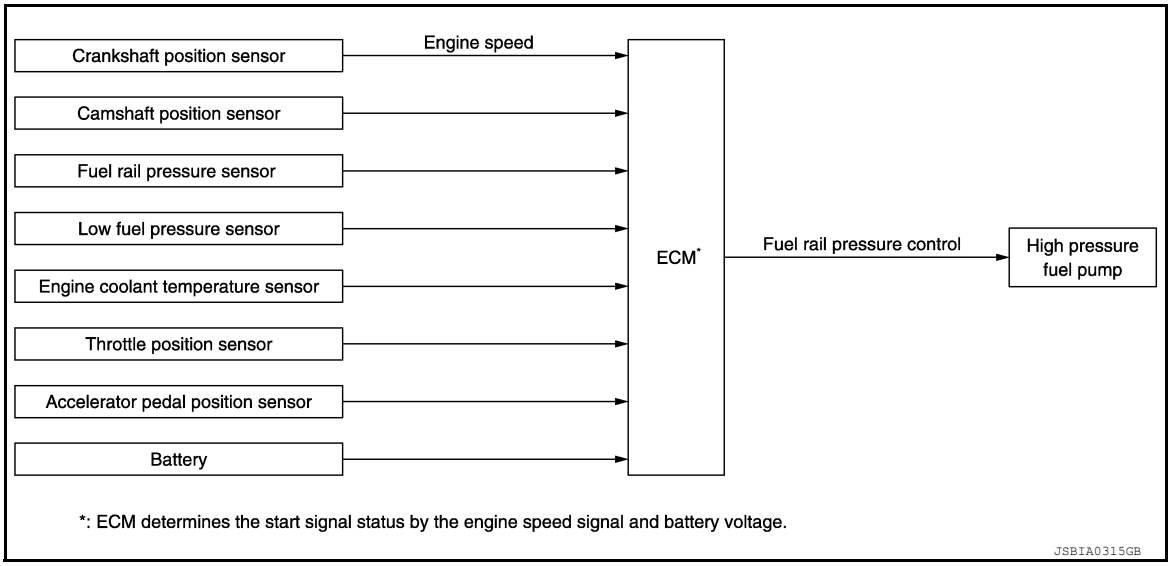
FUEL SHUT-OFF

Fuel to each cylinder is shut-off during deceleration, operation of the engine at excessively high speed or operation of the vehicle at excessively high speed.

FUEL PRESSURE CONTROL

FUEL PRESSURE CONTROL : System Diagram

INFOID:0000000013798098



NOTE:
- Low fuel pressure sensor is not used.
- Both "Engine coolant temperature sensor" and "Engine coolant temperature sensor 1" are used in this manual. These indicate the same part.

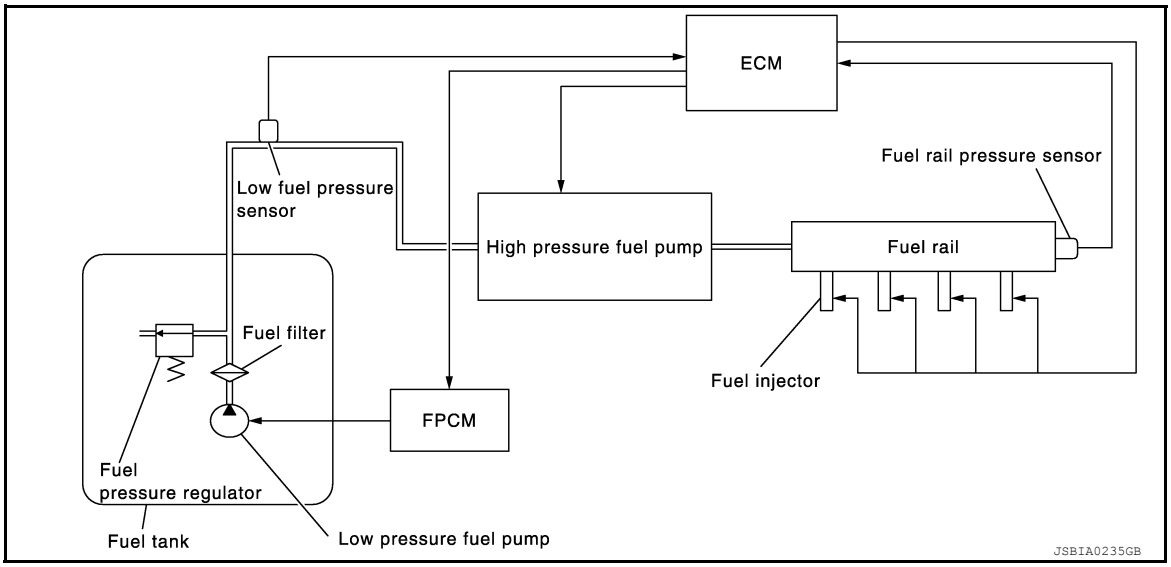
FUEL PRESSURE CONTROL : System Description

INFOID:0000000013798099

INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator
Crankshaft position sensor	Engine speed	Fuel injection & mixture ratio control	High pressure fuel pump
Camshaft position sensor	Camshaft position		
Fuel rail pressure sensor	Fuel rail pressure		
Engine coolant temperature sensor 1	Engine coolant temperature		
Throttle position sensor	Throttle position		
Accelerator pedal position sensor	Accelerator pedal position		
Battery	Battery voltage		

SYSTEM DESCRIPTION



NOTE:
Low fuel pressure sensor is not used.

Low fuel pressure control

- The low fuel pressure pump is controlled by the fuel pump control module (FPCM) and pumps fuel according to a driving condition. The pumped fuel passes through the fuel filter and is sent to the high pressure fuel pump. FPCM controls the low pressure fuel pump, according to a signal from ECM as shown in the table below.

Conditions	Amount of fuel flow	Supplied voltage
After a laps of 1 second after ignition ON	OFF	0 V
• For 1 second after turning ignition switch ON • Engine is running under low load and low speed conditions	Low	Approximately 8.5 V
• Engine cranking • Engine coolant temperature is below 10°C (50°F) • Engine is running under high load and high speed conditions	High	Battery voltage (11 – 14 V)
Except the above	Mid	Approximately 10 V

- Low fuel pressure is adjusted by the fuel pressure regulator.

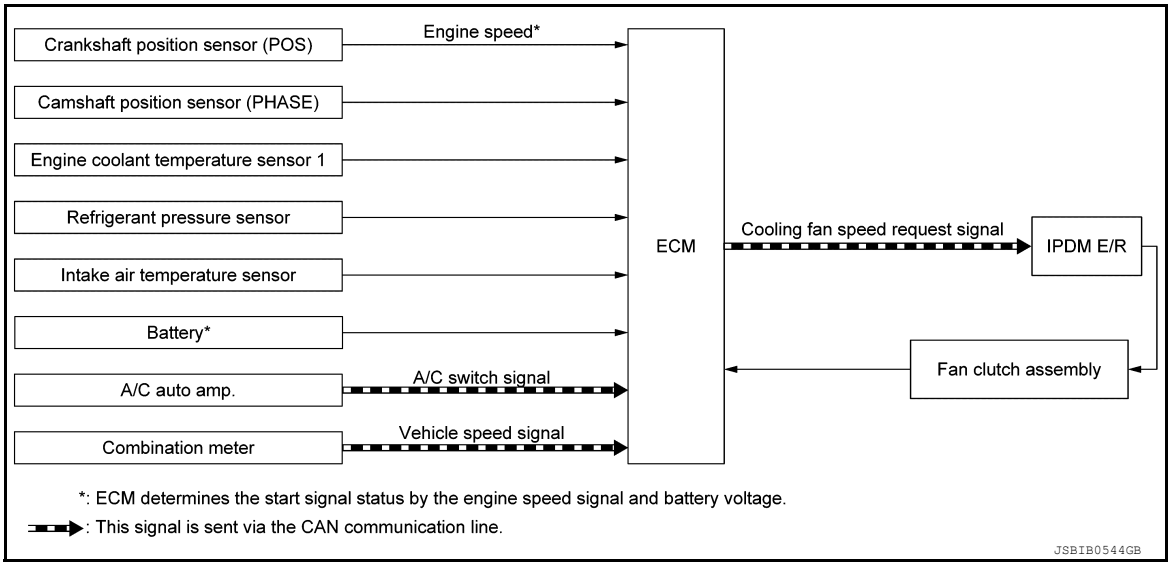
High fuel pressure control

- The high pressure fuel pump raises the pressure of the fuel sent from the low pressure fuel pump. Actuated by the camshaft, the high pressure fuel pump activates the high pressure fuel pump solenoid based on a signal received from ECM, and adjusts the amount of discharge by changing the timing of closing the inlet check valve to control fuel rail pressure.

COOLING FAN CONTROL

COOLING FAN CONTROL : System Diagram

INFOID:0000000013798100



COOLING FAN CONTROL : System Description

INFOID:0000000013798101

INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator
Crankshaft position sensor	Engine speed*1	Cooling fan speed request signal*2	IPDM E/R ↓ Fan clutch assembly
Camshaft position sensor	Camshaft position		
Engine coolant temperature sensor 1	Engine coolant temperature		
Refrigerant pressure sensor	Refrigerant pressure		
Intake air temperature sensor	Intake air temperature		
Battery	Battery voltage		
Combination meter	Vehicle speed signal*2		
BCM	A/C switch signal*2		
Fan clutch assembly	Cooling fan speed		

*1: The ECM determines the engine speed by the signals of crankshaft position and camshaft position.

*2: This signal is sent to ECM via the CAN communication line.

SYSTEM DESCRIPTION

- Based on a signal transmitted from each sensor, ECM calculates a target fan speed responsive to a driving condition. In addition, ECM calculates a fan pulley speed according to an engine speed and transmits a cooling fan request signal to IPDM E/R via the CAN communication line to satisfy the target fan speed. Then, IPDM E/R transmits ON/OFF pulse duty signal to fan clutch assembly.
  The cooling fan speed sensor detects a cooling fan speed and transmits the detection result to ECM.
- ECM judges the start signal state from the engine speed signal and battery voltage.

ELECTRIC IGNITION SYSTEM

Knock sensor	Engine knocking condition		
Combination meter	Vehicle speed*2		

*1: ECM determines the start signal status by the signals of engine speed and battery voltage.

*2: This signal is sent to the ECM via the CAN communication line.

SYSTEM DESCRIPTION

Ignition order: 1 - 8 - 7 - 3 - 6 - 5 - 4 - 2

The ignition timing is controlled by the ECM to maintain the best air-fuel ratio for every running condition of the engine. The ignition timing data is stored in the ECM.

The ECM receives information such as the injection pulse width and camshaft position sensor signal. Computing this information, ignition signals are transmitted to the power transistor.

During the following conditions, the ignition timing is revised by the ECM according to the other data stored in the ECM.

- At starting
- During warm-up
- At idle
- At low battery voltage
- During acceleration

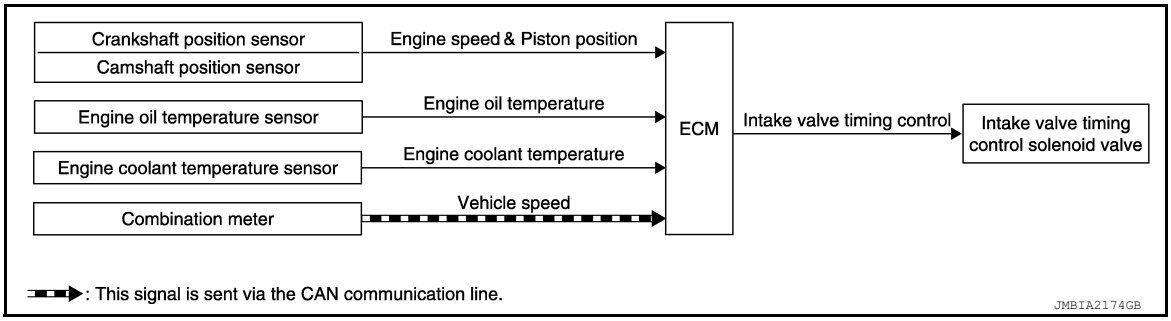
The knock sensor retard system is designed only for emergencies. The basic ignition timing is programmed within the anti-knocking zone, if recommended fuel is used under dry conditions. The retard system does not

operate under normal driving conditions. If engine knocking occurs, the knock sensor monitors the condition. The signal is transmitted to the ECM. The ECM retards the ignition timing to eliminate the knocking condition.

INTAKE VALVE TIMING CONTROL

INTAKE VALVE TIMING CONTROL : System Diagram

INFOID:0000000013798104



NOTE:
Both “Engine coolant temperature sensor” and “Engine coolant temperature sensor 1” are used in this manual. These indicate the same part.

INTAKE VALVE TIMING CONTROL : System Description

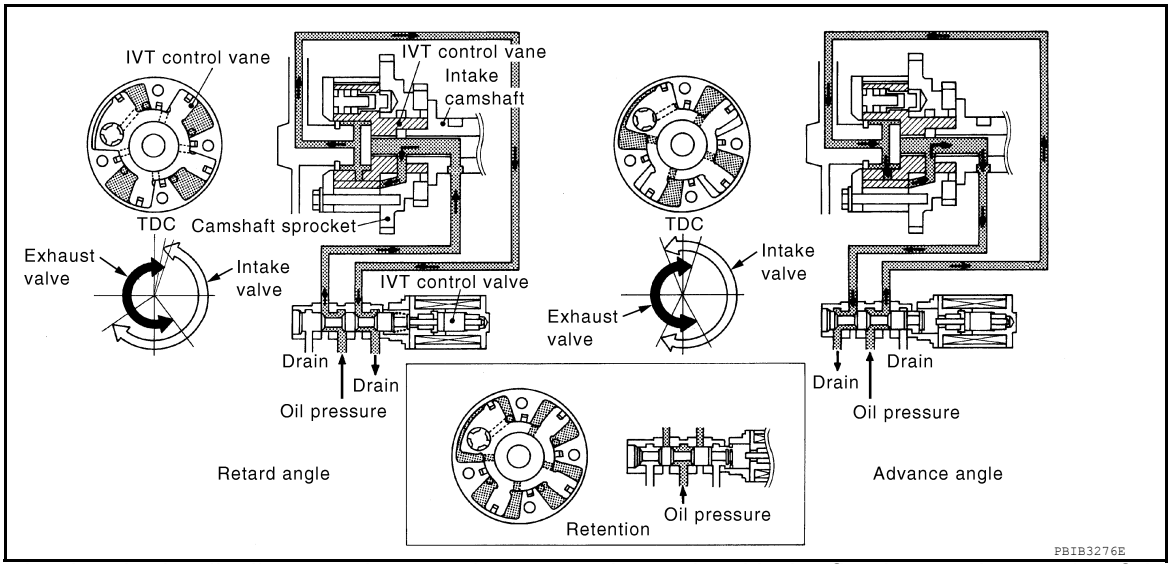
INFOID:0000000013798105

INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator
Crankshaft position sensor	Engine speed and piston position	Intake valve timing control	Intake valve timing control solenoid valve
Camshaft position sensor			
Engine oil temperature sensor	Engine oil temperature		
Engine coolant temperature sensor 1	Engine coolant temperature		
Combination meter	Vehicle speed*		

*: This signal is sent to the ECM via the CAN communication line.

SYSTEM DESCRIPTION



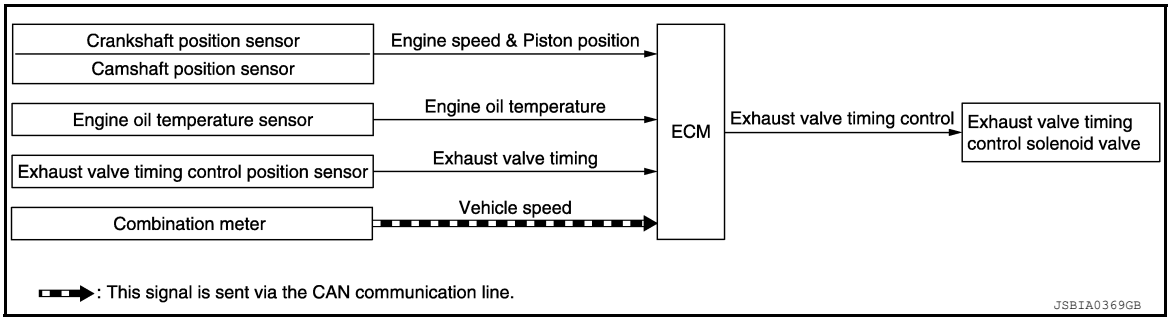
This mechanism hydraulically controls cam phases continuously with the fixed operating angle of the intake valve.

The ECM receives signals such as crankshaft position, camshaft position, engine speed, and engine coolant temperature. Then, the ECM sends ON/OFF pulse duty signals to the intake valve timing control solenoid valve depending on driving status. This makes it possible to control the shut/open timing of the intake valve to increase engine torque in low/mid speed range and output in high speed range.

EXHAUST VALVE TIMING CONTROL

EXHAUST VALVE TIMING CONTROL : System Diagram

INFOID:0000000013798106



EXHAUST VALVE TIMING CONTROL : System Description

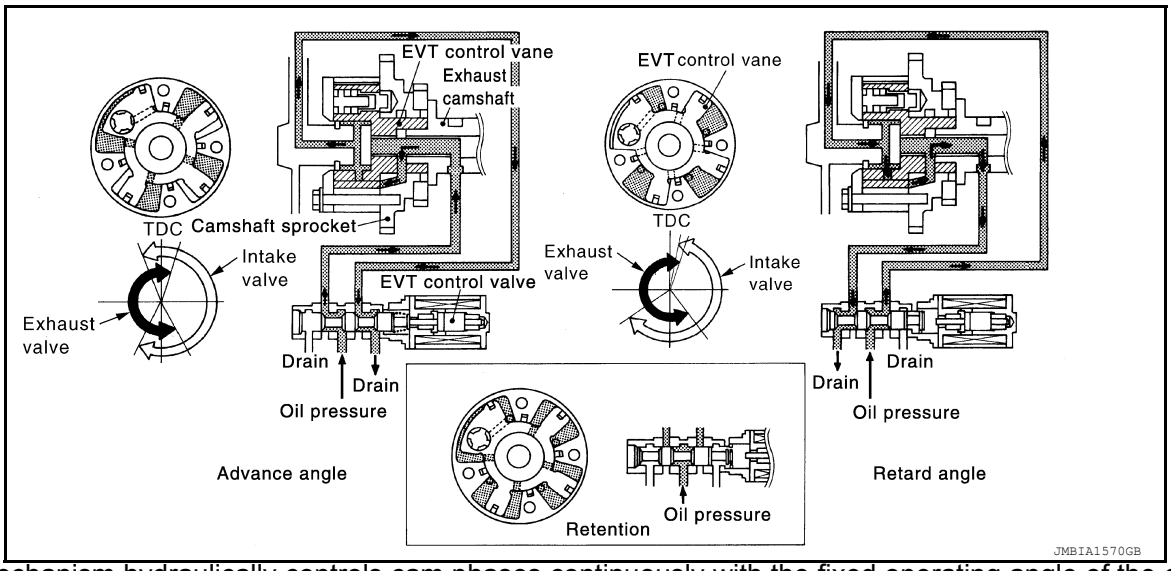
INFOID:0000000013798107

INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator
Crankshaft position sensor	Engine speed and piston position	Exhaust valve timing control	Exhaust valve timing control solenoid valve
Camshaft position sensor			
Engine oil temperature sensor	Engine oil temperature		
Exhaust valve timing control position sensor	Exhaust valve timing signal		
Combination meter	Vehicle speed*		

*: This signal is sent to the ECM via the CAN Communication line

SYSTEM DESCRIPTION



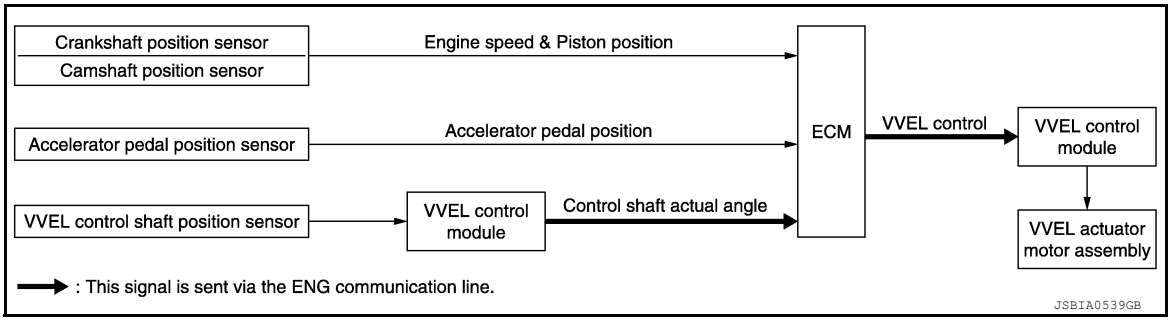
This mechanism hydraulically controls cam phases continuously with the fixed operating angle of the exhaust valve.

The ECM receives signals such as crankshaft position, camshaft position, engine speed, and engine oil temperature. Then, the ECM sends ON/OFF pulse duty signals to the exhaust valve timing control solenoid valve depending on driving status. This makes it possible to control the shut/open timing of the exhaust valve to increase engine torque and output in a range of high engine speed.

VVEL SYSTEM

VVEL SYSTEM : System Diagram

INFOID:0000000013798108



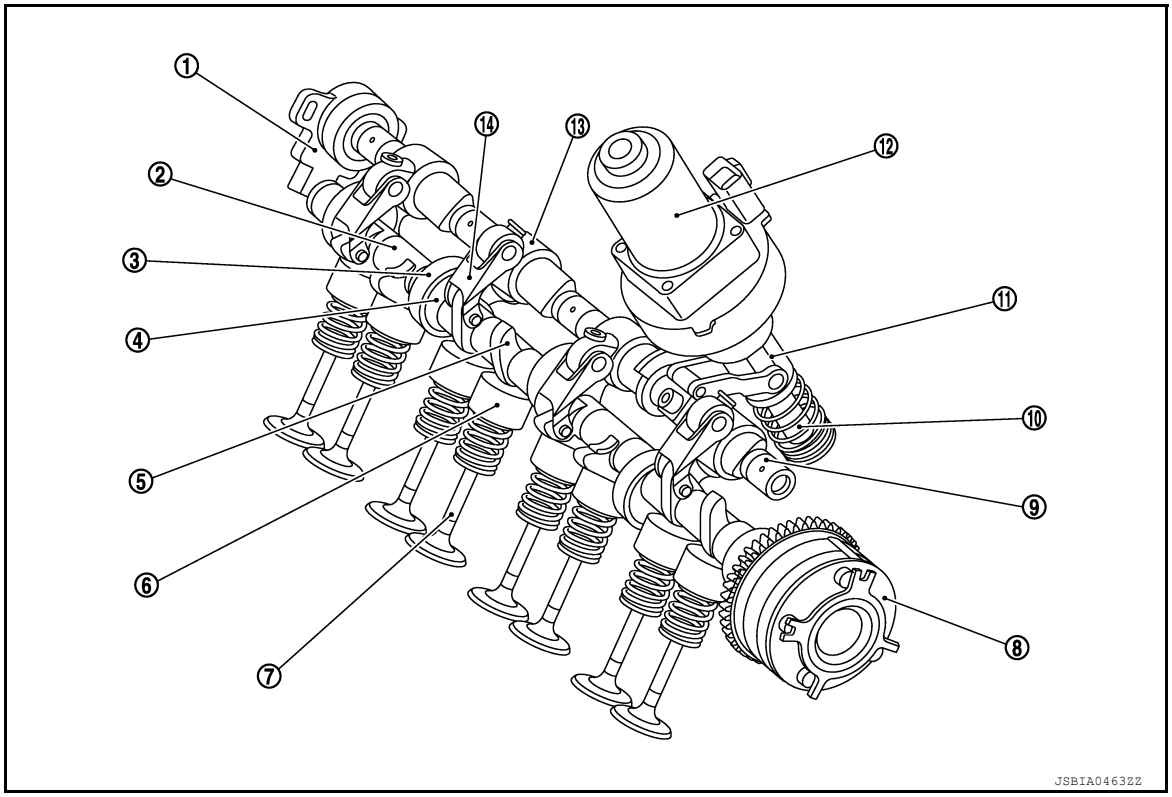
VVEL SYSTEM : System Description

INFOID:0000000013798109

INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator
Camshaft position sensor Crankshaft position sensor	Engine speed and piston position	VVEL control	VVEL control module ↓ VVEL actuator motor assembly
Accelerator pedal position sensor	Accelerator pedal position		
VVEL control shaft position sensor ↓ VVEL control module	Control shaft actual angle		

SYSTEM DESCRIPTION

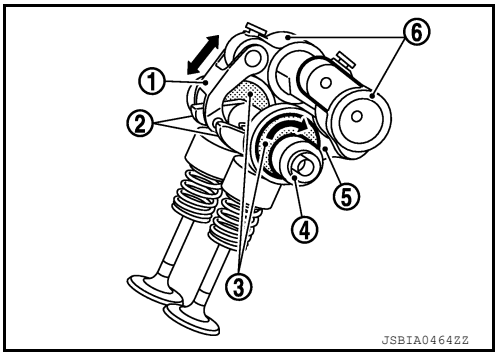


1. VVEL control shaft position sensor
2. Drive shaft
3. Link A
4. Eccentric cam
5. Output cam
6. Valve lifter
7. Intake valve
8. Intake camshaft sprocket
9. Control shaft
10. Ball screw shaft
11. Ball screw nut
12. VVEL actuator motor assembly
13. Rocker arm
14. Link B

VVEL (Variable Valve Event & Lift) is a system that controls valve event and valve lift continuously.
ECM decides the target valve lift according to the driving condition and sends the command signal to the VVEL control module via ENG communication line.

VALVE LIFT OPERATION

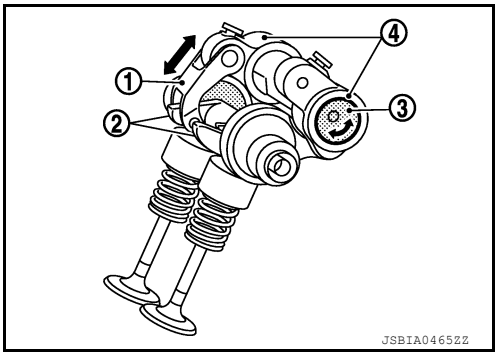
Rotational movement of the drive shaft equipped with eccentric cam is transmitted to output cam via the rocker arm and two kinds of links to depress the intake valve.



1. Link B
2. Output cam
3. Eccentric cam
4. Drive shaft
5. Link A
6. Rocker arm

VARIABLE OPERATION

VVEL control module controls the rotation of the control shaft using the VVEL actuator motor assembly and changes the movement of the output cam by shifting the link supporting point. As a result, valve lift changes continuously to improve engine output and response.

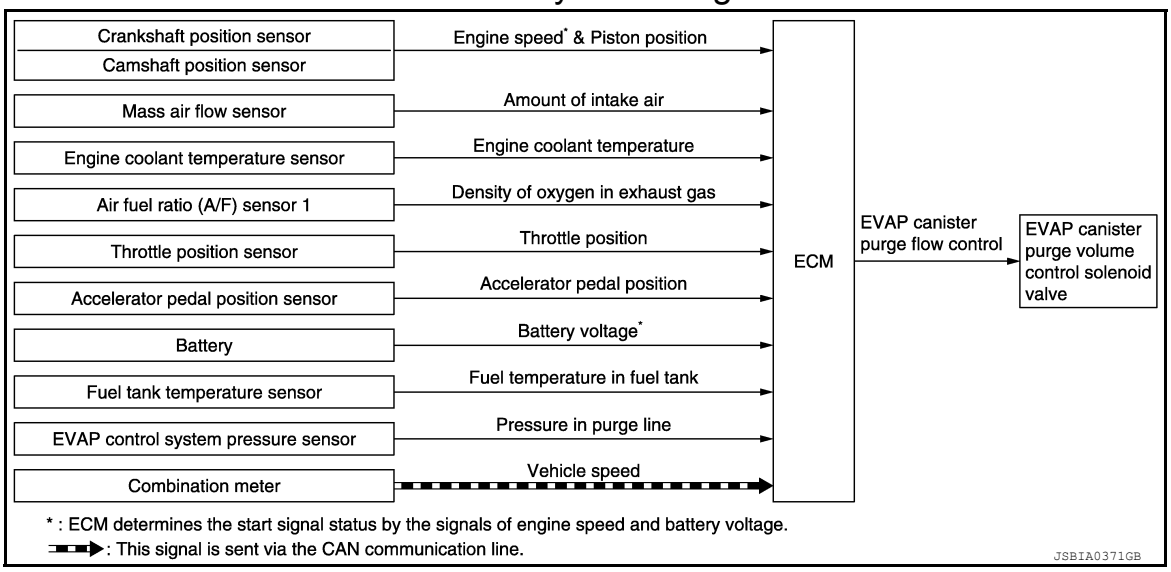


1. Link B
2. Output cam
3. Control shaft
4. Rocker arm

EVAPORATIVE EMISSION SYSTEM

EVAPORATIVE EMISSION SYSTEM : System Diagram

INFOID:0000000013798110



NOTE:
Both “Engine coolant temperature sensor” and “Engine coolant temperature sensor 1” are used in this manual. These indicate the same part.

EVAPORATIVE EMISSION SYSTEM : System Description

INFOID:0000000013798111

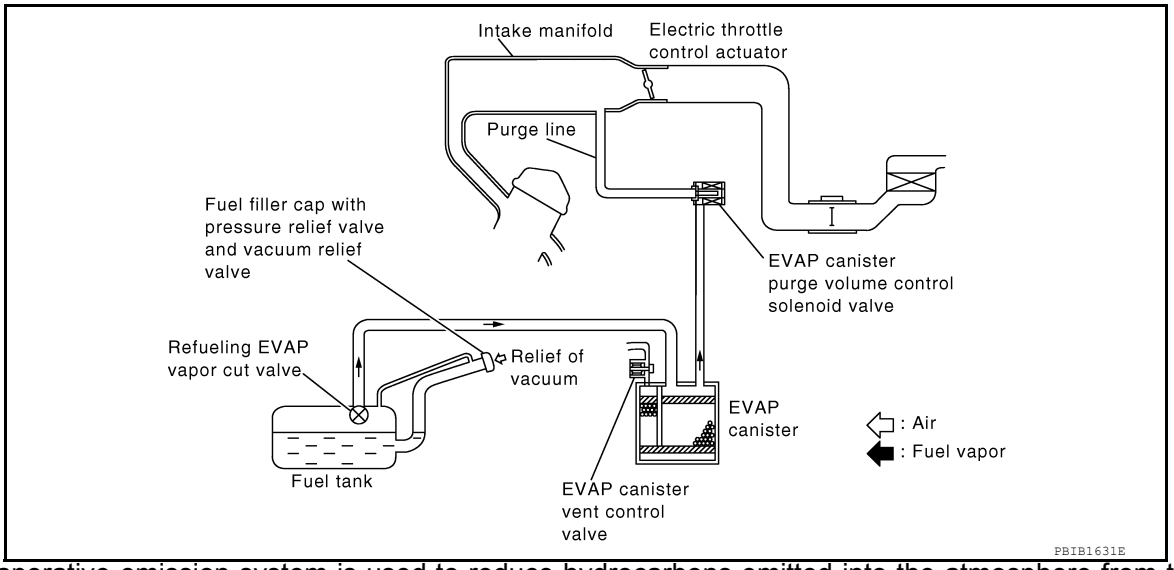
INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator
Crankshaft position sensor Camshaft position sensor	• Engine speed*1 • Piston position	EVAP canister purge flow control	EVAP canister purge volume control solenoid valve
Mass air flow sensor	Amount of intake air		
Engine coolant temperature sensor 1	Engine coolant temperature		
Battery	Battery voltage*1		
Throttle position sensor	Throttle position		
Accelerator pedal position sensor	Accelerator pedal position		
Air fuel ratio (A/F) sensor 1	Density of oxygen in exhaust gas (Mixture ratio feedback signal)		
Fuel tank temperature sensor	Fuel temperature in fuel tank		
EVAP control system pressure sensor	Pressure in purge line		
Combination meter	Vehicle speed*2		

*1: ECM determines the start signal status by the signals of engine speed and battery voltage.

*2: This signal is sent to the ECM via the CAN communication line.

SYSTEM DESCRIPTION



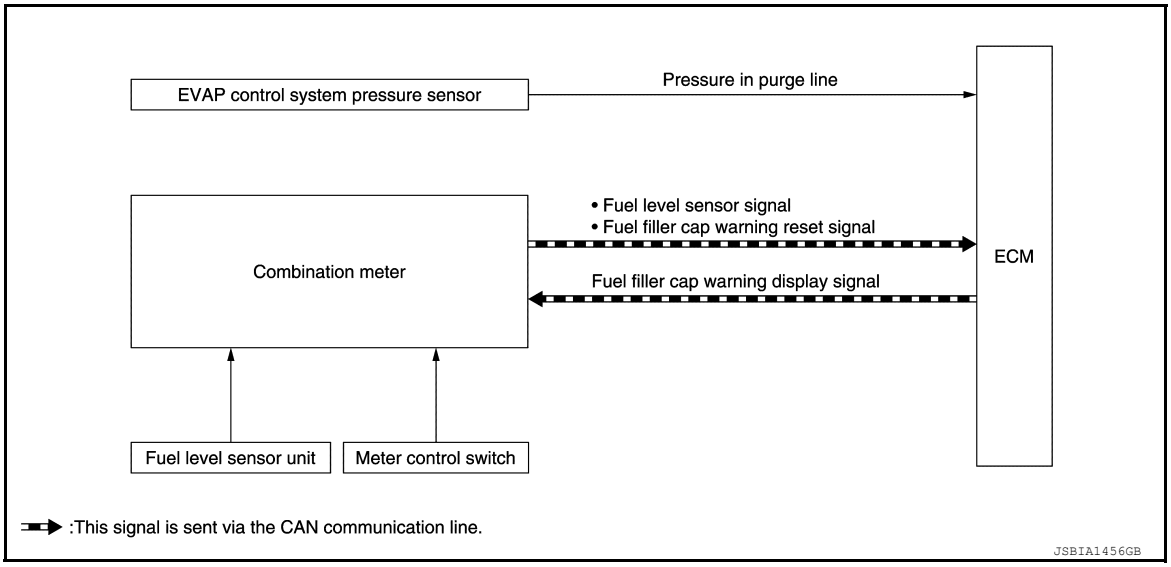
The evaporative emission system is used to reduce hydrocarbons emitted into the atmosphere from the fuel system. This reduction of hydrocarbons is accomplished by activated charcoals in the EVAP canister.
The fuel vapor in the sealed fuel tank is led into the EVAP canister which contains activated carbon and the vapor is stored there when the engine is not operating or when refueling to the fuel tank.
The vapor in the EVAP canister is purged by the air through the purge line to the intake manifold when the engine is operating. EVAP canister purge volume control solenoid valve is controlled by ECM. When the engine operates, the flow rate of vapor controlled by EVAP canister purge volume control solenoid valve is proportionally regulated as the air flow increases.
EVAP canister purge volume control solenoid valve also shuts off the vapor purge line during decelerating and idling.

FUEL FILLER CAP WARNING SYSTEM

FUEL FILLER CAP WARNING SYSTEM : System Description

INFOID:0000000013798112

SYSTEM DIAGRAM



NOTE:
Meter control switch means trip computer switch.

INPUT/OUTPUT SIGNAL CHART

Input

Unit/Sensor	Input signal to ECM	ECM function
EVAP control system pressure sensor	Pressure in purge line	Fuel filler cap warning control
Combination meter	Fuel level sensor signal*	
	Fuel filler cap warning reset signal*	

*: This signal is sent to the ECM via the CAN communication line.

Output

Unit	Output signal	Actuator
ECM	Fuel filler cap warning display signal*	Combination meter

*: This signal is sent to the combination meter via the CAN communication line.

SYSTEM DESCRIPTION

The fuel filler cap warning system alerts the driver to the prevention of the fuel filler being left uncapped and malfunction occurrences after refueling, by turning ON the fuel filler cap warning display on the combination meter.
ECM judges a refueled state, based on a fuel level signal transmitted from the combination meter.
When a very small leak is detected through the EVAP leak diagnosis performed after judging the refueled state, ECM transmits a fuel filler cap warning display signal (request for display ON) to the combination meter via CAN communication.
When receiving the signal, the combination meter turns ON the fuel filler cap warning display.

CAUTION:
Check fuel filler cap installation condition when the fuel filler cap warning display turns ON.

Reset Operation

The fuel filler cap warning lamp tunes OFF, according to any condition listed below:

- Reset operation is performed by operating the meter control switch (trip computer switch) on the combination meter.
  - When the reset operation is performed, the combination meter transmits a fuel filler cap warning reset signal to ECM via CAN communication. ECM transmits a fuel filler cap warning display signal (request for display OFF) to the combination meter via CAN communication. When receiving the signal, the combination meter turns OFF the fuel filler cap warning display.
- EVAP leak diagnosis result is normal.
- Fuel refilled.

• DTC erased by using CONSULT.

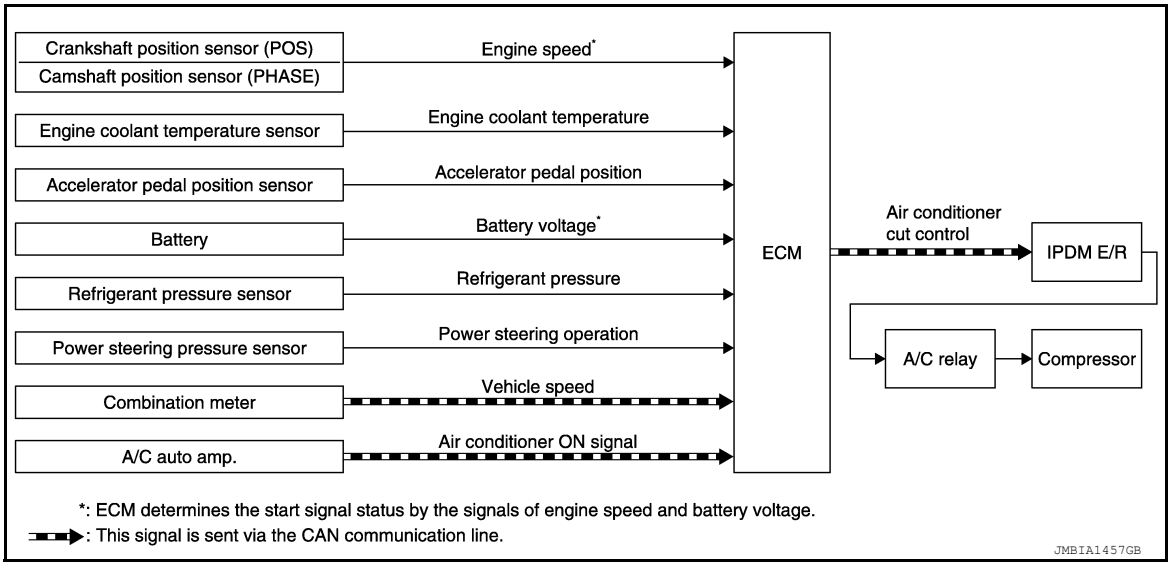
NOTE:

MIL turns ON if a malfunction is detected in leak diagnosis results again at the trip after the fuel filler cap warning display turns ON/OFF.

AIR CONDITIONING CUT CONTROL

AIR CONDITIONING CUT CONTROL : System Diagram

INFOID:0000000013798113



NOTE:

Both “Engine coolant temperature sensor” and “Engine coolant temperature sensor 1” are used in this manual. These indicate the same part.

AIR CONDITIONING CUT CONTROL : System Description

INFOID:0000000013798114

INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator
Crankshaft position sensor Camshaft position sensor	Engine speed*2	Air conditioner cut control	IPDM E/R ↓ A/C relay ↓ Compressor
Engine coolant temperature sensor 1	Engine coolant temperature		
Accelerator pedal position sensor	Accelerator pedal position		
Battery	Battery voltage*2		
Refrigerant pressure sensor	Refrigerant pressure		
Power steering pressure sensor	Power steering operation		
A/C auto amp.	A/C ON signal*1		
	A/C evaporator temperature*1		
	Target A/C evaporator temperature*1		
	Blower fan ON signal		
Combination meter	Vehicle speed*1		

*1: This signal is sent to the ECM via the CAN communication line.

*2: ECM determines the start signal status by the signals of engine speed and battery voltage.

SYSTEM DESCRIPTION

This system improves engine operation when the air conditioner is used.

Under the following conditions, the air conditioner is turned OFF.

• When the accelerator pedal is fully depressed.
• When cranking the engine.
• At high engine speeds.
• When the engine coolant temperature becomes excessively high.

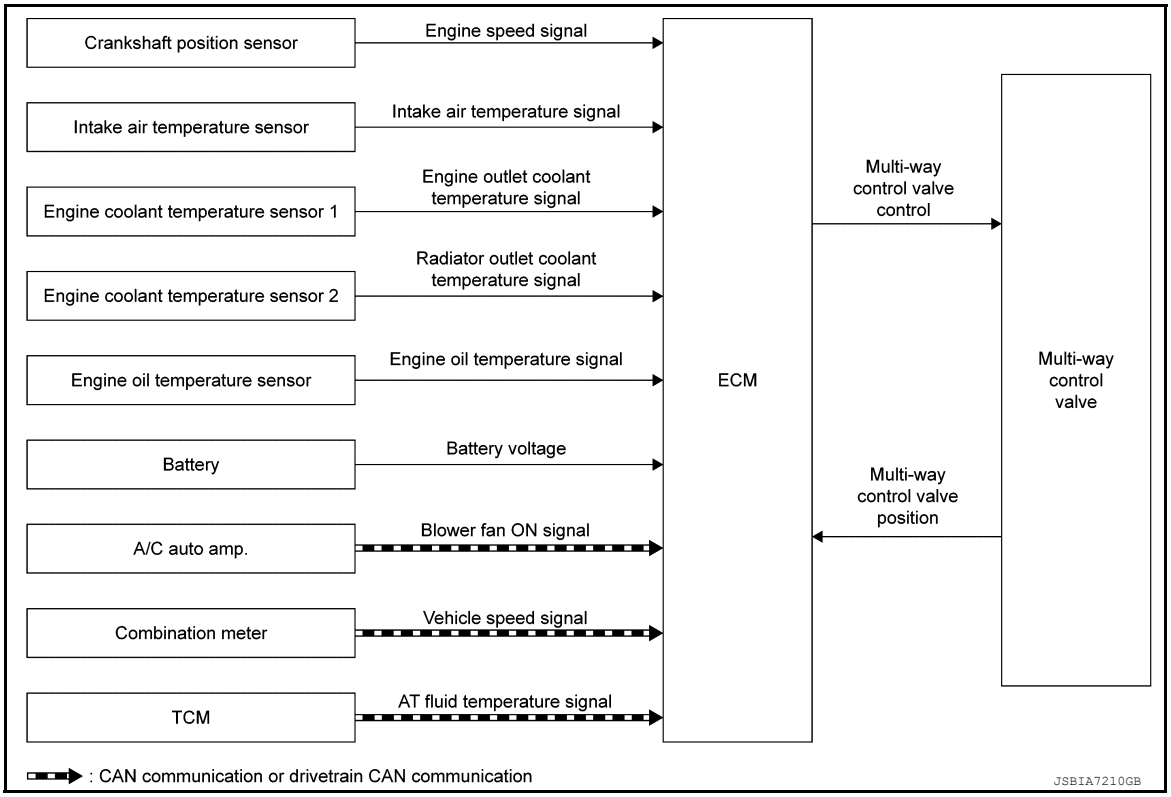
- When operating power steering during low engine speed or low vehicle speed.
- When engine speed is excessively low.
- When refrigerant pressure is excessively low or high.

THERMAL MANAGEMENT CONTROL

THERMAL MANAGEMENT CONTROL : System Description

INFOID:0000000013798115

SYSTEM DIAGRAM



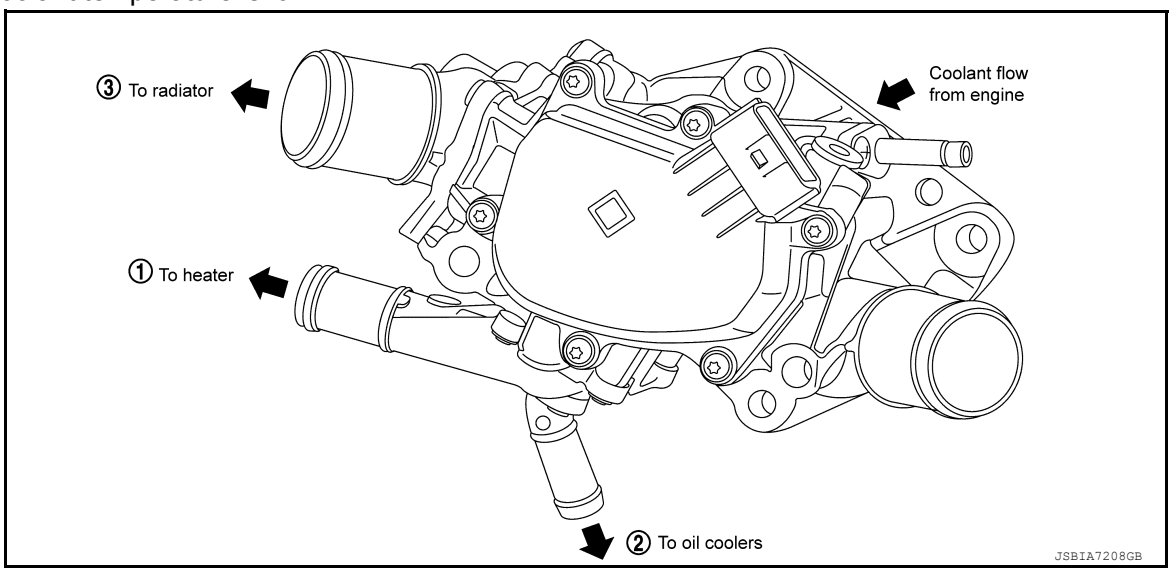
SYSTEM DESCRIPTION

The multi-way control valve changes the paths to heater, oil cooler, and radiator according to engine coolant temperature and driving conditions.
When coolant temperature is low, the paths to heater, oil cooler, and radiator are closed and coolant is circulated only inside the engine to accelerate engine warm-up.
When coolant temperature is high, the paths to heater, oil cooler, and radiator are opened and coolant is refrigerated. This raises the coolant temperature and oil temperature rapidly and improves the fuel economy by reducing friction among parts.

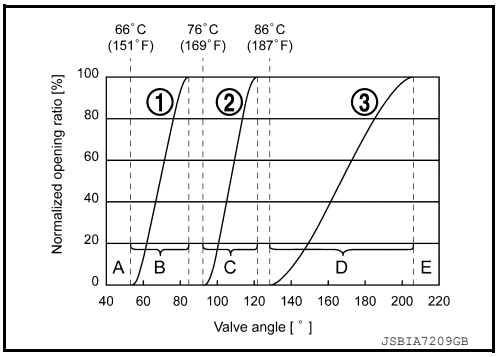
Operation

When the ignition switch is OFF, the valve is fully opened to accelerate bleeding the coolant channels.

When receiving a blower fan ON signal and/or an A/C ON signal, ECM opens the flow path to the heater even when coolant temperature is low.



Valve position	①	②	③
	Heater	Oil cooler	Radiator
A	Full close	Full close	Full close
B	Open	Full close	Full close
C	Full open	Open	Full close
D	Full open	Full open	Open
E	Full open	Full open	Full open



A: Closes all flow paths ①, ②, and ③ and circulates coolant only inside the engine.
B: Opens the flow path to Heater and circulates coolant to Heater.
C: Opens the flow path to oil cooler and circulates coolant to Heater and oil cooler.
D: Opens the flow path to radiator and circulates coolant to Heater, oil cooler, and radiator.
E: Opens all the flow paths ①, ②, and ③.

The high coolant temperature control is performed by opening/closing the flow path to the radiator to raise the engine oil temperature even when the coolant temperature is high. When engine load is high, the high coolant temperature control is not performed because of the knocking control.
When detecting a malfunction in multi-way control valve, ECM fully opens the valve to secure cooling paths.

ALTERNATOR POWER GENERATION VOLTAGE VARIABLE CONTROL SYSTEM

ALTERNATOR POWER GENERATION VOLTAGE VARIABLE CONTROL SYSTEM : System Description

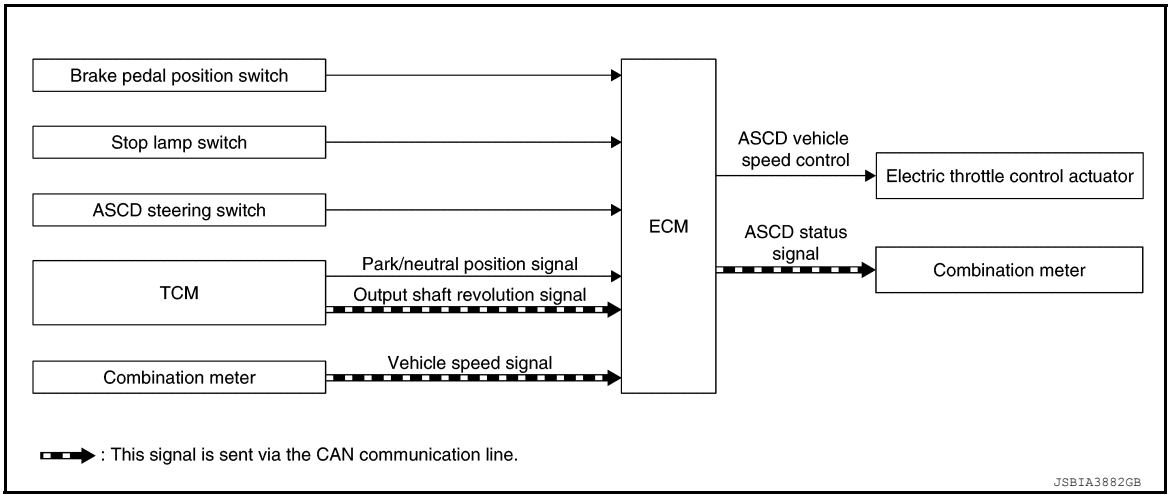
INFOID:0000000013798116

The alternator power generation voltage variable control system controls the amount of power generation, according to a battery loaded condition. ECM judges a battery condition, according to a signal received from the battery current sensor which detects a charge/discharge current. ECM then transmits a signal to IPDM E/R to command power generation via CAN communication. IPDM E/R transmits a power generation control signal to the alternator so that the system can control the amount of power generation. The voltage of power generation is lowered during battery low-load conditions and boosted under heavy load conditions. In this way, the system reduces the engine load through the adequate power generation control.
For details, refer to CHG-10, "POWER GENERATION VOLTAGE VARIABLE CONTROL SYSTEM : System Description".

AUTOMATIC SPEED CONTROL DEVICE (ASCD)

AUTOMATIC SPEED CONTROL DEVICE (ASCD) : System Diagram

INFOID:0000000013798117



AUTOMATIC SPEED CONTROL DEVICE (ASCD) : System Description

INFOID:0000000013798118

INPUT/OUTPUT SIGNAL CHART

Sensor	Input signal to ECM	ECM function	Actuator
ASCD steering switch	ASCD steering switch operation	ASCD vehicle speed control	• Electric throttle control actuator • Combination meter
Brake pedal position switch	Brake pedal operation		
Stop lamp switch			
TCM	Park/neutral position signal		
	Output shaft revolution signal*		
Combination meter	Vehicle speed signal*		

*: This signal is sent to the ECM via the CAN communication line

BASIC ASCD SYSTEM

- Automatic Speed Control Device (ASCD) allows a driver to keep vehicle at predetermined constant speed without depressing accelerator pedal. Driver can be set the vehicle speed in the set speed range.
- ECM controls throttle angle of electric throttle control actuator to regulate engine speed.
- Operation status of ASCD is indicated in combination meter.
- If any malfunction occurs in the ASCD system, it automatically deactivates the ASCD control.

Refer to EC-1312, "AUTMATIC SPEED CONTROL DEVICE (ASCD) : Switch Name and Function" for ASCD operating instructions.

CAUTION:

Always drive vehicle in a safe manner according to traffic conditions and obey all traffic laws.

CAN COMMUNICATION

CAN COMMUNICATION : System Description

INFOID:0000000013798119

CAN (Controller Area Network) is a serial communication line for real time application. It is an on-vehicle multiplex communication line with high data communication speed and excellent error detection ability. Many electronic control units are equipped onto a vehicle, and each control unit shares information and links with other control units during operation (not independent). In CAN communication, control units are connected with 2 communication lines (CAN H line, CAN L line) allowing a high rate of information transmission with less wiring. Each control unit transmits/receives data but selectively reads required data only.

Refer to LAN-70, "CAN COMMUNICATION SYSTEM : CAN Communication Signal Chart", about CAN communication for detail.

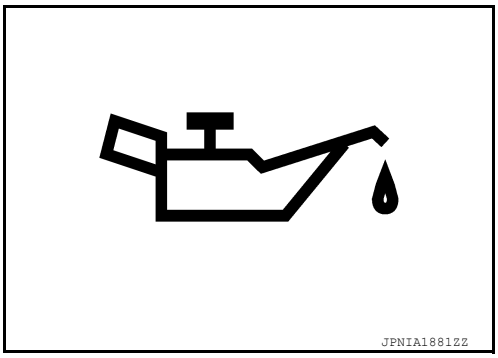
WARNING LAMPS/INDICATOR LAMPS

WARNING LAMPS/INDICATOR LAMPS : Engine Oil Pressure Warning Lamp

INFOID:0000000013927894

DESIGN/PURPOSE

When engine oil pressure is low, the oil pressure warning lamp informs the driver of low oil pressure to prevent damage to the engine.



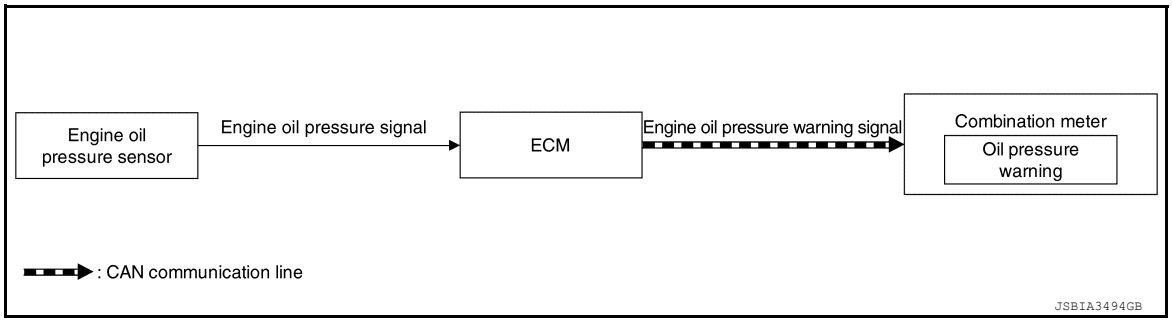
BULB CHECK

Not applicable

OPERATION AT COMBINATION METER CAN COMMUNICATION CUT-OFF OR UNUSUAL SIGNAL

For the operation for CAN communications blackout or abnormal signal reception, refer to MWI-35, "Fail-safe" (TYPE A), MWI-138, "Fail-safe" (TYPE B).

SYSTEM DIAGRAM



SIGNAL PATH

ECM calculates an engine oil pressure according to a signal transmitted from the engine oil pressure sensor. When the engine oil pressure is low, ECM transmits the engine oil pressure warning lamp signal to combination meter via CAN communication. Then the engine oil pressure warning lamp illuminates.

LIGHTING CONDITION

When any of the following conditions is satisfied:

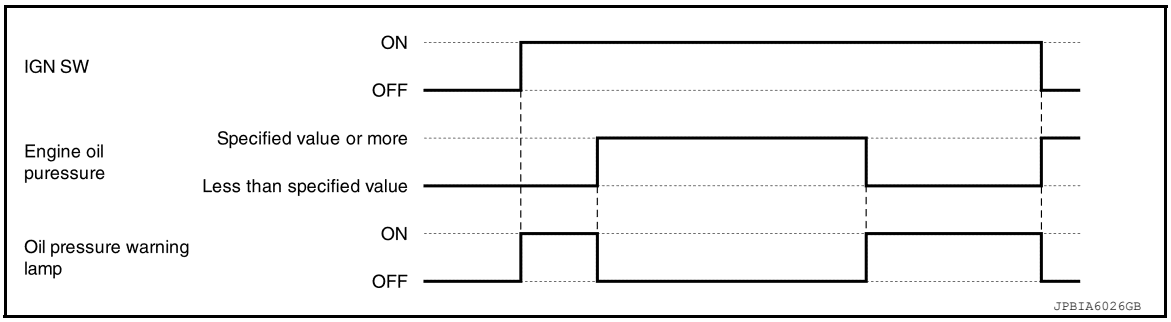
- Ignition switch: OFF
- Engine oil pressure is the specified value or more.

SHUTOFF CONDITION

When any of the following conditions is satisfied:

- Ignition switch: OFF
- Engine oil pressure is the specified value or more.

TIMING CHART



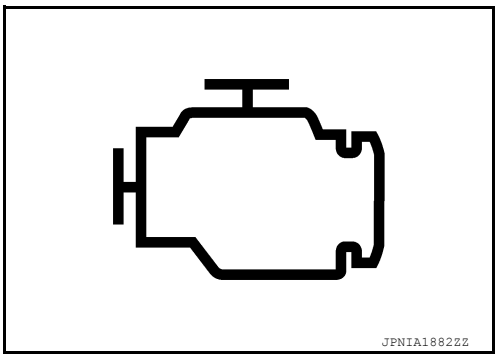
WARNING LAMPS/INDICATOR LAMPS : Malfunction Indicator Lamp (MIL)

INFOID:0000000013927895

DESIGN/PURPOSE

When a malfunction which increases exhaust gases is detected, ECM turns ON MIL and informs the driver of the necessity of inspection and repair.

When a malfunction which causes damage to the catalyst is detected, ECM immediately blinks MIL to alert the driver.



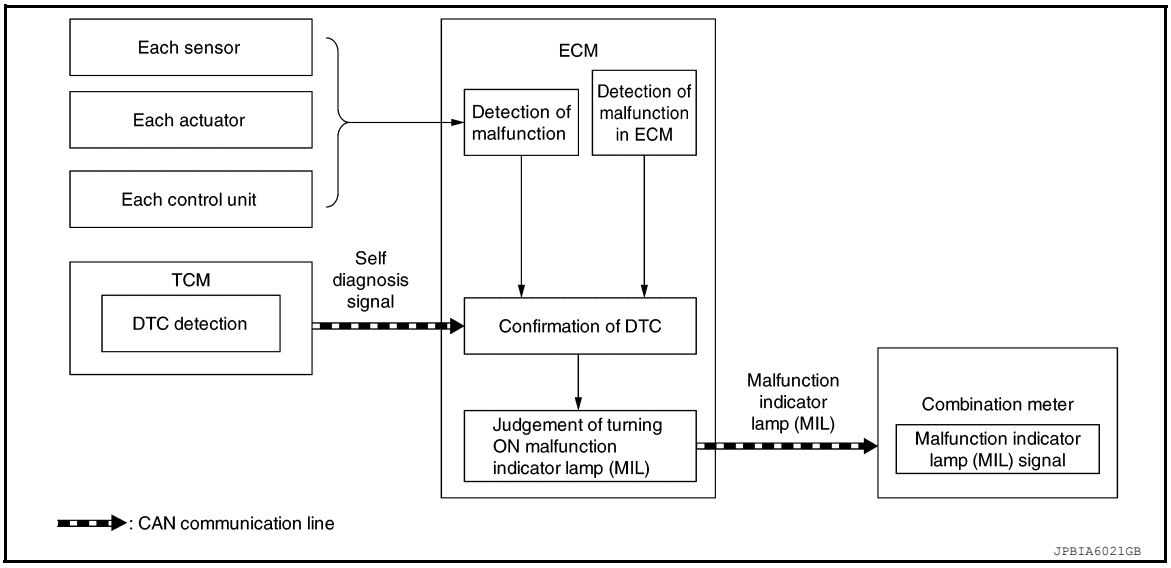
BULB CHECK

The bulb turns ON after turning ON the ignition switch (engine stop) and turns OFF after restarting the engine.

OPERATION AT COMBINATION METER CAN COMMUNICATION CUT-OFF OR UNUSUAL SIGNAL

For the operation for CAN communication blackout in the combination meter, refer to MWI-35, "Fail-safe" (TYPE A), MWI-138, "Fail-safe" (TYPE B).

SYSTEM DIAGRAM



SIGNAL PATH

- When the lighting conditions of the malfunction indicator lamp (MIL) are satisfied, ECM transmits a malfunction indicator lamp (MIL) signal to the combination meter via CAN communication.

• The combination meter turns ON or blinks the malfunction indicator lamp (MIL), according to a signal received from ECM.

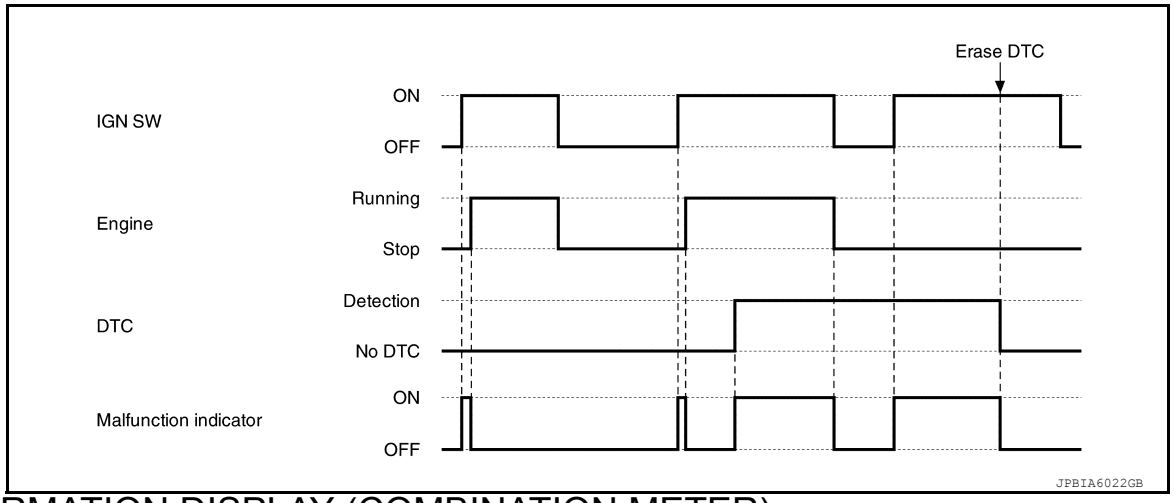
LIGHTING CONDITION

When all of the following conditions are satisfied:
• Ignition switch: ON
• DTC which influences on exhaust gasses is judged.
For DTCs that the malfunction indicator lamp turns ON and the number of DTC diagnosis trips, refer to EC-1366, "DTC Index".

SHUTOFF CONDITION

When any of the following conditions is satisfied:
• Ignition switch: OFF
• Erase DTC

TIMING CHART



INFORMATION DISPLAY (COMBINATION METER)

INFORMATION DISPLAY (COMBINATION METER) : ASCD Indicator

INFOID:0000000013927896

Item	Symbol	Function

Fuel filler cap warning	Refer to EC-1310, "INFORMATION DISPLAY (COMBINATION METER) : Fuel Filler Cap Warning".

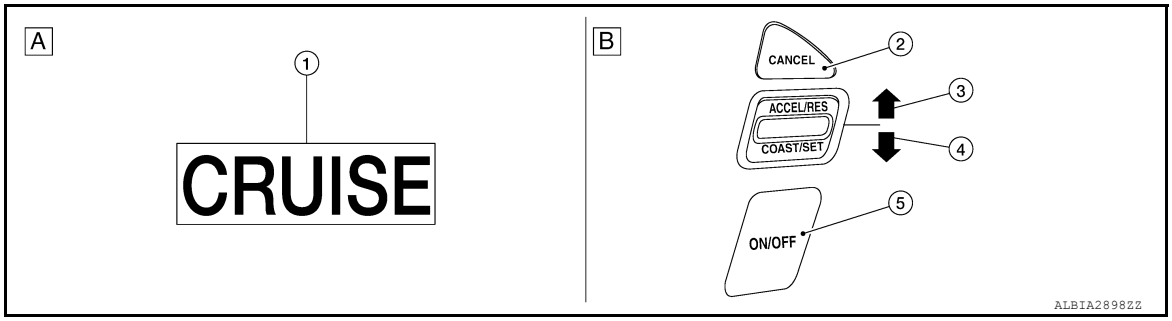
OPERATION

AUTMATIC SPEED CONTROL DEVICE (ASCD)

AUTMATIC SPEED CONTROL DEVICE (ASCD) : Switch Name and Function

INFOID:0000000013798120

SWITCHES AND INDICATORS



1. CRUISE indicator lamp
2. CANCEL switch
3. ACCELERATE/RESUME switch
4. COAST/SET switch
5. ASCD MAIN switch
A. On the combination meter
B. On the steering wheel

SET SPEED RANGE

ASCD system can be set the following vehicle speed.

Minimum speed (Approx.)	Maximum speed (Approx.)
40 km/h (25 MPH)	143 km/h (88 MPH)

SWITCH OPERATION

Item	Function
CANCEL switch	Cancels the cruise control driving.
ACCELERATE/RESUME switch	• Resumes the set speed. • Increases speed incrementally during cruise control driving.
COAST/SET switch	• Sets desired cruise speed. • Decreases speed incrementally during cruise control driving.
ASCD MAIN switch	Master switch to activate the ASCD system. (CRUISE indicator lamp is turned ON when ASCD system is ON.)

CANCEL CONDITION

• When any of following conditions exist, the cruise operation is canceled.
- CANCEL switch is pressed
- ASCD MAIN switch pressed (Set speed is cleared)
- More than two switches at ASCD steering switch are pressed at the same time (Set speed is cleared)
- Brake pedal is depressed
- Selector lever position is changed to N, P or R
- Vehicle speed decreased to 13 km/h (8 MPH) lower than the set speed
- TCS system is operated

• When the ECM detects any of the following conditions, the ECM cancels the cruise operation and informs the driver by blinking CRUISE indicator lamp.
- Engine coolant temperature is slightly higher than the normal operating temperature. Then CRUISE indicator lamp is blinked slowly.

NOTE:

Engine coolant temperature decreases to the normal operating temperature, CRUISE indicator lamp stop blinking and the cruise operation is able to work.

- Malfunction for some self-diagnoses regarding ASCD system. CRUISE indicator lamp is blinked quickly.

- When ASCD MAIN switch is turned to OFF during the cruise control driving, all of ASCD operations is canceled and vehicle speed memory is erased.

ON BOARD DIAGNOSTIC (OBD) SYSTEM

Diagnosis Description

INFOID:0000000013798121

This system is an on board diagnostic system that records exhaust emission-related diagnostic information and detects a sensors/actuator-related malfunction. A malfunction is indicated by the malfunction indicator lamp (MIL) and stored in control module memory as a DTC. The diagnostic information can be obtained with the diagnostic tool (GST: Generic Scan Tool).

GST (Generic Scan Tool)

INFOID:0000000013798122

When GST is connected with a data link connector equipped on the vehicle side, it will communicate with the control module equipped in the vehicle and then enable various kinds of diagnostic tests. Refer to GI-51, "Description".

NOTE:
Service $0A is not applied for regions where it is not mandated.

DIAGNOSIS SYSTEM (ECM)
DIAGNOSIS DESCRIPTION
DIAGNOSIS DESCRIPTION : 1st Trip Detection Logic and Two Trip Detection Logic

INFOID:0000000013798123

When a malfunction is detected for the first time, 1st trip DTC and 1st trip Freeze Frame data are stored in the ECM memory. The MIL will not illuminate at this stage. <1st trip>
If the same malfunction is detected again during the next drive, the DTC and Freeze Frame data are stored in the ECM memory, and the MIL illuminates. The MIL illuminates at the same time when the DTC is stored. <2nd trip> The “trip” in the “Two Trip Detection Logic” means a driving mode in which self-diagnosis is performed during vehicle operation. Specific on board diagnostic items will cause the ECM to illuminate or blink the MIL, and store DTC and Freeze Frame data, even in the 1st trip, as shown below.

×: Applicable —: Not applicable

Items	MIL				DTC		1st trip DTC	
	1st trip		2nd trip		1st trip displaying	2nd trip displaying	1st trip displaying	2nd trip displaying
	Blinking	Illuminate	Blinking	Illuminate				
Misfire (Possible three way catalyst damage) — DTC: P0300 - P0308 is being detected	×	—	—	—	—	—	×	—
Misfire (Possible three way catalyst damage) — DTC: P0300 - P0308 is being detected	—	—	×	—	—	×	—	—
One trip detection diagnoses (Refer to EC-1366, "DTC Index".)	—	×	—	—	×	—	—	—
Except above	—	—	—	×	—	×	×	—

DIAGNOSIS DESCRIPTION : DTC and Freeze Frame Data

INFOID:0000000013798124

DTC AND 1ST TRIP DTC

The 1st trip DTC (whose number is the same as the DTC number) is displayed for the latest self-diagnostic result obtained. If the ECM memory was cleared previously, and the 1st trip DTC did not recur, the 1st trip DTC will not be displayed.
If a malfunction is detected during the 1st trip, the 1st trip DTC is saved in the ECM memory. The MIL will not light up (two trip detection logic). If the same malfunction is not detected in the 2nd trip (meeting the required driving pattern), the 1st trip DTC is cleared from the ECM memory. If the same malfunction is detected in the 2nd trip, both the 1st trip DTC and DTC are saved in the ECM memory and the MIL lights up. In other words, the DTC is stored in the ECM memory and the MIL lights up when the same malfunction occurs in two consecutive trips. If a 1st trip DTC is stored and a non-diagnostic operation is performed between the 1st and 2nd trips, only the 1st trip DTC will continue to be stored. For malfunctions that blink or light up the MIL during the 1st trip, the DTC and 1st trip DTC are stored in the ECM memory.
For malfunctions in which 1st trip DTCs are displayed, refer to EC-1366, "DTC Index". These items are required by legal regulations to continuously monitor the system/component. In addition, the items monitored non-continuously are also displayed on CONSULT.
1st trip DTC is specified in Service $07 of SAE J1979/ISO 15031-5. 1st trip DTC detection occurs without illuminating the MIL and therefore does not warn the driver of a malfunction.
When a 1st trip DTC is detected, check, print out or write down and erase (1st trip) DTC and Freeze Frame data as specified in Work Flow procedure Step 2, refer to EC-1415, "Work Flow". Then perform DTC Confirmation Procedure or Component Function Check to try to duplicate the malfunction. If the malfunction is duplicated, the item requires repair.

FREEZE FRAME DATA AND 1ST TRIP FREEZE FRAME DATA

The ECM records the driving conditions such as fuel system status, calculated load value, engine coolant temperature, short term fuel trim, long term fuel trim, engine speed, vehicle speed, absolute throttle position, base fuel schedule and intake air temperature at the moment a malfunction is detected.
Data which are stored in the ECM memory, along with the 1st trip DTC, are called 1st trip freeze frame data. The data, stored together with the DTC data, are called freeze frame data and displayed on CONSULT or GST. The 1st trip freeze frame data can only be displayed on the CONSULT screen.

Only one set of freeze frame data (either 1st trip freeze frame data or freeze frame data) can be stored in the ECM. 1st trip freeze frame data is stored in the ECM memory along with the 1st trip DTC. There is no priority for 1st trip freeze frame data and it is updated each time a different 1st trip DTC is detected. However, once freeze frame data (2nd trip detection/MIL on) is stored in the ECM memory, 1st trip freeze frame data is no longer stored. Remember, only one set of freeze frame data can be stored in the ECM. The ECM has the following priorities to update the data.

Priority	Items	
1	Freeze frame data	Misfire — DTC: P0300 - P0308 Fuel Injection System Function — DTC: P0171, P0172, P0174, P0175
2		Except the above items
3	1st trip freeze frame data	

For example, the EGR malfunction (Priority: 2) was detected and the freeze frame data was saved in the 2nd trip. After that when the misfire (Priority: 1) is detected in another trip, the freeze frame data will be updated from the EGR malfunction to the misfire. The 1st trip freeze frame data is updated each time a different malfunction is detected. There is no priority for 1st trip freeze frame data. However, once freeze frame data is stored in the ECM memory, 1st trip freeze data is no longer stored (because only one freeze frame data or 1st trip freeze frame data can be stored in the ECM). If freeze frame data is stored in the ECM memory and freeze frame data with the same priority occurs later, the first (original) freeze frame data remains unchanged in the ECM memory.
Both 1st trip freeze frame data and freeze frame data (along with the DTCs) are cleared when the ECM memory is erased.

DIAGNOSIS DESCRIPTION : Counter System

INFOID:0000000013798125

RELATIONSHIP BETWEEN MIL, 1ST TRIP DTC, DTC, AND DETECTABLE ITEMS

- When a malfunction is detected for the first time, the 1st trip DTC and the 1st trip freeze frame data are stored in the ECM memory.
- When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data are stored in the ECM memory, and the MIL will come on.
- The MIL will turn OFF after the vehicle is driven 3 times (driving pattern B) with no malfunction. The drive is counted only when the recorded driving pattern is met (as stored in the ECM). If another malfunction occurs while counting, the counter will reset.
- The DTC and the freeze frame data will be stored until the vehicle is driven 40 times (driving pattern A) without the same malfunction recurring (except for Misfire and Fuel Injection System). For Misfire and Fuel Injection System, the DTC and freeze frame data will be stored until the vehicle is driven 80 times (driving pattern C) without the same malfunction recurring. The “TIME” in “SELF-DIAGNOSTIC RESULTS” mode of CONSULT will count the number of times the vehicle is driven.
- The 1st trip DTC is not displayed when the self-diagnosis results in OK for the 2nd trip.

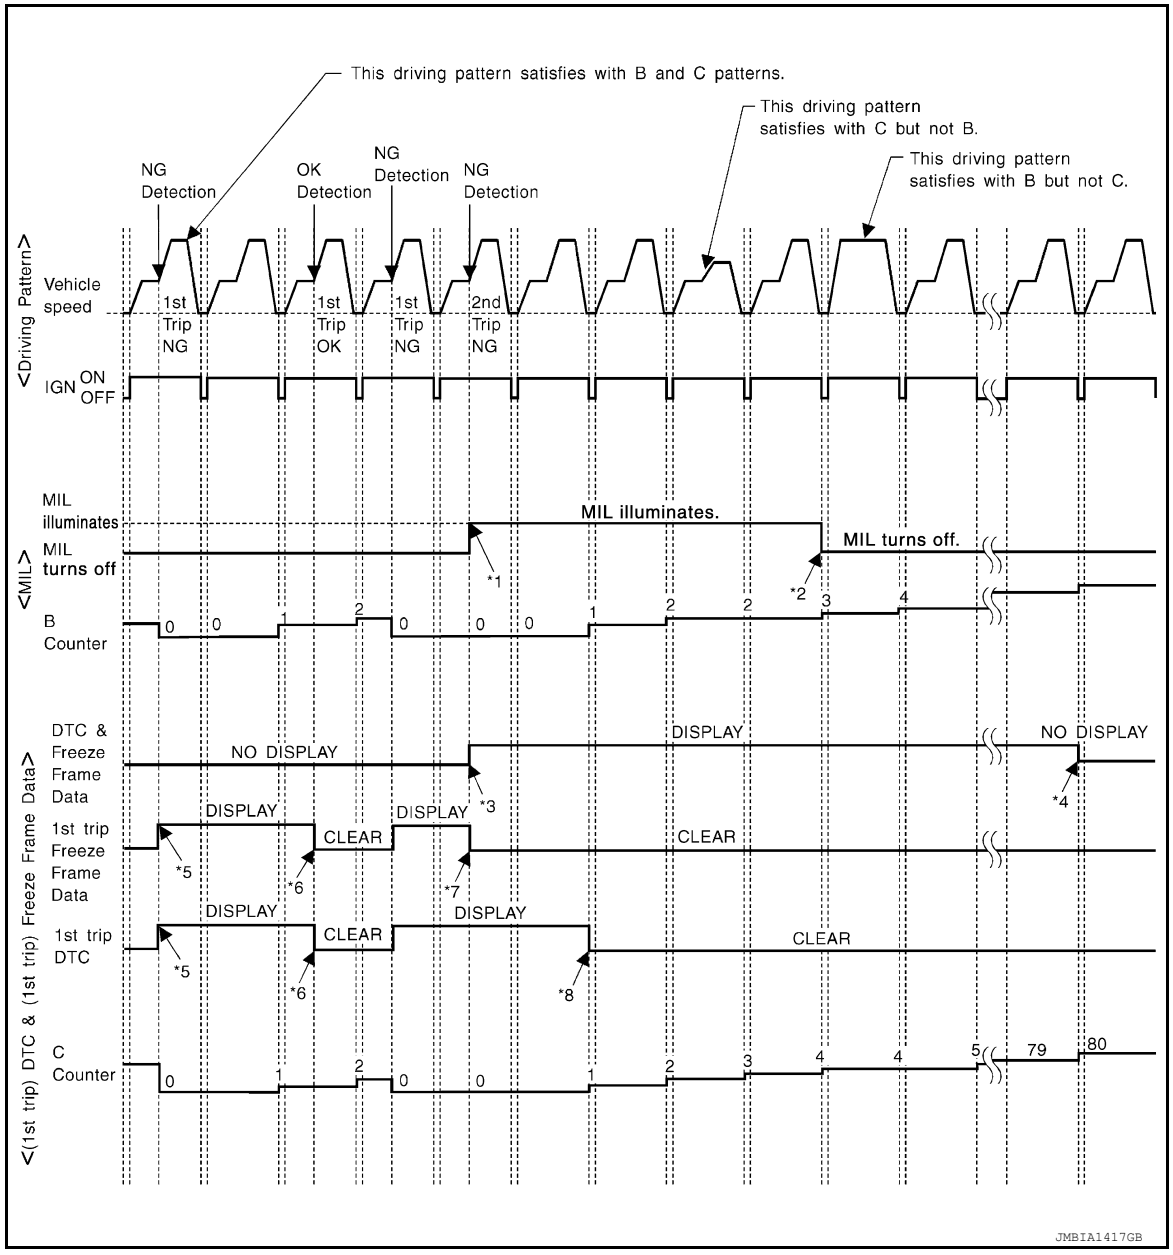
COUNTER SYSTEM CHART

Items	Fuel Injection System	Misfire	Other
MIL (turns OFF)	3 (pattern B)	3 (pattern B)	3 (pattern B)
DTC, Freeze Frame Data (no display)	80 (pattern C)	80 (pattern C)	40 (pattern A)
1st Trip DTC (clear)	1 (pattern C), *1	1 (pattern C), *1	1 (pattern B)
1st Trip Freeze Frame Data (clear)	*1, *2	*1, *2	1 (pattern B)

For details about patterns B and C under “Fuel Injection System” and “Misfire”, see “EXPLANATION FOR DRIVING PATTERNS FOR “MISFIRE <EXHAUST QUALITY DETERIORATION>”, “FUEL INJECTION SYSTEM”.
For details about patterns A and B under Other, see “EXPLANATION FOR DRIVING PATTERNS FOR “MISFIRE <EXHAUST QUALITY DETERIORATION>”, “FUEL INJECTION SYSTEM”.

- *1: Clear timing is at the moment OK is detected.
- *2: Clear timing is when the same malfunction is detected in the 2nd trip.

Relationship Between MIL, DTC, 1st Trip DTC and Driving Patterns for “Misfire <Exhaust Quality Deterioration>”, “Fuel Injection System”



*1: When the same malfunction is detected in two consecutive trips, MIL will light up.

*2: MIL will turn OFF after vehicle is driven 3 times (pattern B) without any malfunctions.

*3: When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data will be stored in ECM.

*4: The DTC and the freeze frame data will not be displayed any longer after vehicle is driven 80 times (pattern C) without the same malfunction. (The DTC and the freeze frame data still remain in ECM.)

*5: When a malfunction is detected for the first time, the 1st trip DTC and the 1st trip freeze frame data will be stored in ECM.

*6: The 1st trip DTC and the 1st trip freeze frame data will be cleared at the moment OK is detected.

*7: When the same malfunction is detected in the 2nd trip, the 1st trip freeze frame data will be cleared.

*8: 1st trip DTC will be cleared when vehicle is driven once (pattern C) without the same malfunction after DTC is stored in ECM.

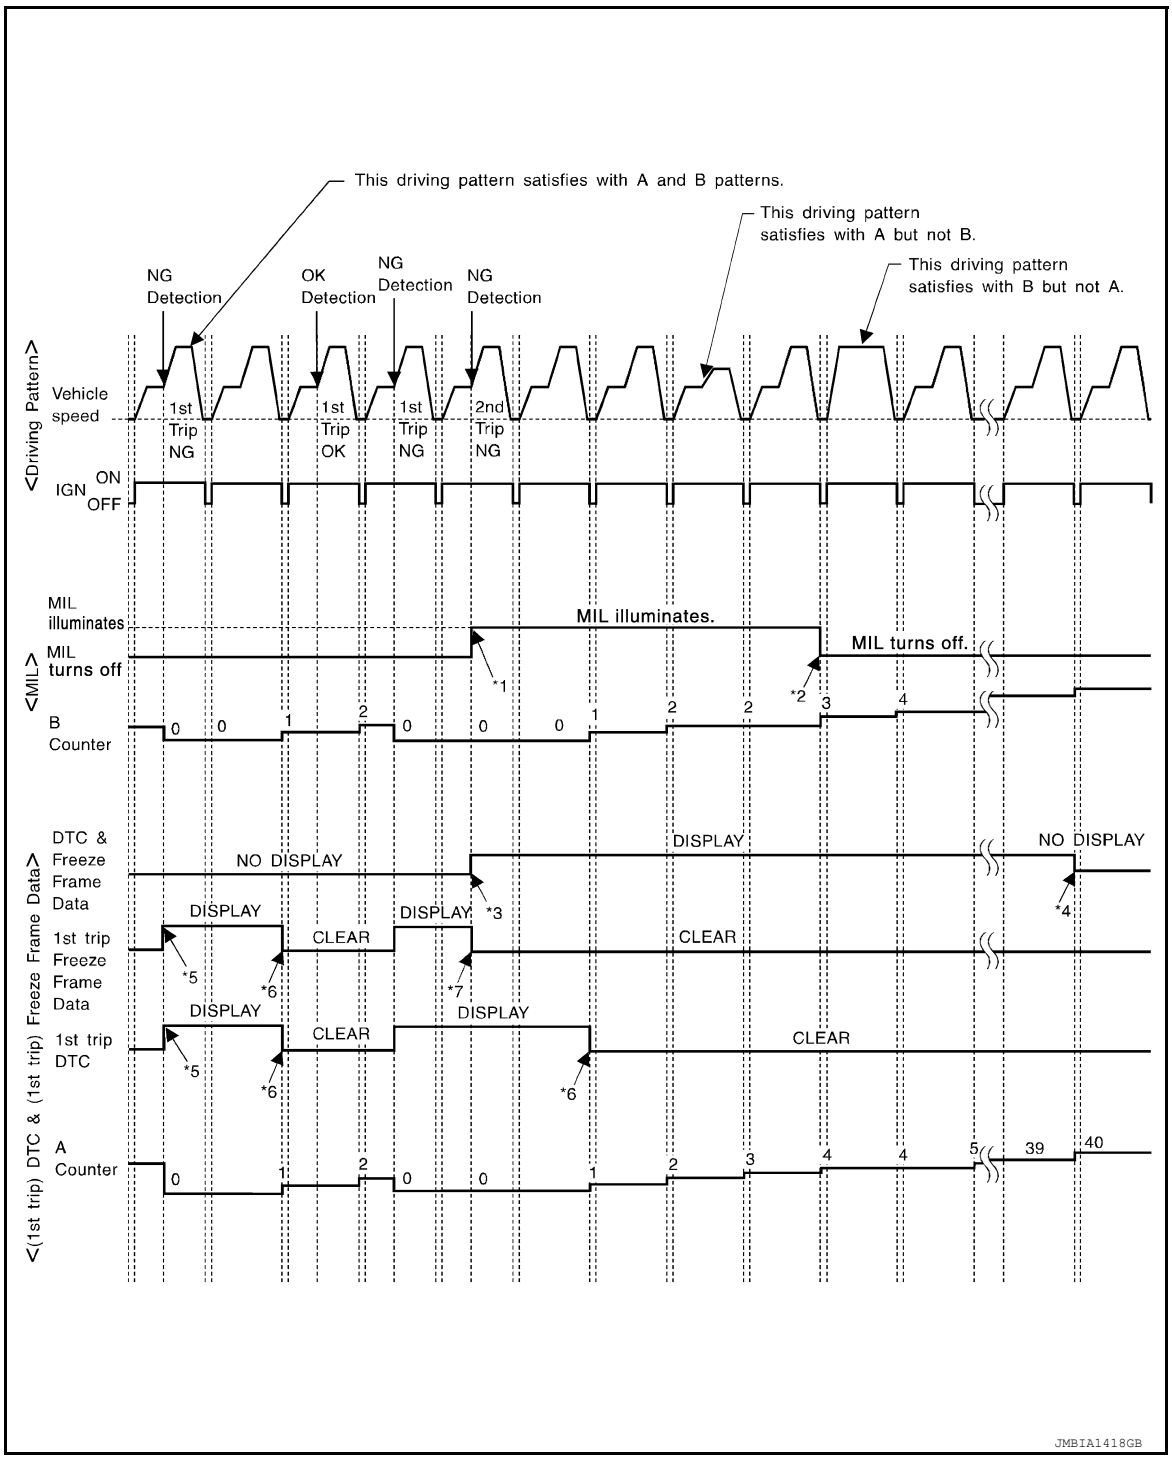
Explanation for Driving Patterns for “Misfire <Exhaust Quality Deterioration>”, “Fuel Injection System”

Driving Pattern B

Refer to EC-1319, "DIAGNOSIS DESCRIPTION : Driving Pattern".

Driving Pattern C
Refer to EC-1319, "DIAGNOSIS DESCRIPTION : Driving Pattern".
Example:
If the stored freeze frame data is as per the following:
Engine speed: 850 rpm, Calculated load value: 30%, Engine coolant temperature: 80°C (176°F)
To be satisfied with driving pattern C, the vehicle should run under the following conditions:
Engine speed: 475 – 1,225 rpm, Calculated load value: 27 – 33%, Engine coolant temperature: more than 70°C (158°F)

Relationship Between MIL, DTC, 1st Trip DTC and Driving Patterns Except For “Misfire <Exhaust Quality Deterioration>”, “Fuel Injection System”



*1: When the same malfunction is detected in two consecutive trips, MIL will light up.

*2: MIL will turn OFF after vehicle is driven 3 times (pattern B) without any malfunctions.

*3: When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data will be stored in ECM.

*4: The DTC and the freeze frame data will not be displayed any longer after vehicle is driven 40 times (pattern A) without the same malfunction. (The DTC and the freeze frame data still remain in ECM.)

*5: When a malfunction is detected for the first time, the 1st trip DTC and the 1st trip freeze frame data will be stored in ECM.

*6: 1st trip DTC will be cleared after vehicle is driven once (pattern B) without the same malfunction.

*7: When the same malfunction is detected in the 2nd trip, the 1st trip freeze frame data will be cleared.

Explanation for Driving Patterns Except for “Misfire <Exhaust Quality Deterioration>”, “Fuel Injection System”

Driving Pattern A
Refer to EC-1319, "DIAGNOSIS DESCRIPTION : Driving Pattern".

Driving Pattern B
Refer to EC-1319, "DIAGNOSIS DESCRIPTION : Driving Pattern".

DIAGNOSIS DESCRIPTION : Driving Pattern

INFOID:0000000013798126

CAUTION:
Always drive at a safe speed.

DRIVING PATTERN A

Driving pattern A means a trip satisfying the following conditions.
- Engine speed reaches 400 rpm or more.
- Engine coolant temperature rises by 20°C (68°F) or more after starting the engine.
- Engine coolant temperature reaches 70°C (158°F) or more.
- The ignition switch is turned from ON to OFF.

NOTE:
- When the same malfunction is detected regardless of driving conditions, reset the counter of driving pattern A.
- When the above conditions are satisfied without detecting the same malfunction, reset the counter of driving pattern A.

DRIVING PATTERN B

Driving pattern B means a trip satisfying the following conditions.
- Engine speed reaches 400 rpm or more.
- Engine coolant temperature reaches 70°C (158°F) or more.
- Vehicle speed of 70 – 120 km/h (44 – 75 MPH) is maintained for 60 seconds or more under the control of closed loop.
- Vehicle speed of 30 – 60 km/h (19 – 37 MPH) is maintained for 10 seconds or more under the control of closed loop.
- Under the closed loop control condition, the following state reaches 12 seconds or more in total: Vehicle speed of 4 km/h (2 MPH) or less with idling condition.
- The state of driving at 10 km/h (7 MPH) or more reaches 10 minutes or more in total.
- A lapse of 22 minutes or more after engine start.

NOTE:
- Drive the vehicle at a constant velocity.
- When the same malfunction is detected regardless of driving conditions, reset the counter of driving pattern B.
- When the above conditions are satisfied without detecting the same malfunction, reset the counter of driving pattern B.

DRIVING PATTERN C

Driving pattern C means operating vehicle as per the following:
The following conditions should be satisfied at the same time:
Engine speed: (Engine speed in the freeze frame data) ±375 rpm

Calculated load value: (Calculated load value in the freeze frame data) x (1±0.1) [%]
Engine coolant temperature condition:
- When the freeze frame data shows lower than 70°C (158°F), engine coolant temperature should be lower than 70°C (158°F).
- When the freeze frame data shows higher than or equal to 70°C (158°F), engine coolant temperature should be higher than or equal to 70°C (158°F).

NOTE:
- When the same malfunction is detected regardless of the above vehicle conditions, reset the counter of driving pattern C.
- When the above conditions are satisfied without detecting the same malfunction, reset the counter of driving pattern C.
- The 1st trip DTC will be cleared when C counter is counted once without the same malfunction after DTC is stored in ECM.

DRIVING PATTERN D

Driving pattern D means a trip satisfying the following conditions.
- The state of driving at 40 km/h (25 MPH) reaches 300 seconds or more in total.
- Idle speed lasts 30 seconds or more.
- A lapse of 600 seconds or more after engine start.

NOTE:
- When the same malfunction is detected regardless of driving conditions, reset the counter of driving pattern D.
- When the above conditions are satisfied without detecting the same malfunction, reset the counter of driving pattern D.

DIAGNOSIS DESCRIPTION : System Readiness Test (SRT) Code

INFOID:0000000013798127

System Readiness Test (SRT) code is specified in Service $01 of SAE J1979/ISO 15031-5.
As part of an enhanced emissions test for Inspection & Maintenance (I/M), certain states require the status of SRT be used to indicate whether the ECM has completed self-diagnosis of major emission systems and components. Completion must be verified in order for the emissions inspection to proceed.
If a vehicle is rejected for a State emissions inspection due to one or more SRT items indicating “INCMP”, use the information in this Service Manual to set the SRT to “CMPLT”.
In most cases the ECM will automatically complete its self-diagnosis cycle during normal usage, and the SRT status will indicate “CMPLT” for each application system. Once set as “CMPLT”, the SRT status remains “CMPLT” until the self-diagnosis memory is erased.
Occasionally, certain portions of the self-diagnostic test may not be completed as a result of the customer's normal driving pattern; the SRT will indicate “INCMP” for these items.

NOTE:
The SRT will also indicate “INCMP” if the self-diagnosis memory is erased for any reason or if the ECM memory power supply is interrupted for several hours.
If, during the state emissions inspection, the SRT indicates “CMPLT” for all test items, the inspector will continue with the emissions test. However, if the SRT indicates “INCMP” for one or more of the SRT items the vehicle is returned to the customer untested.

NOTE:
If permanent DTC is stored or MIL illuminates during the state emissions inspection, the vehicle is also returned to the customer untested even though the SRT indicates “CMPLT” for all test items. Therefore, it is important to check SRT (“CMPLT”), DTC (No DTCs) and permanent DTC (NO permanent DTCs) before the inspection.

SRT SET TIMING

SRT is set as “CMPLT” after self-diagnosis has been performed one or more times. Completion of SRT is done regardless of whether the result is OK or NG. The set timing is different between OK and NG results and is shown in the table below.

Self-diagnosis result		Example				
		Diagnosis	Ignition cycle ← ON →	OFF ← ON →	OFF ← ON →	OFF ← ON →
All OK	Case 1	P0400	OK (1)	— (1)	OK (2)	— (2)
		P0402	OK (1)	— (1)	— (1)	OK (2)
		P1402	OK (1)	OK (2)	— (2)	— (2)
		SRT of EGR	“CMPLT”	“CMPLT”	“CMPLT”	“CMPLT”
	Case 2	P0400	OK (1)	— (1)	— (1)	— (1)
		P0402	— (0)	— (0)	OK (1)	— (1)
		P1402	OK (1)	OK (2)	— (2)	— (2)
		SRT of EGR	“INCMP”	“INCMP”	“CMPLT”	“CMPLT”
NG exists	Case 3	P0400	OK	OK	—	—
		P0402	—	—	—	—
		P1402	NG	—	NG	NG (Consecutive NG)
		(1st trip) DTC	1st trip DTC	—	1st trip DTC	DTC (= MIL ON)
		SRT of EGR	“INCMP”	“INCMP”	“INCMP”	“CMPLT”

OK: Self-diagnosis is carried out and the result is OK.

NG: Self-diagnosis is carried out and the result is NG.

—: Self-diagnosis is not carried out.

When all SRT related self-diagnoses show OK results in a single cycle (Ignition OFF-ON-OFF), the SRT will indicate “CMPLT”. → Case 1 above

When all SRT related self-diagnoses show OK results through several different cycles, the SRT will indicate “CMPLT” at the time the respective self-diagnoses have at least one OK result. → Case 2 above

If one or more SRT related self-diagnoses show NG results in 2 consecutive cycles, the SRT will also indicate “CMPLT”. → Case 3 above

The table above shows that the minimum number of cycles for setting SRT as “INCMP” is the number one (1) for each self-diagnosis (Case 1 & 2) or the number two (2) for one of self-diagnoses (Case 3). However, in preparation for the state emissions inspection, it is unnecessary for each self-diagnosis to be executed twice (Case 3) for the following reasons:

- The SRT will indicate “CMPLT” at the time the respective self-diagnoses have one (1) OK result.
- The emissions inspection requires “CMPLT” of the SRT only with OK self-diagnosis results.
- During SRT driving pattern, the 1st trip DTC (NG) is detected prior to “CMPLT” of SRT and the self-diagnosis memory must be erased from the ECM after repair.
- If the 1st trip DTC is erased, all the SRT will indicate “INCMP”.

NOTE:

SRT can be set as “CMPLT” together with the DTC(s). Therefore, DTC check must always be carried out prior to the state emission inspection even though the SRT indicates “CMPLT”.

DIAGNOSIS DESCRIPTION : Permanent Diagnostic Trouble Code (Permanent DTC)

INFOID:0000000013798128

Permanent DTC is defined in SAE J1979/ISO 15031-5 Service $0A.

ECM stores a DTC issuing a command of turning on MIL as a permanent DTC and keeps storing the DTC as a permanent DTC until ECM judges that there is no presence of malfunction.

Permanent DTCs cannot be erased by using the erase function of CONSULT or Generic Scan Tool (GST) and by disconnecting the battery to shut off power to ECM. This prevents a vehicle from passing the in-use inspection without repairing a malfunctioning part.

When not passing the in-use inspection due to more than one permanent DTC, permanent DTCs should be erased, referring to this manual.

NOTE:

- The important items in in-use inspection are that MIL is not ON, SRT test items are set, and permanent DTCs are not included.
- Permanent DTCs do not apply for regions that permanent DTCs are not regulated by law.

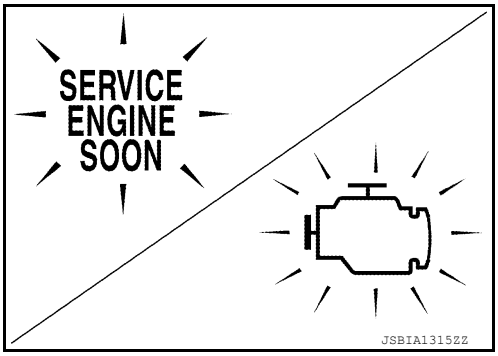
PERMANENT DTC SET TIMING

The setting timing of permanent DTC is stored in ECM with the lighting of MIL when a DTC is confirmed.

DIAGNOSIS DESCRIPTION : Malfunction Indicator Lamp (MIL)

INFOID:0000000013798129

When emission-related ECU detects a malfunction in the emission control systems components and/or the powertrain control components (which affect vehicle emissions), it turns on/blinks MIL to inform the driver that a malfunction has been detected.



1. The MIL illuminates when ignition switch is turned ON (engine is not running).
   NOTE:
   Check the MIL circuit if MIL does not illuminate. Refer to EC-1911, "Component Function Check".
2. When the engine is started, the MIL should go off.
   NOTE:
   If MIL continues to illuminate/blink, perform self-diagnoses and inspect/repair accordingly because an emission-related ECU has detected a malfunction in the emission control systems components and/or the powertrain control components (which affect vehicle emissions).

On Board Diagnosis Function

INFOID:0000000013798130

ON BOARD DIAGNOSIS ITEM

The on board diagnostic system has the following functions.

Diagnostic test mode	Function
Bulb check	MIL can be checked.
SRT status	ECM can read if SRT codes are set.
Malfunction warning	If ECM detects a malfunction, it illuminates or blinks MIL to inform the driver that a malfunction has been detected.
Self-diagnostic results	DTCs or 1st trip DTCs stored in ECM can be read.
Accelerator pedal released position learning	ECM can learn the accelerator pedal released position. Refer to EC-1428, "Description".
Throttle valve closed position learning	ECM can learn the throttle valve closed position. Refer to EC-1429, "Description".
Idle air volume learning	ECM can learn the idle air volume. Refer to EC-1430, "Description".
VVEL control shaft position sensor adjustment	The initial position of the VVEL control shaft position sensor can be adjusted. Refer to EC-1432, "Description".

BLUB CHECK MODE

Description

This function allows damage inspection in the MIL bulb (blown, open circuit, etc.).

Operation Procedure

1. Turn ignition switch ON.
2. The MIL on the instrument panel should stay ON.
   If it remains OFF, check MIL circuit. Refer to EC-1911, "Diagnosis Procedure".

SRT STATUS MODE

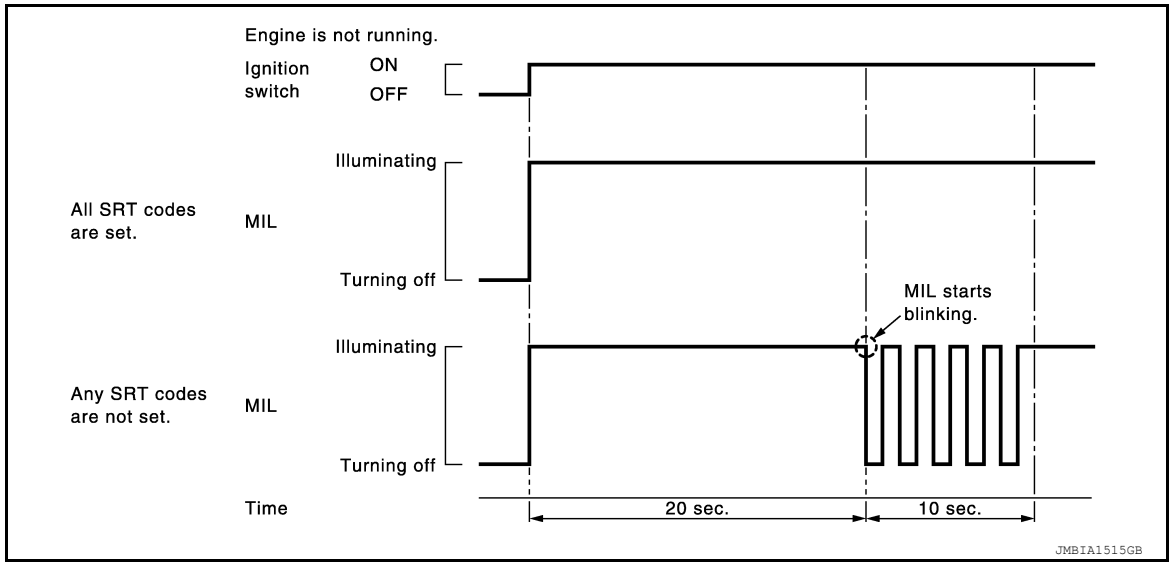
Description

This function allows to read if ECM has completed the self-diagnoses of major emission control systems and components. For SRT, refer to EC-1320, "DIAGNOSIS DESCRIPTION : System Readiness Test (SRT) Code".

Operation Procedure

1. Turn ignition switch ON and wait 20 seconds.
2. SRT status is indicated as shown blow.
   - ECM continues to illuminate MIL if all SRT codes are set.

- ECM blinks MIL for about 10 seconds if all SRT codes are not set.



MALFUNCTION WARNING MODE

Description

In this function ECM turns on or blinks MIL when it detects a malfunction in the emission control system components and/or the powertrain control components (which affect vehicle emissions) to inform the driver that a malfunction has been detected.

Operation Procedure

1. Turn ignition switch ON.
2. Check that MIL illuminates.
   If it remains OFF, check MIL circuit. Refer to EC-1911, "Diagnosis Procedure".
3. Start engine and let it idle.
   - For two trip detection logic diagnoses, ECM turns on MIL when it detects the same malfunction twice in the two consecutive driving cycles.
   - For 1st trip detection logic diagnoses, ECM turns on MIL when it detects a malfunction in one driving cycle.
   - ECM blinks MIL when it detects a malfunction that may damage the three way catalyst (misfire).

SELF-DIAGNOSTIC RESULTS MODE

Description

This function allows to indicate DTCs or 1st trip DTCs stored in ECM according to the number of times MIL is blinking.

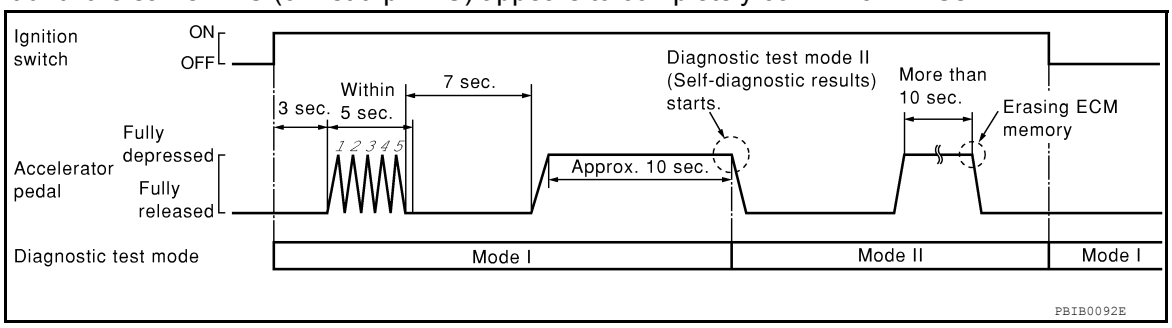
How to Set Self-diagnostic Results Mode

NOTE:

- It is better to count the time accurately with a clock.
- It is impossible to switch the diagnostic mode when an accelerator pedal position sensor circuit has a malfunction.
- After ignition switch is turned off, ECM is always released from the “Self-diagnostic results” mode.

1. Confirm that accelerator pedal is fully released, turn ignition switch ON and wait 3 seconds.
2. Repeat the following procedure quickly five times within 5 seconds.
   - Fully depress the accelerator pedal.
   - Fully release the accelerator pedal.
3. Wait 7 seconds, fully depress the accelerator pedal and keep it depressed for approx. 10 seconds until the MIL starts blinking.
   NOTE:
   Do not release the accelerator pedal for 10 seconds if MIL starts blinking during this period. This blinking is displaying SRT status and is continued for another 10 seconds.
4. Fully release the accelerator pedal.
   ECM has entered to Self-diagnostic results mode.

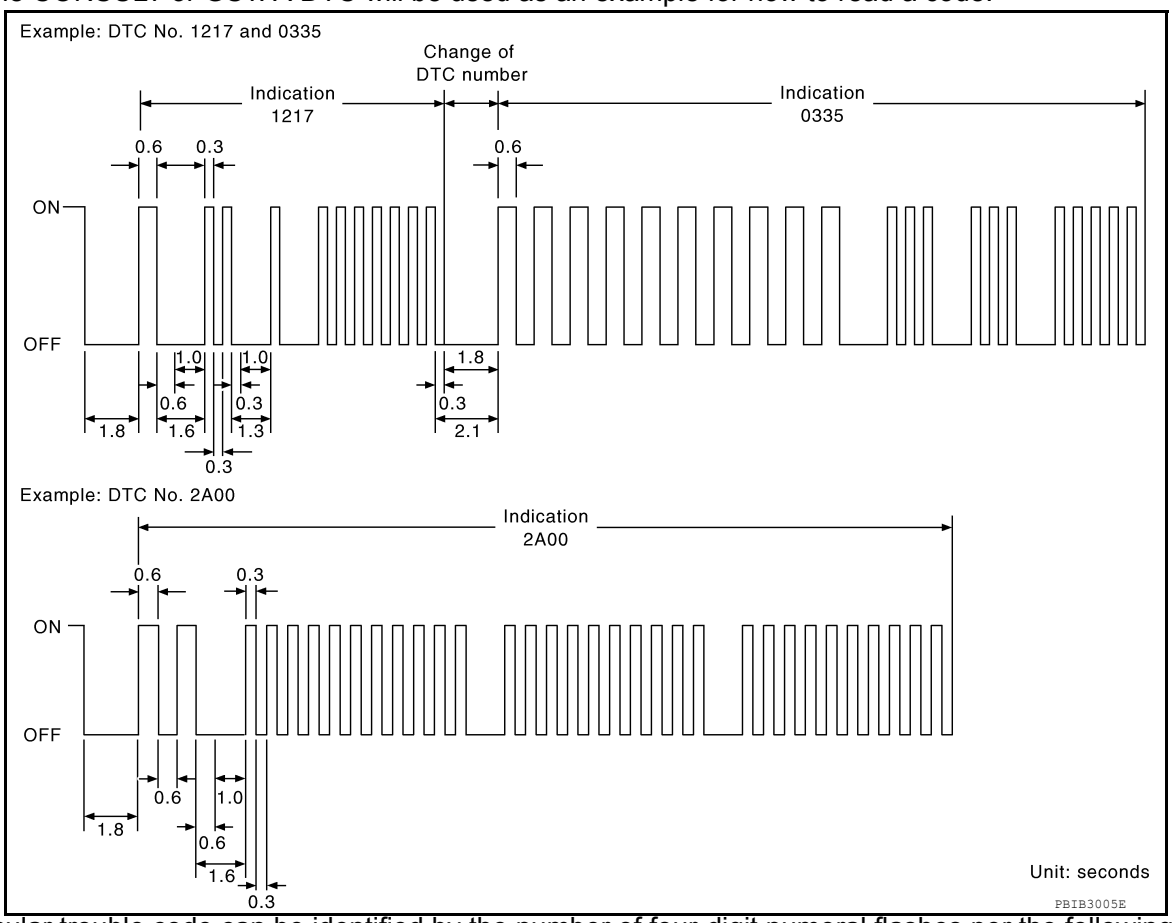
NOTE:
Wait until the same DTC (or 1st trip DTC) appears to completely confirm all DTCs.



How to Read Self-diagnostic Results

The DTC and 1st trip DTC are indicated by the number of blinks of the MIL as shown below.

The DTC and 1st trip DTC are displayed at the same time. If the MIL does not illuminate in diagnostic test mode I (Malfunction warning), all displayed items are 1st trip DTCs. If only one code is displayed when the MIL illuminates in “malfunction warning” mode, it is a DTC; if two or more codes are displayed, they may be either DTCs or 1st trip DTCs. DTC No. is same as that of 1st trip DTC. These unidentified codes can be identified by using the CONSULT or GST. A DTC will be used as an example for how to read a code.



A particular trouble code can be identified by the number of four-digit numeral flashes per the following.

Number	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Flashes	10	1	2	3	4	5	6	7	8	9	11	12	13	14	15	16

The length of time the 1,000th-digit numeral flashes on and off is 1.2 seconds consisting of an ON (0.6-seconds) - OFF (0.6-seconds) cycle.

The 100th-digit numeral and lower digit numerals consist of a 0.3-seconds ON and 0.3-seconds OFF cycle.

A change from one digit numeral to another occurs at an interval of 1.0-second OFF. In other words, the later numeral appears on the display 1.3 seconds after the former numeral has disappeared.

A change from one trouble code to another occurs at an interval of 1.8-seconds OFF.

In this way, all the detected malfunctions are classified by their DTC numbers. The DTC 0000 refers to no malfunction. Refer to EC-1366, "DTC Index".

How to Erase Self-diagnostic Results

By performing this procedure, ECM memory is erased and the following diagnostic information is erased as well.

- Diagnostic trouble codes
- 1st trip diagnostic trouble codes
- Freeze frame data
- 1st trip freeze frame data
- System readiness test (SRT) codes
- Test values

NOTE:

Also, if a battery terminal is disconnected, ECM memory is erased and the diagnostic information as listed above is erased. (The amount of time required for erasing may vary from a few seconds to several hours.)

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Set ECM in “Self-diagnostic” results.
6. The diagnostic information has been erased from the backup memory in the ECM.
   Fully depress the accelerator pedal and keep it depressed for more than 10 seconds.
7. Fully release the accelerator pedal, and confirm the DTC 0000 is displayed.

CONSULT Function

INFOID:0000000013798131

FUNCTION

Diagnostic test mode	Function
Self Diagnostic Result	Self-diagnostic results such as 1st trip DTC, DTCs and 1st trip freeze frame data or freeze frame data can be read and erased quickly.*
Data Monitor	Input/Output data in the ECM can be read.
Work support	This mode enables a technician to adjust some devices faster and more accurately by following the indications on the CONSULT unit.
Active Test	Diagnostic Test Mode in which CONSULT drives some actuators apart from the ECMs and also shifts some parameters in a specified range.
ECU Identification	ECM part number can be read.
DTC Work Support	The status of system monitoring tests and the self-diagnosis status/results can be confirmed.

*: The following emission-related diagnostic information is cleared when the ECM memory is erased.

- Diagnostic trouble codes
- 1st trip diagnostic trouble codes
- Freeze frame data
- 1st trip freeze frame data
- System readiness test (SRT) codes
- Test values

SELF DIAGNOSTIC RESULT MODE

Self Diagnostic Item

Regarding items of DTC and 1st trip DTC, refer to EC-1366, "DTC Index".

How to Read DTC and 1st Trip DTC

DTCs and 1st trip DTCs related to the malfunction are displayed in “Self-diag results”.

- When ECM detects a 1st trip DTC, “1t” is displayed for “TIME”.
- When ECM has detected a current DTC, “0” is displayed for “TIME”.
- If “TIME” is neither “0” nor “1t”, the DTC occurred in the past and ECM shows the number of times the vehicle has been driven since the last detection of the DTC.

How to Erase DTC and 1st Trip DTC

NOTE:

- If the ignition switch stays ON after repair work, be sure to turn ignition switch OFF once. Wait at least 10 seconds and then turn it ON (engine stopped) again.
- If the DTC is not for A/T related items (see EC-1366, "DTC Index"), skip step 1.

1. Erase DTC in TCM. Refer to TM-315, "Diagnosis Description".
2. Select “ENGINE” with CONSULT.
3. Select “SELF-DIAG RESULTS”.
4. Touch “ERASE”. (DTC in ECM will be erased.)

Freeze Frame Data and 1st Trip Freeze Frame Data

Freeze frame data item*	Description
DIAG TROUBLE CODE [PXXXX]	• The engine control component part/control system has a trouble code the is displayed as PXXXX. (Refer to EC-1366, "DTC Index".)
CAL/LD VALUE [%]	• The calculated load value at the moment a malfunction is detected is displayed.
COOLANT TEMP [°C] or [°F]	• The engine coolant temperature at the moment a malfunction is detected is displayed.
L-FUEL TRM-B1 [%]	• “Long-term fuel trim” at the moment a malfunction is detected is displayed. • The long-term fuel trim indicates much more gradual feedback compensation to the base fuel schedule than short-term fuel trim.
L-FUEL TRM-B2 [%]	
S-FUEL TRM-B1 [%]	• “Short-term fuel trim” at the moment a malfunction is detected is displayed. • The short-term fuel trim indicates dynamic or instantaneous feedback compensation to the base fuel schedule.
S-FUEL TRM-B2 [%]	
ENGINE SPEED [rpm]	• The engine speed at the moment a malfunction is detected is displayed.
VEHICL SPEED [km/h] or [mph]	• The vehicle speed at the moment a malfunction is detected is displayed.
INT MANI PRES [kPa]	• These items are displayed but are not applicable to this model.
ABSOL TH·P/S [%]	• The throttle valve opening angle at the moment a malfunction is detected is displayed.
B/FUEL SCHDL [msec]	• The base fuel schedule at the moment a malfunction is detected is displayed.
INT/A TEMP SE [°C] or [°F]	• The intake air temperature at the moment a malfunction is detected is displayed.
FUEL SYS-B1	• “Fuel injection system status” at the moment a malfunction is detected is displayed. • One of the following mode is displayed. Mode2: Open loop due to detected system malfunction Mode3: Open loop due to driving conditions (power enrichment, deceleration enleanment) Mode4: Closed loop - using oxygen sensor(s) as feedback for fuel control Mode5: Open loop - has not yet satisfied condition to go to closed loop
FUEL SYS-B2	
COMBUST CONDITION	• These items are displayed but are not applicable to this model.
FUEL RAIL PRESSURE [MPa]	• The fuel rail pressure at the moment a malfunction is detected is displayed.
TARGET FUEL RAIL PRESSURE [MPa]	• The target fuel rail pressure at the moment a malfunction is detected is displayed.
BATTERY VOLTAGE [V]	• The battery voltage at the moment a malfunction is detected is displayed.
FUEL LEVEL [%]	• The fuel level at the moment a malfunction is detected is displayed.

*: The items are the same as those of 1st trip freeze frame data.

DATA MONITOR MODE

NOTE:

The following table includes information (items) inapplicable to this vehicle. For information (items) applicable to this vehicle, refer to CONSULT display items.

Monitored Item

For reference values of the following items, refer to EC-1337, "Reference Value".

×: Applicable

Monitored item	Unit	Description	Remarks
ENG SPEED	rpm	• Indicates the engine speed computed from the signal of the crankshaft position sensor and camshaft position sensor.	• Accuracy becomes poor if engine speed drops below the idle rpm. • If the signal is interrupted while the engine is running, an abnormal value may be indicated.
MAS A/F SE-B1	V	• The signal voltage of the mass air flow sensor is displayed.	• When the engine is stopped, a certain value is indicated. • When engine is running, specification range is indicated in “SPEC”.
B/FUEL SCHDL	ms	• “Base fuel schedule” indicates the fuel injection pulse width programmed into ECM, prior to any learned on board correction.	• When engine is running, specification range is indicated in “SPEC”.
A/F ALPHA-B1 A/F ALPHA-B2	%	• The mean value of the air-fuel ratio feedback correction factor per cycle is indicated.	• When the engine is stopped, a certain value is indicated. • This data also includes the data for the air-fuel ratio learning control. • When engine is running, specification range is indicated in “SPEC”.
COOLAN TEMP/S	°C or °F	• The engine coolant temperature (determined by the signal voltage of the engine coolant temperature sensor 1) is displayed.	• When the engine coolant temperature sensor 1 is open or short-circuited, ECM enters fail-safe mode. The engine coolant temperature determined by the ECM is displayed.
A/F SEN1 (B1) A/F SEN1 (B2)	V	• The A/F signal computed from the input signal of the air fuel ratio (A/F) sensor 1 is displayed.	
HO2S2 (B1) HO2S2 (B2)	V	• The signal voltage of the heated oxygen sensor 2 is displayed.	
HO2S2 MNTR (B1) HO2S2 MNTR (B2)	RICH/LEAN	• Display of heated oxygen sensor 2 signal: RICH: means the amount of oxygen after three way catalyst is relatively small. LEAN: means the amount of oxygen after three way catalyst is relatively large.	• When the engine is stopped, a certain value is indicated.
VHCL SPEED SE	km/h or mph	• The vehicle speed computed from the vehicle speed signal sent from combination meter is displayed.	
BATTERY VOLT	V	• The power supply voltage of ECM is displayed.	
ACCEL SEN 1 ACCEL SEN 2	V	• The accelerator pedal position sensor signal voltage is displayed.	• ACCEL SEN 2 signal is converted by ECM internally. Thus, they differs from ECM terminal voltage signal.
TP SEN 1-B1 TP SEN 2-B1	V	• The throttle position sensor signal voltage is displayed.	• TP SEN 2-B1 signal is converted by ECM internally. Thus, they differs from ECM terminal voltage signal.
FUEL T/TMP SE	°C or °F	• The fuel temperature (determined by the signal voltage of the fuel tank temperature sensor) is displayed.	
EVAP SYS PRES	V	• The signal voltage of EVAP control system pressure sensor is displayed.	

Monitored item	Unit	Description	Remarks
FUEL LEVEL SE	V	• The signal voltage of the fuel level sensor is displayed.	
START SIGNAL	ON/OFF	• Indicates start signal status [ON/OFF] computed by the ECM according to the signals of engine speed and battery voltage.	• After starting the engine, [OFF] is displayed regardless of the starter signal.
CLSD THL POS	ON/OFF	• Indicates idle position [ON/OFF] computed by ECM according to the accelerator pedal position sensor signal.	
AIR COND SIG	ON/OFF	• Indicates [ON/OFF] condition of the air conditioner switch as determined by the air conditioner signal.	
PW/ST SIGNAL	ON/OFF	• [ON/OFF] condition of the power steering system (determined by the signal voltage of the power steering pressure sensor signal) is indicated.	
LOAD SIGNAL	ON/OFF	• Indicates [ON/OFF] condition from the electrical load signal. ON: Rear window defogger switch is ON and/or lighting switch is in 2nd position. OFF: Both rear window defogger switch and lighting switch are OFF.	
IGNITION SW	ON/OFF	• Indicates [ON/OFF] condition from ignition switch signal.	
HEATER FAN SW	ON/OFF	• Indicates [ON/OFF] condition from the blower fan ON signal.	
BRAKE SW	ON/OFF	• Indicates [ON/OFF] condition from the stop lamp switch signal.	
IGN TIMING	BTDC	• Indicates the ignition timing computed by ECM according to the input signals.	• When the engine is stopped, a certain value is indicated.
COMBUSTION	—	• These items are displayed but are not applicable to this model.	
CAL/LD VALUE	%	• “Calculated load value” indicates the value of the current air flow divided by peak air flow.	
MASS AIRFLOW	g/s	• Indicates the mass air flow computed by ECM according to the signal voltage of the mass air flow sensor.	
PURG VOL C/V	%	• Indicates the EVAP canister purge volume control solenoid valve control value computed by the ECM according to the input signals. • The opening becomes larger as the value increases.	
INT/V SOL (B1)	%	• The control value of the intake valve timing control solenoid valve (determined by ECM according to the input signals) is indicated. • The advance angle becomes larger as the value increases.	
INT/V SOL (B2)			
AIR COND RLY	ON/OFF	• The air conditioner relay control condition (determined by ECM according to the input signals) is indicated.	
VENT CONT/V	ON/OFF	• The control condition of the EVAP canister vent control valve (determined by ECM according to the input signals) is indicated. ON: Closed OFF: Open	
THRTL RELAY	ON/OFF	• Indicates the throttle control motor relay control condition determined by the ECM according to the input signals.	

Monitored item	Unit	Description	Remarks
A/F S1 HTR (B1)	%	• Air fuel ratio (A/F) sensor 1 heater control value computed by ECM according to the input signals. • The current flow to the heater becomes larger as the value increases.	
A/F S1 HTR (B2)			
HO2S2 HTR (B1)	ON/OFF	• Indicates [ON/OFF] condition of heated oxygen sensor 2 heater determined by ECM according to the input signals.	
HO2S2 HTR (B2)			
ALT DUTY SIG	ON/OFF	• The control condition of the power generation voltage variable control (determined by ECM according to the input signals) is indicated. ON: Power generation voltage variable control is active. OFF: Power generation voltage variable control is inactive.	
I/P PULLY SPD	rpm	• Indicates the engine speed computed from the input speed sensor signal.	
VEHICLE SPEED	km/h or mph	• The vehicle speed computed from the vehicle speed signal sent from TCM is displayed.	
IDL A/V LEARN	YET/CMPLT	• Displays the condition of Idle Air Volume Learning YET: Idle air volume learning has not been performed yet. CMPLT: Idle air volume learning has already been performed successfully.	
TRVL AFTER MIL	km or mile	• Distance traveled while MIL is activated.	
SNOW MODE SW	ON/OFF	• Indicates [ON/OFF] condition from the snow mode switch signal.	
ENG OIL TEMP	°C or °F	• The engine oil temperature (determined by the signal voltage of the engine oil temperature sensor) is displayed.	
MAIN SW	ON/OFF	• Indicates [ON/OFF] condition from MAIN switch signal.	
CANCEL SW	ON/OFF	• Indicates [ON/OFF] condition from CANCEL switch signal.	
RESUME/ACC SW	ON/OFF	• Indicates [ON/OFF] condition from ACCELERATE/RESUME switch signal.	
SET SW	ON/OFF	• Indicates [ON/OFF] condition from COAST/SET switch signal.	
BRAKE SW1	ON/OFF	• Indicates [ON/OFF] condition from brake pedal position switch signal.	
BRAKE SW2	ON/OFF	• Indicates [ON/OFF] condition of stop lamp switch signal.	
DIST SW	ON/OFF	• Indicates [ON/OFF] condition from DISTANCE switch signal.	
CRUISE LAMP	ON/OFF	• Indicates [ON/OFF] condition of CRUISE indicator determined by the ECM according to the input signals.	
AC EVA TEMP	°C or °F	• Indicates A/C evaporator temperature sent from A/C auto amp.	
AC EVA TARGET	°C or °F	• Indicates target A/C evaporator temperature sent from A/C auto amp.	
FAN DUTY	%	• Indicates a command value for cooling fan. The value is calculated by ECM based on input signals.	
ALT DUTY	%	• Indicates the duty ratio of the power generation command value. The ratio is calculated by ECM based on the battery current sensor signal.	

Monitored item	Unit	Description	Remarks
BAT CUR SEN	mV	• The signal voltage of battery current sensor is displayed.	
A/F ADJ-B1	—	• Indicates the correction of a factor stored in ECM. The factor is calculated from the difference between the target air-fuel ratio stored in ECM and the air-fuel ratio calculated from A/F sensor 1 signal.	
A/F ADJ-B2			
P/N POSI SW	ON/OFF	• Indicates [ON/OFF] condition from the park/neutral position (PNP) signal.	
INT/A TEMP SE	°C or °F	• The intake air temperature (determined by the signal voltage of the intake air temperature sensor) is indicated.	
AC PRESS SEN	V	• The signal voltage from the refrigerant pressure sensor is displayed.	
FUEL PRES SEN	MPa	• Indicates the fuel rail pressure computed by ECM according to the input signals	
FUEL INJ B1	msec	• ECM-calculated injection pulse width of the fuel injector on the Bank 1 side.	
FUEL INJ B2	msec	• ECM-calculated injection pulse width of the fuel injector on the Bank 2 side.	
INT/V TIM (B1)	°CA	• Indicates [°CA] of intake camshaft advance angle.	
INT/V TIM (B2)			
MAP SENSOR	V	• The signal voltage from the manifold absolute pressure (MAP) sensor is displayed.	
EVAP LEAK DIAG	YET/CMPLT	• Indicates the condition of EVAP leak diagnosis. YET: EVAP leak diagnosis has not been performed yet. CMPLT: EVAP leak diagnosis has been performed successfully.	
EVAP DIAG READY	ON/OFF	• Indicates the ready condition of EVAP leak diagnosis. ON: Diagnosis has been ready condition. OFF: Diagnosis has not been ready condition.	
VVEL LEARN	YET/DONE	• Display the condition of VVEL learning YET: VVEL learning has not been performed yet. DONE: VVEL learning has already been performed successfully.	
VVEL SEN LEARN-B1	V	• Indicates the VVEL learning value.	
VVEL SEN LEARN-B2			
VVEL POSITION SEN-B1	V	• The VVEL control shaft position sensor signal voltage is displayed.	
VVEL POSITION SEN-B2			
VVEL TIM-B1	deg	• Indicates [deg] of VVEL control shaft angle.	
VVEL TIM-B2			
FPCM	HI/MID/LOW/OFF	• The control condition of the fuel pump control module (FPCM) (determined by ECM according to the input signals) is indicated.	
BAT TEMP SEN	V	• The signal voltage from the battery temperature sensor is displayed.	
COOLING FAN SPD	rpm	• Displays a cooling fan speed from a signal of fan clutch assembly.	
THRTL STK CNT B1*	—	—	

Monitored item	Unit	Description	Remarks
HO2 S2 DIAG1(B1)	INCMP/CMPLT	• Indicates DTC P0139 self-diagnosis (delayed response) condition. INCMP: Self-diagnosis is incomplete. CMPLT: Self-diagnosis is complete.	
HO2 S2 DIAG1(B2)	INCMP/CMPLT	• Indicates DTC P0159 self-diagnosis (delayed response) condition. INCMP: Self-diagnosis is incomplete. CMPLT: Self-diagnosis is complete.	
HO2 S2 DIAG2(B1)	INCMP/CMPLT	• Indicates DTC P0139 self-diagnosis (slow response) condition. INCMP: Self-diagnosis is incomplete. CMPLT: Self-diagnosis is complete.	
HO2 S2 DIAG2(B2)	INCMP/CMPLT	• Indicates DTC P0159 self-diagnosis (slow response) condition. INCMP: Self-diagnosis is incomplete. CMPLT: Self-diagnosis is complete.	
FUEL INJ TIMG	deg	• Indicates the fuel injection timing computed by ECM according to the input signals.	
H/P FUEL PUMP DEG	deg	• Displays ECM-calculated fuel discharge position of the high pressure fuel pump.	
FUEL PRES SEN V	mV	• The signal voltage of FRP sensor is displayed.	
L/FUEL PRES SEN	MPa	• Displays a pressure value calculated from a low fuel pressure sensor voltage.	
L/FUEL PRES SEN V	mV	• The signal voltage of low fuel pressure sensor is displayed.	
ECM TEMP 1	°C or °F	• Displays a temperature calculated from a signal of ECM temperature sensor 1.	
ECM TEMP 2	°C or °F	• Displays a temperature calculated from a signal of ECM temperature sensor 2.	
FUEL PUMP DUTY	%	• The control condition of the fuel pump control module (FPCM) (determined by ECM according to the input signals) is indicated.	
A/F SEN1 DIAG1 (B1)	INCMP/CMPLT	• Indicates DTC P015A or P015B self-diagnosis condition. INCMP: Self-diagnosis is incomplete. CMPLT: Self-diagnosis is complete.	
A/F SEN1 DIAG1 (B2)	INCMP/CMPLT	• Indicates DTC P015C or P015D self-diagnosis condition. INCMP: Self-diagnosis is incomplete. CMPLT: Self-diagnosis is complete.	
A/F SEN1 DIAG2 (B1)	INCMP/CMPLT	• Indicates DTC P014C or P014D self-diagnosis condition. INCMP: Self-diagnosis is incomplete. CMPLT: Self-diagnosis is complete.	
A/F SEN1 DIAG2 (B2)	INCMP/CMPLT	• Indicates DTC P014E or P014F self-diagnosis condition. INCMP: Self-diagnosis is incomplete. CMPLT: Self-diagnosis is complete.	
A/F SEN1 DIAG3 (B1)	ABSNT/PRSNT	• Indicates DTC P014C, P014D, P015A or P015B self-diagnosis condition. ABSNT: The vehicle condition is not within the diagnosis range. PRSNT: The vehicle condition is within the diagnosis range.	

Monitored item	Unit	Description	Remarks
A/F SEN1 DIAG3 (B2)	ABSNT/ PRSNT	• Indicates DTC P014E, P014F, P015C or P015D self-diagnosis condition. ABSNT: The vehicle condition is not within the diagnosis range. PRSNT: The vehicle condition is within the diagnosis range.	
SYSTEM 1 DIAGNOSIS A B1	INCMP/CMPLT	• Indicates DTC P219A self-diagnosis condition. - INCMP: Self-diagnosis is incomplete. - CMPLT: Self-diagnosis is complete.	
SYSTEM 1 DIAGNOSIS A B2	INCMP/CMPLT	• Indicates DTC P219B self-diagnosis condition. - INCMP: Self-diagnosis is incomplete. - CMPLT: Self-diagnosis is complete.	
SYSTEM 1 DIAGNOSIS B B1	ABSNT/ PRSNT	• Indicates DTC P219A self-diagnosis condition. - ABSNT: Self-diagnosis standby - PRSNT: Under self-diagnosis	
SYSTEM 1 DIAGNOSIS B B2	ABSNT/ PRSNT	• Indicates DTC P219B self-diagnosis condition. - ABSNT: Self-diagnosis standby - PRSNT: Under self-diagnosis	
A/F-S ATMSPHRC CRCT B1	—	• Displays a determined value of atmospheric correction factor necessary for correcting an A/F sensor signal input to ECM. The signal used for the correction is an A/F sensor signal transmitted while driving under atmospheric pressure.	
A/F-S ATMSPHRC CRCT B2	—	• Displays a determined value of atmospheric correction factor necessary for correcting an A/F sensor signal input to ECM. The signal used for the correction is an A/F sensor signal transmitted while driving under atmospheric pressure.	
A/F-S ATMSPHRC CRCT UP B1	count	• Displays the number of updates of the A/F sensor atmospheric correction factor.	
A/F-S ATMSPHRC CRCT UP B2	count	• Displays the number of updates of the A/F sensor atmospheric correction factor.	
EXH/V TIM B1	°CA	• Indicates [°CA] of exhaust camshaft retard angle.	
EXH/V TIM B2			
EXH V/T LEARN	YET/CMPLT	• Display the condition of Exhaust Valve Timing Control Learning YET: Exhaust Valve Timing Control Learning has not been performed yet. CMPLT: Exhaust Valve Timing Control Learning has already been performed successfully.	
EXHAUST GAS TEMP SEN 1 B1	mV	• The signal voltage of exhaust gas temperature sensor (bank 1) is displayed.	
EXHAUST GAS TEMP SEN 1 B2	mV	• The signal voltage of exhaust gas temperature sensor (bank 2) is displayed.	
EOP SENSOR	mV	• The signal voltage of engine oil pressure sensor is displayed.	
RADIATOR COOLANT TEMP	°C or °F	Description: The radiator coolant temperature (determined by the signal voltage of the radiator coolant temperature sensor) is displayed.	
ENGINE COOLANT B/V POSI	deg	Description: The Multi-way Control Valve position detected by the position sensor is displayed.	

Monitored item	Unit	Description	Remarks
A/F IMBALNC DIAG-CPS STAT	ABSNT/ PRSNT	• Indicates DTC P219C - P219F and P21A0 - P21A3 self-diagnosis condition. ABSNT: The vehicle condition is not within the diagnosis range. PRSNT: The vehicle condition is within the diagnosis range.	
A/F IMBALNC DIAG-CPS CMPLT	INCMP/CMPLT	• Indicates DTC P219C - P219F and P21A0 - P21A3 self-diagnosis condition. - INCMP: Self-diagnosis is incomplete. - CMPLT: Self-diagnosis is complete.	

*: The item is indicated, but not used.

NOTE:

Any monitored item that does not match the vehicle being diagnosed is deleted from the display automatically.

WORK SUPPORT MODE

Work Item

WORK ITEM	CONDITION	USAGE
IDLE AIR VOL LEARN	• THE IDLE AIR VOLUME THAT KEEPS THE ENGINE WITHIN THE SPECIFIED RANGE IS MEMORIZED IN ECM.	When learning the idle air volume
EVAP SYSTEM CLOSE	CLOSE THE EVAP CANISTER VENT CONTROL VALVE IN ORDER TO MAKE EVAP SYSTEM CLOSE UNDER THE FOLLOWING CONDITIONS. • IGN SW ON • ENGINE NOT RUNNING • AMBIENT TEMPERATURE IS ABOVE 0°C (32°F). • NO VACUUM AND NO HIGH PRESSURE IN EVAP SYSTEM • FUEL TANK TEMP. IS MORE THAN 0°C (32°F). • WITHIN 10 MINUTES AFTER STARTING “EVAP SYSTEM CLOSE” • WHEN TRYING TO EXECUTE “EVAP SYSTEM CLOSE” UNDER THE CONDITION EXCEPT ABOVE, CONSULT WILL DISCONTINUE IT AND DISPLAY APPROPRIATE INSTRUCTION. **NOTE:** **WHEN STARTING ENGINE, CONSULT MAY DISPLAY “BATTERY VOLTAGE IS LOW. CHARGE BATTERY”, EVEN WHEN USING A CHARGED BATTERY.**	When detecting EVAP vapor leak in the EVAP system
FUEL PRESSURE RELEASE	• FUEL PUMP WILL STOP BY TOUCHING “START” DURING IDLING. CRANK A FEW TIMES AFTER ENGINE STALLS.	When releasing fuel pressure from fuel line
SELF-LEARNING CONT	• THE COEFFICIENT OF SELF-LEARNING CONTROL MIXTURE RATIO RETURNS TO THE ORIGINAL COEFFICIENT.	When clearing mixture ratio self-learning value
TARGET IDLE RPM ADJ*	• IDLE CONDITION	When setting target idle speed
VIN REGISTRATION	• IN THIS MODE, VIN IS REGISTERED IN ECM.	When registering VIN in ECM
TARGET IGN TIM ADJ*	• IDLE CONDITION	When adjusting target ignition timing
CLSD THL POS LEARN	• IGNITION ON AND ENGINE STOPPED.	When learning the throttle valve closed position
VVEL POS SEN ADJ PREP	• USE THIS ITEM ONLY WHEN REPLACING VVEL ACTUATOR SUB ASSEMBLY. • IGNITION ON AND ENGINE STOPPED.	When adjusting VVEL control shaft position sensor
SAVING DATA FOR REPLC CPU	In this mode, save data that is in ECM.	When ECM is replaced.

WORK ITEM	CONDITION	USAGE
WRITING DATA FOR REPLC CPU	In this mode, write data stored by “SAVE DATA FOR CPU REPLC” in work support mode to ECM.	When ECM is replaced.
ENGINE COOLANT BYPASS VALVE	Condition: The valve is in the full opening position	When filing with coolant.

*: This function is not necessary in the usual service procedure.

ACTIVE TEST MODE

Test Item

TEST ITEM	CONDITION	JUDGMENT	CHECK ITEM (REMEDY)
VENT CONTROL/V	• Ignition switch: ON (Engine stopped) • Turn solenoid valve ON and OFF with the CONSULT and listen to operating sound.	Solenoid valve makes an operating sound.	• Harness and connectors • Solenoid valve
ENG COOLANT TEMP	• Engine: Return to the original non-standard condition • Change the engine coolant temperature using CONSULT.	If malfunctioning symptom disappears, see CHECK ITEM.	• Harness and connectors • Engine coolant temperature sensor 1 • Fuel injector
FUEL INJECTION	• Engine: Return to the original non-standard condition • Change the amount of fuel injection using CONSULT.	If malfunctioning symptom disappears, see CHECK ITEM.	• Harness and connectors • Fuel injector • Air fuel ratio (A/F) sensor 1
FUEL/T TEMP SEN	• Change the fuel tank temperature using CONSULT.		
PURG VOL CONT/V	• Engine: After warming up, run engine at 1,500 rpm. • Change the EVAP canister purge volume control solenoid valve opening percent using CONSULT.	Engine speed changes according to the opening percent.	• Harness and connectors • Solenoid valve
FAN DUTY CONTROL*	• Ignition switch: ON • Change duty ratio using CONSULT.	Cooling fan speed changes.	• Harness and connectors • Cooling fan motor • Cooling fan relay • Cooling fan control module • IPDM E/R
ALTERNATOR DUTY	• Engine: Idle • Change duty ratio using CONSULT.	Battery voltage changes.	• Harness and connectors • IPDM E/R • Alternator
EXH V/T ASSIGN ANGLE	• Engine: Return to the original non-standard condition • Change exhaust valve timing using CONSULT.	If malfunctioning symptom disappears, see CHECK ITEM.	• Harness and connectors • Exhaust valve timing control magnet retarder
POWER BALANCE	• Engine: After warming up, idle the engine. • A/C switch OFF • Selector lever: P or N • Cut off each injector signal one at a time using CONSULT.	Engine runs rough or stops.	• Harness and connectors • Compression • Fuel injector • Power transistor • Spark plug • Ignition coil
IGNITION TIMING	• Engine: Return to the original non-standard condition • Timing light: Set • Retard the ignition timing using CONSULT.	If malfunctioning symptom disappears, see CHECK ITEM.	• Perform Idle Air Volume Learning.

TEST ITEM	CONDITION	JUDGMENT	CHECK ITEM (REMEDY)
V/T ASSIGN ANGLE	• Engine: Return to the original non-standard condition • Change intake valve timing using CONSULT.	If malfunctioning symptom disappears, see CHECK ITEM.	• Harness and connectors • Intake valve timing control solenoid valve
FPCM	• Engine: Return to the original trouble condition • Select “LOW”, “MID” and “HI” with CONSULT.	Fuel pump speed changes or stops.	• Harness and connectors • Fuel pump control module (FPCM)

*: Leaving cooling fan OFF with CONSULT while engine is running may cause the engine to overheat.

DTC WORK SUPPORT MODE

Test mode	Test item	Corresponding DTC No.	Reference page
HO2S2	HO2S2 (B1) P1146	P0138	EC-1576, "DTC Description"
	HO2S2 (B1) P1147	P0137	EC-1570, "DTC Description"
	HO2S2 (B1) P0139	P0139	EC-1584, "DTC Description"
	HO2S2 (B2) P1166	P0158	EC-1576, "DTC Description"
	HO2S2 (B2) P1167	P0157	EC-1570, "DTC Description"
	HO2S2 (B2) P0159	P0159	EC-1584, "DTC Description"
A/F SEN1	A/F SEN1 (B1) P1278/P1279	—	
	A/F SEN1 (B1) P1276	P0130	EC-1560, "DTC Description"
	A/F SEN1 (B2) P1288/P1289	—	
	A/F SEN1 (B2) P1286	P0150	EC-1560, "DTC Description"
EVAPORATIVE SYSTEM	EVP V/S LEAK P0456/P1456*	P0456	EC-1688, "DTC Description"
	PURG VOL CN/V P1444	P0443	EC-1661, "DTC Description"
	PURG FLOW P0441	P0441	EC-1655, "DTC Description"

*: DTC P1456 does not apply but appears in DTC Work Support Mode screens.

SRT & P-DTC MODE

SRT STATUS Mode

- For items whose SRT codes are set, “CMPLT” is displayed on the CONSULT screen; for items whose SRT codes are not set, “INCMP” is displayed.
- “SRT STATUS” provides the presence or absence of permanent DTCs stored in ECM memory.

PERMANENT DTC STATUS Mode

How to display permanent DTC status

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Select “PERMANENT DTC STATUS” in “DTC & SRT CONFIRMATION” mode with CONSULT.
   NOTE:
   Permanent DTCs stored in ECM memory are displayed on the CONSULT screen to show if a driving pattern required for erasing permanent DTCs is complete (CMPLT) or incomplete (INCMP).

CAUTION:
Since the "PERMANENT DTC STATUS" screen displays the previous trip information, repeat the following twice to update the information: "Ignition switch OFF", "Wait for more than 10 seconds" and "Ignition switch ON".

PERMANENT DTC & SRT CONFIRMATION : PERMANENT DTC STATUS

CAUTION:
Turn ignition switch from ON to OFF twice to update the information on the status screen.

PERMANENT DTC	DRIVING PATTERN B	DRIVING PATTERN D
XXXX	INCMP	INCMP
XXXX	CMPLT	INCMP
XXXX	INCMP	CMPLT
XXXX	CMPLT	INCMP
XXXX	INCMP	INCMP
XXXX	INCMP	INCMP

The previous trip information is displayed.

JSBIA0062GB

NOTE:
This mode is not used in regions that permanent DTCs are not regulated by law.

SRT WORK SUPPORT Mode
This mode enables a technician to drive a vehicle to set the SRT while monitoring the SRT status.

PERMANENT DTC WORK SUPPORT Mode
This mode enables a technician to drive a vehicle to complete the driving pattern that is required for erasing permanent DTC.
NOTE:
This mode is not used in regions that permanent DTCs are not regulated by law.

ECU DIAGNOSIS INFORMATION

ECM

Reference Value

INFOID:0000000013798132

VALUES ON THE DIAGNOSIS TOOL

NOTE:

- The following table includes information (items) inapplicable to this vehicle. For information (items) applicable to this vehicle, refer to CONSULT display items.
- Numerical values in the following table are reference values.
- These values are input/output values that ECM receives/transmits and may differ from actual operations.
  Example:
  The ignition timing shown by the timing light may differ from the ignition timing displayed on the data monitor. This occurs because the timing light shows a value calculated by ECM according to signals received from the cam shaft position sensor and other sensors related to ignition timing.

For outlines of following items, refer to EC-1325, "CONSULT Function".

CONSULT MONITOR ITEM

Monitor Item	Condition		Values/Status
ENG SPEED	• Run engine and compare CONSULT value with the tachometer indication.		Almost the same speed as the tachometer indication
MAS A/F SE-B1	See EC-1450, "Description".		
B/FUEL SCHDL	See EC-1450, "Description".		
A/F ALPHA-B1	See EC-1450, "Description".		
A/F ALPHA-B2	See EC-1450, "Description".		
COOLANT TEMP/S	• Ignition switch: ON		Indicates engine coolant temperature
A/F SEN1 (B1)	• Engine: After warming up	Maintaining engine speed at 2,000 rpm	Fluctuates around 2.2 V
A/F SEN1 (B2)	• Engine: After warming up	Maintaining engine speed at 2,000 rpm	Fluctuates around 2.2 V
HO2S2 (B1)	• Revving engine from idle up to 3,000 rpm quickly after the following conditions are met. - Engine: After warming up - After keeping engine speed between 3,500 and 4,000 rpm for 1 minute and at idle for 1 minute under no load		0 - 0.3 V ⇔ Approx. 0.6 - 1.0 V
HO2S2 (B2)	• Revving engine from idle up to 3,000 rpm quickly after the following conditions are met. - Engine: After warming up - After keeping engine speed between 3,500 and 4,000 rpm for 1 minute and at idle for 1 minute under no load		0 - 0.3 V ⇔ Approx. 0.6 - 1.0 V
HO2S2 MNTR (B1)	• Revving engine from idle up to 3,000 rpm quickly after the following conditions are met. - Engine: After warming up - After keeping engine speed between 3,500 and 4,000 rpm for 1 minute and at idle for 1 minute under no load		LEAN ⇔ RICH
HO2S2 MNTR (B2)	• Revving engine from idle up to 3,000 rpm quickly after the following conditions are met. - Engine: After warming up - After keeping engine speed between 3,500 and 4,000 rpm for 1 minute and at idle for 1 minute under no load		LEAN ⇔ RICH
VHCL SPEED SE	• Turn drive wheels and compare CONSULT value with the speedometer indication.		Almost the same speed as speedometer indication
BATTERY VOLT	• Ignition switch: ON (Engine stopped)		11 - 14 V
ACCEL SEN 1	• Ignition switch: ON (Engine stopped)	Accelerator pedal: Fully released	0.5 - 1.0 V
		Accelerator pedal: Fully depressed	4.2 - 4.8 V

Monitor Item	Condition		Values/Status
ACCEL SEN 2*1	• Ignition switch: ON (Engine stopped)	Accelerator pedal: Fully released	0.5 - 1.0 V
		Accelerator pedal: Fully depressed	4.2 - 4.8 V
TP SEN 1-B1	• Ignition switch: ON (Engine stopped) • Selector lever: D position	Accelerator pedal: Fully released	More than 0.36 V
		Accelerator pedal: Fully depressed	Less than 4.75 V
TP SEN 2-B1*1	• Ignition switch: ON (Engine stopped) • Selector lever: D position	Accelerator pedal: Fully released	More than 0.36 V
		Accelerator pedal: Fully depressed	Less than 4.75 V
FUEL T/TMP SE	• Ignition switch: ON		Indicates fuel tank temperature
EVAP SYS PRES	• Ignition switch: ON		Approx. 1.8 - 4.8 V
FUEL LEVEL SE	• Ignition switch: ON		Depending on fuel level of fuel tank
START SIGNAL	• Ignition switch: ON → START → ON		OFF → ON → OFF
CLSD THL POS	• Ignition switch: ON (Engine stopped)	Accelerator pedal: Fully released	ON
		Accelerator pedal: Slightly depressed	OFF
AIR COND SIG	• Engine: After warming up, idle the engine	Air conditioner switch: OFF	OFF
		Air conditioner switch: ON (Compressor operates.)	ON
PW/ST SIGNAL	• Engine: After warming up, idle the engine	Steering wheel: Not being turned	OFF
		Steering wheel: Being turned	ON
LOAD SIGNAL	• Ignition switch: ON	Rear window defogger switch: ON and/or Lighting switch: 2nd position	ON
		Rear window defogger switch and lighting switch: OFF	OFF
IGNITION SW	• Ignition switch: ON → OFF → ON		ON → OFF → ON
HEATER FAN SW	• Engine: After warming up, idle the engine	Heater fan switch: ON	ON
		Heater fan switch: OFF	OFF
BRAKE SW	• Ignition switch: ON	Brake pedal: Fully released	OFF
		Brake pedal: Slightly depressed	ON
IGN TIMING	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	1 - 4°BTDC
		2,000 rpm	25 - 45°BTDC
COMBUSTION	—		These items are displayed but are not applicable to this model.
CAL/LD VALUE	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	5 - 35%
		2,500 rpm	5 - 35%
MASS AIRFLOW	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	2.0 - 6.0 g/s
		2,500 rpm	7.0 - 20.0 g/s
PURG VOL C/V	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle (Accelerator pedal: Not depressed even slightly, after engine starting.)	0%
		2,000 rpm	5%

Monitor Item	Condition		Values/Status
INT/V SOL (B1)	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	0 - 2%
		2,000 rpm	Approx. 0 - 50%
INT/V SOL (B2)	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	0 - 2%
		2,000 rpm	Approx. 0 - 50%
AIR COND RLY	• Engine: After warming up, idle the engine	A/C switch: OFF	OFF
		A/C switch: ON (Compressor operates)	ON
VENT CONT/V	• Ignition switch: ON		OFF
THRTL RELAY	• Ignition switch: ON		ON
A/F S1 HTR (B1)	• Engine: After warming up, idle the engine (More than 140 seconds after starting engine)		4 - 100%
A/F S1 HTR (B2)	• Engine: After warming up, idle the engine (More than 140 seconds after starting engine)		4 - 100%
HO2S2 HTR (B1)	• Engine speed: Below 3,600 rpm after the following conditions are met. - Engine: After warming up - Keeping the engine speed between 3,500 and 4,000 rpm for 1 minute and at idle for 1 minute under no load		ON
	• Engine speed: Above 3,600 rpm		OFF
HO2S2 HTR (B2)	• Engine speed: Below 3,600 rpm after the following conditions are met. - Engine: After warming up - Keeping the engine speed between 3,500 and 4,000 rpm for 1 minute and at idle for 1 minute under no load		ON
	• Engine speed: Above 3,600 rpm		OFF
ALT DUTY SIG	• Power generation voltage variable control: Operating		ON
	• Power generation voltage variable control: Not operating		OFF
I/P PULLY SPD	• Vehicle speed: More than 20 km/h (12 MPH)		Almost the same speed as the tachometer indication
VEHICLE SPEED	• Turn drive wheels and compare CONSULT value with the speedometer indication.		Almost the same speed as the speedometer indication
IDL A/V LEARN	• Engine: Running	Idle air volume learning has not been performed yet.	YET
		Idle air volume learning has already been performed successfully.	CMPLT
TRVL AFTER MIL	• Ignition switch: ON	Vehicle has traveled after MIL has illuminated.	0 - 65,535 km (0 - 40,723 miles)
SNOW MODE SW	• Ignition switch: ON	Snow mode switch: ON	ON
		Snow mode switch: OFF	OFF
ENG OIL TEMP	• Engine: After warming up		More than 70°C (158°F)
MAIN SW	• Ignition switch: ON	MAIN switch: Pressed	ON
		MAIN switch: Released	OFF
CANCEL SW	• Ignition switch: ON	CANCEL switch: Pressed	ON
		CANCEL switch: Released	OFF
RESUME/ACC SW	• Ignition switch: ON	ACCELERATE/RESUME switch: Pressed	ON
		ACCELERATE/RESUME switch: Released	OFF

Monitor Item	Condition		Values/Status
SET SW	• Ignition switch: ON	COAST/SET switch: Pressed	ON
		COAST/SET switch: Released	OFF
BRAKE SW1 (Brake pedal position switch)	• Ignition switch: ON	Brake pedal: Fully released	ON
		Brake pedal: Slightly depressed	OFF
BRAKE SW2 (Stop lamp switch)	• Ignition switch: ON	Brake pedal: Fully released	OFF
		Brake pedal: Slightly depressed	ON
DIST SW	• Ignition switch: ON	DISTANCE switch: Pressed	ON
		DISTANCE switch: Released	OFF
CRUISE LAMP	• Ignition switch: ON	MAIN switch: Pressed at the 1st time → at the 2nd time	ON → OFF
AC EVA TEMP	• Engine: Running		Indicates A/C evaporator temperature sent from “unified meter and A/C amp.”.
AC EVA TARGET	• Engine: Running		Indicates target A/C evaporator temperature sent from “unified meter and A/C amp.”.
FAN DUTY	• Engine: Running		0 - 100%
ALT DUTY	• Engine: Idle		0 - 80%
BAT CUR SEN	• Engine speed: Idle • Battery: Fully charged*2 • Selector lever: P or N position • A/C switch: OFF • No load		Approx. 2,600 - 3,500 mV
A/F ADJ-B1	• Engine: Running		−0.330 - 0.330
A/F ADJ-B2	• Engine: Running		−0.330 - 0.330
P/N POSI SW	• Ignition switch: ON	Selector lever: P or N	ON
		Selector lever: Except above position	OFF
INT/A TEMP SE	• Ignition switch: ON		Indicates intake air temperature
AC PRESS SEN	• Engine: Idle • Both A/C switch and blower fan switch: ON (Compressor operates)		1.0 - 4.0 V
FUEL PRES SEN	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 2.74 Mpa
		2,000 rpm	Approx. 3.0 Mpa
FUEL INJ B1	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 1.4 msec
		2,000 rpm	Approx. 1.0 msec
FUEL INJ B2	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 1.4 msec
		2,000 rpm	Approx. 1.0 msec
INT/V TIM (B1)	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	−5 - 5°CA
		2,000 rpm	Approx. 0 - 30°CA
INT/V TIM (B2)	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	−5 - 5°CA
		2,000 rpm	Approx. 0 - 30°CA

Monitor Item	Condition		Values/Status
MAP SENSOR	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 1.0 V
		2,000 rpm	Approx. 1.35 V
EVAP LEAK DIAG	• Ignition switch: ON		Indicates the condition of EVAP leak diagnosis.
EVAP DIAG READY	• Ignition switch: ON		Indicates the ready condition of EVAP leak diagnosis.
VVEL LEARN	• Ignition switch: OFF → ON (After warming up)	VVEL learning has not been performed yet.	YET
		VVEL learning has already been performed successfully.	DONE
VVEL SEN LEARN-B1	• VVEL learning has already been performed successfully		Approx. 0.30 - 0.80 V
VVEL SEN LEARN-B2	• VVEL learning has already been performed successfully		Approx. 0.30 - 0.80 V
VVEL POSITION SEN-B1	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 0.25 - 1.50 V
		When revving engine up to 2,000 rpm quickly	Approx. 0.25 - 4.75 V
VVEL POSITION SEN-B2	• Engine: After warming up • Selector lever: P or N position • Air conditioner switch: OFF • No load	Idle	Approx. 0.25 - 1.50 V
		When revving engine up to 2,000 rpm quickly	Approx. 0.25 - 4.75 V
VVEL TIM-B1	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 0 - 23 deg
		When revving engine up to 2,000 rpm quickly	Approx. 0 - 90 deg
VVEL TIM-B2	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 0 - 23 deg
		When revving engine up to 2,000 rpm quickly	Approx. 0 - 90 deg
FPCM	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	• Engine: Cranking	HI
		• Revving engine from idle to 4,000 rpm quickly	MID
		• Engine: Idle • Engine coolant temperature: More than 10°C (50°F)	LOW
BAT TEMP SEN	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Indicates the temperature around the battery.
COOLING FAN SPD	• Engine speed: Idle • Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Water temp: Less than 98°C	Approx. 100 – 200 rpm
		Water temp: More than 98°C	Approx. 600 – 700 rpm
THRTL STK CNT B1	**NOTE:** The item is indicated, but not used.		—
HO2 S2 DIAG1(B1)	DTC P0139 self-diagnosis (delayed response) has not been performed yet.		INCMP
	DTC P0139 self-diagnosis (delayed response) has already been performed successfully.		CMPLT
HO2 S2 DIAG1(B2)	DTC P0159 self-diagnosis (delayed response) has not been performed yet.		INCMP

Monitor Item	Condition		Values/Status
HO2 S2 DIAG2(B1)*3	DTC P0139 self-diagnosis (slow response) has not been performed yet.		INCMP
	DTC P0139 self-diagnosis (slow response) has already been performed successfully.		CMPLT
HO2 S2 DIAG2(B2)*3	DTC P0159 self-diagnosis (slow response) has not been performed yet.		INCMP
	DTC P0159 self-diagnosis (slow response) has already been performed successfully.		CMPLT
FUEL INJ TIMG	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 16 deg
		2,000 rpm	Approx. −170 deg
H/P FUEL PUMP DEG	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 211.0 deg
		2,000 rpm	Approx. 206.0 deg
FUEL PRES SEN V	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 820 – 1.220 mV
		Revving engine from idle to 4,000 rpm quickly	Approx. 820 – 3.060 mV
L/FUEL PRES SEN	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 0.45 MPa
		2,000 rpm	Approx. 0.45 MPa
L/FUEL PRES SEN V	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Approx. 3250 mV
		3,000 rpm	Approx. 3100 mV
ECM TEMP 1	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Indicates the temperature of ECM internal circuit 1.
ECM TEMP 2	• Engine: After warming up • Selector lever: P or N position • A/C switch: OFF • No load	Idle	Indicates the temperature of ECM internal circuit 2.
FUEL PUMP DUTY	• Engine: After warming up • Shift lever: P or N • Air conditioner switch: OFF • No load	Engine speed: Idle	30 - 40%

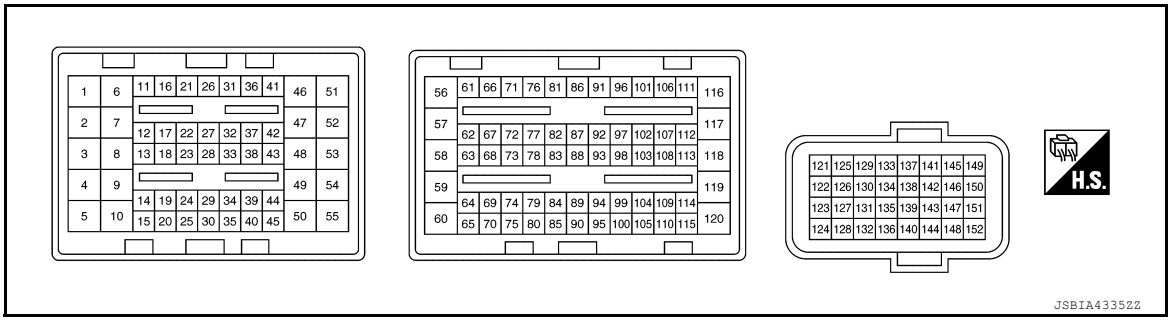
*1: Accelerator pedal position sensor 2 signal and throttle position sensor 2 signal are converted by ECM internally. Thus, they differ from ECM terminals voltage signal.

*2: Before measuring the terminal voltage, confirm that the battery is fully charged. Refer to PG-164, "How to Handle Battery".

*3: For America and Canada.

TERMINAL LAYOUT



PHYSICAL VALUES

NOTE:
- Specification data are reference values and are measured between each terminals.
- Pulse signal is measured by CONSULT.

Terminal No. (Wire color)		Description		Condition	Value (Approx.)

★: Average voltage for pulse signal (Actual pulse signal can be confirmed by oscilloscope.)

*1: This may vary depending on internal resistance of the tester.

*2: Before measuring the terminal voltage, confirm that the battery is fully charged. Refer to PG-164, "How to Handle Battery".

Fail-safe

INFOID:0000000013798133

DTC No.	Detected items	Engine operating condition in fail-safe mode
U0113 U1003 U1024	Can communication circuit	VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.
P0011 P0012 P0016 P0018 P0021 P0022	Intake valve timing control	The signal is not energized to the intake valve timing control solenoid valve and the valve control does not function.
P0014 P0015 P0017 P0019 P0024 P0025	Exhaust valve timing control	The signal is not energized to the exhaust valve timing control magnet retarder and the magnet retarder control does not function.
P0087	FRP control system	• Engine torque is limited. • VVEL value is maintained at a fixed angle.
P0088		Engine speed is limited.
P0090	FRP control system	• Engine torque is limited. • VVEL value is maintained at a fixed angle.
P00B3 P00B4	Engine coolant temperature sensor 2	High coolant temperature control does not function.

</table>

DTC No.	Detected items	Engine operating condition in fail-safe mode
P062B	ECM	Type1 • Engine torque is limited. • Idle engine speed is increased. • Fuel injector power supply shut-off. • High fuel pressure limitation.
		Type2 • Engine torque is limited. • Fuel injection shut-off of malfunction cylinder. • Mixture ratio feedback control does not function. • Idle engine speed is increased.
P0643	ECM	• ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (Approx. 5 decrees) by the return spring. • The position of the following components is fixed. - Intake valve timing control solenoid valve - Exhaust valve timing control solenoid valve
P1087 P1088	VVEL control function	VVEL of normal bank is controlled at VVEL angle of abnormal bank. Engine speed will not rise more than 3,500 rpm due to the fuel cut.
P1089 P1092	VVEL control shaft position sensor	VVEL value is maintained at a fixed angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut
P1090 P1093	VVEL actuator motor	VVEL of normal bank is controlled at VVEL angle of abnormal bank. Engine speed will not rise more than 3,500 rpm due to the fuel cut.
		VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.
P1091	VVEL actuator motor relay	VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.
P1197	Out of gas	• Engine torque is limited. • VVEL value is maintained at a fixed angle.
P1606	VVEL control module	VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.
P1608	VVEL control shaft position sensor	VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.
P1805	Brake switch	ECM controls the electric throttle control actuator by regulating the throttle opening to a small range. Therefore, acceleration will be poor.
		Vehicle condition: When engine is idling — Driving condition: Normal
		Vehicle condition: When accelerating — Driving condition: Poor acceleration
P2100 P2103	Throttle control motor relay	ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring.
P2101	Electric throttle control function	ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring.
P2118	Throttle control motor	ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring.
P2119	Electric throttle control actuator	(When electric throttle control actuator does not function properly due to the return spring malfunction:) ECM controls the electric throttle actuator by regulating the throttle opening around the idle position. The engine speed will not rise more than 2,000 rpm.
		(When throttle valve opening angle in fail-safe mode is not in specified range:) ECM controls the electric throttle control actuator because of regulating the throttle opening to 20 degrees or less.
		(When ECM detects the throttle valve is stuck open:) While the vehicle is being driven, it slows down gradually by fuel cut. After the vehicle stops, the engine stalls. The engine can restart in the N or P position, and engine speed will not exceed 1,000 rpm or more.

DTC No.	Detected items	Engine operating condition in fail-safe mode
P2122 P2123 P2127 P2128 P2138	Accelerator pedal position sensor	The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees. The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. Therefore, the acceleration will be poor.
P26A3 P26A5 P26A6 P26A7	Multi-way control valve	• When detecting a malfunction with the valve closed, ECM fully opens the valve. • When detecting a malfunction with the valve opened, ECM maintains valve angle. • When detecting a malfunction in sensor, ECM fully opens the valve. • ECM limits the engine output depending on malfunctions.

DTC Inspection Priority Chart

*1: 1st trip DTC No. is the same as DTC No.

*2: This number is prescribed by SAE J2012/ISO 15031-6.

*3: In Diagnostic Test Mode II (Self-diagnostic results), this number is controlled by NISSAN.

*4: The troubleshooting for this DTC needs CONSULT.

*5: When the fail safe operations for both self-diagnoses occur, the MIL illuminates.

*6: When the ECM is in the mode that displays SRT status, MIL may blink. For the details, refer to “How to Display SRT Status”.

*7: When erasing this DTC, always use CONSULT or GST.

*8: SRT code will not be set if the self-diagnostic result is NG.

*9: Refer to EC-1444, "Description", “HOW TO ERASE PERMANENT DTC”.

Test Value and Test Limit

INFOID:0000000013798136

The following is the information specified in Service $06 of SAE J1979/ISO 15031-5.
The test value is a parameter used to determine whether a system/circuit diagnostic test is OK or NG while being monitored by the ECM during self-diagnosis. The test limit is a reference value which is specified as the maximum or minimum value and is compared with the test value being monitored.
These data (test value and test limit) are specified by On Board Monitor ID (OBDMID), Test ID (TID), Unit and Scaling ID and can be displayed on the GST screen.
The items of the test value and test limit will be displayed with GST screen which items are provided by the ECM. (e.g., if bank 2 is not applied on this vehicle, only the items of bank 1 are displayed)

Item	OBD-MID	Self-diagnostic test item	DTC	Test value and Test limit (GST display)		Description
				TID	Unit and Scaling ID	
HO2S	01H	Air fuel ratio (A/F) sensor 1 (Bank 1)	P0131	83H	0BH	Minimum sensor output voltage for test cycle
			P0131	84H	0BH	Maximum sensor output voltage for test cycle
			P0130	85H	0BH	Minimum sensor output voltage for test cycle
			P0130	86H	0BH	Maximum sensor output voltage for test cycle

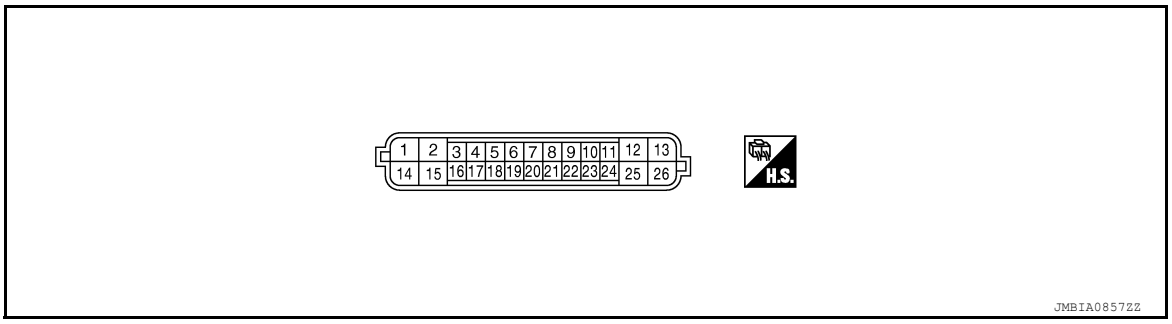
TERMINAL LAYOUT



PHYSICAL VALUES

NOTE:

- Specification data are reference values and are measured between each terminals.
- Pulse signal is measured by CONSULT.

Terminal No.		Description		Condition	Value (Approx.)
+	–	Signal name	Input/ Output		
1 (R)	14 (B)	VVEL actuator motor power supply (bank 2)	Input	[Ignition switch: ON]	BATTERY VOLTAGE (11 - 14V)
2 (B)	14 (B)	VVEL actuator motor (High lift) (bank 2)	Output	[Engine is running] • Warm-up condition • Idle speed	0 - 14 V★ 				[Engine is running] • Warm-up condition • When revving engine up to 2,000 rpm quickly	0 - 14 V★ 3 (W)	6 (R)	VVEL control shaft position sensor 1 (bank 1)	Input	[Engine is running] • Warm-up condition • Idle speed	0.25 - 1.40 V
				[Engine is running] • Warm-up condition • When revving engine up to 3,000 rpm quickly	0.25 - 4.75 V
4 (W/G)	—	Sensor ground [VVEL control shaft position sensor 1 (bank 2)]	—	—	—

Terminal No. +	Terminal No. –	Description: Signal name	Description: Input/ Output	Condition	Value (Approx.)
5 (L/G)	4 (W/G)	VVEL control shaft position sensor 1 (bank 2)	Input	[Engine is running] • Warm-up condition • Idle speed	0.25 - 1.40 V
				[Engine is running] • Warm-up condition • When revving engine up to 3,000 rpm quickly	0.25 - 4.75 V
6 (R)	—	Sensor ground [VVEL control shaft position sensor 1 (bank 1)]	—	—	—
7 (B)	6 (R)	Sensor power supply [VVEL control shaft position sensor 1 (bank 1)]	—	[Ignition switch: ON]	5 V
8 (W)	14 (B)	Power supply for VVEL control module	—	[Ignition switch: ON]	BATTERY VOLTAGE (11 - 14 V)
9 (L)	4 (W/G)	Sensor power supply [VVEL position sensor 1 (bank 2)]	—	[Ignition switch: ON]	5 V
11 (W)	—	ENG communication line	Input/ Output	—	—
12 (B)	14 (B)	VVEL actuator motor (High lift) (bank 1)	Output	[Engine is running] • Warm-up condition • Idle speed	0 - 14 V★ 				[Engine is running] • Warm-up condition • When revving engine up to 3,000 rpm quickly	0 - 14 V★ 13 (R)	14 (B)	VVEL actuator motor power supply (bank 1)	Input	[Ignition switch: ON]	BATTERY VOLTAGE (11 - 14 V)
14 (B)	—	VVEL control module ground	—	—	—

Terminal No.		Description		Condition	Value (Approx.)
+	–	Signal name	Input/ Output		
15 (W)	14 (B)	VVEL actuator motor (Low lift) (bank 2)	Output	[Engine is running] • Warm-up condition • Idle speed	0 - 14 V★ 				[Engine is running] • Warm-up condition • When revving engine up to 3,000 rpm quickly	0 - 14 V★ 16 (L/G)	19 (L)	VVEL control shaft position sensor 2 (bank 1)	Input	[Engine is running] • Warm-up condition • Idle speed	3.50 - 4.75 V
				[Engine is running] • Warm-up condition • When revving engine up to 3,000 rpm quickly	0.25 - 4.75 V
17 (O)	—	Sensor ground [VVEL control shaft position sensor 2 (bank 2)]	—	—	—
18 (O/L)	17 (O)	VVEL control shaft position sensor 2 (bank 2)	Input	[Engine is running] • Warm-up condition • Idle speed	3.50 - 4.75 V
				[Engine is running] • Warm-up condition • When revving engine up to 3,000 rpm quickly	0.25 - 4.75 V
19 (L)	—	Sensor ground [VVEL control shaft position sensor 2 (bank 1)]	—	—	—
20 (W/G)	19 (L)	Sensor power supply [VVEL control shaft position sensor 2 (bank 1)]	—	[Ignition switch: ON]	5 V
21 (BR/ W)	14 (B)	VVEL actuator motor relay abort signal (ECM)	Input	[Engine is running] • Warm-up condition • Idle speed	0 V
22 (L/G)	17 (O)	Sensor power supply [VVEL control shaft position sensor 2 (bank 2)]	—	[Ignition switch: ON]	5 V
23 (BR/Y)	14 (B)	VVEL control motor relay	Output	[Ignition switch: OFF]	BATTERY VOLTAGE (11 - 14 V)
				[Ignition switch: ON]	0 - 1.0 V
24 (R/W)	—	ENG communication line	Input/ Output	—	—

Terminal No.		Description		Condition	Value (Approx.)
+	–	Signal name	Input/ Output		
25 (W)	14 (B)	VVEL control motor (Low lift) (bank 1)	Output	[Engine is running] • Warm-up condition • Idle speed	0 - 14 V★ 				[Engine is running] • Warm-up condition • When revving engine up to 3,000 rpm quickly	0 - 14 V★ 
★: Average voltage for pulse signal (Actual pulse signal can be confirmed by oscilloscope.)

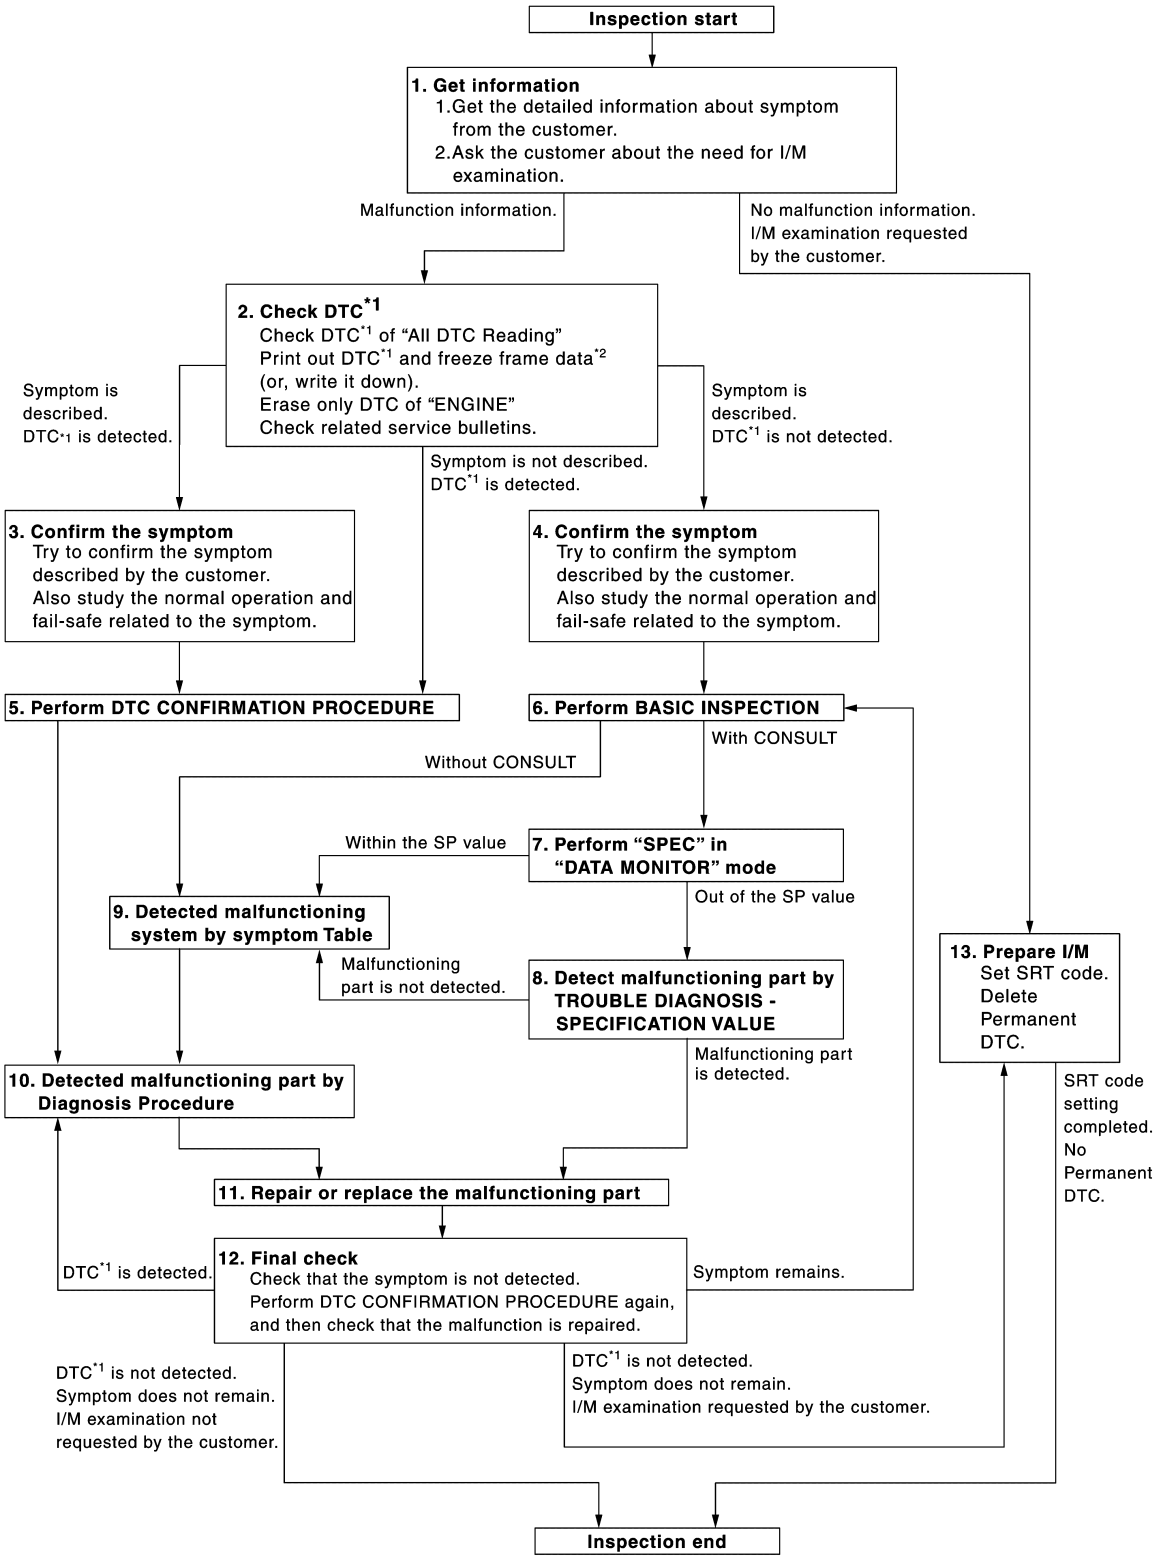
BASIC INSPECTION

DIAGNOSIS AND REPAIR WORKFLOW

Work Flow

INFOID:0000000013798139

OVERALL SEQUENCE



*1: Include 1st trip DTC
*2: Include 1st trip freeze frame data

DETAILED FLOW

1.GET INFORMATION FOR SYMPTOM

1. Get the detailed information from the customer about the symptom (the condition and the environment when the incident/malfunction occurred) using the “Diagnostic Work Sheet”. (Refer to EC-1418, "Diagnostic Work Sheet".)
2. Ask if the customer requests I/M examination.

Malfunction information, obtained>>GO TO 2.
No Malfunction information, but a request for I/M examination>>GO TO 13.

2.CHECK DTC

1. Check DTC of “All DTC Reading”.
2. Perform the following procedure if DTC is displayed.

- Record DTC and freeze frame data. (Print them out with CONSULT or GST.)
- Erase only DTC of “ENGINE”.
  - With CONSULT: Refer to “How to Erase DTC and 1st Trip DTC” in EC-1325, "CONSULT Function".
  - Without CONSULT: Refer to “How to Erase Self-diagnostic Results” in EC-1322, "On Board Diagnosis Function".
- Turn ignition switch OFF.
- Study the relationship between the cause detected by DTC and the symptom described by the customer. (Symptom Table is useful. Refer to EC-1922, "Symptom Table".)

3. Check related service bulletins for information.

Are any symptoms described and any DTCs detected?

Symptom is described, DTC is detected>>GO TO 3.
Symptom is described, DTC is not detected>>GO TO 4.
Symptom is not described, DTC is detected>>GO TO 5.

3.CONFIRM THE SYMPTOM

Try to confirm the symptom described by the customer (except MIL ON).
Also study the normal operation and fail-safe related to the symptom. Refer to EC-1927, "Description" and EC-1361, "Fail-safe".
Diagnosis Work Sheet is useful to verify the incident.
Verify relation between the symptom and the condition when the symptom is detected.

>> GO TO 5.

4.CONFIRM THE SYMPTOM

Try to confirm the symptom described by the customer.
Also study the normal operation and fail-safe related to the symptom. Refer to EC-1927, "Description" and EC-1361, "Fail-safe".
Diagnosis Work Sheet is useful to verify the incident.
Verify relation between the symptom and the condition when the symptom is detected.

>> GO TO 6.

5.PERFORM DTC CONFIRMATION PROCEDURE

Perform DTC CONFIRMATION PROCEDURE for the displayed DTC, and then make sure that DTC is detected again.
If two or more DTCs are detected, refer to EC-1364, "DTC Inspection Priority Chart" and determine trouble diagnosis order.

NOTE:

- Freeze frame data is useful if the DTC is not detected.
- Perform Component Function Check if DTC CONFIRMATION PROCEDURE is not included on Service Manual. This simplified check procedure is an effective alternative though DTC cannot be detected during this check.
  If the result of Component Function Check is NG, it is the same as the detection of DTC by DTC CONFIRMATION PROCEDURE.

Is DTC detected?

YES >> GO TO 10.
NO >> Check according to GI-43, "Intermittent Incident".

6.PERFORM BASIC INSPECTION

Perform EC-1420, "Work Procedure".

Do you have CONSULT?

YES >> GO TO 7.
NO >> GO TO 9.

7.PERFORM SPEC IN DATA MONITOR MODE

With CONSULT

Make sure that “MAS A/F SE-B1”, “B/FUEL SCHDL”, “A/F ALPHA-B1” and “A/F ALPHA-B2” are within the SP value using CONSULT “SPEC” in “DATA MONITOR” mode of “ENGINE”. Refer to EC-1450, "Component Function Check".

Is the measurement value within the SP value?

YES >> GO TO 9.
NO >> GO TO 8.

8.DETECT MALFUNCTIONING PART BY TROUBLE DIAGNOSIS - SPECIFICATION VALUE

Detect malfunctioning part according to EC-1451, "Diagnosis Procedure".

Is a malfunctioning part detected?

YES >> GO TO 11.
NO >> GO TO 9.

9.DETECT MALFUNCTIONING SYSTEM BY SYMPTOM TABLE

Detect malfunctioning system according to EC-1922, "Symptom Table" based on the confirmed symptom in step 4, and determine the trouble diagnosis order based on possible causes and symptoms.

>> GO TO 10.

10.DETECT MALFUNCTIONING PART BY DIAGNOSIS PROCEDURE

Inspect according to Diagnosis Procedure of the system.

NOTE:

The Diagnosis Procedure in EC section described based on open circuit inspection. A short circuit inspection is also required for the circuit check in the Diagnosis Procedure. For details, refer to GI-45, "Circuit Inspection".

Is a malfunctioning part detected?

YES >> GO TO 11.
NO >> Monitor input data from related sensors or check voltage of related ECM terminals using CONSULT. Refer to EC-1337, "Reference Value".

11.REPAIR OR REPLACE THE MALFUNCTIONING PART

1. Repair or replace the malfunctioning part.
2. Reconnect parts or connectors disconnected during Diagnosis Procedure again after repair and replacement.
3. Check DTC. If DTC is displayed, erase it.
   With CONSULT: Refer to “How to Erase DTC and 1st Trip DTC” in EC-1325, "CONSULT Function".
   Without CONSULT: Refer to “How to Erase Self-diagnostic Results” in EC-1322, "On Board Diagnosis Function".

>> GO TO 12.

12.FINAL CHECK

When DTC was detected in step 2, perform DTC CONFIRMATION PROCEDURE or Component Function Check again, and then make sure that the malfunction have been completely repaired.
When symptom was described from the customer, refer to confirmed symptom in step 3 or 4, and make sure that the symptom is not detected.

Is DTC detected and does symptom remain?

YES-1 >> DTC is detected: GO TO 10.
YES-2 >> Symptom remains: GO TO 6.
NO-1 >> No request for I/M examination from the customer: Before returning the vehicle to the customer, always erase unnecessary DTC in ECM and TCM (With CONSULT: Refer to “How to Read DTC and 1st Trip DTC” in EC-1325, "CONSULT Function", Without CONSULT: Refer to “How to Read Self-diagnostic Results” in EC-1322, "On Board Diagnosis Function").
NO-2 >> I/M examination, requested from the customer: GO TO 13.

13. PREPARE FOR I/M EXAMINATION

1. Set SRT codes. Refer to EC-1438, "Description".
2. Erase permanent DTCs. Refer to EC-1444, "Description".

>> INSPECTION END.

Diagnostic Work Sheet

INFOID:0000000013798140

DESCRIPTION

There are many operating conditions that lead to the malfunction of engine components. A good grasp of such conditions can make troubleshooting faster and more accurate.
In general, each customer feels differently about symptoms. It is important to fully understand the symptoms or conditions for a customer complaint.
Utilize a diagnostic worksheet like the WORKSHEET SAMPLE below in order to organize all the information for troubleshooting.
Some conditions may cause the MIL to illuminate or blink, and DTC to be detected. Examples:

- Vehicle ran out of fuel, which caused the engine to misfire.
- Fuel filler cap was left off or incorrectly screwed on, allowing fuel to evaporate into the atmosphere.

KEY POINTS

WHAT ..... Vehicle & engine model
WHEN ..... Date, Frequencies
WHERE..... Road conditions
HOW ..... Operating conditions, Weather conditions, Symptoms

SEF907L

WORKSHEET SAMPLE

Customer name MR/MS		Model & Year	VIN
Engine #		Trans.	Mileage
Incident Date		Manuf. Date	In Service Date
Fuel and fuel filler cap		☐ Vehicle ran out of fuel causing misfire ☐ Fuel filler cap was left off or incorrectly screwed on.	
Symptoms	☐ Startability	☐ Impossible to start ☐ No combustion ☐ Partial combustion ☐ Partial combustion affected by throttle position ☐ Partial combustion NOT affected by throttle position ☐ Possible but hard to start ☐ Others [ ]	
	☐ Idling	☐ No fast idle ☐ Unstable ☐ High idle ☐ Low idle ☐ Others [ ]	
	☐ Driveability	☐ Stumble ☐ Surge ☐ Knock ☐ Lack of power ☐ Intake backfire ☐ Exhaust backfire ☐ Others [ ]	
	☐ Engine stall	☐ At the time of start ☐ While idling ☐ While accelerating ☐ While decelerating ☐ Just after stopping ☐ While loading	
Incident occurrence		☐ Just after delivery ☐ Recently ☐ In the morning ☐ At night ☐ In the daytime	
Frequency		☐ All the time ☐ Under certain conditions ☐ Sometimes	
Weather conditions		☐ Not affected	
	Weather	☐ Fine ☐ Raining ☐ Snowing ☐ Others [ ]	
	Temperature	☐ Hot ☐ Warm ☐ Cool ☐ Cold ☐ Humid °F	
Engine conditions		☐ Cold ☐ During warm-up ☐ After warm-up Engine speed 0 2,000 4,000 6,000 8,000 rpm	
Road conditions		☐ In town ☐ In suburbs ☐ Highway ☐ Off road (up/down)	
Driving conditions		☐ Not affected ☐ At starting ☐ While idling ☐ At racing ☐ While accelerating ☐ While cruising ☐ While decelerating ☐ While turning (RH/LH) Vehicle speed 0 10 20 30 40 50 60 MPH	
Malfunction indicator lamp		☐ Turned on ☐ Not turned on	

MTBL0017

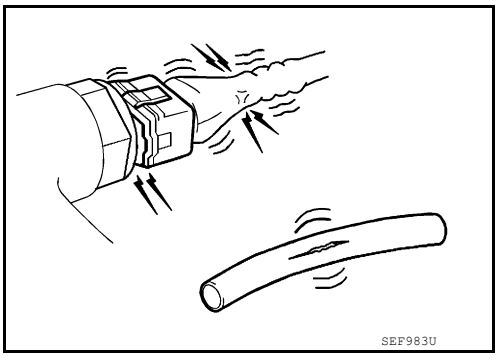
BASIC INSPECTION

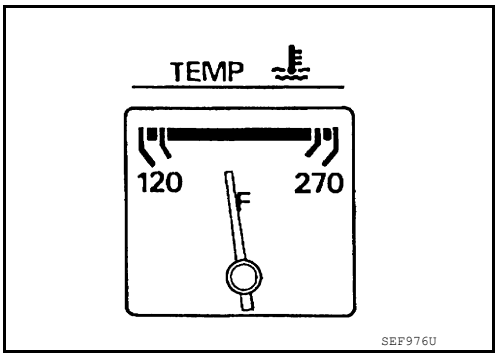
Work Procedure

INFOID:0000000013798141

1.INSPECTION START

1. Check service records for any recent repairs that may indicate a related malfunction, or a current need for scheduled maintenance.
2. Open engine hood and check the following:
- Harness connectors for improper connections
- Wiring harness for improper connections, pinches and cut
- Vacuum hoses for splits, kinks and improper connections
- Hoses and ducts for leakage
- Air cleaner clogging
- Gasket
3. Check that electrical or mechanical loads are not applied.
- Headlamp switch is OFF.
- Air conditioner switch is OFF.
- Rear window defogger switch is OFF.
- Steering wheel is in the straight-ahead position, etc.
4. Start engine and warm it up until engine coolant temperature indicator points to the middle of gauge.
   Check that engine stays below 1,000 rpm.

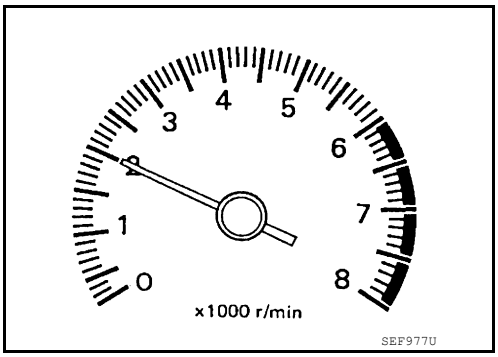




5. Run engine at approximately 2,000 rpm for approximately 2 minutes under no load.
6. Check that no DTC is displayed with CONSULT or GST.

Are any DTCs detected?

YES >> GO TO 2.
NO >> GO TO 3.



2.REPAIR OR REPLACE

Repair or replace components as necessary according to corresponding Diagnosis Procedure.

>> GO TO 3

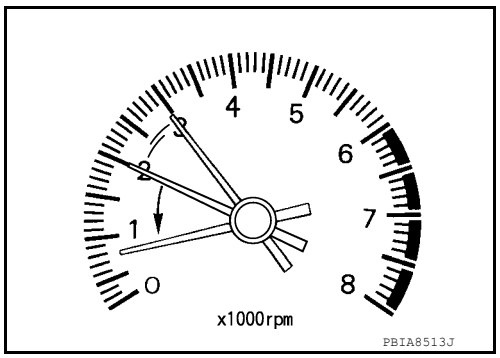
3.CHECK IDLE SPEED

1. Run engine at approximately 2,000 rpm for approximately 2 minutes under no load.

2. Rev engine between 2,000 and 3,000 rpm 2 or 3 times under no load, then run engine at idle speed for approximately 1 minute.
3. Check idle speed.
   For procedure, refer to EC-1928, "Inspection".
   For specification, refer to EC-1936, "Idle Speed".

Is the inspection result normal?

YES >> GO TO 10.
NO >> GO TO 4.



4. PERFORM ACCELERATOR PEDAL RELEASED POSITION LEARNING

1. Stop engine.
2. Perform EC-1428, "Description".

>> GO TO 5.

5. PERFORM THROTTLE VALVE CLOSED POSITION LEARNING

Perform EC-1429, "Description".

>> GO TO 6.

6. PERFORM IDLE AIR VOLUME LEARNING

Perform EC-1430, "Description".

Is Idle Air Volume Learning carried out successfully?

YES >> GO TO 7.
NO >> Follow the instruction of Idle Air Volume Learning. Then GO TO 4.

7. CHECK IDLE SPEED AGAIN

1. Start engine and warm it up to normal operating temperature.
2. Check idle speed.
   For procedure, refer to EC-1928, "Inspection".
   For specification, refer to EC-1936, "Idle Speed".

Is the inspection result normal?

YES >> GO TO 10.
NO >> GO TO 8.

8. DETECT MALFUNCTIONING PART

Check the Following.
- Check camshaft position sensor and circuit. Refer to EC-1644, "DTC Description".
- Check crankshaft position sensor and circuit. Refer to EC-1641, "DTC Description".

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace malfunctioning part. Then GO TO 4.

9. CHECK ECM FUNCTION

1. Substitute with a non-malfunctioning ECM to check ECM function. (ECM may be the cause of the incident, although this is rare.)
2. Perform initialization of IVIS (NATS) system and registration of all IVIS (NATS) ignition key IDs. Refer to SEC-67, "ECM : Description".

>> GO TO 4.

10. CHECK IGNITION TIMING

1. Run engine at idle.
2. Check ignition timing with a timing light.
   For procedure, refer to EC-1929, "Inspection".

For specification, refer to EC-1936, "Ignition Timing".

Is the inspection result normal?

YES >> GO TO 19.
NO >> GO TO 11.

11. PERFORM ACCELERATOR PEDAL RELEASED POSITION LEARNING

1. Stop engine.
2. Perform EC-1428, "Description".

>> GO TO 12.

12. PERFORM THROTTLE VALVE CLOSED POSITION LEARNING

Perform EC-1429, "Description".

>> GO TO 13.

13. PERFORM IDLE AIR VOLUME LEARNING

Perform EC-1430, "Description".

Is Idle Air Volume Learning carried out successfully?

YES >> GO TO 14.
NO >> Follow the instruction of Idle Air Volume Learning. Then GO TO 4.

14. CHECK IDLE SPEED AGAIN

1. Start engine and warm it up to normal operating temperature.
2. Check idle speed.
   For procedure, refer to EC-1928, "Inspection".
   For specification, refer to EC-1936, "Idle Speed".

Is the inspection result normal?

YES >> GO TO 15.
NO >> GO TO 17.

15. CHECK IGNITION TIMING AGAIN

1. Run engine at idle.
2. Check ignition timing with a timing light.
   For procedure, refer to EC-1929, "Inspection".
   For specification, refer to EC-1936, "Ignition Timing".

Is the inspection result normal?

YES >> GO TO 19.
NO >> GO TO 16.

16. CHECK TIMING CHAIN INSTALLATION

Check timing chain installation. Refer to EM-69, "Removal and Installation".

Is the inspection result normal?

YES >> GO TO 17.
NO >> Repair the timing chain installation. Then GO TO 4.

17. DETECT MALFUNCTIONING PART

Check the following.
- Check camshaft position sensor and circuit. Refer to EC-1644, "DTC Description".
- Check crankshaft position sensor and circuit. Refer to EC-1641, "DTC Description".

Is the inspection result normal?

YES >> GO TO 18.
NO >> Repair or replace malfunctioning part. Then GO TO 4.

18. CHECK ECM FUNCTION

1. Substitute with a non-malfunctioning ECM to check ECM function. (ECM may be the cause of the incident, although this is rare.)

2. Perform initialization of IVIS (NATS) system and registration of all IVIS (NATS) ignition key IDs. Refer to SEC-67, "ECM : Description".

>> GO TO 4.

19. INSPECTION END

If ECM is replaced during this BASIC INSPECTION procedure, perform EC-1424, "Description".

>> INSPECTION END

ADDITIONAL SERVICE WHEN REPLACING ECM

Description

INFOID:0000000013798142

When replacing ECM, the following procedure must be performed. (For details, refer to EC-1424, "Work Procedure".)

PROGRAMMING OPERATION

NOTE:
After replacing with a blank ECM, programming is required to write ECM information. Be sure to follow the procedure to perform the programming.

BEFORE REPLACEMENT

When replacing ECM, perform “SAVING DATA FOR REPLC CPU” in “WORK SUPPORT” of “ENGINE” by using CONSULT to save current ECM data before replacement.

AFTER REPLACEMENT

After replacing ECM, the following items must be performed:
- Write data after replace CPU
- Accelerator pedal released position learning
- Throttle valve closed position learning
- Idle air volume learning

Work Procedure

INFOID:0000000013798143

1.SAVE ECM DATA

With CONSULT
1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Turn ignition switch ON.
4. Select “SAVING DATA FOR REPLC CPU” in “WORK SUPPORT” mode of “ENGINE” using CONSULT.
5. Follow the instruction of CONSULT display.

NOTE:
- Necessary data in ECM is copied and saved to CONSULT.
- Go to Step 2 regardless of with or without success in saving data.

>> GO TO 2.

2.CHECK ECM PART NUMBER

Check ECM part number to see whether it is blank ECM or not.
NOTE:
- Part number of blank ECM is 23703 - ×××××.
- Check part number when ordering ECM or the one included in the label on the container box.

Is the ECM a blank ECM?

YES >> GO TO 3.
NO >> GO TO 5.

3.SAVE ECM PART NUMBER

Read out the part number from the old ECM and save the number, following the programming instructions. Refer to CONSULT Operation Manual.
NOTE:
- The ECM part number is saved in CONSULT.
- Even when ECM part number is not saved in CONSULT, go to 4.

>> GO TO 4.

4.PERFORM ECM PROGRAMMING

After replacing ECM, perform the ECM programming. Refer to CONSULT Operation Manual.
NOTE:
- Refer to EC-1933, "Removal and Installation" for replacement of ECM.

- During programming, maintain the following conditions:
- Ignition switch: ON
- Electric load: OFF
- Brake pedal: Not depressed
- Battery voltage: 12 – 13.5 V (Be sure to check the value of battery voltage by selecting “BATTERY VOLT” in “Data monitor” of CONSULT.)

>> GO TO 6.

5.REPLACE ECM

Replace ECM. Refer to EC-1933, "Removal and Installation".

>> GO TO 6.

6.PERFORM INITIALIZATION OF IVIS (NATS) SYSTEM AND REGISTRATION OF ALL IVIS (NATS) IGNITION KEY IDS

Refer to SEC-67, "ECM : Description".

>> GO TO 7.

7.CHECK ECM DATA STATUS

Check if the data is successfully copied from the ECM at Step 1 (before replacement) and saved in CONSULT.

Is the data saved successfully?

YES >> GO TO 8.
NO >> GO TO 9.

8.WRITE ECM DATA

With CONSULT
1. Select “WRITING DATA FOR REPLC CPU” in “WORK SUPPORT” mode of “ENGINE” using CONSULT.
2. Follow the instruction of CONSULT display.

NOTE:
The data saved by “SAVING DATA FOR REPLC CPU” is written to ECM.

>> GO TO 10.

9.PERFORM VIN REGISTRATION

Refer to EC-1427, "Description".

>> GO TO 10.

10.PERFORM ACCELERATOR PEDAL RELEASED POSITION LEARNING

Perform Accelerator Pedal Released Position Learning. Refer to EC-1428, "Description".

>> GO TO 11.

11.PERFORM THROTTLE VALVE CLOSED POSITION LEARNING

Perform Throttle Valve Closed Position Learning. Refer to EC-1429, "Description".

>> GO TO 12.

12.PERFORM IDLE AIR VOLUME LEARNING

Perform Idle Air Volume Learning. Refer to EC-1430, "Description".

>> END

ADDITIONAL SERVICE WHEN REPLACING VVEL CONTROL MODULE

Description

INFOID:0000000013798144

When replacing VVEL control module, the following procedure must be performed. (For details, refer to EC-1426, "Work Procedure".)

Work Procedure

INFOID:0000000013798145

1.PERFORM IDLE AIR VOLUME LEARNING

Perform idle air volume learning. Refer to EC-1430, "Description".

>> END

VIN REGISTRATION

Description

INFOID:0000000013798146

VIN Registration is an operation to registering VIN in ECM. It must be performed each time ECM is replaced. (For details, refer to EC-1427, "Work Procedure".)

NOTE:
Accurate VIN which is registered in ECM may be required for Inspection & Maintenance (I/M).

Work Procedure

INFOID:0000000013798147

1.CHECK VIN

Check the VIN of the vehicle and note it. Refer to GI-34, "Identification Number".

>> GO TO 2.

2.PERFORM VIN REGISTRATION

With CONSULT

1. Turn ignition switch ON and engine stopped.
2. Select “VIN REGISTRATION” in “WORK SUPPORT” mode of “ENGINE”.
3. Follow the instruction of CONSULT display.

>> END

ACCELERATOR PEDAL RELEASED POSITION LEARNING

Description

INFOID:0000000013798148

Accelerator Pedal Released Position Learning is a function of ECM to learn the fully released position of the accelerator pedal by monitoring the accelerator pedal position sensor output signal. It must be performed each time the harness connector of the accelerator pedal position sensor or ECM is disconnected. (For details, refer to EC-1428, "Work Procedure".)

Work Procedure

INFOID:0000000013798149

1.START

1. Check that accelerator pedal is fully released.
2. Turn ignition switch ON and wait at least 2 seconds.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON and wait at least 2 seconds.
5. Turn ignition switch OFF and wait at least 10 seconds.

>> END

THROTTLE VALVE CLOSED POSITION LEARNING

Description

INFOID:0000000013798150

Throttle Valve Closed Position Learning is a function of ECM to learn the fully closed position of the throttle valve by monitoring the throttle position sensor output signal. It must be performed each time the harness connector of the electric throttle control actuator or ECM is disconnected or electric throttle control actuator inside is cleaned. (For details, refer to EC-1429, "Work Procedure".)

Work Procedure

INFOID:0000000013798151

1.START

WITH CONSULT
1. Turn ignition switch ON.
2. Select “CLSD THL POS LEARN” in “WORK SUPPORT” mode.
3. Follow the instructions on the CONSULT display.
4. Turn ignition switch OFF and wait at least 10 seconds.
   Check that throttle valve moves during the above 10 seconds by confirming the operating sound.

WITHOUT CONSULT
1. Start the engine.
   NOTE:
   Engine coolant temperature is 25°C (77°F) or less before engine starts.
2. Warm up the engine.
   NOTE:
   Raise engine coolant temperature until it reaches 65°C (149°F) or more.
3. Turn ignition switch OFF and wait at least 10 seconds.
   Check that throttle valve moves during the above 10 seconds by confirming the operating sound.

>> END

IDLE AIR VOLUME LEARNING

Description

INFOID:0000000013798152

Idle Air Volume Learning is a function of ECM to learn the idle air volume that keeps engine idle speed within the specific range. (For details, refer to EC-1430, "Work Procedure".) It must be performed under the following conditions:

- Each time the electric throttle control actuator or ECM is replaced.
- Idle speed or ignition timing is out of the specification.

Work Procedure

INFOID:0000000013798153

1.PRECONDITIONING

Check that all of the following conditions are satisfied.
Learning will be cancelled if any of the following conditions are missed for even a moment.

- Battery voltage: More than 12.9 V (At idle)
- Engine coolant temperature: 70 - 105°C (158 - 221°F)
- Selector lever position: P or N
- Electric load switch: OFF
  (Air conditioner, headlamp, rear window defogger)
  On vehicles equipped with daytime light systems, if the parking brake is applied before the engine is started the headlamp will not illuminate.
- Steering wheel: Neutral (Straight-ahead position)
- Vehicle speed: Stopped
- Transmission: Warmed-up

- With CONSULT: Drive vehicle until “ATF TEMP 2” in “DATA MONITOR” mode of “A/T” system indicates less than 0.9 V.
- Without CONSULT: Drive vehicle for 10 minutes.

Will CONSULT be used?

YES >> GO TO 2.
NO >> GO TO 3.

2.PERFORM IDLE AIR VOLUME LEARNING

WITH CONSULT

1. Perform Accelerator Pedal Released Position Learning. Refer to EC-1428, "Description".
2. Perform Throttle Valve Closed Position Learning. EC-1429, "Description".
3. Start engine and warm it up to normal operating temperature.
4. Select “IDLE AIR VOL LEARN” in “WORK SUPPORT” mode.
5. Touch “START” and wait 20 seconds.

Is “CMPLT” displayed on CONSULT screen?

YES >> GO TO 4.
NO >> GO TO 5.

3.PERFORM IDLE AIR VOLUME LEARNING

WITHOUT CONSULT

NOTE:

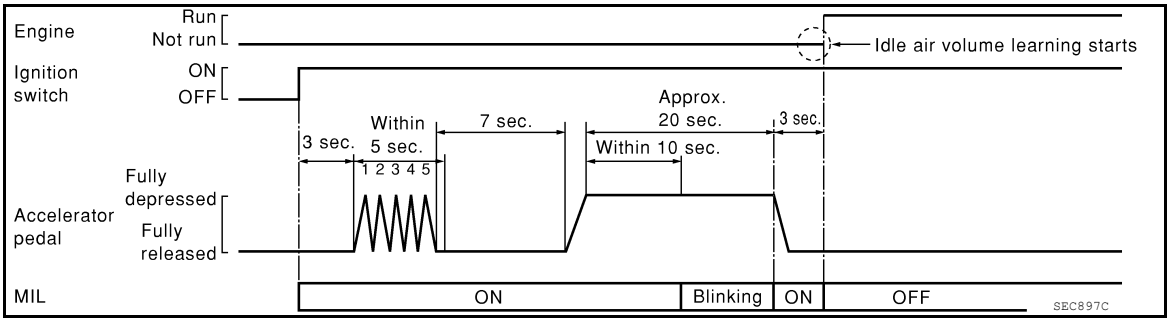
- **It is better to count the time accurately with a clock.**
- **It is impossible to switch the diagnostic mode when an accelerator pedal position sensor circuit has a malfunction.**

1. Perform Accelerator Pedal Released Position Learning. Refer to EC-1428, "Description".
2. Perform Throttle Valve Closed Position Learning. EC-1429, "Description".
3. Start engine and warm it up to normal operating temperature.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Confirm that accelerator pedal is fully released, turn ignition switch ON and wait 3 seconds.
6. Repeat the following procedure quickly 5 times within 5 seconds.

- Fully depress the accelerator pedal.
- Fully release the accelerator pedal.

7. Wait 7 seconds, fully depress the accelerator pedal for approx. 20 seconds until the MIL stops blinking and turns ON.

8. Fully release the accelerator pedal within 3 seconds after the MIL turns ON.
9. Start engine and let it idle.
10. Wait 20 seconds.



>> GO TO 4.

4. CHECK IDLE SPEED AND IGNITION TIMING

Rev up engine two or three times and check that idle speed and ignition timing are within the specifications.
For procedure, refer to EC-1928, "Inspection" and EC-1929, "Inspection".
For specifications, refer to EC-1936, "Idle Speed" and EC-1936, "Ignition Timing".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 5.

5. DETECT MALFUNCTIONING PART-I

Check the following
- Check that throttle valve is fully closed.
- Check PCV valve operation.
- Check that downstream of throttle valve is free from air leakage.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace malfunctioning part.

6. DETECT MALFUNCTIONING PART-II

Engine component parts and their installation condition are questionable. Check and eliminate the cause of the incident.
It is useful to perform “TROUBLE DIAGNOSIS - SPECIFICATION VALUE”. Refer to EC-1450, "Description".
If any of the following conditions occur after the engine has started, eliminate the cause of the incident and perform Idle Air Volume Learning again:
- Engine stalls.
- Incorrect idle.

>> INSPECTION END

VVEL CONTROL SHAFT POSITION SENSOR ADJUSTMENT

Description

INFOID:0000000013798154

VVEL control shaft position sensor adjustment is an operation to adjust the initial position of the VVEL control shaft position sensor. (For details, refer to EC-1432, "Work Procedure".)
It must be performed each time VVEL ladder assembly is replaced.

CAUTION:

- **It must be performed only on the replaced bank side.**
- **It must not be performed except when VVEL ladder assembly is replaced. If by any chance the adjustment is performed, replace VVEL ladder assembly.**

Work Procedure

INFOID:0000000013798155

1.START

Will CONSULT be used?

Will CONSULT be used?

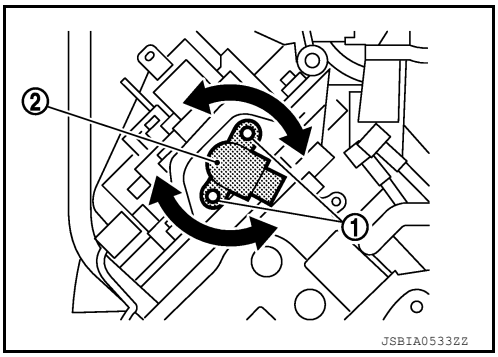
YES >> GO TO 2.
NO >> GO TO 3.

2.PERFORM VVEL CONTROL SHAFT POSITION SENSOR ADJUSTMENT

WITH CONSULT

1. Turn ignition switch ON.
2. Select “VVEL POS SEN ADJ PREP” in “WORK SUPPORT” mode with CONSULT.
3. Touch “Start” and wait a few seconds.
4. Check that “CMPLT” is displayed on CONSULT screen.
5. Select “VVEL POSITION SEN-B1” or “VVEL POSITION SEN-B2” in “DATA MONITOR” mode with CONSULT.
6. Loosen the VVEL control shaft position sensor mounting bolts (1).
7. Turn the VVEL control shaft position sensor (2) clockwise and counterclockwise while monitoring the output voltage of “VVEL POSITION SEN-B1” or “VVEL POSITION SEN-B2” and adjust the output voltage to be within the standard value.

   Voltage: 500 ± 48 mV



8. Tighten the VVEL control shaft position sensor mounting bolts.

   : 7.0 N·m (0.71 kg-m, 62 in-lb)

9. Reconfirm that the output voltage of “VVEL POSITION SEN-B1” or “VVEL POSITION SEN-B2” is within the standard value.

   Voltage: 500 ± 48 mV

   NOTE:
   If it varies from the standard value after the mounting bolts are tightened, perform steps 6 to 8 again.
10. Turn ignition switch OFF and wait at least 10 seconds.
11. Start engine and warm it up to normal operating temperature.
12. Turn ignition switch OFF and wait at least 10 seconds.
13. Perform idle air volume learning. Refer to EC-1430, "Description".

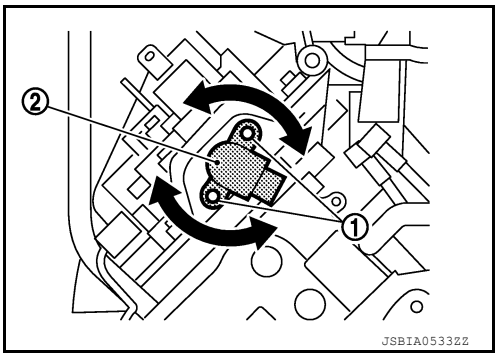
>> INSPECTION END

3.PERFORM VVEL CONTROL SHAFT POSITION SENSOR ADJUSTMENT

WITHOUT CONSULT

1. Disconnect VVEL control shaft position sensor harness connector.
2. Remove VVEL actuator motor relay.
3. Turn ignition switch ON, wait at least 5 seconds and then turn it OFF.

4. Reconnect all harness connectors disconnected.
5. Install VVEL actuator motor relay.
6. Turn ignition switch ON and wait at least 5 seconds.
7. Loosen the VVEL control shaft position sensor mounting bolts (1).
8. Turn the VVEL control shaft position sensor (2) clockwise and counterclockwise while monitoring the output voltage between the VVEL control module terminals with a tester and adjust the output voltage to be within the standard value.



VVEL control module				Voltage
Bank	Connector	+	–	
		Terminal	Terminal	
1	F84	3	6	500 ± 48 mV
2		5	4	

9. Tighten the VVEL control shaft position sensor mounting bolts.

: **7.0 N·m (0.71 kg-m, 62 in-lb)**

10. Reconfirm that the output voltage of VVEL control shaft position sensor is within the standard value.

VVEL control module				Voltage
Bank	Connector	+	–	
		Terminal	Terminal	
1	F84	3	6	500 ± 48 mV
2		5	4	

NOTE:
If it varies from the standard value after the mounting bolts are tightened, perform steps 7 to 9 again.

11. Turn ignition switch OFF and wait at least 10 seconds.
12. Start engine and warm it up to normal operating temperature.
13. Turn ignition switch OFF and wait at least 10 seconds.
14. Perform Idle Air Volume Learning. Refer to EC-1430, "Description".

>> INSPECTION END

MIXTURE RATIO SELF-LEARNING VALUE CLEAR

Description

INFOID:0000000013798156

This describes how to erase the mixture ratio self-learning value. For the actual procedure, follow the instructions in “Diagnosis Procedure”. (For details, refer to EC-1434, "Work Procedure".)

Work Procedure

INFOID:0000000013798157

1.START

WITH CONSULT
1. Start engine and warm it up to normal operating temperature.
2. Select “SELF-LEARNING CONT” in “WORK SUPPORT” mode with CONSULT.
3. Clear mixture ratio self-learning value by touching “CLEAR”.

WITH GST
1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch OFF.
3. Disconnect mass air flow sensor harness connector.
4. Restart engine and let it idle for at least 5 seconds.
5. Stop engine and reconnect mass air flow sensor harness connector.
6. Select Service $03 with GST. Check DTC P0102 is detected.
7. Select Service $04 with GST to erase the DTC P0102.

>> END

FUEL PRESSURE

Work Procedure

INFOID:0000000013798158

FUEL PRESSURE RELEASE

WITH CONSULT

1. Turn ignition switch ON.
2. Perform “FUEL PRESSURE RELEASE” in “WORK SUPPORT” mode with CONSULT.
3. Start engine.
4. After engine stalls, crank it two or three times to release all fuel pressure.
5. Turn ignition switch OFF.

WITHOUT CONSULT

1. Remove fuel pump fuse in IPDM E/R.
   NOTE:
   - For the fuse number, refer to EC-1386, "Wiring Diagram".
   - For the fuse arrangement, refer to PG-163, "IPDM E/R Terminal Arrangement".
2. Start engine.
3. After engine stalls, crank it two or three times to release all fuel pressure.
4. Turn ignition switch OFF.
5. Reinstall fuel pump fuse after servicing fuel system.

LOW FUEL PRESSURE CHECK

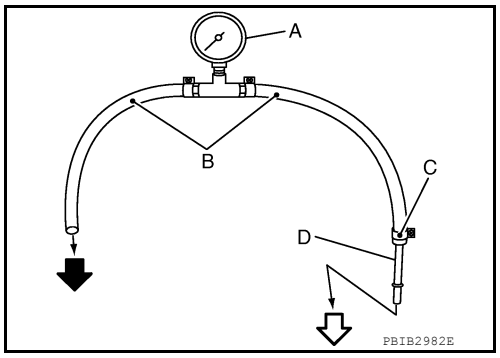
CAUTION:

- **Before disconnecting fuel line, release fuel pressure from fuel line to eliminate danger.**
- **The fuel hose connection method used when taking fuel pressure check must not be used for other purposes.**
- **Do not perform fuel pressure check with electrical systems operating (i.e. lights, rear defogger, A/C, etc.) Fuel pressure gauge may indicate false readings due to varying engine load and changes in manifold vacuum.**

NOTE:

Prepare pans or saucers under the disconnected fuel line because the fuel may spill out.

1. Release fuel pressure to zero.
2. Prepare fuel hose for fuel pressure check (B) and fuel tube adapter [SST (KV10118400)] (D), then connect fuel pressure gauge (A).



⇦ **To quick connector**

⬅ **To fuel tube (engine side)**

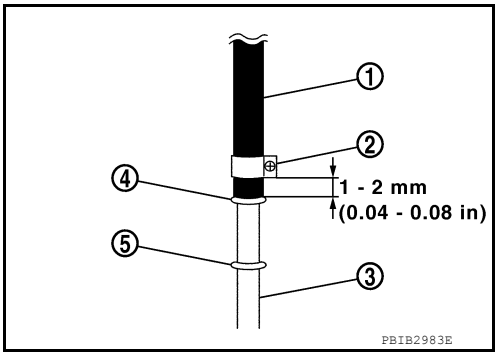
C **: Hose clamp**

CAUTION:

- **Use suitable fuel hose for fuel pressure check (genuine NISSAN fuel hose without quick connector).**
- **To avoid unnecessary force or tension to hose, use moderately long fuel hose for fuel pressure check.**
- **Do not use the fuel hose for checking fuel pressure with damage or cracks on it.**
- **Use Pressure Gauge to check fuel pressure.**

3. Disconnect fuel feed hose from fuel tube. Refer to EM-49, "Exploded View".
   CAUTION:
   Do not twist or kink fuel hose because it is plastic hose.

4. Connect fuel hose for fuel pressure check (1) to fuel tube (engine side) with clamp (2) as shown in the figure.



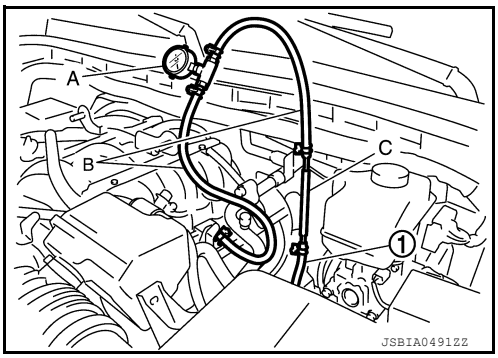
5 : No.2 spool

CAUTION:
- **Wipe off oil or dirt from hose insertion part using cloth moistened with gasoline.**
- **Apply proper amount of gasoline between top of the fuel tube (3) and No.1 spool (4).**
- **Insert fuel hose for fuel pressure check until it touches the No.1 spool on fuel tube.**
- **Use NISSAN genuine hose clamp (part number: 16439 N4710 or 16439 40U00).**
- **When reconnecting fuel line, always use new clamps.**
- **Use a torque driver to tighten clamps.**
- **Install hose clamp to the position within 1 - 2 mm (0.04 - 0.08 in).**

Tightening torque : 1.0 - 1.5 N·m (0.1 - 0.15 kg-m, 9 - 13 in-lb)

- **Make sure that clamp screw does not contact adjacent parts.**

5. Connect fuel tube adapter (C) to fuel feed hose (1) in the same manner as instructed in Step 4.



A : Fuel pressure gauge

B : Fuel hose for fuel pressure check

6. After connecting fuel hose for fuel pressure check, pull the hose with a force of approximately 98 N (10 kg, 22 lb) to confirm fuel tube does not come off.
7. Reinstall the part removed at Step 3.
   NOTE:
   Install the part to allow smooth engine starts.
8. Turn ignition switch ON and check for fuel leakage.
9. Start engine and check for fuel leakage.
10. Read the indication of fuel pressure gauge.
    CAUTION:
    - **Do not perform fuel pressure check with system operating. Fuel pressure gauge may indicate false readings.**
    - **During fuel pressure check, confirm for fuel leakage from fuel connection every 3 minutes.**

At idling : Approximately 450 kPa (4.5 bar, 4.6 kg/cm^2, 65 psi)

HIGH FUEL PRESSURE CHECK

NOTE:
Since the fuel pressure gauge kit cannot be connected, follow the method shown below to check high fuel pressure.

WITH CONSULT

1. Start engine.
2. Check “FUEL PRES SEN V” in “DATA MONITOR” mode with CONSULT.

Monitor Item	Condition	Values/Status
FUEL PRES SEN V	Idle	980 – 1,200 mV
	Revving engine from idle to 4,000 rpm quickly	1,100 – 2,900 mV

⊗WITHOUT CONSULT
1. Start the engine.
2. Check fuel rail pressure sensor signal voltage.

+		−	Condition	Value (Approx.)
Fuel rail pressure sensor				
Connector	Terminal			
F91	2	Ground	Engine speed: idle	0.98 – 1.2 V
			Engine speed: Revving engine from idle to 4,000 rpm quickly	1.1 – 2.9 V

HOW TO SET SRT CODE

Description

INFOID:0000000013798159

OUTLINE

In order to set all SRTs, the self-diagnoses as in the “SRT ITEM” table must have been performed at least once. Each diagnosis may require actual driving for a long period of time under various conditions.

SRT ITEM

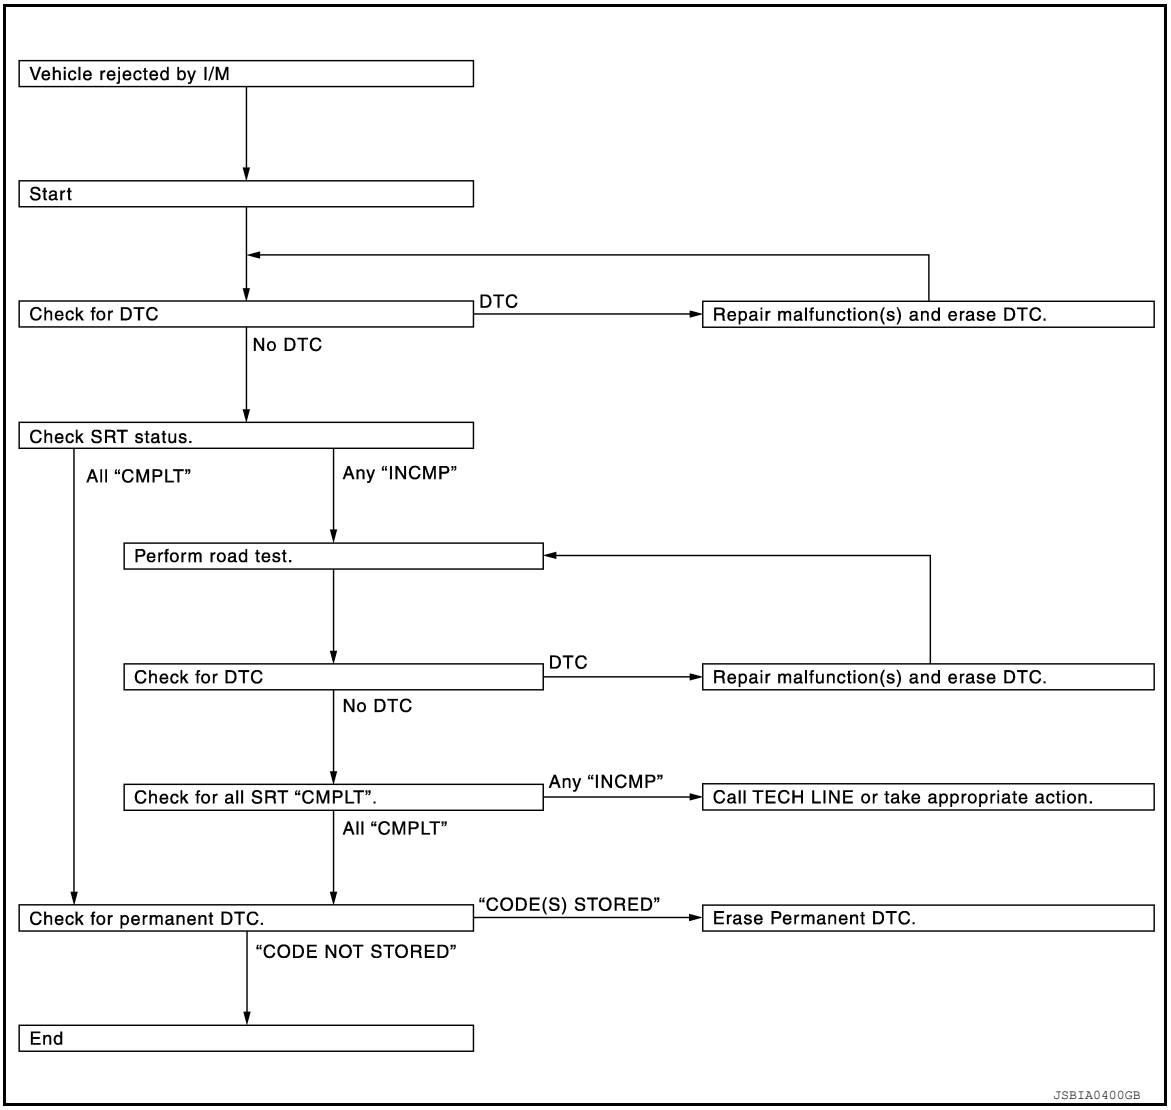
The table below shows required self-diagnostic items to set the SRT to “CMPLT”.

SRT item*1 (CONSULT indication)	Required self-diagnostic items to set the SRT to “CMPLT”	Corresponding DTC No.
CATALYST	Three way catalyst function	P0420, P0430
EVAP SYSTEM	EVAP control system purge flow monitoring	P0441
	EVAP control system	P0456
HO2S	Air fuel ratio (A/F) sensor 1	P0130, P014C, P014D, P014E, P014F, P0150, P015A, P015B, P015C, P015D, P219C, P219D, P219E, P219F, P21A0, P21A1, P21A2, P21A3
	Heated oxygen sensor 2	P0137, P0157
	Heated oxygen sensor 2	P0138, P0158
	Heated oxygen sensor 2	P0139, P0159
EGR/VVT SYSTEM	Intake/Exhaust valve timing control function	P0011, P0012, P0015, P0016, P0017, P0018, P0019, P0021, P0022, P0025

*1: Though displayed on the CONSULT screen, “HO2S HTR” is not SRT item.

SRT SERVICE PROCEDURE

If a vehicle has failed the state emissions inspection due to one or more SRT items indicating “INCMP”, review the flowchart diagnostic sequence, referring to the following flowchart.

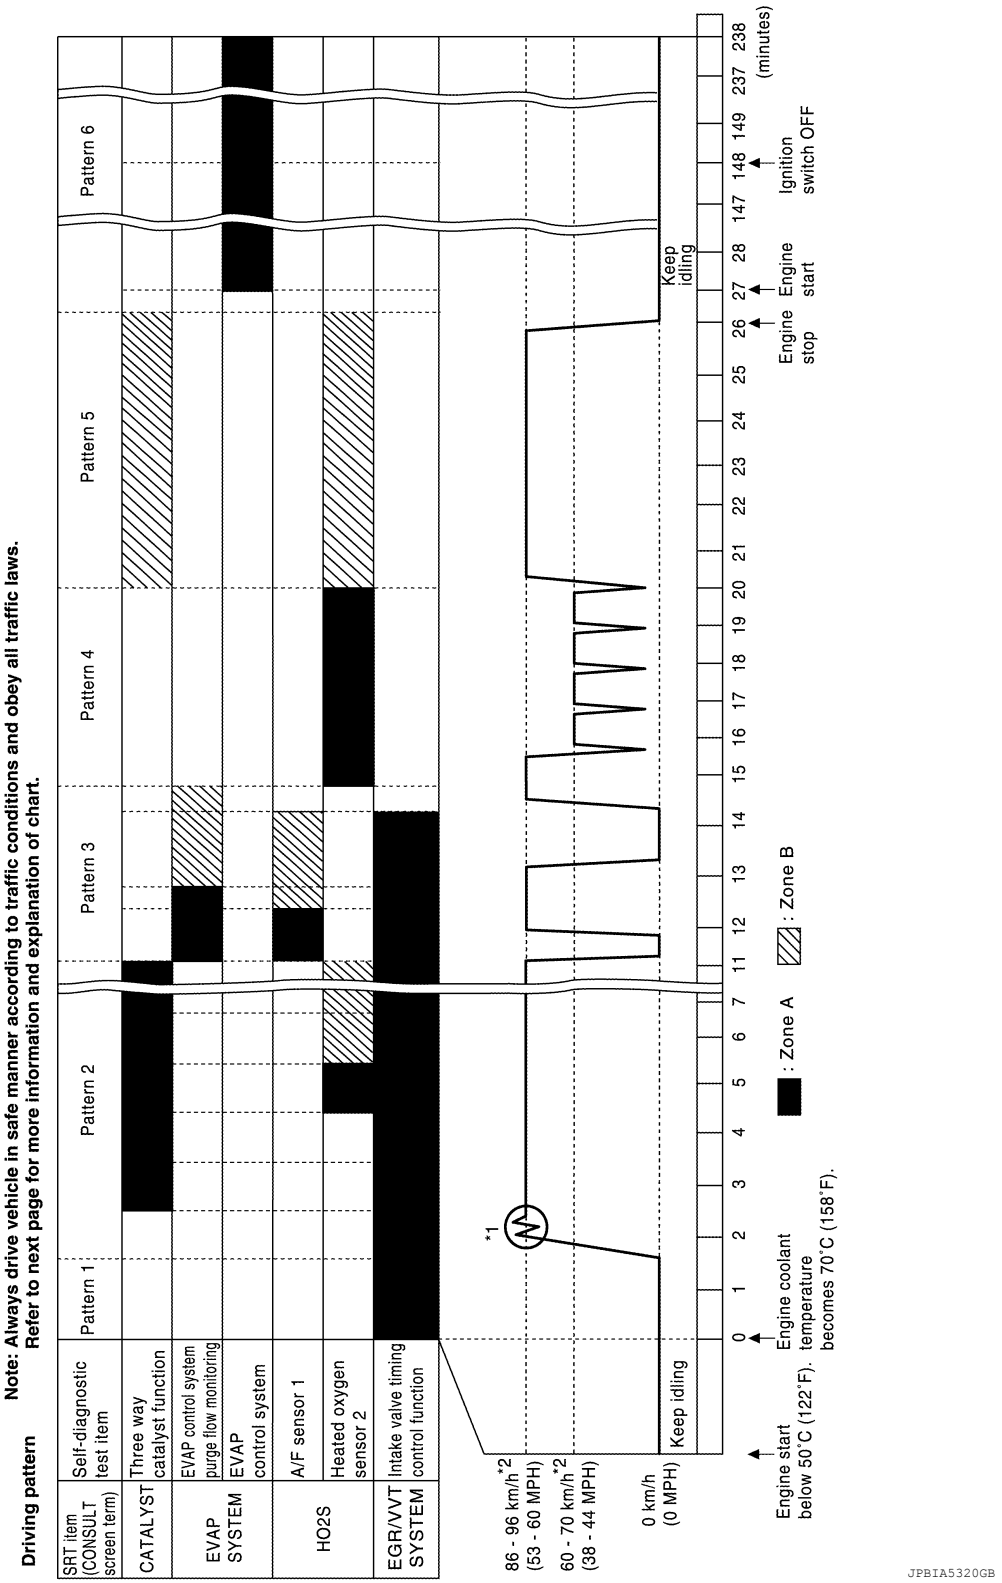


SRT Set Driving Pattern

INFOID:0000000013798160

CAUTION:

Always drive the vehicle in safe manner according to traffic conditions and obey all traffic laws.



*1: Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.

*2: Checking the vehicle speed with GST is advised.

- The time required for each diagnosis varies with road surface conditions, weather, altitude, individual driving habits, etc.
  Zone A refers to the range where the time, required for the diagnosis under normal conditions*, is the shortest.

Zone B refers to the range where the diagnosis can still be performed if the diagnosis is not completed within zone A.

*: Normal conditions refer to the following:

- Sea level
- Flat road
- Ambient air temperature: 20 - 30°C (68 - 86°F)
- Diagnosis is performed as quickly as possible under normal conditions.
  Under different conditions [For example: ambient air temperature other than 20 - 30°C (68 - 86°F)], diagnosis may also be performed.

Work Procedure

INFOID:0000000013798161

1.CHECK DTC

Check DTC.

Is any DTC detected?

YES >> Repair malfunction(s) and erase DTC. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK SRT STATUS

WITH CONSULT
Select “SRT STATUS” in “DTC & SRT CONFIRMATION” mode with CONSULT.
WITHOUT CONSULT
Perform “SRT status” mode with EC-1322, "On Board Diagnosis Function".
WITH GST
Select Service $01 with GST.

Is SRT code(s) set?

YES >> GO TO 12.
NO-1 >> With CONSULT: GO TO 3.
NO-2 >> Without CONSULT: GO TO 4.

3.DTC CONFIRMATION PROCEDURE

1. Select “SRT WORK SUPPORT” in “DTC & SRT CONFIRMATION” mode with CONSULT.
2. For SRT(s) that is not set, perform the corresponding “DTC CONFIRMATION PROCEDURE” according to the “Performance Priority” in the “SRT ITEM” table. Refer to EC-1438, "Description".
3. Check DTC.

Is any DTC detected?

YES >> Repair malfunction(s) and erase DTC. Refer to EC-1366, "DTC Index".
NO >> GO TO 11.

4.PERFORM ROAD TEST

- Check the “Performance Priority” in the “SRT ITEM” table. Refer to EC-1438, "Description".
- Perform the most efficient SRT set driving pattern to set the SRT properly. Refer to EC-1439, "SRT Set Driving Pattern".
  In order to set all SRTs, the SRT set driving pattern must be performed at least once.

>> GO TO 5.

5.PATTERN 1

1. Check the vehicle condition;
- Engine coolant temperature is −10 to 35°C (14 to 95°F).
- Fuel tank temperature is more than 0°C (32°F).
2. Start the engine.
3. Keep engine idling until the engine coolant temperature is greater than 70°C (158°F)

NOTE:
ECM terminal voltage is follows;

- Engine coolant temperature
  - −10 to 35°C (14 to 95°F): 3.0 - 4.3 V
  - 70°(158°F): Less than 1.4 V

• Fuel tank temperature: Less than 4.1 V
Refer to EC-1337, "Reference Value".

>> GO TO 6.

6. PATTERN 2

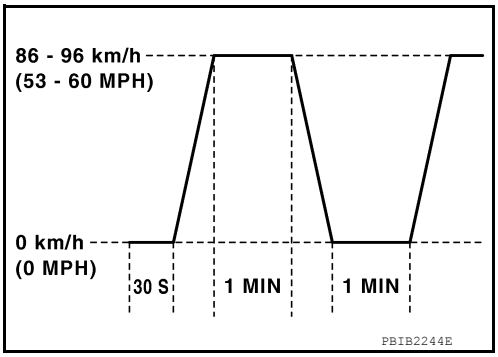
1. Drive the vehicle. And depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds.
2. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again

NOTE:
• Checking the vehicle speed with GST is advised.
• When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

>> GO TO 7.

7. PATTERN 3

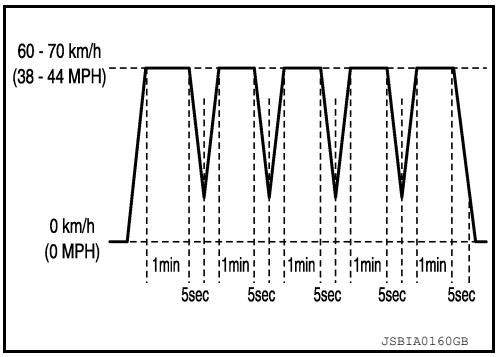
• Operate vehicle following the driving pattern shown in the figure.
• Release the accelerator pedal during deceleration of vehicle speed from 90 km/h (56 MPH) to 0 km/h (0 MPH).



>> GO TO 8.

8. PATTERN 4

• Operate vehicle following the driving pattern shown in the figure.
- Drive the vehicle in a proper gear at 60 km/h (38 MPH) and maintain the speed.
- Release the accelerator pedal fully at least 5 seconds.
- Repeat the above two steps at least 5 times.



>> GO TO 9.

9. PATTERN 5

• The accelerator pedal must be held very steady during steady-state driving.
• If the accelerator pedal is moved, the test must be conducted again.

>> GO TO 10.

10. PATTERN 6

• Cool down the engine so that the engine coolant temperature lowers between 15 - 35°C (59 - 95°F).
CAUTION:
Never turn the ignition switch ON while cooling down the engine.
• Engine coolant temperature at engine start is between 15 – 35°C (59 – 95°F) and has lowered 45°C (113°F) or more since the latest engine stop.

>> GO TO 11.

11. CHECK SRT STATUS

WITH CONSULT
Select “SRT STATUS” in “DTC & SRT CONFIRMATION” mode with CONSULT.
WITHOUT CONSULT
Perform “SRT status” mode with EC-1322, "On Board Diagnosis Function".
WITH GST
Select Service $01 with GST.

Is SRT(s) set?

YES >> GO TO 12.
NO >> Call TECH LINE or take appropriate action.

12. CHECK PERMANENT DTC

NOTE:
Permanent DTC cannot be checked with a tool other than CONSULT or GST.

With CONSULT
Select “SRT STATUS” in “DTC & SRT CONFIRMATION” mode with CONSULT.
With GST
Select Service $0A with GST.

Is permanent DTC(s) detected?

YES >> Go to EC-1444, "Description".
NO >> END

HOW TO ERASE PERMANENT DTC

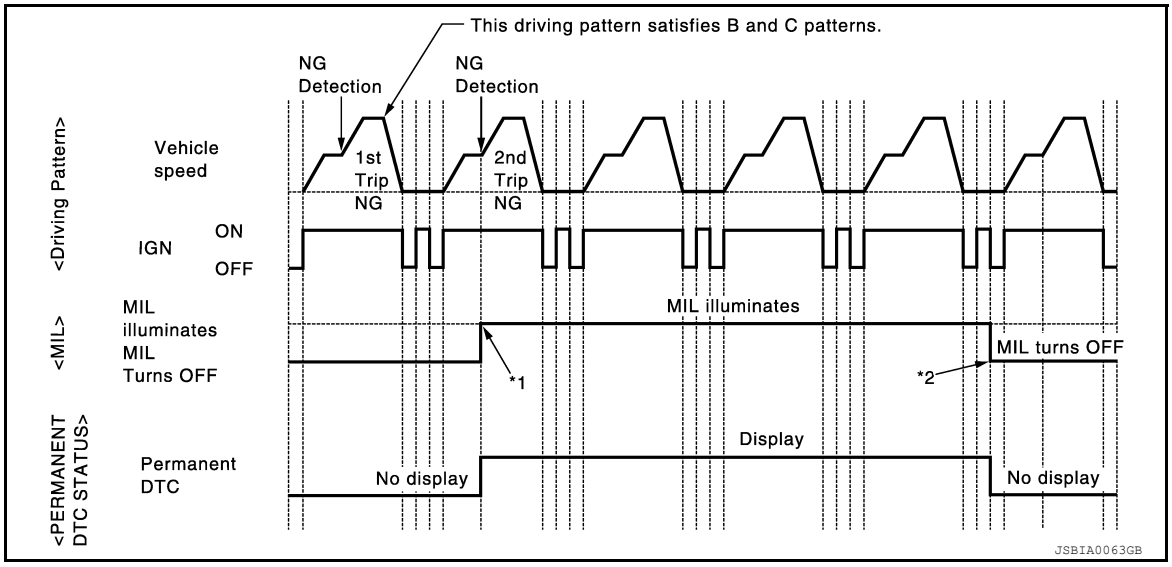
Description

INFOID:0000000013798165

NOTE:
Permanent DTC is not applied for regions where ti is not mandated.

OUTLINE

When a DTC is stored in ECM
When a DTC is stored in ECM and MIL is ON, a permanent DTC is erased with MIL shutoff if the same malfunction is not detected after performing the driving pattern for MIL shutoff three times in a raw.



*1: When the same malfunction is detected in two consecutive trips, MIL will illuminate.

*2: MIL will turn off after vehicle is driven 3 times (driving pattern B) without any malfunctions.

When a DTC is not stored in ECM
The erasing method depends on a permanent DTC stored in ECM. Refer to the following table.
NOTE:
If the applicable permanent DTC includes multiple groups, perform the procedure of Group B first. If the permanent DTC is not erased, perform the procedure of Group A.

×: Applicable —: Not applicable

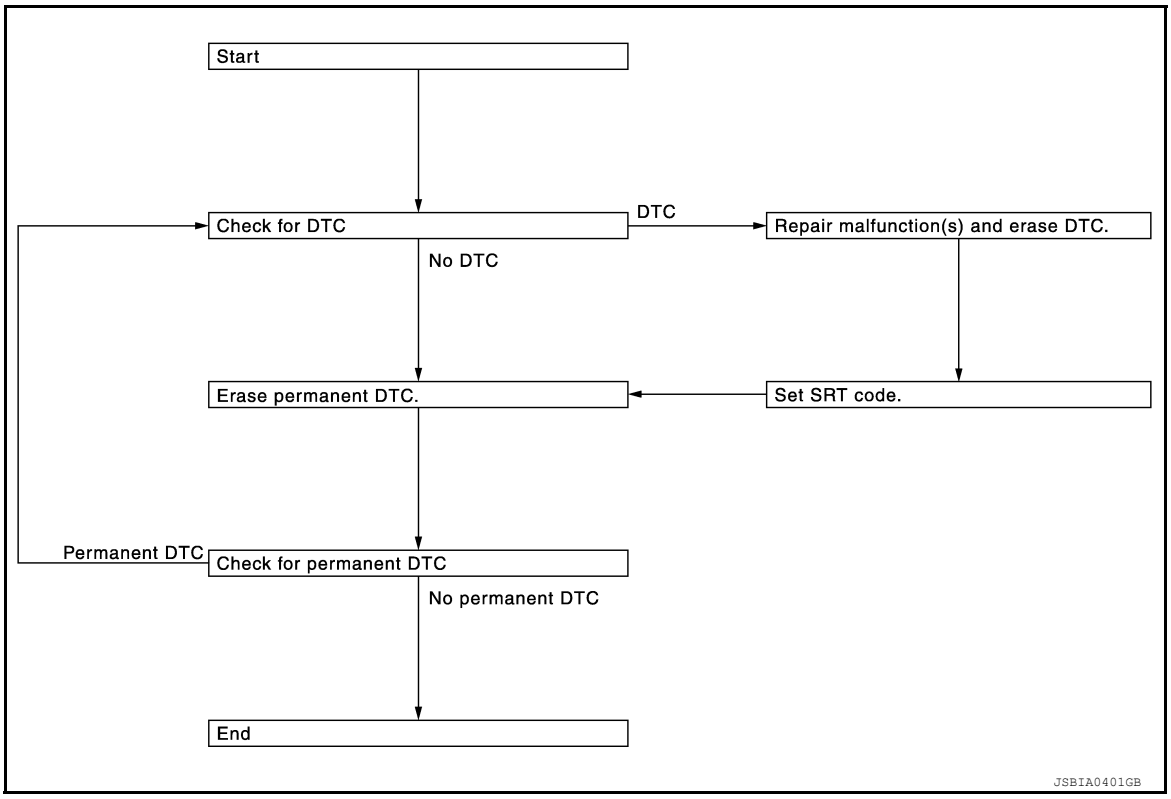
Group*	Perform "DTC CONFIRMATION PROCEDURE" for applicable DTCs.	Driving pattern		Reference
		B	D	
A	×	—	—	EC-1445
B	—	×	×	EC-1447

*: For group, refer to EC-1366, "DTC Index".

PERMANENT DTC ITEM

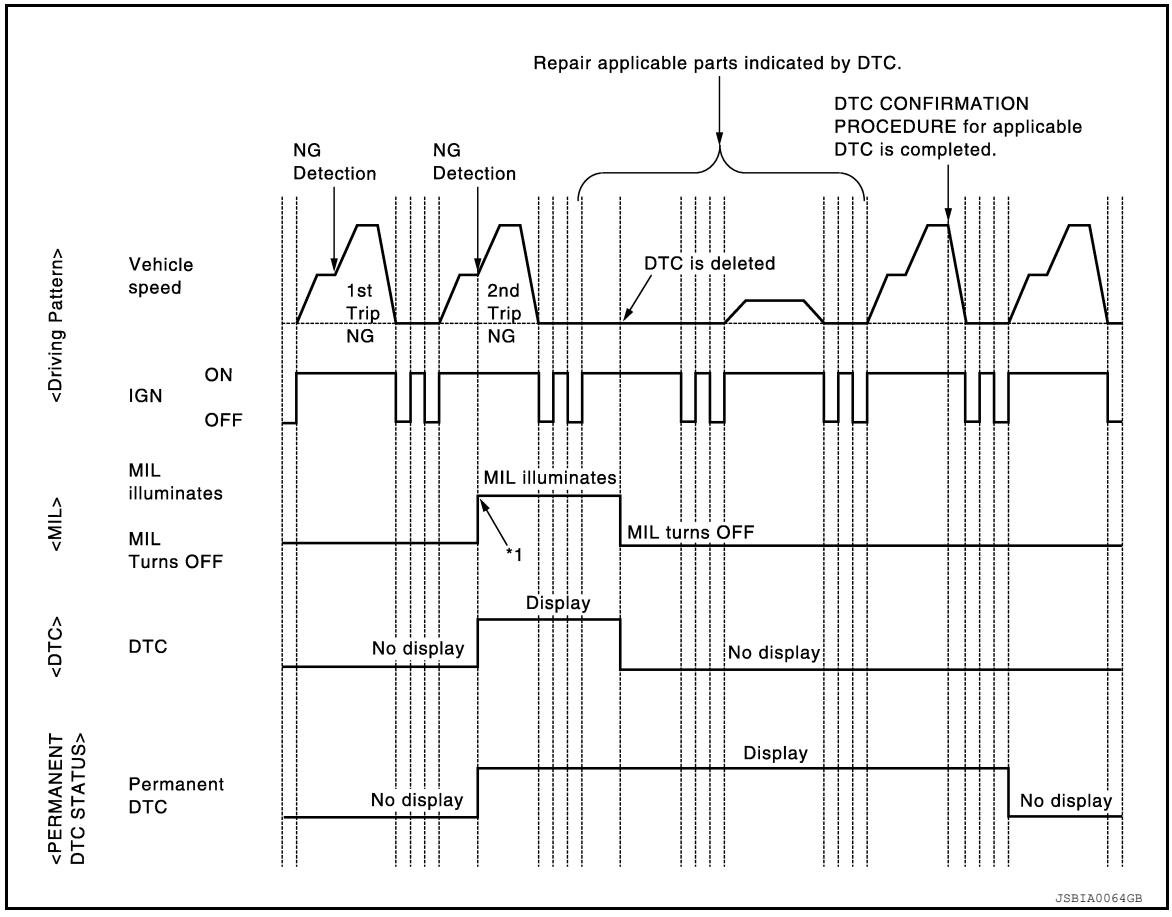
For permanent DTC items, MIL turns ON. Refer to EC-1366, "DTC Index".

PERMANENT DTC SERVICE PROCEDURE



Work Procedure (Group A)

INFOID:0000000013798166



*1: When the same malfunction is detected in two consecutive trips, MIL will illuminate.

1.CHECK DTC

Check DTC.

Is any DTC detected?

YES >> Repair malfunction(s) and erase DTC. Refer to EC-1325, "CONSULT Function", EC-1322, "On Board Diagnosis Function".

NO >> GO TO 2.

2.CHECK PERMANENT DTC

With CONSULT

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Select “PERMANENT DTC STATUS” mode with CONSULT.

With GST

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Select Service $0A with GST.

Is any permanent DTC detected?

YES >> GO TO 3.

NO >> END

3.PERFORM DTC CONFIRMATION PROCEDURE

Perform “DTC CONFIRMATION PROCEDURE” for DTCs which are the same as permanent DTCs stored in ECM. Refer to EC-1325, "CONSULT Function", EC-1322, "On Board Diagnosis Function".

>> GO TO 4.

4.CHECK PERMANENT DTC

With CONSULT

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Select “PERMANENT DTC STATUS” mode with CONSULT.

With GST

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Select Service $0A with GST.

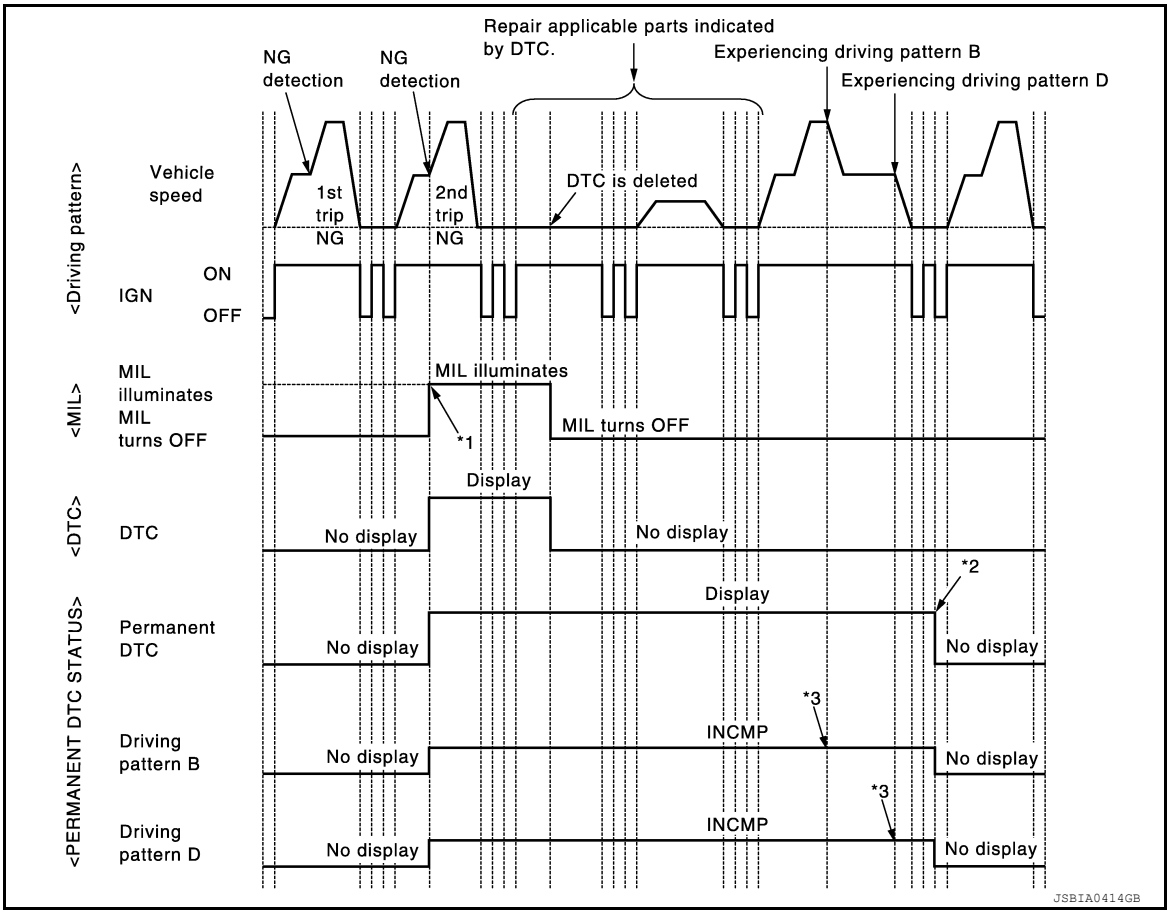
Is any permanent DTC detected?

YES >> GO TO 1.

NO >> END

Work Procedure (Group B)

INFOID:0000000013798167



*1: When the same malfunction is detected in two consecutive trips, MIL will illuminate.

*2: After experiencing driving pattern B and D, permanent DTC is erased.

*3: Indication does not change unless the ignition switch is turned from ON to OFF twice even after experiencing driving pattern B or D.

NOTE:
Drive the vehicle according to only driving patterns indicating “INCMP” in driving patterns B and D on the “PERMANENT DTC STATUS” screen.

1.CHECK DTC

Check DTC.

Is any DTC detected?

YES >> Repair malfunction(s) and erase DTC. Refer to EC-1325, "CONSULT Function", EC-1322, "On Board Diagnosis Function".

NO >> GO TO 2.

2.CHECK PERMANENT DTC

With CONSULT

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Select “PERMANENT DTC STATUS” mode with CONSULT.

With GST

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

4. Turn ignition switch ON.
5. Select Service $0A with GST.

Is any permanent DTC detected?

YES >> GO TO 3.
NO >> END

3. DRIVE DRIVING PATTERN B

CAUTION:
- **Always drive at a safe speed.**
- **Never erase self-diagnosis results.**
- **If self-diagnosis results are erased during the trip of driving pattern B or D, the counter of driving pattern B and D is reset.**

With CONSULT
1. Start engine and warm it up to normal operating temperature.
2. Use “PERMANENT DTC WORK SUPPORT” mode with CONSULT to drive the vehicle according to driving pattern B. Refer to EC-1325, "CONSULT Function", EC-1319, "DIAGNOSIS DESCRIPTION : Driving Pattern".

With GST
1. Start engine and warm it up to normal operating temperature.
2. Drive the vehicle according to driving pattern B. Refer to EC-1319, "DIAGNOSIS DESCRIPTION : Driving Pattern".

>> GO TO 4.

4. CHECK PERMANENT DTC

With CONSULT
1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Select “PERMANENT DTC STATUS” mode with CONSULT.

With GST
1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Select Service $0A with GST.

Is any permanent DTC detected?

YES >> GO TO 5.
NO >> END

5. DRIVE DRIVING PATTERN D

CAUTION:
- **Always drive at a safe speed.**
- **Never erase self-diagnosis results.**
- **If self-diagnosis results are erased during the trip of driving pattern B or D, the counter of driving pattern B and D is reset.**

Drive the vehicle according to driving pattern D. Refer to EC-1319, "DIAGNOSIS DESCRIPTION : Driving Pattern".

>> GO TO 6.

6. CHECK PERMANENT DTC

With CONSULT
1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.

5. Select “PERMANENT DTC STATUS” mode with CONSULT.

With GST

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Select Service $0A with GST.

Is any permanent DTC detected?

YES >> GO TO 1.
NO >> END

DTC/CIRCUIT DIAGNOSIS

TROUBLE DIAGNOSIS - SPECIFICATION VALUE

Description

INFOID:0000000013798168

The specification (SP) value indicates the tolerance of the value that is displayed in “SPEC” in “DATA MONITOR” mode of CONSULT during normal operation of the Engine Control System. When the value in “SPEC” in “DATA MONITOR” mode is within the SP value, the Engine Control System is confirmed OK. When the value in “SPEC” in “DATA MONITOR” mode is NOT within the SP value, the Engine Control System may have one or more malfunctions.
The SP value is used to detect malfunctions that may affect the Engine Control System, but will not illuminate the MIL.
The SP value will be displayed for the following items:
- B/FUEL SCHDL (The fuel injection pulse width programmed into ECM prior to any learned on board correction)
- A/F ALPHA-B1/B2 (The mean value of air-fuel ratio feedback correction factor per cycle)
- MAS A/F SE-B1/B2 (The signal voltage of the mass air flow sensor)
- IDLE FUEL PRES MAX/MIN (the signal voltage of the fuel rail pressure sensor)

Component Function Check

INFOID:0000000013798169

1.PRECONDITIONING

Check that all of the following conditions are satisfied.
TESTING CONDITION
- Vehicle driven distance: More than 5,000 km (3,107 miles)
- Barometric pressure: 98.3 - 104.3 kPa (0.983 - 1.043 bar, 1.003 - 1.064 kg/cm^2, 14.25 - 15.12 psi)
- Atmospheric temperature: 20 - 30°C (68 - 86°F)
- Engine coolant temperature: 75 - 95°C (167 - 203°F)
- Transmission: Warmed-up
- After the engine is warmed up to normal operating temperature, drive vehicle until “ATF TEMP 2” (A/T fluid temperature sensor signal) indicates more than 60°C (140°F).
- Electrical load: Not applied
- Rear window defogger switch, air conditioner switch and lighting switch are OFF. Steering wheel is straight ahead.
- Engine speed: Idle
- Gear position: Neutral (or parking)

>> GO TO 2.

2.PERFORM SPEC IN DATA MONITOR MODE

WITH CONSULT
NOTE:
Perform “SPEC” in “DATA MONITOR” mode in maximum scale display.
1. Perform EC-1420, "Work Procedure".
2. Select “B/FUEL SCHDL”, “A/F ALPHA-B1”, “A/F ALPHA-B2”, “MAS A/F SE-B1” in “SPEC” of “DATA MONITOR” mode with CONSULT.
3. Check that monitor items are within the SP value.

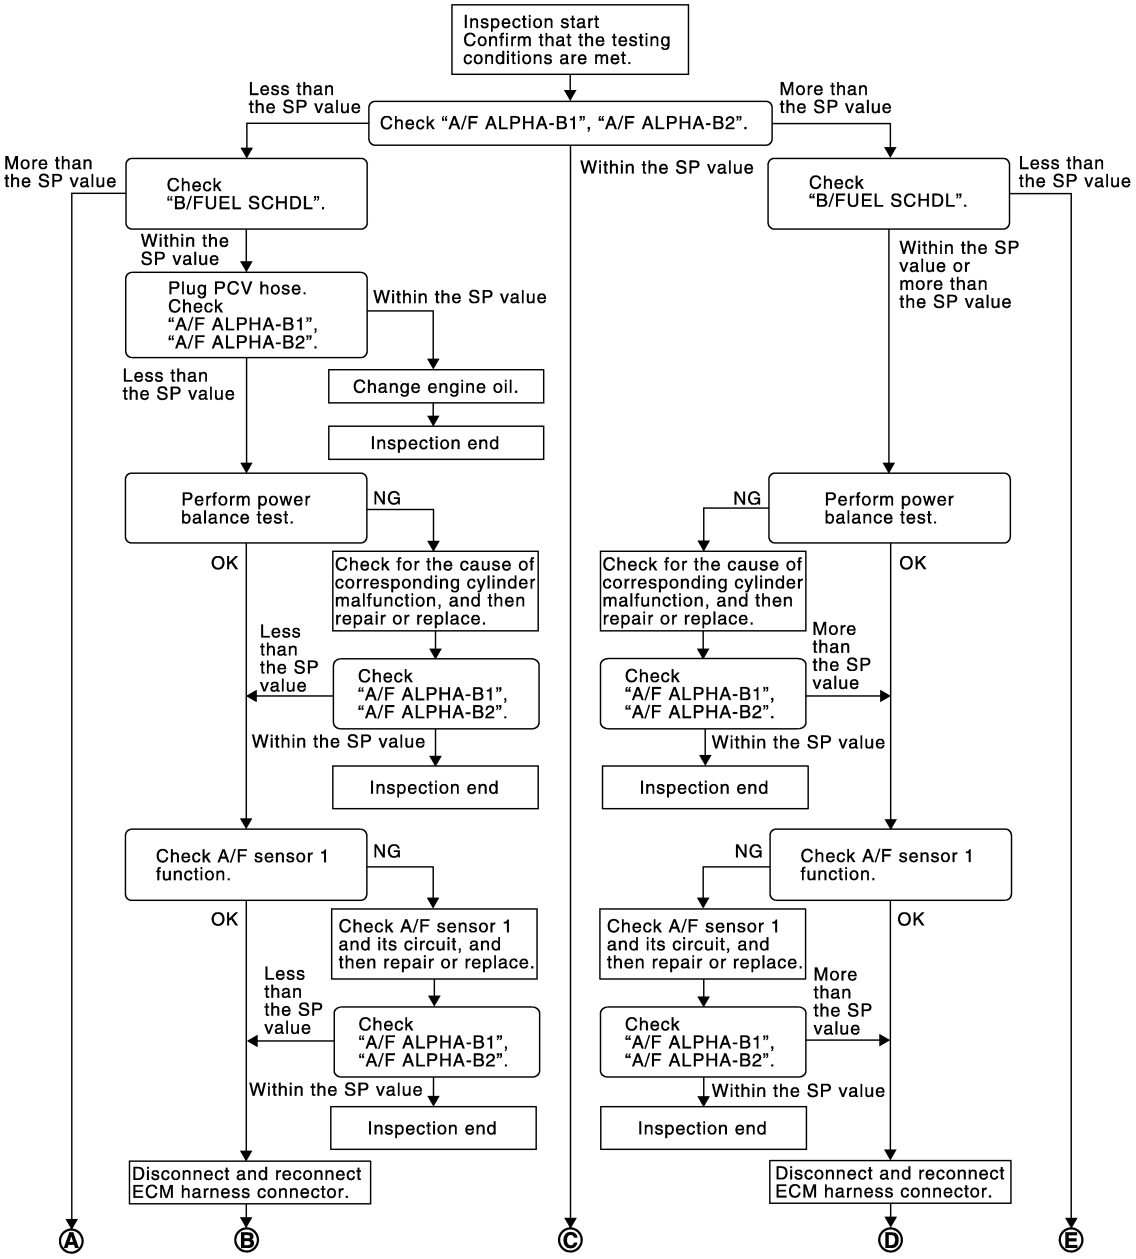
Is the measurement value within the SP value?

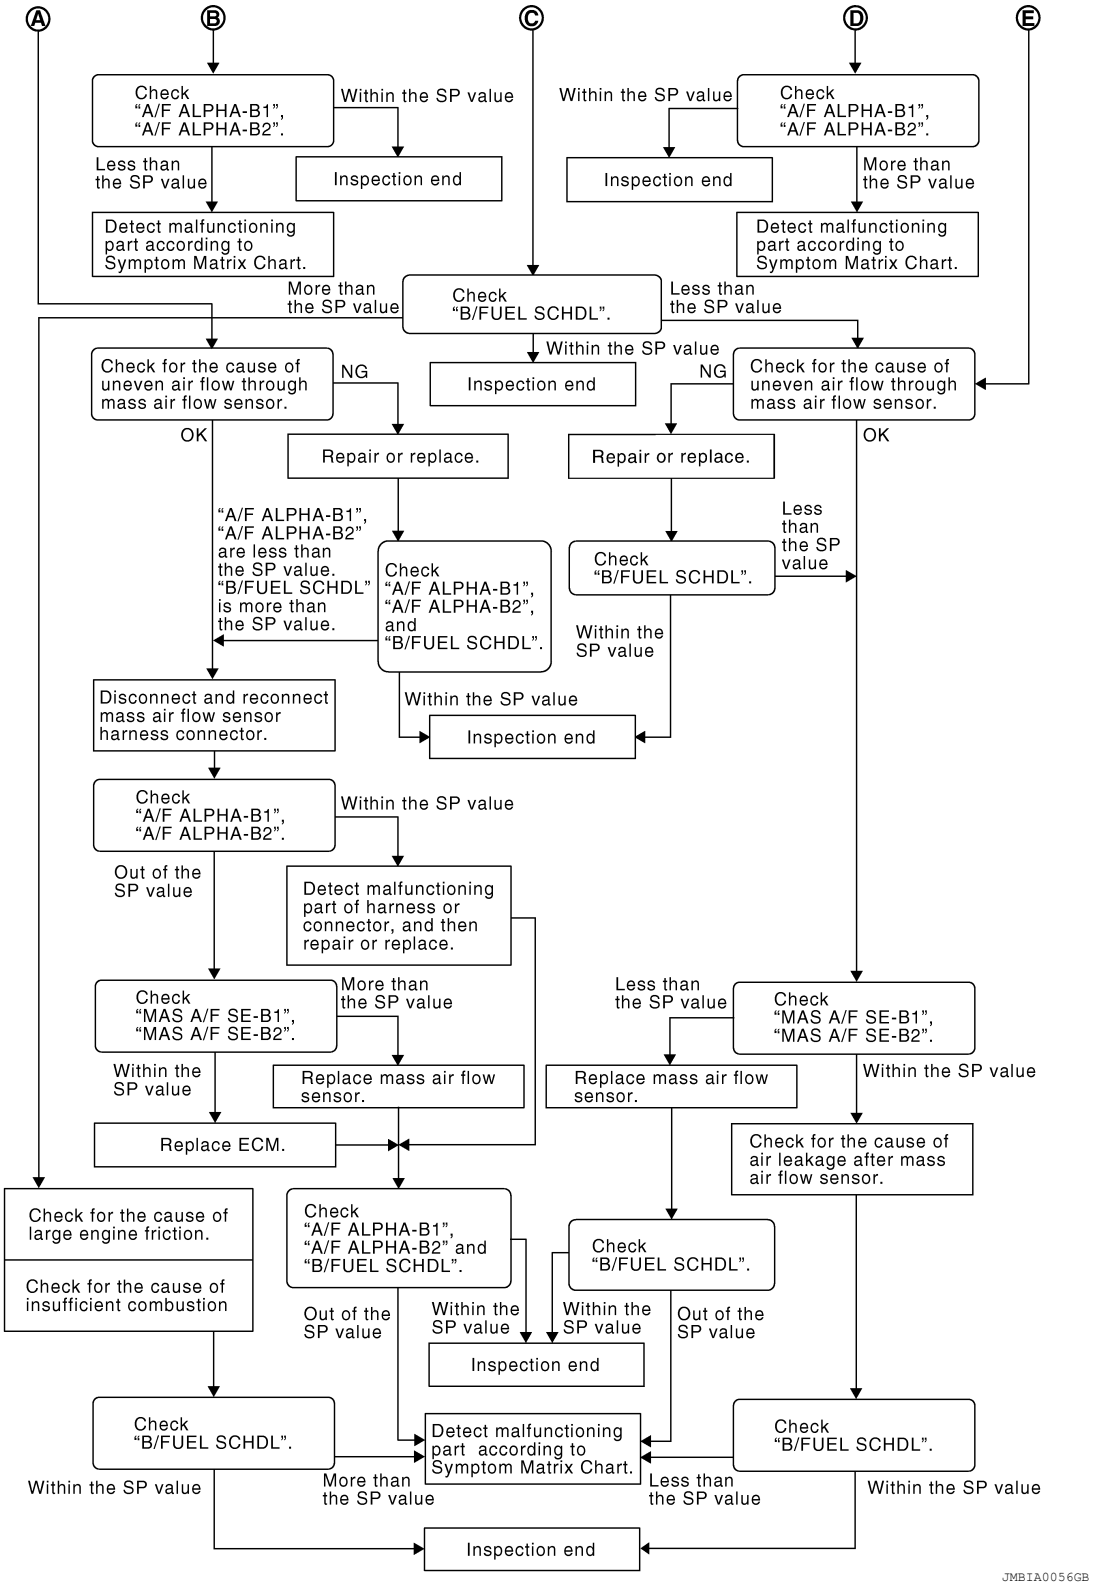
YES >> INSPECTION END
NO >> Proceed to EC-1451, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798170

OVERALL SEQUENCE





DETAILED PROCEDURE

1. CHECK "A/F ALPHA-B1" AND "A/F ALPHA-B2"

WITH CONSULT

1. Start engine.
2. Check that the testing conditions are met. Refer to EC-1450, "Component Function Check".
3. Select "A/F ALPHA-B1" and "A/F ALPHA-B2" in "SPEC" of "DATA MONITOR" mode, and check that each indication is within the SP value.

NOTE:
Check “A/F ALPHA-B1” and “A/F ALPHA-B2” for approximately 1 minute because they may fluctuate. It is NG if the indication is out of the SP value even a little.

Is the measurement value within the SP value?

YES >> GO TO 14.
NO-1 >> Less than the SP value: GO TO 2.
NO-2 >> More than the SP value: GO TO 3.

2. CHECK “B/FUEL SCHDL”

Select “B/FUEL SCHDL” in “SPEC” of “DATA MONITOR” mode, and check that the indication is within the SP value.

Is the measurement value within the SP value?

YES >> GO TO 4.
NO >> More than the SP value: GO TO 16.

3. CHECK “B/FUEL SCHDL”

Select “B/FUEL SCHDL” in “SPEC” of “DATA MONITOR” mode, and check that the indication is within the SP value.

Is the measurement value within the SP value?

YES >> GO TO 6.
NO-1 >> More than the SP value: GO TO 6.
NO-2 >> Less than the SP value: GO TO 22.

4. CHECK “A/F ALPHA-B1”, “A/F ALPHA-B2”

1. Stop the engine.
2. Disconnect PCV hose, and then plug it.
3. Start engine.
4. Select “A/F ALPHA-B1” and “A/F ALPHA-B2” in “SPEC” of “DATA MONITOR” mode, and check that each indication is within the SP value.

Is the measurement value within the SP value?

YES >> GO TO 5.
NO >> GO TO 6.

5. CHANGE ENGINE OIL

1. Stop the engine.
2. Change engine oil.

NOTE:
This symptom may occur when a large amount of gasoline is mixed with engine oil because of driving conditions (such as when engine oil temperature does not rise enough since a journey distance is too short during winter). The symptom will not be detected after changing engine oil or changing driving conditions.

>> INSPECTION END

6. PERFORM POWER BALANCE TEST

1. Perform “POWER BALANCE” in “ACTIVE TEST” mode.
2. Check that each cylinder produces a momentary engine speed drop.

Is the inspection result normal?

YES >> GO TO 9.
NO >> GO TO 7.

7. DETECT MALFUNCTIONING PART

Check the following below.
- Ignition coil and its circuit (Refer to EC-1901, "Component Function Check".)
- Fuel injector and its circuit (Refer to EC-1891, "Component Function Check".)
- Intake air leakage
- Low compression pressure (Refer to EM-20, "Inspection".)

Is the inspection result normal?

YES >> Replace fuel injector and then GO TO 8.
NO >> Repair or replace malfunctioning part and then GO TO 8.

8. CHECK “A/F ALPHA-B1” AND “A/F ALPHA-B2”

1. Start engine.
2. Select “A/F ALPHA-B1” and “A/F ALPHA-B2” in “SPEC” of “DATA MONITOR” mode, and check that each indication is within the SP value.

Is the measurement value within the SP value?

YES >> INSPECTION END
NO >> GO TO 9.

9. CHECK A/F SENSOR 1 FUNCTION

Perform all DTC CONFIRMATION PROCEDURE related with A/F sensor 1.
- For DTC P0130, P0150, refer to EC-1560, "DTC Description".
- For DTC P0131, P0151, refer to EC-1564, "DTC Description".
- For DTC P0132, P0152, refer to EC-1567, "DTC Description".
- For DTC P014C, P014D, P014E, P014F, P015A, P015B, P015C, P015D, refer to EC-1591, "DTC Description".
- For DTC P2096, P2097, P2098, P2099 refer to EC-1827, "DTC Description".

Are any DTCs detected?

YES >> GO TO 10.
NO >> GO TO 12.

10. CHECK A/F SENSOR 1 CIRCUIT

Perform Diagnosis Procedure according to corresponding DTC.

>> GO TO 11.

11. CHECK “A/F ALPHA-B1” AND “A/F ALPHA-B2”

1. Start engine.
2. Select “A/F ALPHA-B1” and “A/F ALPHA-B2” in “SPEC” of “DATA MONITOR” mode, and check that each indication is within the SP value.

Is the measurement value within the SP value?

YES >> INSPECTION END
NO >> GO TO 12.

12. DISCONNECT AND RECONNECT ECM HARNESS CONNECTOR

1. Stop the engine.
2. Disconnect ECM harness connector. Check pin terminal and connector for damage, and then reconnect it.

>> GO TO 13.

13. CHECK “A/F ALPHA-B1” AND “A/F ALPHA-B2”

1. Start engine.
2. Select “A/F ALPHA-B1” and “A/F ALPHA-B2” in “SPEC” of “DATA MONITOR” mode, and check that each indication is within the SP value.

Is the measurement value within the SP value?

YES >> INSPECTION END
NO >> Detect malfunctioning part according to EC-1922, "Symptom Table".

14. CHECK “B/FUEL SCHDL”

Select “B/FUEL SCHDL” in “SPEC” of “DATA MONITOR” mode, and check that the indication is within the SP value.

Is the measurement value within the SP value?

YES >> INSPECTION END
NO-1 >> More than the SP value: GO TO 15.
NO-2 >> Less than the SP value: GO TO 22.

15. DETECT MALFUNCTIONING PART

1. Check for the cause of large engine friction. Refer to the following.
- Engine oil level is too high
- Engine oil viscosity
- Belt tension of power steering, alternator, A/C compressor, etc. is excessive
- Noise from engine
- Noise from transmission, etc.
2. Check for the cause of insufficient combustion. Refer to the following.
- Valve clearance malfunction
- Intake valve timing control function malfunction
- Camshaft sprocket installation malfunction, etc.

>> Repair or replace malfunctioning part, and then GO TO 27.

16. CHECK INTAKE SYSTEM

Check for the cause of uneven air flow through mass air flow sensor. Refer to the following.
- Crushed air ducts
- Malfunctioning seal of air cleaner element
- Uneven dirt of air cleaner element
- Improper specification of intake air system

Is the inspection result normal?

YES >> GO TO 18.
NO >> Repair or replace malfunctioning part, and then GO TO 17.

17. CHECK “A/F ALPHA-B1”, “A/F ALPHA-B2” AND “B/FUEL SCHDL”

Select “A/F ALPHA-B1”, “A/F ALPHA-B2” and “B/FUEL SCHDL” in “SPEC” of “DATA MONITOR” mode, and check that each indication is within the SP value.

Is the measurement value within the SP value?

YES >> INSPECTION END
NO >> “B/FUEL SCHDL” is more, “A/F ALPHA-B1” and “A/F ALPHA-B2” are less than the SP value: GO TO 18.

18. DISCONNECT AND RECONNECT MASS AIR FLOW SENSOR HARNESS CONNECTOR

1. Stop the engine.
2. Disconnect mass air flow sensor harness connector. Check pin terminal and connector for damage and then reconnect it again.

>> GO TO 19.

19. CHECK “A/F ALPHA-B1” AND “A/F ALPHA-B2”

1. Start engine.
2. Select “A/F ALPHA-B1” and “A/F ALPHA-B2” in “SPEC” of “DATA MONITOR” mode, and check that each indication is within the SP value.

Is the measurement value within the SP value?

YES >> Detect malfunctioning part of mass air flow sensor circuit and repair it. Refer to EC-1539, "Diagnosis Procedure". Then GO TO 26.
NO >> GO TO 20.

20. CHECK “MAS A/F SE-B1”

Select “MAS A/F SE-B1” in “SPEC” of “DATA MONITOR” mode, and check that the indication is within the SP value.

Is the measurement value within the SP value?

YES >> GO TO 21.
NO >> More than the SP value: Replace malfunctioning mass air flow sensor, and then GO TO 26.

21. REPLACE ECM

1. Replace ECM.

2. Perform EC-1424, "Description".

>> GO TO 26.

22. CHECK INTAKE SYSTEM

Check for the cause of uneven air flow through mass air flow sensor. Refer to the following.
- Crushed air ducts
- Malfunctioning seal in air cleaner element
- Uneven dirt in air cleaner element
- Improper specification in intake air system

Is the inspection result normal?

YES >> GO TO 24.
NO >> Repair or replace malfunctioning part, and then GO TO 23.

23. CHECK “B/FUEL SCHDL”

Select “B/FUEL SCHDL” in “SPEC” of “DATA MONITOR” mode, and check that the indication is within the SP value.

Is the measurement value within the SP value?

YES >> INSPECTION END
NO >> Less than the SP value: GO TO 24.

24. CHECK “MAS A/F SE-B1”

Select “MAS A/F SE-B1” in “SPEC” of “DATA MONITOR” mode, and check that the indication is within the SP value.

Is the measurement value within the SP value?

YES >> GO TO 25.
NO >> Less than the SP value: Replace malfunctioning mass air flow sensor, and then GO TO 27.

25. CHECK INTAKE SYSTEM

Check for the cause of air leakage after the mass air flow sensor. Refer to the following.
- Disconnection, looseness, and cracks in air duct
- Looseness of oil filler cap
- Disconnection of oil level gauge
- Open stuck, breakage, hose disconnection, or cracks in PCV valve
- Disconnection or cracks in EVAP purge hose, stuck open EVAP canister purge volume control solenoid valve
- Malfunctioning seal in rocker cover gasket
- Disconnection, looseness, or cracks in hoses, such as a vacuum hose, connecting to intake air system parts
- Malfunctioning seal in intake air system, etc.

>> GO TO 27.

26. CHECK “A/F ALPHA-B1”, “A/F ALPHA-B2” AND “B/FUEL SCHDL”

Select “A/F ALPHA-B1”, “A/F ALPHA-B2” and “B/FUEL SCHDL” in “SPEC” of “DATA MONITOR” mode, and check that each indication is within the SP value.

Is the measurement value within the SP value?

YES >> INSPECTION END
NO >> Detect malfunctioning part according to EC-1922, "Symptom Table".

27. CHECK “B/FUEL SCHDL”

Select “B/FUEL SCHDL” in “SPEC” of “DATA MONITOR” mode, and then check that the indication is within the SP value.

Is the measurement value within the SP value?

YES >> INSPECTION END
NO >> Detect malfunctioning part according to EC-1922, "Symptom Table".

POWER SUPPLY AND GROUND CIRCUIT

Diagnosis Procedure

INFOID:0000000013798171

1.CHECK FUSE

Check that the following fuse is not blowing.

Location	Fuse No.	Capacity
IPDM E/R	#56	20 A
	#40	15 A

Is the fuse blown (open)?

YES >> Replace the fuse after repairing the applicable circuit. (If the replaced fuse is blown again, check IPDM E/R power supply circuit.)
NO >> GO TO 2.

2.CHECK GROUND CONNECTION

1. Turn ignition switch OFF.
2. Check ground connection E24. Refer to GI-45, "Circuit Inspection".

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace ground connection.

3.CHECK ECM GROUND CIRCUIT

1. Disconnect ECM harness connectors.
2. Check the continuity between ECM harness connector and ground.

+		–	Continuity
ECM			
Connector	Terminal		
F78	10	Ground	Existed
	50		
	55		
E16	147		
	149		
	152		

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK ECM POWER SUPPLY (MAIN)-I

1. Reconnect ECM harness connector.
2. Turn ignition switch ON.
3. Check the voltage between ECM harness connector terminals.

ECM			Voltage
Connector	+	–	
	Terminal		
E16	145	152	Battery voltage

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 6.

5.CHECK ECM POWER SUPPLY (MAIN)-II

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Check the voltage between ECM harness connector terminals as per the following.

ECM			Condition	Voltage (Approx.)
Connector	+	–		
	Terminal			
E16	145	152	After turning ignition switch OFF, battery voltage will exist for a few seconds	Drop to 0 V

Is the inspection result normal?

YES >> GO TO 9.
NO >> GO TO 7.

6.CHECK ECM POWER SUPPLY (MAIN) CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connectors.
3. Disconnect IPDM E/R harness connector.
4. Check the continuity between ECM harness connector and IPDM E/R harness connector.

+		–		Continuity
ECM		IPDM E/R		
Connector	Terminal	Connector	Terminal	
E16	145	E121	26	Existed

5. Also check harness for short to ground.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit.
NO >> Repair or replace error-detected parts.

7.CHECK ECM RELAY CONTROL SIGNAL

Check the voltage between ECM harness connector terminals as per the following.

ECM				Condition	Voltage (Approx.)
Connector	+	Connector	–		
	Terminal		Terminal		
F79	88	E16	152	Ignition switch ON	0 V
				Turn ignition switch OFF and wait at least 10 seconds.	Battery voltage

Is the inspection result normal?

YES >> Check Intermittent Incident. Refer to GI-43, "Intermittent Incident".
NO >> GO TO 8.

8.CHECK ECM RELAY CONTROL SIGNAL CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Disconnect IPDM E/R harness connector.
4. Check the continuity between ECM harness connector and IPDM E/R harness connector.

+		–		Continuity
ECM		IPDM E/R		
Connector	Terminal	Connector	Terminal	
F79	88	E121	31	Existed

5. Also check harness for short to ground and to power.

Is the inspection result normal?

YES >> Replace IPDM E/R. Refer to PCS-43, "Removal and Installation of IPDM E/R".
NO >> Repair or replace error-detected parts.

9. CHECK IGNITION SWITCH SIGNAL

1. Turn ignition switch ON.
2. Check the voltage between ECM harness connector terminals.

ECM			Condition	Voltage (Approx.)
Connector	+	–		
	Terminal			
E16	133	152	Ignition switch OFF	0 V
			Ignition switch ON	Battery voltage

Is the inspection result normal?

YES >> GO TO 11.
NO >> GO TO 10.

10. CHECK IGNITION SWITCH SIGNAL CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Disconnect IPDM E/R harness connector.
4. Check the continuity between ECM harness connector and IPDM E/R harness connector.

+		–		Continuity
ECM		IPDM E/R		
Connector	Terminal	Connector	Terminal	
E16	133	E119	17	Existed

5. Also check harness for short to ground and to power.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit.
NO >> Repair or replace error-detected parts.

11. CHECK ECM POWER SUPPLY (BACK-UP)

Check the voltage between ECM harness connector terminals.

+		–		Voltage
ECM		ECM		
Connector	Terminal	Connector	Terminal	
F79	120	E16	152	Battery voltage

Is the inspection result normal?

YES >> Check Intermittent Incident. Refer to GI-43, "Intermittent Incident".
NO >> GO TO 12.

12. CHECK ECM POWER SUPPLY (BACK-UP) CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.

3. Disconnect IPDM E/R harness connector.
4. Check the continuity between ECM harness connector and IPDM E/R harness connector.

+		–		Continuity
ECM		IPDM E/R		
Connector	Terminal	Connector	Terminal	
F79	120	E121	32	Existed

5. Also check harness for short to ground.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit.
NO >> Repair or replace error-detected parts.

U0101 CAN COMM CIRCUIT

DTC Description

INFOID:0000000013798172

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U0101	LOST COMM (TCM) (Lost Communication with TCM)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	CAN communication signal
		Threshold	ECM is not transmitting or receiving CAN communication signal of OBD (emission related diagnosis)
		Diagnosis delay time	TCM for 2 seconds or more

POSSIBLE CAUSE

CAN communication line between TCM and ECM (CAN communication line is open or shorted)

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 3 seconds.
2. Check DTC.

Is DTC detected?

YES >> EC-1461, "Diagnosis Procedure".
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013798173

Perform the trouble diagnosis for CAN communication system. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

U0113, U1003 CAN COMM CIRCUIT

DTC Description

INFOID:0000000013798174

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U0113	CAN COMM CIRCUIT (Lost communication with VVEL control module)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	CAN communication signal
		Threshold	ECM is not transmitting or receiving CAN communication signal of OBD (emission related diagnosis)
		Diagnosis delay time	VVEL control module for 2 seconds or more
U1003		Diagnosis condition	Ignition switch ON
		Signal (terminal)	CAN communication signal
		Threshold	ECM is not transmitting or receiving CAN communication signal other than OBD (emission related diagnosis)
		Diagnosis delay time	VVEL control module for 2 seconds or more

POSSIBLE CAUSE

U0113
- Harness or connectors (VVEL CAN communication line is open or shorted)
- ECM
- VVEL control module

U1003
- Harness or connectors (VVEL CAN communication line is open or shorted)
- ECM
- VVEL control module

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
U0113	Can communication circuit	VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.
U1003	Can communication circuit	VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC U0113 or U1003 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1738, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 3 seconds.
2. Check DTC.

Is DTC detected?

YES >> Proceed to EC-1463, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798175

1.CHECK DTC PRIORITY

If DTC U0113 or U1003 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1738, "DTC Description".
NO >> GO TO 2.

2.CHECK VVEL CAN COMMUNICATION CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Disconnect VVEL control module harness connector.
4. Check the continuity between ECM harness connector and VVEL control module harness connector.

ECM		VVEL control module		Continuity
Connector	Terminal	Connector	Terminal	
E16	137	F84	24	Existed
	138		11	

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and VVEL control module
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

4.REPLACE VVEL CONTROL MODULE

Replace VVEL control module. Refer to EC-1934, "Removal and Installation".

>> GO TO 5.

5.PERFORM DTC CONFIRMATION PROCEDURE

WITH CONSULT
1. Reconnect all harness connectors disconnected.
2. Turn ignition switch ON.
3. Select “SELF DIAGNOSTIC RESULT” mode with CONSULT.
4. Touch “ERASE”.
5. Perform DTC Confirmation Procedure.
   See EC-1462, "DTC Description".

WITH GST
1. Reconnect all harness connectors disconnected.
2. Turn ignition switch ON.
3. Select Service $04 with GST.
4. Perform DTC Confirmation Procedure.
   See EC-1462, "DTC Description".

Is the DTC U0113 or U1003 displayed again?

YES >> GO TO 6.

NO >> INSPECTION END

6.REPLACE ECM

Replace ECM. Refer to EC-1933, "Removal and Installation".

>> INSPECTION END

U1001 CAN COMM CIRCUIT

DTC Description

INFOID:0000000013798176

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
U1001	CAN COMM CIRCUIT (CAN communication line)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	CAN communication signal
		Threshold	ECM is not transmitting or receiving CAN communication signal other than OBD (emission related diagnosis)
		Diagnosis delay time	2 seconds or more

POSSIBLE CAUSE

Harness or connectors (CAN communication line is open or shorted)

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 3 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> EC-1465, "Diagnosis Procedure".
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013798177

Perform the trouble diagnosis for CAN communication system. Refer to LAN-51, "Trouble Diagnosis Flow Chart".

U1024 CAN COMM CIRCUIT

DTC Description

INFOID:0000000013798178

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
U1024	VVEL CAN COMM CIRCUIT (VVEL CAN communication)	1	Diagnosis condition	Ignition switch ON
			Signal (terminal)	CAN communication signal
			Threshold	VVEL control module cannot transmitting or receiving CAN communication signal
			Diagnosis delay time	2 seconds or more
		2	Diagnosis condition	Ignition switch ON
			Signal (terminal)	CAN communication signal
			Threshold	Detecting error during the initial diagnosis of CAN controller of VVEL control module
			Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (CAN communication line is open or shorted)
- ECM
- VVEL control module

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
U1024	Can communication circuit	VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC U1024 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1738, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 3 seconds.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1466, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798179

1.CHECK DTC PRIORITY

If DTC U1024 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1738, "DTC Description".
NO >> GO TO 2.

2. CHECK VVEL CAN COMMUNICATION CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Disconnect VVEL control module harness connector.
4. Check the continuity between ECM harness connector and VVEL control module harness connector.

ECM		VVEL control module		Continuity
Connector	Terminal	Connector	Terminal	
E16	137	F84	24	Existed
	138		11	

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and VVEL control module
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

4. REPLACE VVEL CONTROL MODULE

1. Replace VVEL control module.
2. Perform additional service when replacing VVEL control module. Refer to EC-1426, "Description".

>> GO TO 5.

5. PERFORM DTC CONFIRMATION PROCEDURE

WITH CONSULT
1. Reconnect all harness connectors disconnected.
2. Turn ignition switch ON.
3. Select “SELF DIAGNOSTIC RESULT” mode with CONSULT.
4. Touch “ERASE”.
5. Perform DTC Confirmation Procedure.
   See EC-1466, "DTC Description".

WITH GST
1. Reconnect all harness connectors disconnected.
2. Turn ignition switch ON.
3. Select Service $04 with GST.
4. Perform DTC Confirmation Procedure.
   See EC-1466, "DTC Description".

Is the DTC U1024 displayed again?

YES >> GO TO 6.
NO >> INSPECTION END

6. REPLACE ECM

1. Replace ECM.
2. Perform additional service when replacing ECM. Refer to EC-1424, "Description".

>> INSPECTION END

P0011, P0021 IVT CONTROL

DTC Description

INFOID:0000000013798180

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0011	INT/V TIM CONT-B1 [Intake valve timing control performance (bank 1)]	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree
		Diagnosis delay time	—
P0021	INT/V TIM CONT-B2 [Intake valve timing control performance (bank 2)]	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree
		Diagnosis delay time	—

POSSIBLE CAUSE

P0011
- Crankshaft position sensor
- Camshaft position sensor
- Intake valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

P0021
- Crankshaft position sensor
- Camshaft position sensor
- Intake valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0011	Intake valve timing control	The signal is not energized to the intake valve timing control solenoid valve and the valve control does not function.
P0021	Intake valve timing control	The signal is not energized to the intake valve timing control solenoid valve and the valve control does not function.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0011 or P0021 is displayed with DTC P0075 or P0081, first perform the trouble diagnosis for DTC P0075 or P0081.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3. PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT
1. Turn ignition switch ON and select “DATA MONITOR” mode with CONSULT.
2. Start engine and warm it up to the normal operating temperature.
3. Maintain the following conditions for at least 6 consecutive seconds.
   Hold the accelerator pedal as steady as possible.

ENG SPEED	Less than 2,000 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	P or N position

4. Let engine idle for 25 seconds.
5. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1469, "Diagnosis Procedure"
NO >> GO TO 4.

4. PERFORM DTC CONFIRMATION PROCEDURE-II

WITH CONSULT
1. Select “DATA MONITOR” mode with CONSULT.
2. Maintain the following conditions for at least 20 consecutive seconds.

ENG SPEED	1,000 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

CAUTION:
Always drive at a safe speed.

3. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1469, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798181

1. CHECK DTC PRIORITY

If DTC P0011 or P0021 is displayed with DTC P0075 or P0081, first perform the trouble diagnosis for DTC P0075 or P0081.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

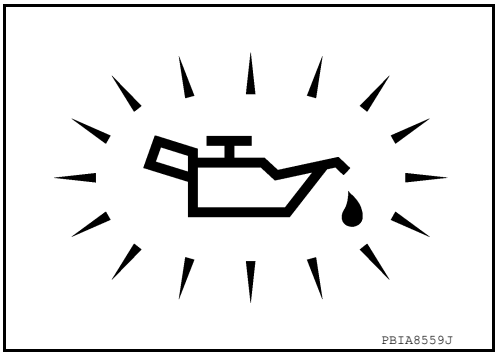
2. CHECK OIL PRESSURE WARNING LAMP

1. Start engine.

2. Check that oil pressure warning lamp is not illuminated.

Is oil pressure warning lamp illuminated?

YES >> Go to LU-9, "Inspection".
NO >> GO TO 3.



3. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE

Refer to EC-1471, "Component Inspection (Intake Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

4. CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace crankshaft position sensor. Refer to EM-120, "Exploded View".

5. CHECK CAMSHAFT POSITION SENSOR

Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

Is the inspection result normal?

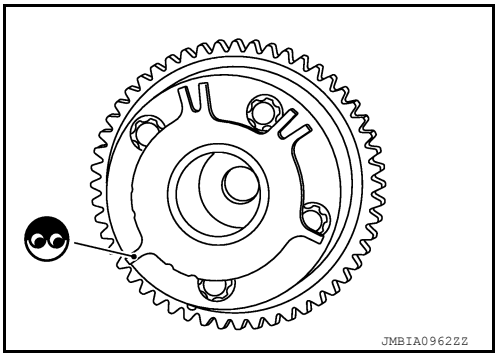
YES >> GO TO 6.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-120, "Exploded View".

6. CHECK CAMSHAFT (INTAKE)

Check the following.
- Accumulation of debris on the signal plate of camshaft front end
- Chipping signal plate of camshaft front end

Is the inspection result normal?

YES >> GO TO 7.
NO >> Remove debris and clean the signal plate of camshaft front end or replace camshaft. Refer to EM-68, "Exploded View" or EM-86, "Removal and Installation".



7. CHECK TIMING CHAIN INSTALLATION

Check service records for any recent repairs that may cause timing chain misalignment.

Are there any service records that may cause timing chain misalignment?

YES >> Check timing chain installation. Refer to EM-86, "Removal and Installation".
NO >> GO TO 8.

8. CHECK LUBRICATION CIRCUIT

Perform “Inspection of Camshaft Sprocket (INT) Oil Groove”. Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean lubrication line.

Component Inspection (Intake Valve Timing Control Solenoid Valve)

INFOID:0000000013798182

1. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect intake valve timing control solenoid valve harness connector.
3. Check resistance between intake valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

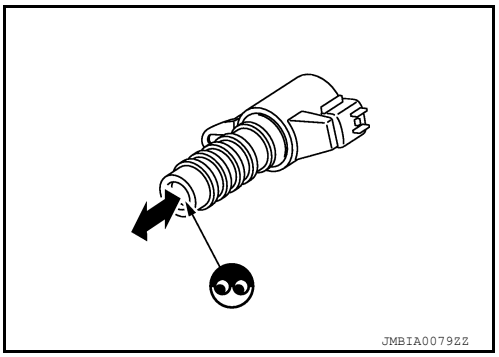
Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove intake valve timing control solenoid valve.
2. Provide 12 V DC between intake valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:
Never apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in intake valve timing control solenoid valve.
NOTE:
Always replace O-ring when intake valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0012 INTAKE VALVE TIMING CONTROL

DTC Description

INFOID:0000000013946681

DTC DETECTION LOGIC

DTC No.	Trouble diagnosis (Trouble diagnosis content)	Detecting condition	Possible cause
P0012	A camshaft position B1 ["A" camshaft position - timing over-retarded bank 1]	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree
		Diagnosis delay time	—
		Diagnosis condition	—

POSSIBLE CAUSE

- Crankshaft position sensor
- Camshaft position sensor
- Intake valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0012	Intake valve timing control	The signal is not energized to the intake valve timing control solenoid valve and the valve control does not function.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0012 is displayed with DTC P0075, first perform the trouble diagnosis for DTC P0075.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT
1. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT.
2. Start engine and warm it up to the normal operating temperature.
3. Maintain the following conditions for at least 6 consecutive seconds.
   Hold the accelerator pedal as steady as possible.

ENG SPEED	Less than 2,000 rpm (A constant rotation is maintained.)

COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	P or N position

4. Let engine idle for 25 seconds.
5. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1473, "Diagnosis Procedure"
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

WITH CONSULT
1. Select “DATA MONITOR” mode with CONSULT.
2. Maintain the following conditions for at least 20 consecutive seconds.

For USA and Canada

ENG SPEED	1,000 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

Except for USA and Canada

ENG SPEED	1,300 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

CAUTION:
Always drive at a safe speed.

3. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1473, "Diagnosis Procedure".
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013946745

1.CHECK DTC PRIORITY

If DTC P0012 is displayed with DTC P0075, first perform the trouble diagnosis for DTC P0075.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

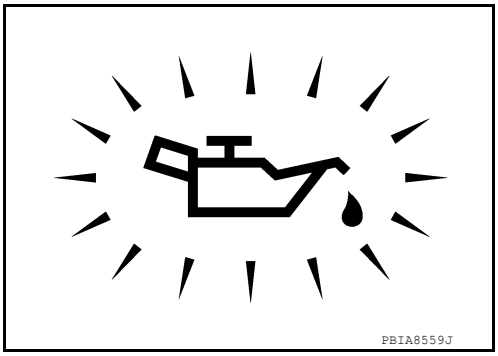
2.CHECK OIL PRESSURE WARNING LAMP

1. Start engine.

2. Check that oil pressure warning lamp is not illuminated.

Is oil pressure warning lamp illuminated?

YES >> Go to LU-9, "Inspection".
NO >> GO TO 3.



3. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE

Refer to EC-1503, "Component Inspection (Intake Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

4. CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace crankshaft position sensor. Refer to EM-120, "Exploded View".

5. CHECK CAMSHAFT POSITION SENSOR

Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

Is the inspection result normal?

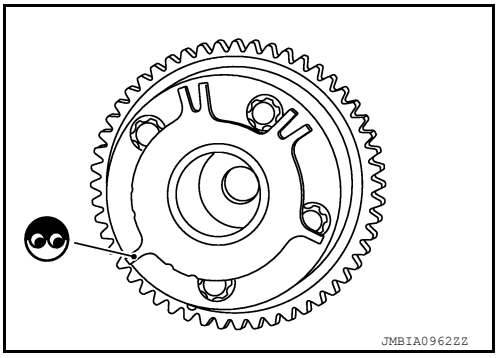
YES >> GO TO 6.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-120, "Exploded View".

6. CHECK CAMSHAFT (INTAKE)

Check the following.
- Accumulation of debris on the signal plate of camshaft front end
- Chipping signal plate of camshaft front end

Is the inspection result normal?

YES >> GO TO 7.
NO >> Remove debris and clean the signal plate of camshaft front end or replace camshaft. Refer to EM-68, "Exploded View" or EM-86, "Removal and Installation".



7. CHECK TIMING CHAIN INSTALLATION

Check service records for any recent repairs that may cause timing chain misalignment.

Are there any service records that may cause timing chain misalignment?

YES >> Check timing chain installation. Refer to EM-86, "Removal and Installation".
NO >> GO TO 8.

8. CHECK LUBRICATION CIRCUIT

Perform “Inspection of Camshaft Sprocket (INT) Oil Groove”. Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean lubrication line.

Component Inspection (Intake Valve Timing Control Solenoid Valve)

INFOID:0000000013946746

1. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect intake valve timing control solenoid valve harness connector.
3. Check resistance between intake valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

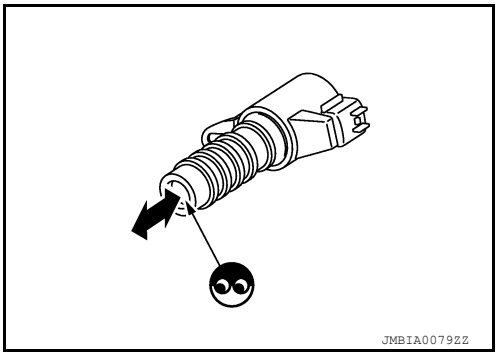
Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove intake valve timing control solenoid valve.
2. Provide 12 V DC between intake valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:
Never apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in intake valve timing control solenoid valve.
NOTE:
Always replace O-ring when intake valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0014, P0024 EVT CONTROL

DTC Description

INFOID:0000000013798183

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0014	EXH/V TIM CONT-B1 [Exhaust valve timing control performance (bank 1)]	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree.
		Diagnosis delay time	—
P0024	EXH/V TIM CONT-B2 [Exhaust valve timing control performance (bank 2)]	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree.
		Diagnosis delay time	—

POSSIBLE CAUSE

P0014
- Crankshaft position sensor
- Camshaft position sensor
- Exhaust valve timing control position sensor
- Exhaust valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

P0024
- Crankshaft position sensor
- Camshaft position sensor
- Exhaust valve timing control position sensor
- Exhaust valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0014	Exhaust valve timing control	The signal is not energized to the exhaust valve timing control magnet retarder and the magnet retarder control does not function.
P0024	Exhaust valve timing control	The signal is not energized to the exhaust valve timing control magnet retarder and the magnet retarder control does not function.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P0014 or P0024 is displayed with DTC P0078, P0084, first perform the trouble diagnosis for DTC P0078, P0084.
- If DTC P0014 or P0024 is displayed with DTC P1078, P1084, first perform the trouble diagnosis for DTC P1078, P1084.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT
1. Turn ignition switch ON and select “DATA MONITOR” mode with CONSULT.
2. Start engine and warm it up to the normal operating temperature.
3. Maintain the following conditions for at least 6 consecutive seconds.
   Hold the accelerator pedal as steady as possible.

ENG SPEED	Less than 2,000 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	P or N position

4. Let engine idle for 10 seconds.
5. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1477, "Diagnosis Procedure"
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

WITH CONSULT
1. Select “DATA MONITOR” mode with CONSULT.
2. Maintain the following conditions for at least 20 consecutive seconds.

ENG SPEED	1,500 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

CAUTION:
Always drive at a safe speed.

3. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1477, "Diagnosis Procedure"
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798184

1.CHECK DTC PRIORITY

- If DTC P0014 or P0024 is displayed with DTC P0078, P0084, first perform the trouble diagnosis for DTC P0078, P0084.

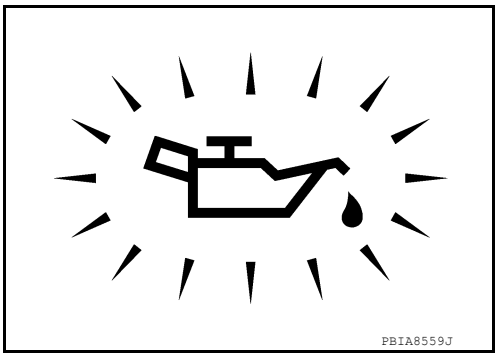
- If DTC P0014 or P0024 is displayed with DTC P1078, P1084, first perform the trouble diagnosis for DTC P1078, P1084.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK OIL PRESSURE WARNING LAMP

1. Start engine.
2. Check that oil pressure warning lamp is not illuminated.



Is oil pressure warning lamp illuminated?

YES >> Refer to LU-9, "Inspection".
NO >> GO TO 3.

3.CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE

Refer to EC-1479, "Component Inspection (Echaust Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

4.CHECK EXHAUST VALVE TIMING CONTROL POSITION SENSOR

Refer to EC-1759, "Component Inspection (Exhaust Valve Timing Control Position Sensor)".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace malfunctioning exhaust valve timing control position sensor. Refer to EM-68, "Exploded View".

5.CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace crankshaft position sensor. Refer to EM-120, "Exploded View".

6.CHECK CAMSHAFT POSITION SENSOR

Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

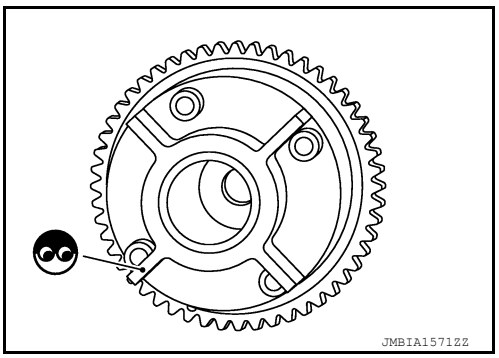
Is the inspection result normal?

YES >> GO TO 7.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-120, "Exploded View".

7.CHECK CAMSHAFT (EXH)

Check the following.

- Accumulation of debris to the signal plate of camshaft front end
- Chipping signal plate of camshaft front end



Is the inspection result normal?

YES >> GO TO 8.
NO >> Remove debris and clean the signal plate of camshaft front end or replace camshaft. Refer to EM-86, "Removal and Installation".

8. CHECK TIMING CHAIN INSTALLATION

Check service records for any recent repairs that may cause timing chain misaligned.

Are there any service records that may cause timing chain misaligned?

YES >> Check timing chain installation. Refer to EM-86, "Removal and Installation".
NO >> GO TO 9.

9. CHECK LUBRICATION CIRCUIT

Perform “Inspection of Camshaft Sprocket (EXT) Oil Groove”. Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean lubrication line.

Component Inspection (Echaust Valve Timing Control Solenoid Valve)

INFOID:0000000013798185

1. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect exhaust valve timing control solenoid valve harness connector.
3. Check resistance between exhaust valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

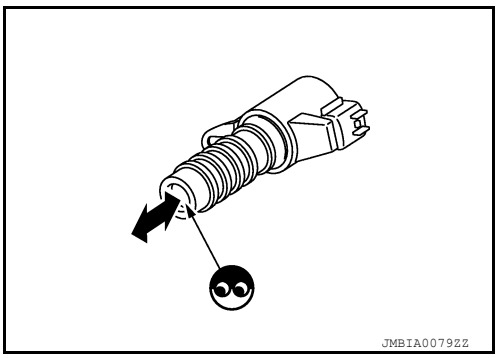
Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".
2. Provide 12 V DC between exhaust valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:
Do not apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in exhaust valve timing control solenoid valve.
NOTE:
Always replace O-ring when exhaust valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0015 EXHAUST VALVE TIMING CONTROL

DTC Description

INFOID:0000000013946689

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0015	B camshaft position B1 (“B” camshaft position - timing over-retarded bank 1)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Crankshaft position sensor
- Camshaft position sensor
- Exhaust valve timing control position sensor
- Exhaust valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0015	Exhaust valve timing control	The signal is not energized to the exhaust valve timing control magnet retarder and the magnet retarder control does not function.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0015 is displayed with DTC P0078 or P1078, first perform the trouble diagnosis for DTC P0078 or P1078.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT
1. Turn ignition switch ON and select “DATA MONITOR” mode with CONSULT.
2. Start engine and warm it up to the normal operating temperature.
3. Maintain the following conditions for at least 6 consecutive seconds.
   Hold the accelerator pedal as steady as possible.

ENG SPEED	Less than 2,000 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	P or N position

4. Let engine idle for 10 seconds.
5. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1481, "Diagnosis Procedure"
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

WITH CONSULT
1. Select “DATA MONITOR” mode with CONSULT.
2. Maintain the following conditions for at least 20 consecutive seconds.

ENG SPEED	1,500 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

CAUTION:
Always drive at a safe speed.

3. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1481, "Diagnosis Procedure"
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013946747

1.CHECK DTC PRIORITY

If DTC P0015 is displayed with DTC P0078 or P1078, first perform the trouble diagnosis for DTC P0078 or P1078.

Is applicable DTC detected?

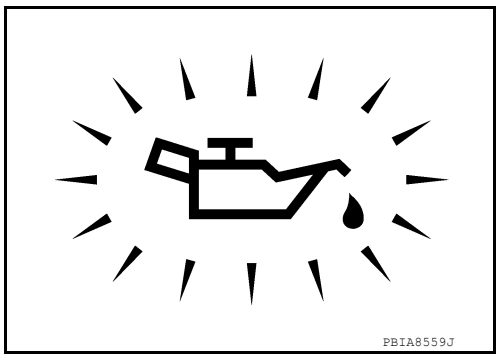
YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK OIL PRESSURE WARNING LAMP

1. Start engine.
2. Check that oil pressure warning lamp is not illuminated.

Is oil pressure warning lamp illuminated?

YES >> Refer to LU-9, "Inspection".
NO >> GO TO 3.



3.CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE

Refer to EC-1506, "Component Inspection (Echaust Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 4.

NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

4. CHECK EXHAUST VALVE TIMING CONTROL POSITION SENSOR

Refer to EC-1759, "Component Inspection (Exhaust Valve Timing Control Position Sensor)".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace malfunctioning exhaust valve timing control position sensor. Refer to EM-68, "Exploded View".

5. CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace crankshaft position sensor. Refer to EM-120, "Exploded View".

6. CHECK CAMSHAFT POSITION SENSOR

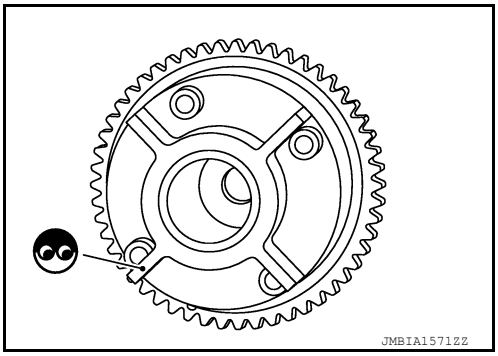
Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 7.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-120, "Exploded View".

7. CHECK CAMSHAFT (EXH)

Check the following.
- Accumulation of debris to the signal plate of camshaft front end
- Chipping signal plate of camshaft front end



Is the inspection result normal?

YES >> GO TO 8.
NO >> Remove debris and clean the signal plate of camshaft front end or replace camshaft. Refer to EM-86, "Removal and Installation".

8. CHECK TIMING CHAIN INSTALLATION

Check service records for any recent repairs that may cause timing chain misaligned.

Are there any service records that may cause timing chain misaligned?

YES >> Check timing chain installation. Refer to EM-86, "Removal and Installation".
NO >> GO TO 9.

9. CHECK LUBRICATION CIRCUIT

Perform “Inspection of Camshaft Sprocket (EXT) Oil Groove”. Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean lubrication line.

Component Inspection (Echaust Valve Timing Control Solenoid Valve)

INFOID:0000000013946748

1. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect exhaust valve timing control solenoid valve harness connector.
3. Check resistance between exhaust valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

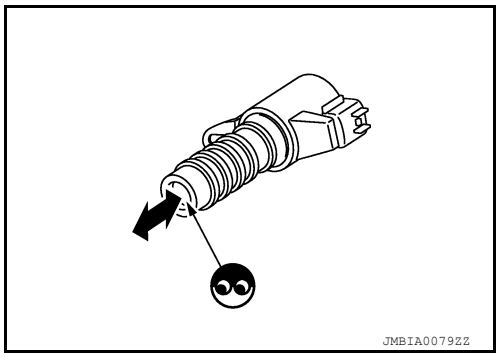
Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".
2. Provide 12 V DC between exhaust valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:
Do not apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in exhaust valve timing control solenoid valve.
NOTE:
Always replace O-ring when exhaust valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0016 INTAKE VALVE TIMING CONTROL

DTC Description

INFOID:0000000013946692

DTC DETECTION LOGIC

DTC No.	Trouble diagnosis (Trouble diagnosis content)	Detecting condition	Possible cause
P0016	Crankshaft position B1 sensor A (Crankshaft position - camshaft position correlation bank 1 sensor A)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree
		Diagnosis delay time	—
		Diagnosis condition	—

POSSIBLE CAUSE

- Crankshaft position sensor
- Camshaft position sensor
- Intake valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0016	Intake valve timing control	The signal is not energized to the intake valve timing control solenoid valve and the valve control does not function.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0016 is displayed with DTC P0075, first perform the trouble diagnosis for DTC P0075.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT
1. Turn ignition switch ON and select “DATA MONITOR” mode with CONSULT.
2. Start engine and warm it up to the normal operating temperature.
3. Maintain the following conditions for at least 6 consecutive seconds.
   Hold the accelerator pedal as steady as possible.

ENG SPEED	Less than 2,000 rpm (A constant rotation is maintained.)

COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	P or N position

4. Let engine idle for 25 seconds.
5. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1485, "Diagnosis Procedure"
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

WITH CONSULT
1. Select “DATA MONITOR” mode with CONSULT.
2. Maintain the following conditions for at least 20 consecutive seconds.

For USA and Canada

ENG SPEED	1,000 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

Except for USA and Canada

ENG SPEED	1,300 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

CAUTION:
Always drive at a safe speed.

3. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1485, "Diagnosis Procedure".
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013946749

1.CHECK DTC PRIORITY

If DTC P0016 is displayed with DTC P0075, first perform the trouble diagnosis for DTC P0075.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

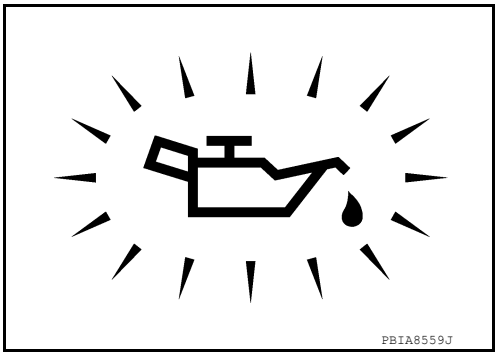
2.CHECK OIL PRESSURE WARNING LAMP

1. Start engine.

2. Check that oil pressure warning lamp is not illuminated.

Is oil pressure warning lamp illuminated?

YES >> Go to LU-9, "Inspection".
NO >> GO TO 3.



3. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE

Refer to EC-1503, "Component Inspection (Intake Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

4. CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace crankshaft position sensor. Refer to EM-120, "Exploded View".

5. CHECK CAMSHAFT POSITION SENSOR

Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

Is the inspection result normal?

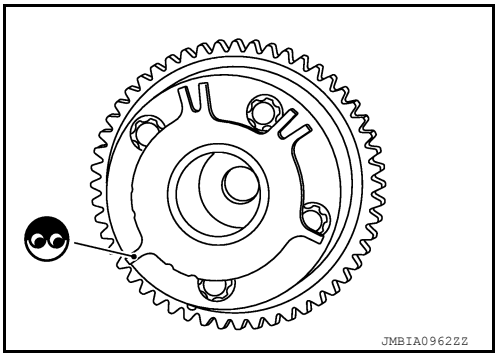
YES >> GO TO 6.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-120, "Exploded View".

6. CHECK CAMSHAFT (INTAKE)

Check the following.
- Accumulation of debris on the signal plate of camshaft front end
- Chipping signal plate of camshaft front end

Is the inspection result normal?

YES >> GO TO 7.
NO >> Remove debris and clean the signal plate of camshaft front end or replace camshaft. Refer to EM-68, "Exploded View" or EM-86, "Removal and Installation".



7. CHECK TIMING CHAIN INSTALLATION

Check service records for any recent repairs that may cause timing chain misalignment.

Are there any service records that may cause timing chain misalignment?

YES >> Check timing chain installation. Refer to EM-86, "Removal and Installation".
NO >> GO TO 8.

8. CHECK LUBRICATION CIRCUIT

Perform “Inspection of Camshaft Sprocket (INT) Oil Groove”. Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean lubrication line.

Component Inspection (Intake Valve Timing Control Solenoid Valve)

INFOID:0000000013946750

1. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect intake valve timing control solenoid valve harness connector.
3. Check resistance between intake valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

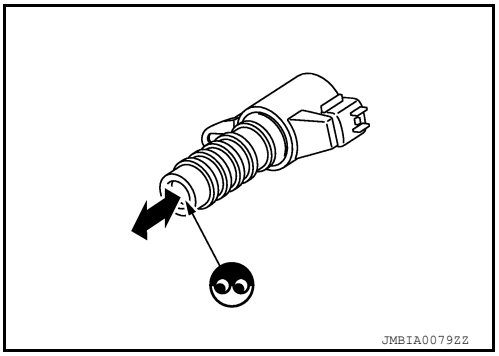
Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove intake valve timing control solenoid valve.
2. Provide 12 V DC between intake valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:
Never apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in intake valve timing control solenoid valve.
NOTE:
Always replace O-ring when intake valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0017 EXHAUST VALVE TIMING CONTROL

DTC Description

INFOID:0000000013946695

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0017	Crankshaft position B1 sensor B (Crankshaft position - camshaft position correlation bank 1 sensor B)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Crankshaft position sensor
- Camshaft position sensor
- Exhaust valve timing control position sensor
- Exhaust valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0017	Exhaust valve timing control	The signal is not energized to the exhaust valve timing control magnet retarder and the magnet retarder control does not function.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0017 is displayed with DTC P0078 or P1078, first perform the trouble diagnosis for DTC P0078 or P1078.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT
1. Turn ignition switch ON and select “DATA MONITOR” mode with CONSULT.
2. Start engine and warm it up to the normal operating temperature.
3. Maintain the following conditions for at least 6 consecutive seconds.
   Hold the accelerator pedal as steady as possible.

ENG SPEED	Less than 2,000 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	P or N position

4. Let engine idle for 10 seconds.
5. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1489, "Diagnosis Procedure"
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

WITH CONSULT
1. Select “DATA MONITOR” mode with CONSULT.
2. Maintain the following conditions for at least 20 consecutive seconds.

ENG SPEED	1,500 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

CAUTION:
Always drive at a safe speed.

3. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1489, "Diagnosis Procedure"
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013946751

1.CHECK DTC PRIORITY

If DTC P0017 is displayed with DTC P0078 or P1078, first perform the trouble diagnosis for DTC P0078 or P1078.

Is applicable DTC detected?

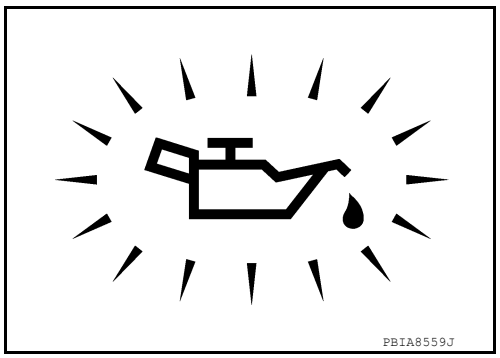
YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK OIL PRESSURE WARNING LAMP

1. Start engine.
2. Check that oil pressure warning lamp is not illuminated.

Is oil pressure warning lamp illuminated?

YES >> Refer to LU-9, "Inspection".
NO >> GO TO 3.



3.CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE

Refer to EC-1506, "Component Inspection (Echaust Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 4.

NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

4. CHECK EXHAUST VALVE TIMING CONTROL POSITION SENSOR

Refer to EC-1759, "Component Inspection (Exhaust Valve Timing Control Position Sensor)".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace malfunctioning exhaust valve timing control position sensor. Refer to EM-68, "Exploded View".

5. CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace crankshaft position sensor. Refer to EM-120, "Exploded View".

6. CHECK CAMSHAFT POSITION SENSOR

Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

Is the inspection result normal?

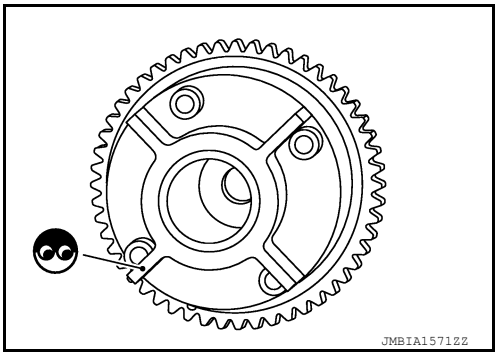
YES >> GO TO 7.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-120, "Exploded View".

7. CHECK CAMSHAFT (EXH)

Check the following.
- Accumulation of debris to the signal plate of camshaft front end
- Chipping signal plate of camshaft front end

Is the inspection result normal?

YES >> GO TO 8.
NO >> Remove debris and clean the signal plate of camshaft front end or replace camshaft. Refer to EM-86, "Removal and Installation".



8. CHECK TIMING CHAIN INSTALLATION

Check service records for any recent repairs that may cause timing chain misaligned.

Are there any service records that may cause timing chain misaligned?

YES >> Check timing chain installation. Refer to EM-86, "Removal and Installation".
NO >> GO TO 9.

9. CHECK LUBRICATION CIRCUIT

Perform “Inspection of Camshaft Sprocket (EXT) Oil Groove”. Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean lubrication line.

Component Inspection (Echaust Valve Timing Control Solenoid Valve)

INFOID:0000000013946752

1. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect exhaust valve timing control solenoid valve harness connector.
3. Check resistance between exhaust valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

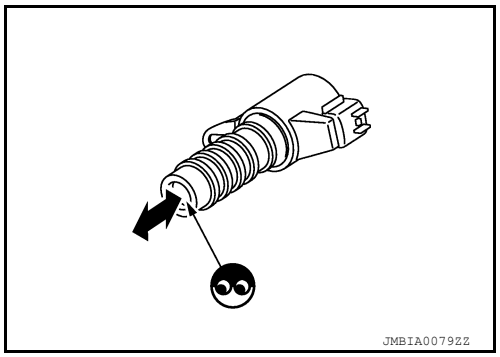
Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".
2. Provide 12 V DC between exhaust valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:
Do not apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in exhaust valve timing control solenoid valve.
NOTE:
Always replace O-ring when exhaust valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0018 INTAKE VALVE TIMING CONTROL

DTC Description

INFOID:0000000013946698

DTC DETECTION LOGIC

DTC No.	Trouble diagnosis (Trouble diagnosis content)	Detecting condition	Possible cause
P0018	Crankshaft position B2 sensor A (Crankshaft position - camshaft position correlation bank 2 sensor A)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree
		Diagnosis delay time	—
		Diagnosis condition	—

POSSIBLE CAUSE

- Crankshaft position sensor
- Camshaft position sensor
- Intake valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0018	Intake valve timing control	The signal is not energized to the intake valve timing control solenoid valve and the valve control does not function.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0018 is displayed with DTC P0081, first perform the trouble diagnosis for DTC P0081.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT
1. Turn ignition switch ON and select “DATA MONITOR” mode with CONSULT.
2. Start engine and warm it up to the normal operating temperature.
3. Maintain the following conditions for at least 6 consecutive seconds.
   Hold the accelerator pedal as steady as possible.

ENG SPEED	Less than 2,000 rpm (A constant rotation is maintained.)

COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	P or N position

4. Let engine idle for 25 seconds.
5. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1493, "Diagnosis Procedure"
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

WITH CONSULT
1. Select “DATA MONITOR” mode with CONSULT.
2. Maintain the following conditions for at least 20 consecutive seconds.

For USA and Canada

ENG SPEED	1,000 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

Except for USA and Canada

ENG SPEED	1,300 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

CAUTION:
Always drive at a safe speed.

3. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1493, "Diagnosis Procedure".
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013946753

1.CHECK DTC PRIORITY

If DTC P0018 is displayed with DTC P0081, first perform the trouble diagnosis for DTC P0081.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

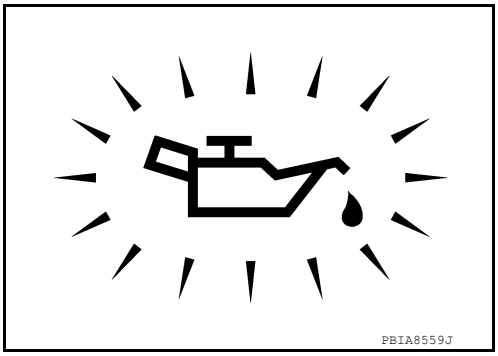
2.CHECK OIL PRESSURE WARNING LAMP

1. Start engine.

2. Check that oil pressure warning lamp is not illuminated.

Is oil pressure warning lamp illuminated?

YES >> Go to LU-9, "Inspection".
NO >> GO TO 3.



3. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE

Refer to EC-1503, "Component Inspection (Intake Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

4. CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace crankshaft position sensor. Refer to EM-120, "Exploded View".

5. CHECK CAMSHAFT POSITION SENSOR

Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

Is the inspection result normal?

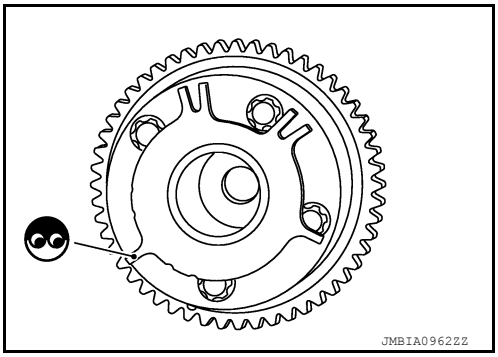
YES >> GO TO 6.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-120, "Exploded View".

6. CHECK CAMSHAFT (INTAKE)

Check the following.
- Accumulation of debris on the signal plate of camshaft front end
- Chipping signal plate of camshaft front end

Is the inspection result normal?

YES >> GO TO 7.
NO >> Remove debris and clean the signal plate of camshaft front end or replace camshaft. Refer to EM-68, "Exploded View" or EM-86, "Removal and Installation".



7. CHECK TIMING CHAIN INSTALLATION

Check service records for any recent repairs that may cause timing chain misalignment.

Are there any service records that may cause timing chain misalignment?

YES >> Check timing chain installation. Refer to EM-86, "Removal and Installation".
NO >> GO TO 8.

8. CHECK LUBRICATION CIRCUIT

Perform “Inspection of Camshaft Sprocket (INT) Oil Groove”. Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean lubrication line.

Component Inspection (Intake Valve Timing Control Solenoid Valve)

INFOID:0000000013946754

1. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect intake valve timing control solenoid valve harness connector.
3. Check resistance between intake valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

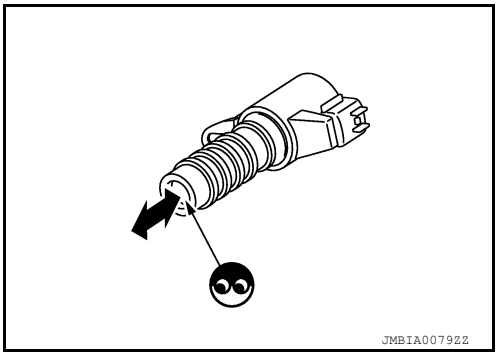
Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove intake valve timing control solenoid valve.
2. Provide 12 V DC between intake valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:
Never apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in intake valve timing control solenoid valve.
NOTE:
Always replace O-ring when intake valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0019 EXHAUST VALVE TIMING CONTROL

DTC Description

INFOID:0000000013946701

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0019	Crankshaft position B2 sensor B (Crankshaft position - camshaft position correlation bank 2 sensor B)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Crankshaft position sensor
- Camshaft position sensor
- Exhaust valve timing control position sensor
- Exhaust valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0019	Exhaust valve timing control	The signal is not energized to the exhaust valve timing control magnet retarder and the magnet retarder control does not function.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0019 is displayed with DTC P0084 or P1084, first perform the trouble diagnosis for DTC P0084 or P1084.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT
1. Turn ignition switch ON and select “DATA MONITOR” mode with CONSULT.
2. Start engine and warm it up to the normal operating temperature.
3. Maintain the following conditions for at least 6 consecutive seconds.
   Hold the accelerator pedal as steady as possible.

ENG SPEED	Less than 2,000 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	P or N position

4. Let engine idle for 10 seconds.
5. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1497, "Diagnosis Procedure"
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

WITH CONSULT
1. Select “DATA MONITOR” mode with CONSULT.
2. Maintain the following conditions for at least 20 consecutive seconds.

ENG SPEED	1,500 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

CAUTION:
Always drive at a safe speed.

3. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1497, "Diagnosis Procedure"
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013946755

1.CHECK DTC PRIORITY

If DTC P0019 is displayed with DTC P0084 or P1084, first perform the trouble diagnosis for DTC P0084 or P1084.

Is applicable DTC detected?

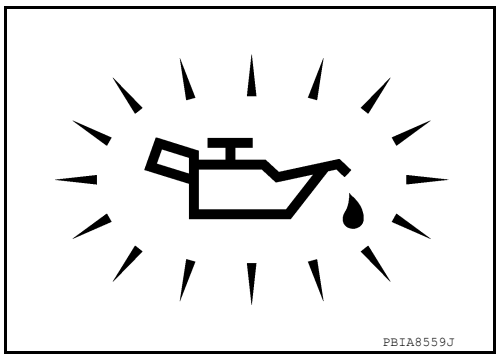
YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK OIL PRESSURE WARNING LAMP

1. Start engine.
2. Check that oil pressure warning lamp is not illuminated.

Is oil pressure warning lamp illuminated?

YES >> Refer to LU-9, "Inspection".
NO >> GO TO 3.



3.CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE

Refer to EC-1506, "Component Inspection (Echaust Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 4.

NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

4. CHECK EXHAUST VALVE TIMING CONTROL POSITION SENSOR

Refer to EC-1759, "Component Inspection (Exhaust Valve Timing Control Position Sensor)".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace malfunctioning exhaust valve timing control position sensor. Refer to EM-68, "Exploded View".

5. CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace crankshaft position sensor. Refer to EM-120, "Exploded View".

6. CHECK CAMSHAFT POSITION SENSOR

Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

Is the inspection result normal?

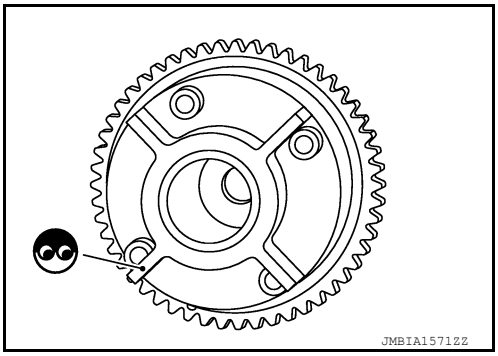
YES >> GO TO 7.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-120, "Exploded View".

7. CHECK CAMSHAFT (EXH)

Check the following.
- Accumulation of debris to the signal plate of camshaft front end
- Chipping signal plate of camshaft front end

Is the inspection result normal?

YES >> GO TO 8.
NO >> Remove debris and clean the signal plate of camshaft front end or replace camshaft. Refer to EM-86, "Removal and Installation".



8. CHECK TIMING CHAIN INSTALLATION

Check service records for any recent repairs that may cause timing chain misaligned.

Are there any service records that may cause timing chain misaligned?

YES >> Check timing chain installation. Refer to EM-86, "Removal and Installation".
NO >> GO TO 9.

9. CHECK LUBRICATION CIRCUIT

Perform “Inspection of Camshaft Sprocket (EXT) Oil Groove”. Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean lubrication line.

Component Inspection (Echaust Valve Timing Control Solenoid Valve)

INFOID:0000000013946756

1. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect exhaust valve timing control solenoid valve harness connector.
3. Check resistance between exhaust valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

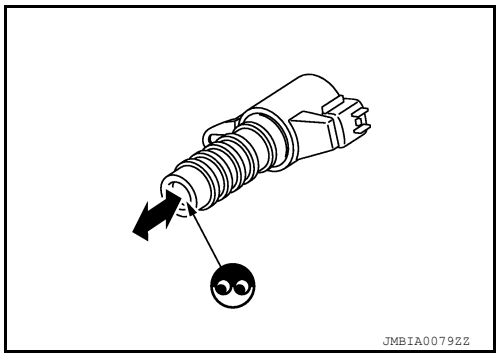
Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".
2. Provide 12 V DC between exhaust valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:
Do not apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in exhaust valve timing control solenoid valve.
NOTE:
Always replace O-ring when exhaust valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0022 INTAKE VALVE TIMING CONTROL

DTC Description

INFOID:0000000013946704

DTC DETECTION LOGIC

DTC No.	Trouble diagnosis (Trouble diagnosis content)	Detecting condition	Possible cause
P0022	A camshaft position B2 (“A” camshaft position - timing over-retarded bank 2)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree
		Diagnosis delay time	—
		Diagnosis condition	—

POSSIBLE CAUSE

- Crankshaft position sensor
- Camshaft position sensor
- Intake valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0022	Intake valve timing control	The signal is not energized to the intake valve timing control solenoid valve and the valve control does not function.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0022 is displayed with DTC P0081, first perform the trouble diagnosis for DTC P0081.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT
1. Turn ignition switch ON and select “DATA MONITOR” mode with CONSULT.
2. Start engine and warm it up to the normal operating temperature.
3. Maintain the following conditions for at least 6 consecutive seconds.
   Hold the accelerator pedal as steady as possible.

ENG SPEED	Less than 2,000 rpm (A constant rotation is maintained.)

COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	P or N position

4. Let engine idle for 25 seconds.
5. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1501, "Diagnosis Procedure"
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

WITH CONSULT
1. Select “DATA MONITOR” mode with CONSULT.
2. Maintain the following conditions for at least 20 consecutive seconds.

For USA and Canada

ENG SPEED	1,000 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

Except for USA and Canada

ENG SPEED	1,300 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

CAUTION:
Always drive at a safe speed.

3. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1501, "Diagnosis Procedure".
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013946757

1.CHECK DTC PRIORITY

If DTC P0022 is displayed with DTC P0081, first perform the trouble diagnosis for DTC P0081.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

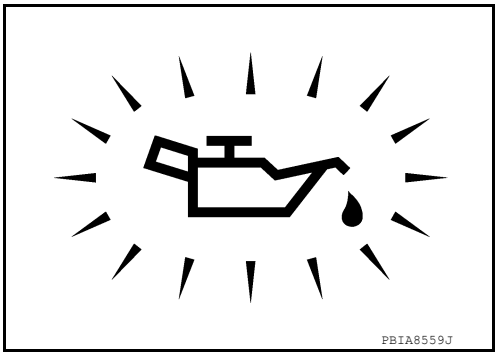
2.CHECK OIL PRESSURE WARNING LAMP

1. Start engine.

2. Check that oil pressure warning lamp is not illuminated.

Is oil pressure warning lamp illuminated?

YES >> Go to LU-9, "Inspection".
NO >> GO TO 3.



3. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE

Refer to EC-1503, "Component Inspection (Intake Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

4. CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace crankshaft position sensor. Refer to EM-120, "Exploded View".

5. CHECK CAMSHAFT POSITION SENSOR

Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

Is the inspection result normal?

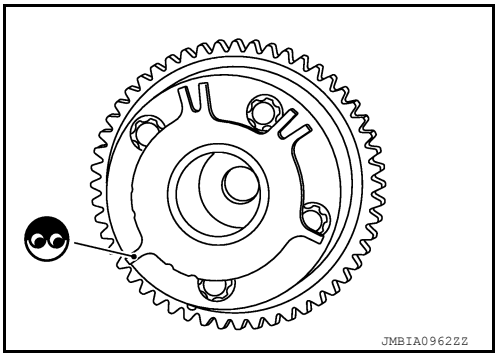
YES >> GO TO 6.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-120, "Exploded View".

6. CHECK CAMSHAFT (INTAKE)

Check the following.
- Accumulation of debris on the signal plate of camshaft front end
- Chipping signal plate of camshaft front end

Is the inspection result normal?

YES >> GO TO 7.
NO >> Remove debris and clean the signal plate of camshaft front end or replace camshaft. Refer to EM-68, "Exploded View" or EM-86, "Removal and Installation".



7. CHECK TIMING CHAIN INSTALLATION

Check service records for any recent repairs that may cause timing chain misalignment.

Are there any service records that may cause timing chain misalignment?

YES >> Check timing chain installation. Refer to EM-86, "Removal and Installation".
NO >> GO TO 8.

8. CHECK LUBRICATION CIRCUIT

Perform “Inspection of Camshaft Sprocket (INT) Oil Groove”. Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean lubrication line.

Component Inspection (Intake Valve Timing Control Solenoid Valve)

INFOID:0000000013946758

1. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect intake valve timing control solenoid valve harness connector.
3. Check resistance between intake valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

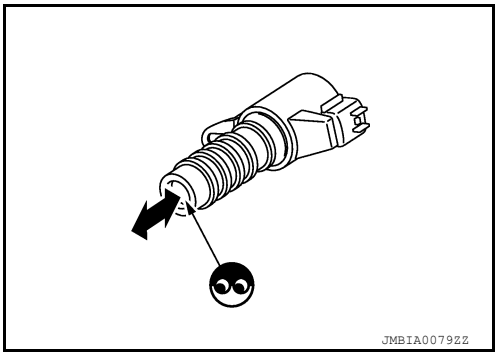
Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2. CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove intake valve timing control solenoid valve.
2. Provide 12 V DC between intake valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:
Never apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in intake valve timing control solenoid valve.
NOTE:
Always replace O-ring when intake valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0025 EXHAUST VALVE TIMING CONTROL

DTC Description

INFOID:0000000013946707

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0025	B camshaft position B2 (“B” camshaft position - timing over-retarded bank 2)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	There is a gap between angle of target and phase-control angle degree.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Crankshaft position sensor
- Camshaft position sensor
- Exhaust valve timing control position sensor
- Exhaust valve timing control solenoid valve
- Accumulation of debris to the signal pick-up portion of the camshaft
- Timing chain installation
- Foreign matter caught in the oil groove for intake valve timing control

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0025	Exhaust valve timing control	The signal is not energized to the exhaust valve timing control magnet retarder and the magnet retarder control does not function.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0025 is displayed with DTC P0084 or P1084, first perform the trouble diagnosis for DTC P0084 or P1084.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT
1. Turn ignition switch ON and select “DATA MONITOR” mode with CONSULT.
2. Start engine and warm it up to the normal operating temperature.
3. Maintain the following conditions for at least 6 consecutive seconds.
   Hold the accelerator pedal as steady as possible.

ENG SPEED	Less than 2,000 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	P or N position

4. Let engine idle for 10 seconds.
5. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1505, "Diagnosis Procedure"
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

WITH CONSULT
1. Select “DATA MONITOR” mode with CONSULT.
2. Maintain the following conditions for at least 20 consecutive seconds.

ENG SPEED	1,500 - 3,175 rpm (A constant rotation is maintained.)
COOLAN TEMP/S	More than 70°C (158°F)
Selector lever	1st or 2nd position
Driving location uphill	Driving vehicle uphill (Increased engine load will help maintain the driving conditions required for this test.)

CAUTION:
Always drive at a safe speed.

3. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1505, "Diagnosis Procedure"
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013946759

1.CHECK DTC PRIORITY

If DTC P0025 is displayed with DTC P0084 or P1084, first perform the trouble diagnosis for DTC P0084 or P1084.

Is applicable DTC detected?

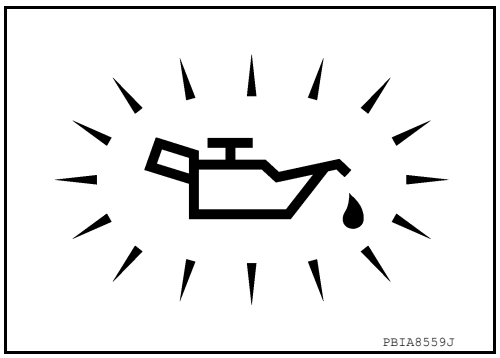
YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK OIL PRESSURE WARNING LAMP

1. Start engine.
2. Check that oil pressure warning lamp is not illuminated.

Is oil pressure warning lamp illuminated?

YES >> Refer to LU-9, "Inspection".
NO >> GO TO 3.



3.CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE

Refer to EC-1506, "Component Inspection (Echaust Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 4.

NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

4. CHECK EXHAUST VALVE TIMING CONTROL POSITION SENSOR

Refer to EC-1759, "Component Inspection (Exhaust Valve Timing Control Position Sensor)".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace malfunctioning exhaust valve timing control position sensor. Refer to EM-68, "Exploded View".

5. CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace crankshaft position sensor. Refer to EM-120, "Exploded View".

6. CHECK CAMSHAFT POSITION SENSOR

Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

Is the inspection result normal?

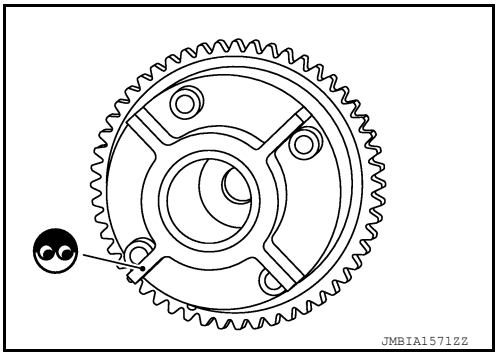
YES >> GO TO 7.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-120, "Exploded View".

7. CHECK CAMSHAFT (EXH)

Check the following.
- Accumulation of debris to the signal plate of camshaft front end
- Chipping signal plate of camshaft front end

Is the inspection result normal?

YES >> GO TO 8.
NO >> Remove debris and clean the signal plate of camshaft front end or replace camshaft. Refer to EM-86, "Removal and Installation".



8. CHECK TIMING CHAIN INSTALLATION

Check service records for any recent repairs that may cause timing chain misaligned.

Are there any service records that may cause timing chain misaligned?

YES >> Check timing chain installation. Refer to EM-86, "Removal and Installation".
NO >> GO TO 9.

9. CHECK LUBRICATION CIRCUIT

Perform “Inspection of Camshaft Sprocket (EXT) Oil Groove”. Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean lubrication line.

Component Inspection (Echaust Valve Timing Control Solenoid Valve)

INFOID:0000000013946760

1. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect exhaust valve timing control solenoid valve harness connector.
3. Check resistance between exhaust valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

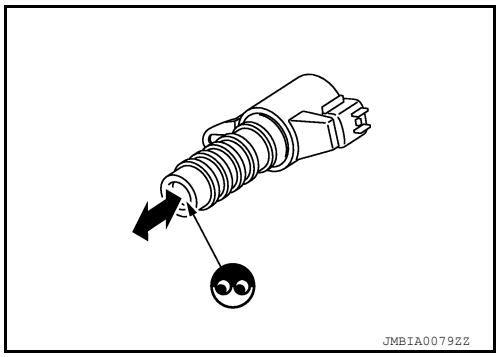
Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".
2. Provide 12 V DC between exhaust valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:
Do not apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in exhaust valve timing control solenoid valve.
NOTE:
Always replace O-ring when exhaust valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0030, P0031, P0032, P0036, P0051, P0052 A/F SENSOR 1 HEATER

DTC Description

INFOID:0000000013798186

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0030	A/F SEN1 HTR (B1) [A/F sensor 1 heater (bank 1) performance]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	A/F sensor 1 heater signal
		Threshold	Voltage signal transmitted from A/F sensor 1 heater to ECM is higher/lower than voltage in the normal range
		Diagnosis delay time	—
P0031	A/F SEN1 HTR (B1) [A/F sensor 1 heater (bank 1) control circuit low]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	A/F sensor 1 heater signal
		Threshold	An excessively low voltage signal is sent to ECM through the A/F sensor 1 heater
		Diagnosis delay time	—
P0032	A/F SEN1 HTR (B1) [A/F sensor 1 heater (bank 1) control circuit high]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	A/F sensor 1 heater signal
		Threshold	An excessively high voltage signal is sent to ECM through the A/F sensor 1 heater
		Diagnosis delay time	—
P0036	A/F SEN1 HTR (B2) [A/F sensor 1 heater (bank 2) performance]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	A/F sensor 1 heater signal
		Threshold	Voltage signal transmitted from A/F sensor 1 heater to ECM is higher/lower than voltage in the normal range
		Diagnosis delay time	—
P0051	A/F SEN1 HTR (B2) [A/F sensor 1 heater (bank 2) control circuit low]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	A/F sensor 1 heater signal
		Threshold	An excessively low voltage signal is sent to ECM through the A/F sensor 1 heater
		Diagnosis delay time	—
P0052	A/F SEN1 HTR (B2) [A/F sensor 1 heater (bank 2) control circuit high]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	A/F sensor 1 heater signal
		Threshold	An excessively high voltage signal is sent to ECM through the A/F sensor 1 heater
		Diagnosis delay time	—

POSSIBLE CAUSE

P0030, P0031, P0036, P0051
- Harness or connectors (The A/F sensor 1 heater circuit is open or shorted)
- The A/F sensor 1 heater

P0032, P0052
- Harness or connectors (The A/F sensor 1 heater circuit is shorted)
- The A/F sensor 1 heater

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for at least 10 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1509, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798187

1.CHECK AIR FUEL RATIO (A/F) SENSOR 1 POWER SUPPLY CIRCUIT

1. Disconnect air fuel ratio (A/F) sensor 1 harness connector.
2. Turn ignition switch ON.
3. Check the voltage between A/F sensor 1 harness connector and ground.

DTC	A/F sensor 1			Ground	Voltage
	Bank	Connector	Terminal		
P0030, P0031, P0032	1	F25	1	Ground	Battery voltage
P0036, P0051, P0052	2	F16	1		

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.DETECT MALFUNCTIONING PART

Check the following.

- 20 A fuse (No. 56)
- Harness for open or short between A/F sensor 1 and fuse
- Loose or poor connection for each connector and harness

>> Repair or replace harness or connectors.

3.CHECK A/F SENSOR 1 HEATER OUTPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between A/F sensor 1 harness connector and ECM harness connector.

DTC	A/F sensor 1			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0030, P0031, P0032	1	F25	2	F79	116	Existed
P0036, P0051, P0052	2	F16	2		117	

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4.CHECK A/F SENSOR 1 HEATER

Refer to EC-1510, "Component Inspection (A/F Sensor 1 Heater)".

Is the inspection result normal?

YES >> Repair or replace error-detected parts.
NO >> GO TO 5.

5.REPLACE A/F SENSOR 1

Replace malfunctioning A/F sensor 1. Refer to EM-45, "Exploded View".

CAUTION:

- **Discard any A/F sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new A/F sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

Component Inspection (A/F Sensor 1 Heater)

INFOID:0000000013798188

1.CHECK AIR FUEL RATIO (A/F) SENSOR 1

1. Turn ignition switch OFF.
2. Disconnect air fuel ratio (A/F) sensor 1 harness connector.
3. Check resistance between A/F sensor 1 terminals as per the following.

A/F sensor 1		Resistance
+	–	
Terminal		
2	1	1.80 - 2.44 Ω [at 20°C (68°F)]
	3	Not exist
	4	
1	3	
	4	

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.REPLACE A/F SENSOR 1

Replace malfunctioning A/F sensor 1. Refer to EM-45, "Exploded View".

CAUTION:

- **Discard any A/F sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new A/F sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

P0037, P0038, P0057, P0058 HO2S2 HEATER

DTC Description

INFOID:0000000013798189

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0037	HO2S2 HTR (B1) [Heated oxygen sensor 2 heater (bank 1) control circuit low]	Diagnosis condition	—
		Signal (terminal)	Heated oxygen sensor 2 heater signal
		Threshold	An excessively low voltage signal is sent to ECM through the heated oxygen sensor 2 heater
		Diagnosis delay time	—
P0038	HO2S2 HTR (B1) [Heated oxygen sensor 2 heater (bank 1) control circuit high]	Diagnosis condition	—
		Signal (terminal)	Heated oxygen sensor 2 heater signal
		Threshold	An excessively high voltage signal is sent to ECM through the heated oxygen sensor 2 heater
		Diagnosis delay time	—
P0057	HO2S2 HTR (B2) [Heated oxygen sensor 2 heater (bank 2) control circuit low]	Diagnosis condition	—
		Signal (terminal)	Heated oxygen sensor 2 heater signal
		Threshold	An excessively low voltage signal is sent to ECM through the heated oxygen sensor 2 heater
		Diagnosis delay time	—
P0058	HO2S2 HTR (B2) [Heated oxygen sensor 2 heater (bank 2) control circuit high]	Diagnosis condition	—
		Signal (terminal)	Heated oxygen sensor 2 heater signal
		Threshold	An excessively high voltage signal is sent to ECM through the heated oxygen sensor 2 heater
		Diagnosis delay time	—

POSSIBLE CAUSE

P0037, P0057
- Harness or connectors (The heated oxygen sensor 2 heater circuit is open or shorted)
- Heated oxygen sensor 2 heater

P0038, P0058
- Harness or connectors (The heated oxygen sensor 2 heater circuit is shorted)
- Heated oxygen sensor 2 heater

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
6. Let engine idle for 1 minute.
7. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1512, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798190

1.CHECK HEATED OXYGEN SENSOR 2 (HO2S2) POWER SUPPLY CIRCUIT

1. Disconnect heated oxygen sensor 2 (HO2S2) harness connector.
2. Turn ignition switch ON.
3. Check the voltage between HO2S2 harness connector and ground.

DTC	HO2S2			Ground	Voltage
	Bank	Connector	Terminal		
P0037, P0038	1	F57	4	Ground	Battery voltage
P0057, P0058	2	F54	4		

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.DETECT MALFUNCTIONING PART

Check the following.
- 20 A fuse (No. 56)
- Harness for open or short between heated oxygen sensor 2 and fuse
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

3.CHECK HO2S2 OUTPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between HO2S2 harness connector and ECM harness connector.

DTC	HO2S2			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0037, P0038	1	F57	3	F79	118	Existed
P0057, P0058	2	F54	3		119	

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4.CHECK HO2S2 HEATER

Refer to EC-1513, "Component Inspection (HO2 Sensor 2 Heater)".

Is the inspection result normal?

YES >> Repair or replace error-detected parts.

NO >> GO TO 5.

5. REPLACE HEATED OXYGEN SENSOR 2

Replace malfunctioning heated oxygen sensor 2. Refer to EX-6, "Removal and Installation".

CAUTION:

- **Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new oxygen sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

Component Inspection (HO2 Sensor 2 Heater)

INFOID:0000000013798191

1. CHECK HEATED OXYGEN SENSOR 2 HEATER

1. Turn ignition switch OFF.
2. Disconnect heated oxygen sensor 2 (HO2S2) harness connector.
3. Check resistance between HO2S2 terminals as follows.

Terminal	Resistance
2 and 3	3.4 - 4.4 Ω [at 25°C (77°F)]
1 and 2, 3, 4	∞ Ω (Continuity should not exist)
4 and 1, 2, 3	

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2. REPLACE HEATED OXYGEN SENSOR 2

Replace malfunctioning heated oxygen sensor 2. Refer to EX-6, "Removal and Installation".

CAUTION:

- **Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new oxygen sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

P0075, P0081 IVT CONTROL SOLENOID VALVE

DTC Description

INFOID:0000000013798192

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0075	INT/V TIM V/CIR-B1 [Intake valve timing control solenoid valve (bank 1) circuit]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	—
		Threshold	An improper voltage is sent to the ECM through intake valve timing control solenoid valve
		Diagnosis delay time	—
P0081	INT/V TIM V/CIR-B2 [Intake valve timing control solenoid valve (bank 2) circuit]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	—
		Threshold	An improper voltage is sent to the ECM through intake valve timing control solenoid valve
		Diagnosis delay time	—

POSSIBLE CAUSE

P0075
- Harness or connectors (Intake valve timing control solenoid valve circuit is open or shorted)
- Intake valve timing control solenoid valve

P0081
- Harness or connectors (Intake valve timing control solenoid valve circuit is open or shorted)
- Intake valve timing control solenoid valve

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for 5 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1514, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798193

1.CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect intake valve timing (IVT) control solenoid valve harness connector.
3. Turn ignition switch ON.
4. Check the voltage between IVT control solenoid valve harness connector and ground.

DTC	IVT control solenoid valve			Ground	Voltage
	Bank	Connector	Terminal		
P0075	1	F36	2	Ground	Battery voltage
P0081	2	F37	2		

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between IVT control solenoid valve and IPDM E/R
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

3.CHECK IVT CONTROL SOLENOID VALVE OUTPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between IVT control solenoid valve harness connector and ECM harness connector.

DTC	IVT control solenoid valve			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0075	1	F36	1	F79	112	Existed
P0081	2	F37	1		113	

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4.CHECK IVT CONTROL SOLENOID VALVE

Refer to EC-1515, "Component Inspection (Intake Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning IVT control solenoid valve. Refer to EM-68, "Exploded View".

Component Inspection (Intake Valve Timing Control Solenoid Valve)

INFOID:0000000013798194

1.CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect intake valve timing control solenoid valve harness connector.
3. Check resistance between intake valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2.CHECK INTAKE VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove intake valve timing control solenoid valve.

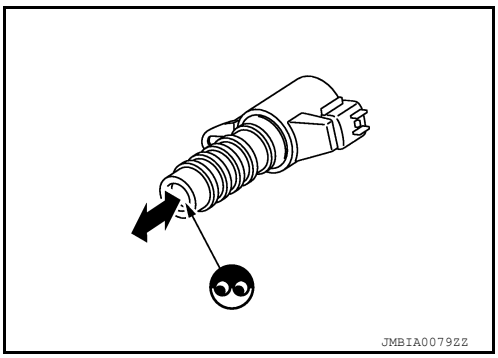
2. Provide 12 V DC between intake valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:

Never apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in intake valve timing control solenoid valve.

NOTE:

Always replace O-ring when intake valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END

NO >> Replace malfunctioning intake valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0078, P0084 EVT CONTROL SOLENOID VALVE

DTC Description

INFOID:0000000013798195

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0078	EX V/T ACT/CIRC-B1 [Exhaust valve timing control solenoid valve (bank 1) circuit]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Exhaust valve timing control solenoid valve signal
		Threshold	An improper voltage is sent to the ECM through exhaust valve timing control solenoid valve
		Diagnosis delay time	—
P0084	EX V/T ACT/CIRC-B2 [Exhaust valve timing control solenoid valve (bank 2) circuit]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Exhaust valve timing control solenoid valve signal
		Threshold	An improper voltage is sent to the ECM through exhaust valve timing control solenoid valve
		Diagnosis delay time	—

POSSIBLE CAUSE

P0078
- Harness or connectors (Exhaust valve timing control solenoid valve circuit is open or shorted)
- Exhaust valve timing control solenoid valve

P0084
- Harness or connectors (Exhaust valve timing control solenoid valve circuit is open or shorted)
- Exhaust valve timing control solenoid valve

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.
1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for 5 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1517, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798196

1.CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect exhaust valve timing (EVT) control solenoid valve harness connector.
3. Turn ignition switch ON.
4. Check the voltage between EVT control solenoid valve harness connector and ground.

DTC	EVT control solenoid valve			Ground	Voltage
	Bank	Connector	Terminal		
P0078	1	F80	2	Ground	Battery voltage
P0084	2	F81	2		

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between EVT control solenoid valve and IPDM E/R
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

3. CHECK EVT CONTROL SOLENOID VALVE OUTPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EVT control solenoid valve harness connector and ECM harness connector.

DTC	EVT control solenoid valve			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0078	1	F80	1	F79	114	Existed
P0084	2	F81	1		115	

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4. CHECK EVT CONTROL SOLENOID VALVE

Refer to EC-1518, "Component Inspection (Echaust Valve Timing Control Solenoid Valve)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning EVT control solenoid valve. Refer to EM-68, "Exploded View".

Component Inspection (Echaust Valve Timing Control Solenoid Valve)

INFOID:0000000013798197

1. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-I

1. Turn ignition switch OFF.
2. Disconnect exhaust valve timing control solenoid valve harness connector.
3. Check resistance between exhaust valve timing control solenoid valve terminals as per the following.

Terminals	Resistance
1 and 2	7.0 - 7.7 Ω [at 20°C (68°F)]
1 or 2 and ground	∞ Ω (Continuity should not exist)

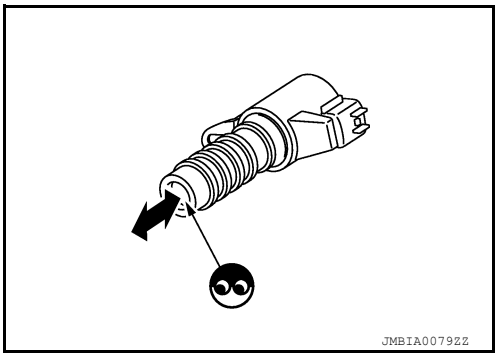
Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

2. CHECK EXHAUST VALVE TIMING CONTROL SOLENOID VALVE-II

1. Remove exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".
2. Provide 12 V DC between exhaust valve timing control solenoid valve terminals 1 and 2, and then interrupt it. Check that the plunger moves as shown in the figure.

CAUTION:
Do not apply 12 V DC continuously for 5 seconds or more. Doing so may result in damage to the coil in exhaust valve timing control solenoid valve.
NOTE:
Always replace O-ring when exhaust valve timing control solenoid valve is removed.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning exhaust valve timing control solenoid valve. Refer to EM-68, "Exploded View".

P0087 FRP CONTROL SYSTEM

DTC Description

INFOID:0000000013798198

DTC DETECTION LOGIC

NOTE:
DTC P0087 may be displayed when running out of gas or air accumulation.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0087	LOW FUEL PRES (High fuel pressure too low)	1	Diagnosis condition	Engine cold start [water temperature 5°C (41°F) – 40°C (104°F)]
			Signal (terminal)	Fuel rail pressure signal
			Threshold	Fuel rail pressure does not reach 1.3 MPa (13 bar, 13.3 kg/cm2, 188.5 psi)
			Diagnosis delay time	—
		2	Diagnosis condition	Engine idle condition after cold start [water temperature 5°C (41°F) – 40°C (104°F)]
			Signal (terminal)	Fuel rail pressure signal
			Threshold	Fuel rail pressure remains at 8.5 MPa (85 bar, 86.7 kg/cm2, 1232.8 psi) or less
			Diagnosis delay time	1 second or more
		3	Diagnosis condition	After engine start (regardless of water temperature)
			Signal (terminal)	Fuel rail pressure signal
			Threshold	Actual fuel pressure − Target fuel pressure ≥ 2.7 MPa (27 bar, 27.5 kg/cm^2, 392 psi)
			Diagnosis delay time	5 seconds or more

POSSIBLE CAUSE

- Fuel system
- Leakage in fuel line
- High pressure fuel pump
- Low pressure fuel pump
- Damage in lifter

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0087	FRP control system	• Engine torque is limited. • VVEL value is maintained at a fixed angle.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0087 is displayed with DTC P0090 and/or P1197, first perform the trouble diagnosis for DTC P0090 and/or P1197.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK FUEL LEAKAGE

1. Turn ignition switch ON.
2. Visually check the piping between low pressure fuel pump and fuel injectors for fuel leakage.

3. Start the engine.
4. Visually check the piping between low pressure fuel pump and fuel injectors for fuel leakage.

Is inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.PRECONDITIONING

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

- **Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.**
- **Before performing the following procedure, check that the fuel tank is 1/8 full of fuel.**

>> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-1

WITH CONSULT

1. Turn ignition switch ON.
2. Select “COOLAN TEMP/S” in “DATA MONITOR” mode of “ENGNE” using CONSULT.
3. Check the following condition;

COOLAN TEMP/S	**: 5 – 40°C (41 – 104°F)**

WITH GST

Follow the above steps for “WITH CONSULT”.

Is the condition satisfied?

YES >> GO TO 5.
NO >> 1. Satisfy the condition.
2. Retry from step 1.

5.PERFORM DTC CONFIRMATION PROCEDURE-2

WITH CONSULT

1. Start the engine and let it idle for 10 seconds.
2. Check 1st trip DTC.

WITH GST

Follow the above steps for “WITH CONSULT”.

Is 1st trip DTC detected?

YES >> Proceed to EC-1522, "Diagnosis Procedure".
NO >> GO TO 6.

6.PERFORM DTC CONFIRMATION PROCEDURE-3

WITH CONSULT

1. Select “COOLAN TEMP/S” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
2. Maintain the following condition for 10 seconds or more at idle.

COOLAN TEMP/S	**: 70°C (104°F) or more**

3. Check 1st trip DTC.

WITH GST

Follow the above steps for “WITH CONSULT”.

Is 1st trip DTC detected?

YES >> Proceed to EC-1522, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798199

1.CHECK DTC PRIORITY

If DTC P0087 is displayed with DTC P0090 and/or P1197, first perform the trouble diagnosis for DTC P0090 and/or P1197.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.BLEED THE FUEL LINE

1. Start the engine, and let the engine run at idle at least for 10 minutes.
2. Perform DTC confirmation procedure of DTC P0087.

Is 1st trip DTC detected?

YES >> GO TO 3.
NO >> GO TO 7.

3.CHECK LOW FUEL PRESSURE

Check low fuel pressure. Refer to EC-1435, "Work Procedure".

Is inspection result normal?

YES >> GO TO 4.
NO >> Check low fuel pressure system. Refer to EC-1907, "Diagnosis Procedure".

4.CHECK LOW PRESSURE FUEL LINE FOR INTERNAL LEAKAGE

1. Turn ignition switch OFF.
2. Turn ignition switch ON.
3. Check the following value 30 minutes after turning the ignition switch ON.

Low fuel pressure : 206 kPa (2.1 bar, 2.2 kgf/cm2, 30 psi) or more

Is inspection result normal?

YES >> GO TO 5.
NO >> Replace low pressure fuel pump. Refer to FL-6, "Exploded View".

5.CHECK HIGH PRESSURE FUEL PUMP

Check high pressure fuel pump. Refer to EC-1523, "Component Inspection (High Pressure Fuel Pump)".

Is inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace the error-detected parts.

6.CHECK LIFTER

Check lifter. Refer to EM-49, "Removal and Installation".

Does the lifter top surface have scratches and/or dents?

YES >> Replace the error-detected parts.
NO >> INSPECTION END

7.CHECK LOW PRESSURE FUEL LINE FOR INTERNAL LEAKAGE

1. Turn ignition switch OFF.
2. Connect fuel pressure gauge. Refer to EC-1435, "Work Procedure".
3. Turn ignition switch ON.
4. Check the following value 30 minutes after turning the ignition switch ON.

Low fuel pressure : 206 kPa (2.1 bar, 2.2 kgf/cm2, 30 psi) or more

Is inspection result normal?

YES >> INSPECTION END
NO >> Replace low pressure fuel pump. Refer to FL-6, "Exploded View".

Component Inspection (High Pressure Fuel Pump)

INFOID:0000000013798200

1. CHECK HIGH PRESSURE FUEL PUMP-1

1. Turn ignition switch OFF.
2. Disconnect high pressure fuel pump harness connector.
3. Check the resistance between high pressure fuel pump terminals.

+	–	Condition		Resistance (Approx.)
High pressure fuel pump Terminal				
1	2	Temperature °C (°F)	20 – 30 (68 - 86)	9 - 11 Ω

Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace high pressure fuel pump. Refer to EM-49, "Exploded View".

2. CHECK HIGH PRESSURE FUEL PUMP-2

WITH CONSULT

1. Reconnect high pressure fuel pump harness connector.
2. Start the engine.
3. Check “FUEL PRES SEN V” in “DATA MONITOR” mode of “ECM” using CONSULT.

Monitor item	Condition	Voltage (Approx.)
FUEL PRES SEN V	Engine speed: idle	820 – 1,220 mV
	Engine speed: Revving engine from idle to 4,000 rpm quickly	820 – 3,060 mV

WITHOUT CONSULT

1. Reconnect high pressure fuel pump harness connector.
2. Start the engine.
3. Check FRP sensor signal voltage.

ECM			Condition	Value (Approx.)
Connector	+	–		
	Terminal			
F78	25	13	Engine speed: idle	0.82 – 1.22 V
			Engine speed: Revving engine from idle to 4,000 rpm quickly	0.82 – 3.06 V

YES >> INSPECTION END
NO >> Replace high pressure fuel pump. Refer to EM-49, "Exploded View".

P0088 FRP CONTROL SYSTEM

DTC Description

INFOID:0000000013798201

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0088	HIGH FUEL PRES (High fuel pressure too high)	1	Diagnosis condition	Engine idle condition after cold start [water temperature 5°C (41°F) - 40°C (104°F)]
			Signal (terminal)	Fuel rail pressure signal
			Threshold	Fuel rail pressure remains at more than 16.5 MPa (165 bar, 168.3 kg/cm^2, 2392.5 psi)
			Diagnosis delay time	1 second or more
		2	Diagnosis condition	After engine start (regardless of water temperature)
			Signal (terminal)	Fuel rail pressure signal
			Threshold	Actual fuel pressure – Target fuel pressure ≥ 2.7 MPa (27 bar, 27.5 kg/cm^2, 392 psi)
			Diagnosis delay time	5 seconds or more

POSSIBLE CAUSE

- Harness or connector (The high pressure fuel pump circuit is open or shorted)
- High pressure fuel pump

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0088	FRP control system	Engine speed is limited.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0088 is displayed with DTC P0090, first perform the trouble diagnosis for DTC P0090.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1527, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

- **Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.**
- **Before performing the following procedure, check that the fuel tank is 1/8 full of fuel.**

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-1

1. Warm up the engine to the normal operating temperature and keep the engine speed at idle for 15 seconds.
   NOTE:

Warm up the engine until “COOLAN TEMP/S” on “DATA MONITOR” mode of “ENGINE” using CONSULT reaches at least 70°C (158°F).
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1528, "Diagnosis Procedure".
NO >> GO TO 4.

4. PERFORM DTC CONFIRMATION PROCEDURE-2

1. Cool the engine until the engine coolant temperature reaches 60°C (140°F) or less.
2. Start the engine and wait at least 40 seconds.
3. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1528, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798202

1. CHECK DTC PRIORITY

If DTC P0088 is displayed with DTC P0090, first perform the trouble diagnosis for DTC P0090.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1527, "DTC Description".
NO >> GO TO 2.

2. CHECK LOW FUEL PRESSURE

Check low fuel pressure. Refer to EC-1435, "Work Procedure".

Is inspection result normal?

YES >> GO TO 3.
NO >> Check low fuel pressure system. Refer to EC-1907, "Diagnosis Procedure".

3. CHECK HIGH PRESSURE FUEL PUMP

Check high pressure fuel pump. Refer to EC-1525, "Component Inspection (High Pressure Fuel Pump)".

Is inspection result normal?

YES >> GO TO 4.
NO >> Replace error-detected parts.

4. CHECK FUEL LEAKAGE

1. Start the engine.
2. Visually check that the fuel pump, fuel rail, and fuel piping have no fuel leakage.

Is inspection result normal?

YES >> Check that the fuel system has no breakage, bend, and crush. Refer to FL-5, "Inspection".
NO >> Replace or replace the error-detected parts.

Component Inspection (High Pressure Fuel Pump)

INFOID:0000000013798203

1. CHECK HIGH PRESSURE FUEL PUMP-1

1. Turn ignition switch OFF.
2. Disconnect high pressure fuel pump harness connector.
3. Check the resistance between high pressure fuel pump terminals.

+	–	Condition		Resistance (Approx.)
High pressure fuel pump Terminal				
1	2	Temperature °C (°F)	20 – 30 (68 - 86)	9 - 11 Ω

Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace high pressure fuel pump. Refer to EM-49, "Exploded View".

2.CHECK HIGH PRESSURE FUEL PUMP-2

WITH CONSULT
1. Reconnect high pressure fuel pump harness connector.
2. Start the engine.
3. Check “FUEL PRES SEN V” in “DATA MONITOR” mode of “ECM” using CONSULT.

Monitor item	Condition	Value (Approx.)
FUEL PRES SEN V	Engine speed: idle	820 – 1,220 mV
	Engine speed: Revving engine from idle to 4,000 rpm quickly	820 – 3,060 mV

WITHOUT CONSULT
1. Reconnect high pressure fuel pump harness connector.
2. Start the engine.
3. Check FRP sensor signal voltage.

ECM			Condition	Value (Approx.)
Connector	+	–		
	Terminal			
F78	25	13	Engine speed: idle	0.82 – 1.22 V
			Engine speed: Revving engine from idle to 4,000 rpm quickly	0.82 – 3.06 V

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace high pressure fuel pump. Refer to EM-49, "Exploded View".

P0090 HIGH PRESSURE FUEL PUMP

DTC Description

INFOID:0000000013798204

DTC DETECTION LOGIC

NOTE:
DTC P0090 may be displayed when running out of gas.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0090	FUEL PUMP (High pressure fuel pump circuit)	1	Diagnosis condition	Engine rev
			Signal (terminal)	Fuel rail pressure signal
			Threshold	Fuel rail pressure remains at 1.5 MPa (15 bar, 15.3 kg/ cm^2, 217.5 psi)
			Diagnosis delay time	3 seconds or more
		2	Diagnosis condition	Engine rev
			Signal (terminal)	Fuel rail pressure signal
			Threshold	Fuel rail pressure remains at 18.5 MPa (185 bar, 188.7 kg/ cm^2, 2682.5 psi) or more
			Diagnosis delay time	3 seconds or more

POSSIBLE CAUSE

- Harness or connectors (The fuel pump circuit is open or shorted)
- High pressure fuel pump

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0090	FRP control system	• Engine torque is limited. • VVEL value is maintained at a fixed angle.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0090 is displayed with DTC P1197, first perform the trouble diagnosis for DTC P1197.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1772, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

- **Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.**
- **Before performing the following procedure, check that the fuel tank is 1/8 full of fuel.**

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT

1. Start engine.
2. Select “COOLAN TEMP/S” in “DATA MONITOR” mode of “ENGNE” using CONSULT.
3. Maintain the following condition for 5 seconds or more at idle.

COOLAN TEMP/S	**: 70°C (104°F) or more**

4. Check 1st trip DTC.

WITH GST
Follow the above steps for “WITH CONSULT”.

Is 1st trip DTC detected?

YES >> Proceed to EC-1528, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798205

1.CHECK DTC PRIORITY

If DTC P0090 is displayed with DTC P1197, first perform the trouble diagnosis for DTC P1197.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1772, "DTC Description".
NO >> GO TO 2.

2.CHECK HIGH PRESSURE FUEL PUMP CIRCUIT

1. Turn ignition switch ON.
2. Disconnect ECM harness connector and high pressure fuel pump harness connector.
3. Check the continuity between ECM harness connector and high pressure fuel pump harness connector.

+		–		Value (Approx.)
ECM		High pressure fuel pump		
Connector	Terminal	Connector	Terminal	
F79	59	F87	1	Existed
	60		2	

4. Also check harness for short to ground and to power.

Is inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace the error-detected parts.

3.CHECK HIGH PRESSURE FUEL PUMP

Check high pressure fuel pump. Refer to EC-1528, "Component Inspection (High Pressure Fuel Pump)".

Is inspection result normal?

YES >> INSPECTION END
NO >> Replace the error-detected parts.

Component Inspection (High Pressure Fuel Pump)

INFOID:0000000013798206

1.CHECK HIGH PRESSURE FUEL PUMP-1

1. Turn ignition switch OFF.
2. Disconnect high pressure fuel pump harness connector.
3. Check the resistance between high pressure fuel pump terminals.

+	–	Condition		Resistance (Approx.)
High pressure fuel pump				
Terminal				
1	2	Temperature °C (°F)	20 – 30 (68 - 86)	9 - 11 Ω

Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace high pressure fuel pump. Refer to EM-49, "Exploded View".

2.CHECK HIGH PRESSURE FUEL PUMP-2

WITH CONSULT
1. Reconnect high pressure fuel pump harness connector.
2. Start the engine.
3. Check “FUEL PRES SEN V” in “DATA MONITOR” mode of “ECM” using CONSULT.

Monitor item	Condition	Value (Approx.)
FUEL PRES SEN V	Engine speed: idle	820 – 1,220 mV
	Engine speed: Revving engine from idle to 4,000 rpm quickly	820 – 3,060 mV

WITHOUT CONSULT
1. Reconnect high pressure fuel pump harness connector.
2. Start the engine.
3. Check FRP sensor signal voltage.

ECM			Condition	Value (Approx.)
Connector	+	–		
	Terminal			
F78	25	13	Engine speed: idle	0.82 – 1.22 V
			Engine speed: Revving engine from idle to 4,000 rpm quickly	0.82 – 3.06 V

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace high pressure fuel pump. Refer to EM-49, "Exploded View".

P00B3, P00B4 ENGINE COOLANT TEMPERATURE SENSOR 2

DTC Description

INFOID:0000000013798207

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P00B3	RADIATOR COOLANT TEMP SEN (Radiator coolant temperature sensor circuit low)	Diagnosis condition	—
		Signal (terminal)	Engine coolant temperature sensor 2 signal
		Threshold	A voltage signal transmitted from the engine coolant temperature sensor 2 is 0.04 V or less
		Diagnosis delay time	5 seconds or more
P00B4	RADIATOR COOLANT TEMP SEN (Radiator coolant temperature sensor circuit high)	Diagnosis condition	—
		Signal (terminal)	Engine coolant temperature sensor 2 signal
		Threshold	A voltage signal transmitted from the engine coolant temperature sensor 2 is 4.84 V or more.
		Diagnosis delay time	5 seconds or more

POSSIBLE CAUSE

P00B3
- Harness or connectors (Engine coolant temperature sensor 2 circuit is open or shorted)
- Engine coolant temperature sensor 2

P00B4
- Harness or connectors (Engine coolant temperature sensor 2 circuit is open or shorted)
- Engine coolant temperature sensor 2

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P00B3	Engine coolant temperature sensor 2	High coolant temperature control does not function.
P00B4	Engine coolant temperature sensor 2	High coolant temperature control does not function.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.
1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TEST CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 11 V at ignition switch ON.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 5 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1531, "Diagnosis Procedure".

NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798208

1. CHECK ENGINE COOLANT TEMPERATURE SENSOR 2 POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect engine coolant temperature (ECT) sensor 2 harness connector.
3. Turn ignition switch ON.
4. Check the voltage between ECT sensor 2 harness connector and ground.

+		–	Voltage (Approx.)
ECT sensor 2			
Connector	Terminal		
F93	1	Ground	5 V

Is the inspection result normal?

YES >> GO TO 2.
NO >> GO TO 4.

2. CHECK ENGINE COOLANT TEMPERATURE SENSOR 2 GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between ECT sensor 2 harness connector and ECM harness connector.

+		–		Continuity
ECT sensor 2		ECM		
Connector	Terminal	Connector	Terminal	
F93	2	F78	43	Existed

4. Also check harness for short to ground to power.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK ENGINE COOLANT TEMPERATURE SENSOR 2

Check the engine coolant temperature sensor 2. Refer to EC-1532, "Component Inspection (Engine Coolant Temperature Sensor 2)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace engine coolant temperature sensor 2. Refer to CO-22, "Exploded View".

4. CHECK ENGINE COOLANT TEMPERATURE SENSOR 2 POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between ECT sensor 2 harness connector and ECM harness connector.

+		–		Continuity
ECT sensor 2		ECM		
Connector	Terminal	Connector	Terminal	
F93	1	F79	65	Existed

4. Also check harness for short to ground.

Is the inspection result normal?

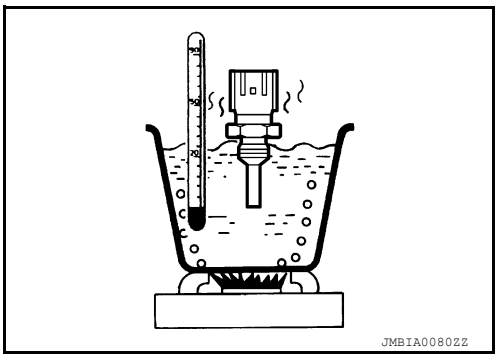
YES >> Perform the trouble diagnosis for power supply circuit.
NO >> Repair or replace error-detected parts.

Component Inspection (Engine Coolant Temperature Sensor 2)

INFOID:0000000013798209

1. CHECK ENGINE COOLANT TEMPERATURE SENSOR 2

1. Turn ignition switch OFF.
2. Disconnect engine coolant temperature sensor 2 harness connector.
3. Remove engine coolant temperature sensor 2.
4. Check resistance between engine coolant temperature sensor 2 terminals by heating with hot water as shown in the figure.



ECT sensor 2		Condition		Resistance
+	–			
Terminal				
1	2	Temperature [°C (°F)]	20 (68)	2.35 - 2.73 kΩ
			50 (122)	0.68 - 1.00 kΩ
			90 (194)	0.236 - 0.260 kΩ

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace engine coolant temperature sensor 2. Refer to CO-22, "Exploded View".

P0101 MAF SENSOR

DTC Description

INFOID:0000000013798210

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0101	MAF SEN/CIRCUIT-B1 (Mass air flow sensor circuit range/performance)	1	Diagnosis condition	—
			Signal (terminal)	Mass air flow sensor signal
			Threshold	A high voltage from the sensor is sent to ECM under light load driving condition
			Diagnosis delay time	—
		2	Diagnosis condition	—
			Signal (terminal)	Mass air flow sensor signal
			Threshold	A low voltage from the sensor is sent to ECM under heavy load driving condition
			Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (The sensor circuit is open or shorted)
- Mass air flow sensor
- EVAP control system pressure sensor
- Intake air leaks
- Intake air temperature sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0101 is displayed with other DTC, first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

If engine will not start or stops soon, wait at least 10 seconds with engine stopped (Ignition switch ON) instead of running engine at idle speed.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and warm it up to normal operating temperature.
2. Drive the vehicle for at least 5 seconds under the following conditions:

CAUTION:
Always drive at a safe speed.

Selector lever	Suitable position
Vehicle speed	40 km/h (25 MPH) or more

NOTE:

- The gear must be fixed while driving the vehicle.
- Keep the accelerator pedal as steady as possible during cruising.

3. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1534, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798211

1.CHECK DTC PRIORITY

If DTC P0101 is displayed with other DTC, first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK INTAKE SYSTEM

Check the following items to see the installation condition and the connection condition of the joint.
- Air duct
- Vacuum hoses
- Intake air passage between air duct and intake manifold

Is the inspection result normal?

YES >> GO TO 3.
NO >> Reconnect or replace error-detected parts.

3.CHECK MASS AIR FLOW SENSOR POWER SUPPLY CIRCUIT

1. Disconnect mass air flow sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between mass air flow sensor harness connector and ground.

+		–	Voltage
Mass air flow sensor			
Connector	Terminal		
F73	5	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between mass air flow sensor and ECM
- Harness for open or short between mass air flow sensor and IPDM E/R
- Loose or poor connection for each connector and harness

>> Repair or replace error-detected parts.

5.CHECK MASS AIR FLOW SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between mass air flow sensor harness connector and ECM harness connector.

Mass air flow sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F73	4	F78	42	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6. CHECK MASS AIR FLOW SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between mass air flow sensor harness connector and ECM harness connector.

Mass air flow sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F73	3	F78	37	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK INTAKE AIR TEMPERATURE SENSOR

Check intake air temperature sensor. Refer to EC-1544, "Component Inspection".

Is the inspection result normal?

YES >> GO TO 8.
NO >> Replace mass air flow sensor (with intake air temperature sensor). Refer to EM-31, "Removal and Installation".

8. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR

Refer to EC-1678, "Component Inspection (EVAP Control System Pressure Sensor)".

Is the inspection result normal?

YES >> GO TO 9.
NO >> Replace EVAP control system pressure sensor. Refer to FL-19, "Removal and Installation"

9. CHECK MASS AIR FLOW SENSOR

Check mass air flow sensor. Refer to EC-1540, "Component Inspection (MAF Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace mass air flow sensor. Refer to EM-31, "Removal and Installation".

Component Inspection (MAF sensor)

INFOID:0000000013798212

1. CHECK MASS AIR FLOW SENSOR-I

WITH CONSULT

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Start engine and warm it up to normal operating temperature.
4. Connect CONSULT and select “DATA MONITOR” mode.
5. Select “MAS A/F SE-B1”, and check the indication.

Monitor item	Condition	Indication (V)
MAS A/F SE-B1	Ignition switch ON (Engine stopped.)	Approx. 0.4
	Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
	2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
	Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

WITHOUT CONSULT

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Start engine and warm it up to normal operating temperature.

4. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
F78	37 [MAF sensor signal]	42	Ignition switch ON (Engine stopped.)	Approx. 0.4
			Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
			2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
			Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.CHECK FOR THE CAUSE OF UNEVEN AIR FLOW THROUGH MASS AIR FLOW SENSOR

1. Turn ignition switch OFF.
2. Check for the cause of uneven air flow through mass air flow sensor. Refer to the following.

- Crushed air ducts
- Malfunctioning seal of air cleaner element
- Uneven dirt of air cleaner element
- Intake valve deposits
- Improper specification of intake air system parts

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.CHECK MASS AIR FLOW SENSOR-II

WITH CONSULT

1. Repair or replace malfunctioning part.
2. Start engine and warm it up to normal operating temperature.
3. Connect CONSULT and select “DATA MONITOR” mode.
4. Select “MAS A/F SE-B1”, and check the indication.

Monitor item	Condition	Indication (V)
MAS A/F SE-B1	Ignition switch ON (Engine stopped.)	Approx. 0.4
	Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
	2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
	Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

WITHOUT CONSULT

1. Repair or replace malfunctioning part.
2. Start engine and warm it up to normal operating temperature.
3. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
F78	37 [MAF sensor signal]	42	Ignition switch ON (Engine stopped.)	Approx. 0.4
			Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
			2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
			Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 4.

4. CHECK MASS AIR FLOW SENSOR-III

WITH CONSULT

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor harness connector and reconnect it again.
3. Start engine and warm it up to normal operating temperature.
4. Connect CONSULT and select “DATA MONITOR” mode.
5. Select “MAS A/F SE-B1”, and check the indication.

Monitor item	Condition	Indication (V)
MAS A/F SE-B1	Ignition switch ON (Engine stopped.)	Approx. 0.4
	Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
	2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
	Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

WITHOUT CONSULT

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor harness connector and reconnect it again.
3. Start engine and warm it up to normal operating temperature.
4. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
F78	37 [MAF sensor signal]	42	Ignition switch ON (Engine stopped.)	Approx. 0.4
			Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
			2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
			Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean or replace malfunctioning mass air flow sensor. Refer to EM-31, "Removal and Installation".

P0102, P0103 MAF SENSOR

DTC Description

INFOID:0000000013798213

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0102	MAF SEN/CIRCUIT-B1 (Mass air flow sensor “A” circuit low input)	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Mass air flow sensor signal
		Threshold	An excessively low voltage from the sensor is sent to ECM.
		Diagnosis delay time	—
P0103	MAF SEN/CIRCUIT-B1 (Mass or volume air flow “A” circuit high input)	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Mass air flow sensor signal
		Threshold	An excessively high voltage from the sensor is sent to ECM.
		Diagnosis delay time	—

POSSIBLE CAUSE

P0102
- Harness or connectors (The mass air flow sensor circuit is open or shorted)
- Intake air leakage
- Mass air flow sensor

P0103
- Harness or connectors (The mass air flow sensor circuit is open or shorted)
- Mass air flow sensor

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0102	Mass air flow sensor circuit	Engine speed will not rise more than 2,400 rpm due to the fuel cut.
P0103	Mass air flow sensor circuit	Engine speed will not rise more than 2,400 rpm due to the fuel cut.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

Which DTC is detected?

P0102 >> GO TO 2.
P0103 >> GO TO 3.

2.PERFORM DTC CONFIRMATION PROCEDURE FOR DTC P0102

1. Start engine and wait at least 5 seconds.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1539, "Diagnosis Procedure".
NO >> INSPECTION END

3.PERFORM DTC CONFIRMATION PROCEDURE FOR DTC P0103-I

1. Turn ignition switch ON and wait at least 5 seconds.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1539, "Diagnosis Procedure".

NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE FOR DTC P0103-II

1. Start engine and wait at least 5 seconds.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1539, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798214

1.INSPECTION START

Confirm the detected DTC.

Which DTC is detected?

P0102 >> GO TO 2.
P0103 >> GO TO 3.

2.CHECK INTAKE SYSTEM

Check the following for connection.
- Air duct
- Vacuum hoses
- Intake air passage between air duct to intake manifold

Is the inspection result normal?

YES >> GO TO 3.
NO >> Reconnect the parts.

3.CHECK MAF SENSOR POWER SUPPLY CIRCUIT

1. Disconnect mass air flow (MAF) sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between MAF sensor harness connector and ground.

MAF sensor		Ground	Voltage
Connector	Terminal		
F73	5	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between mass air flow sensor and ECM
- Harness for open or short between mass air flow sensor and IPDM E/R
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK MAF SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between MAF sensor harness connector and ECM harness connector.

MAF sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F73	4	F78	42	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

6.CHECK MAF SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between MAF sensor harness connector and ECM harness connector.

MAF sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F73	3	F78	37	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

7.CHECK MASS AIR FLOW SENSOR

Refer to EC-1540, "Component Inspection (MAF Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace mass air flow sensor. Refer to EM-31, "Exploded View".

Component Inspection (MAF Sensor)

INFOID:0000000013798215

1.CHECK MASS AIR FLOW SENSOR-I

WITH CONSULT

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Start engine and warm it up to normal operating temperature.
4. Connect CONSULT and select “DATA MONITOR” mode.
5. Select “MAS A/F SE-B1”, and check the indication.

Monitor item	Condition	Indication (V)
MAS A/F SE-B1	Ignition switch ON (Engine stopped.)	Approx. 0.4
	Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
	2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
	Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

WITHOUT CONSULT

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Start engine and warm it up to normal operating temperature.
4. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
F78	37 (MAF sensor signal)	42	Ignition switch ON (Engine stopped.)	Approx. 0.4
			Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
			2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
			Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.CHECK FOR THE CAUSE OF UNEVEN AIR FLOW THROUGH MASS AIR FLOW SENSOR

1. Turn ignition switch OFF.
2. Check for the cause of uneven air flow through mass air flow sensor. Refer to the following.

- Crushed air ducts
- Malfunctioning seal of air cleaner element
- Uneven dirt of air cleaner element
- Improper specification of intake air system parts

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.CHECK MASS AIR FLOW SENSOR-II

WITH CONSULT

1. Repair or replace malfunctioning part.
2. Start engine and warm it up to normal operating temperature.
3. Connect CONSULT and select “DATA MONITOR” mode.
4. Select “MAS A/F SE-B1””, and check the indication.

Monitor item	Condition	Indication (V)
MAS A/F SE-B1	Ignition switch ON (Engine stopped.)	Approx. 0.4
	Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
	2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
	Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

WITHOUT CONSULT

1. Repair or replace malfunctioning part.
2. Start engine and warm it up to normal operating temperature.
3. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
F78	37 (MAF sensor signal)	42	Ignition switch ON (Engine stopped.)	Approx. 0.4
			Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
			2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
			Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 4.

4.CHECK MASS AIR FLOW SENSOR-III

WITH CONSULT

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor harness connector and reconnect it again.
3. Start engine and warm it up to normal operating temperature.
4. Connect CONSULT and select “DATA MONITOR” mode.

5. Select “MAS A/F SE-B1”, and check the indication.

Monitor item	Condition	Indication (V)
MAS A/F SE-B1	Ignition switch ON (Engine stopped.)	Approx. 0.4
	Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
	2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
	Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

⊗WITHOUT CONSULT
1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor harness connector and reconnect it again.
3. Start engine and warm it up to normal operating temperature.
4. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
F78	37 (MAF sensor signal)	42	Ignition switch ON (Engine stopped.)	Approx. 0.4
			Idle (Engine is warmed-up to normal operating temperature.)	0.7 - 1.2
			2,500 rpm (Engine is warmed-up to normal operating temperature.)	1.4 - 1.9
			Idle to about 4,000 rpm	0.7 - 1.2 to Approx. 2.4*

*: Check for linear voltage rise in response to engine being increased to about 4,000 rpm.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Clean or replace malfunctioning mass air flow sensor. Refer to EM-31, "Removal and Installation".

P0111 IAT SENSOR

DTC Description

INFOID:0000000013798216

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0111	IAT SENSOR 1 B1 [Intake air temperature (IAT) sensor circuit range/performance]	Diagnosis condition	Engine is started with its cold state
		Signal (terminal)	Intake air temperature sensor signal
		Threshold	The comparison result of signals transmitted to ECM from each temperature sensor (IAT sensor, ECT sensor 1, FTT sensor, and EOT sensor) shows that the voltage signal of the IAT sensor is higher/lower than that of other temperature sensors
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (High or low resistance in the IAT sensor circuit)
- IAT sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.INSPECTION START

Is it necessary to erase permanent DTC?

YES >> GO TO 3.
NO >> GO TO 2.

2.PERFORM COMPONENT FUNCTION CHECK

Perform component function check. Refer to EC-1544, "Component Function Check".

NOTE:

Use the component function check to check the overall function of the IAT sensor circuit. During this check, a 1st trip DTC might not be confirmed.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Proceed to EC-1544, "Diagnosis Procedure".

3.PRECONDITIONING

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

- **Before performing the following procedure, do not add fuel.**
- **Before performing the following procedure, check that fuel level is between 1/4 and 4/4.**
- **Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.**

>> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE

1. Move the vehicle to a cool place.
   NOTE:
   Cool the vehicle in an environment of ambient air temperature between −10°C (14°F) and 35°C (95°F).

2. Turn ignition switch OFF and soak the vehicle for 12 hours.
   CAUTION:
   Never turn ignition switch ON during soaking.
   NOTE:
   The vehicle must be cooled with the hood open.
3. Start engine and let it idle for 5 minutes or more.
   CAUTION:
   Never turn ignition switch OFF during idling.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1544, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Component Function Check

INFOID:0000000013798217

1.CHECK INTAKE AIR TEMPERATURE (IAT) SENSOR

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor harness connector.
3. Check resistance between mass air flow sensor terminals as follows.

Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	25 (77)	1.94 – 2.06

Is the inspection result normal?

YES >> INSPECTION END
NO >> Proceed to EC-1544, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798218

1.CHECK INTAKE AIR TEMPERATURE (IAT) SENSOR

Check intake air temperature sensor. Refer to EC-1544, "Component Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace mass air flow sensor (with intake air temperature sensor). Refer to EM-31, "Removal and Installation".

Component Inspection

INFOID:0000000013798219

1.CHECK INTAKE AIR TEMPERATURE (IAT) SENSOR

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor harness connector.
3. Check resistance between mass air flow sensor terminals as follows.

Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	25 (77)	1.94 – 2.06

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace mass air flow sensor (with intake air temperature sensor). Refer to EM-31, "Removal and Installation".

P0112, P0113 IAT SENSOR

DTC Description

INFOID:0000000013798220

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0112	IAT SEN/CIRCUIT-B1 (Intake air temperature sensor circuit low input)	Diagnosis condition	—
		Signal (terminal)	Intake air temperature sensor signal
		Threshold	An excessively low voltage from the sensor is sent to ECM
		Diagnosis delay time	—
P0113	IAT SEN/CIRCUIT-B1 (Intake air temperature sensor circuit high input)	Diagnosis condition	—
		Signal (terminal)	Intake air temperature sensor signal
		Threshold	An excessively high voltage from the sensor is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

P0112
- Harness or connectors (The intake air temperature sensor circuit is open or shorted)
- Intake air temperature sensor

P0113
- Harness or connectors (The intake air temperature sensor circuit is open or shorted)
- Intake air temperature sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 5 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1545, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798221

1.CHECK INTAKE AIR TEMPERATURE SENSOR POWER SUPPLY CIRCUIT

1. Disconnect mass air flow (MAF) sensor (intake air temperature sensor is built-in) harness connector.
2. Turn ignition switch ON.
3. Check the voltage between MAF sensor harness connector and ground.

MAF sensor		Ground	Voltage (V)
Connector	Terminal		
F73	2	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

2.CHECK INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between MAF sensor harness connector and ECM harness connector.

MAF sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F73	1	F78	42	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

3.CHECK INTAKE AIR TEMPERATURE SENSOR

Refer to EC-1546, "Component Inspection (Intake Air Temperature Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace mass air flow sensor (with intake air temperature sensor).

Component Inspection (Intake Air Temperature Sensor)

INFOID:0000000013798222

1.CHECK INTAKE AIR TEMPERATURE SENSOR

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor harness connector.
3. Check resistance between mass air flow sensor terminals as per the following.

Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	25 (77)	1.94 - 2.06

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace mass air flow sensor (with intake air temperature sensor). Refer to EM-31, "Removal and Installation".

P0116 ENGINE COOLANT TEMPERATURE SENSOR 1

DTC Description

INFOID:0000000013798223

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0116	ECT SEN/CIRC [Engine coolant temperature (ECT) sensor 1 circuit range/performance]	Diagnosis condition	Engine is started with its cold state
		Signal (terminal)	Engine coolant temperature sensor 1 signal
		Threshold	The comparison result of signals transmitted to ECM from each temperature sensor (IAT sensor, ECT sensor 1, FTT sensor, and EOT sensor) shows that the voltage signal of the ECT sensor 1 is higher/lower than that of other temperature sensors
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (High or low resistance in the ECT sensor 1 circuit)
- ECT sensor 1

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.INSPECTION START

Is it necessary to erase permanent DTC?

YES >> GO TO 3.
NO >> GO TO 2.

2.PERFORM COMPONENT FUNCTION CHECK

Perform component function check. Refer to EC-1548, "Component Function Check".

NOTE:

Use the component function check to check the overall function of the ECT sensor 1 circuit. During this check, a 1st trip DTC might not be confirmed.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Proceed to EC-1548, "Diagnosis Procedure".

3.PRECONDITIONING

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

- **Before performing the following procedure, do not add fuel.**
- **Before performing the following procedure, check that fuel level is between 1/4 and 4/4.**
- **Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.**

>> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE

1. Move the vehicle to a cool place.
   NOTE:
   Cool the vehicle in an environment of ambient air temperature between −10°C (14°F) and 35°C (95°F).

2. Turn ignition switch OFF and soak the vehicle for 12 hours.
   CAUTION:
   Never turn ignition switch ON during soaking.
   NOTE:
   The vehicle must be cooled with the hood open.
3. Start engine and let it idle for 5 minutes or more.
   CAUTION:
   Never turn ignition switch OFF during idling.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

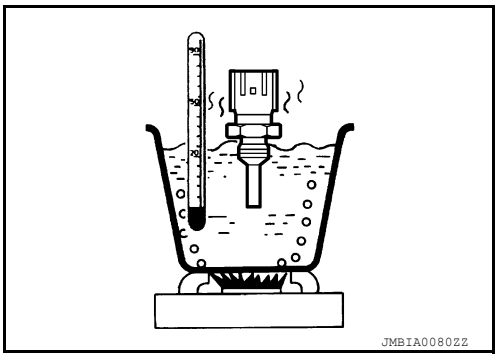
YES >> Proceed to EC-1548, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Component Function Check

INFOID:0000000013798224

1. CHECK ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1

1. Turn ignition switch OFF.
2. Disconnect ECT sensor 1 harness connector.
3. Remove ECT sensor 1. Refer to EC-1269, "Component Parts Location".
4. Check resistance between ECT sensor 1 terminals by heating with hot water as shown in the figure.



Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	20 (68)	2.35 – 2.73
		50 (122)	0.68 – 1.00
		90 (194)	0.236 – 0.260

Is the inspection result normal?

YES >> INSPECTION END
NO >> Proceed to EC-1548, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798225

1. CHECK ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1

Check ECT sensor 1. Refer to EC-1548, "Component Inspection".

Is the inspection result normal?

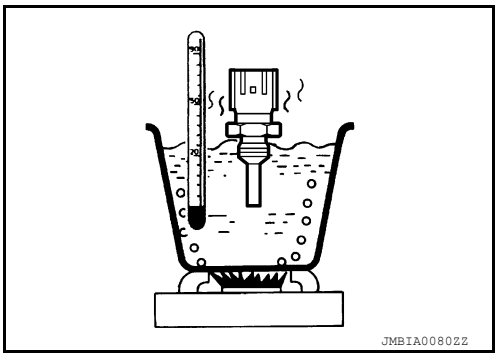
YES >> INSPECTION END
NO >> Replace ECT sensor 1. Refer to EC-1269, "Component Parts Location".

Component Inspection

INFOID:0000000013798226

1. CHECK ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1

1. Turn ignition switch OFF.
2. Disconnect ECT sensor 1 harness connector.
3. Remove ECT sensor 1. Refer to EC-1269, "Component Parts Location".
4. Check resistance between ECT sensor 1 terminals by heating with hot water as shown in the figure.



Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	20 (68)	2.35 – 2.73
		50 (122)	0.68 – 1.00
		90 (194)	0.236 – 0.260

Is the inspection result normal?

YES >> INSPECTION END

NO >> Replace ECT sensor 1. Refer to EC-1269, "Component Parts Location".

P0117, P0118 ENGINE COOLANT TEMPERATURE SENSOR 1

DTC Description

INFOID:0000000013798227

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0117	ECT SEN/CIRC (Engine coolant temperature sensor 1 circuit low input)	Diagnosis condition	—
		Signal (terminal)	Engine coolant temperature sensor 1 signal
		Threshold	An excessively low voltage from the sensor is sent to ECM
		Diagnosis delay time	—
P0118	ECT SEN/CIRC (Engine coolant temperature sensor 1 circuit high input)	Diagnosis condition	—
		Signal (terminal)	Engine coolant temperature sensor 1 signal
		Threshold	An excessively high voltage from the sensor is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

P0117
- Harness or connectors (The engine coolant temperature sensor 1 circuit is open or shorted)
- Engine coolant temperature sensor 1

P0118
- Harness or connectors (The engine coolant temperature sensor 1 circuit is open or shorted)
- Engine coolant temperature sensor 1

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode	
P0117 P0118	Engine coolant temperature sensor 1 circuit	Engine coolant temperature will be determined by ECM based on the following condition. CONSULT displays the engine coolant temperature decided by ECM.	
		Condition	Engine coolant temperature decided (CONSULT display)
		Just as ignition switch is turned ON or START	40°C (104°F)
		Approx. 4 minutes or more after engine starting	80°C (176°F)
		Except as shown above	40 - 80°C (104 - 176°F) (Depends on the time)
		When the fail-safe system for engine coolant temperature sensor 1 is activated, the cooling fan operates while engine is running.	

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 5 seconds.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1551, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798228

1. CHECK ENGINE COOLANT TEMPERATURE SENSOR 1 POWER SUPPLY CIRCUIT

1. Disconnect engine coolant temperature (ECT) sensor 1 harness connector.
2. Turn ignition switch ON.
3. Check the voltage between ECT sensor 1 harness connector and ground.

ECT sensor 1		Ground	Voltage (V)
Connector	Terminal		
F28	1	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

2. CHECK ECT SENSOR 1 GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between ECT sensor 1 harness connector and ECM harness connector.

ECT sensor 1		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F28	2	F78	43	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

3. CHECK ENGINE COOLANT TEMPERATURE SENSOR 1

Refer to EC-1551, "Component Inspection (Engine Coolant Temperature Sensor 1)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace engine coolant temperature sensor 1.

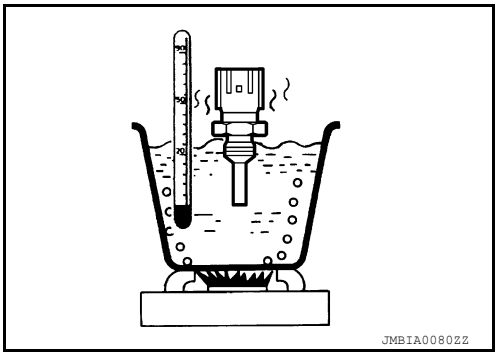
Component Inspection (Engine Coolant Temperature Sensor 1)

INFOID:0000000013798229

1. CHECK ENGINE COOLANT TEMPERATURE SENSOR 1

1. Turn ignition switch OFF.
2. Disconnect engine coolant temperature sensor 1 harness connector.
3. Remove engine coolant temperature sensor 1.
4. Check resistance between engine coolant temperature sensor 1 terminals by heating with hot water as shown in the figure.

Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	20 (68)	2.35 - 2.73
		50 (122)	0.68 - 1.00
		90 (194)	0.236 - 0.260



Is the inspection result normal?

YES >> INSPECTION END

NO >> Replace engine coolant temperature sensor 1. Refer to EM-97, "Exploded View".

P0122, P0123 TP SENSOR

DTC Description

INFOID:0000000013798230

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0122	TP SEN 2/CIRC-B1 (Throttle pedal position sensor/switch "A" circuit low)	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Throttle position sensor 2 signal
		Threshold	An excessively low voltage from the TP sensor 2 is sent to ECM
		Diagnosis delay time	—
P0123	TP SEN 2/CIRC-B1 (Throttle pedal position sensor/switch "A" circuit high)	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Throttle position sensor 2 signal
		Threshold	An excessively high voltage from the TP sensor 2 is sent to ECM.
		Diagnosis delay time	—

POSSIBLE CAUSE

P0122
- Harness or connectors (TP sensor 2 circuit is open or shorted)
- Throttle position sensor 2

P0123
- Harness or connectors (TP sensor 2 circuit is open or shorted)
- Throttle position sensor 2

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0122	Throttle position sensor	The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees. The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. Therefore, the acceleration will be poor.
P0123	Throttle position sensor	The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees. The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. Therefore, the acceleration will be poor.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0122 or P0123 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 8 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for 1 second.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1554, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798231

1.CHECK DTC PRIORITY

If DTC P0122 or P0123 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.CHECK THROTTLE POSITION SENSOR 2 POWER SUPPLY CIRCUIT

1. Disconnect electric throttle control actuator harness connector.
2. Turn ignition switch ON.
3. Check the voltage between electric throttle control actuator harness connector and ground.

Electric throttle control actuator		Ground	Voltage
Connector	Terminal		
F50	2	Ground	Approx. 5 V

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

3.CHECK THROTTLE POSITION SENSOR 2 GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between electric throttle control actuator harness connector and ECM harness connector.

Electric throttle control actuator		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F50	4	F79	85	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4.CHECK THROTTLE POSITION SENSOR 2 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between electric throttle control actuator harness connector and ECM harness connector.

Electric throttle control actuator		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F50	3	F79	80	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK THROTTLE POSITION SENSOR

Refer to EC-1555, "Component Inspection (Throttle Position Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 6.

6.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

Component Inspection (Throttle Position Sensor)

INFOID:0000000013798232

1.CHECK THROTTLE POSITION SENSOR

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Perform EC-1429, "Description".
4. Turn ignition switch ON.
5. Set selector lever position to D.
6. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition		Voltage (V)
Connector	+	–			
	Terminal	Terminal			
F79	78 (TP sensor 1 signal)	85 (Sensor ground)	Accelerator pedal	Fully released	More than 0.36
				Fully depressed	Less than 4.75
	80 (TP sensor 2 signal)			Fully released	Less than 4.75
				Fully depressed	More than 0.36

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

P0125 ECT SENSOR

DTC Description

INFOID:0000000013798233

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0125	ECT SENSOR (Insufficient engine coolant temperature for closed loop fuel control)	1	Diagnosis condition	After starting the engine
			Signal (terminal)	Mass air flow sensor signal
			Threshold	Voltage sent to ECM from the sensor is not practical
			Diagnosis delay time	Some time has passed
		2	Diagnosis condition	—
			Signal (terminal)	Mass air flow sensor signal
			Threshold	Engine coolant temperature is insufficient for closed loop fuel control
			Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (High resistance in the circuit)
- Engine coolant temperature sensor 1
- Multi-way control valve

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0125 is displayed with P0117 or P0118, first perform the trouble diagnosis for DTC P0117, P0118.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 3.

3.CHECK ENGINE COOLANT TEMPERATURE SENSOR 1 FUNCTION

WITH CONSULT
1. Turn ignition switch ON.
2. Select “DATA MONITOR” mode with CONSULT.
3. Check that “COOLAN TEMP/S” is above –10°C (14°F).

WITH GST
Follow the procedure “With CONSULT” above.

Is the temperature above –10°C (14°F)?

YES >> INSPECTION END
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE

WITH CONSULT
1. Start engine and run it for 65 minutes at idle speed.

If "COOLAN TEMP/S" increases to more than –10°C (14°F) within 65 minutes, stop engine because the test result will be OK.

CAUTION:

Never overheat engine.

2. Check 1st trip DTC.

WITH GST

Follow the procedure "With CONSULT" above.

Is 1st trip DTC detected?

YES >> EC-1557, "Diagnosis Procedure"
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798234

1.CHECK DTC PRIORITY

If DTC P0125 is displayed with P0117 or P0118, first perform the trouble diagnosis for DTC P0117, P0118.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK ENGINE COOLANT TEMPERATURE SENSOR 1

Refer to EC-1551, "Component Inspection (Engine Coolant Temperature Sensor 1)".

Is the inspection result normal?

YES >> GO TO 3.
NO >> Replace engine coolant temperature sensor 1.

3.CHECK MULTI-WAY CONTROL VALVE OPERATION

When the engine is cold [lower than 66°C (151°F)] condition, grasp lower radiator hose and confirm that the engine coolant does not flow.

Is the inspection result normal?

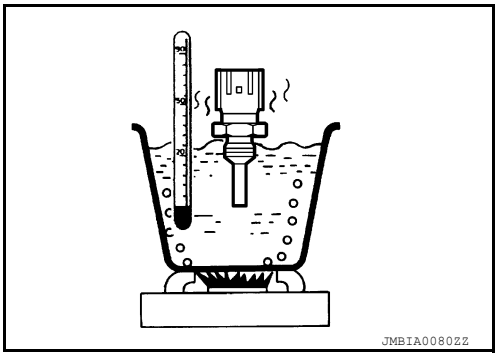
YES >> INSPECTION END
NO >> Repair or replace water outlet (MCV). Refer to CO-22, "Exploded View".

Component Inspection (Engine Coolant Temperature Sensor 1)

INFOID:0000000013798235

1.CHECK ENGINE COOLANT TEMPERATURE SENSOR 1

1. Turn ignition switch OFF.
2. Disconnect engine coolant temperature sensor 1 harness connector.
3. Remove engine coolant temperature sensor 1.
4. Check resistance between engine coolant temperature sensor 1 terminals by heating with hot water as shown in the figure.



Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	20 (68)	2.35 - 2.73
		50 (122)	0.68 - 1.00
		90 (194)	0.236 - 0.260

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace engine coolant temperature sensor 1. Refer to EM-97, "Exploded View".

P0127 IAT SENSOR

DTC Description

INFOID:0000000013798236

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0127	IAT SENSOR-B1 (Intake air temperature too high)	Diagnosis condition	—
		Signal (terminal)	Intake air temperature sensor signal
		Threshold	Rationally incorrect voltage from the sensor is sent to ECM, compared with the voltage signal from Intake air temperature sensor.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (The intake air temperature sensor circuit is open or shorted)
- Intake air temperature sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

This test may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

WITH CONSULT

1. Wait until engine coolant temperature is less than 90°C (194°F)

- Turn ignition switch ON.
- Select “DATA MONITOR” mode with CONSULT.
- Check the engine coolant temperature.
- If the engine coolant temperature is not less than 90°C (194°F), turn ignition switch OFF and cool down engine.

NOTE:

Perform the following steps before engine coolant temperature is above 90°C (194°F).

2. Turn ignition switch ON.
3. Select “DATA MONITOR” mode with CONSULT.
4. Start engine.
5. Hold vehicle speed at more than 70 km/h (43 MPH) for 100 consecutive seconds.

CAUTION:

Always drive vehicle at a safe speed.

6. Check 1st trip DTC.

WITH GST

Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1559, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798237

1.CHECK INTAKE AIR TEMPERATURE SENSOR

Refer to EC-1559, "Component Inspection (Intake Air Temperature Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace mass air flow sensor (with intake air temperature sensor).

Component Inspection (Intake Air Temperature Sensor)

INFOID:0000000013798238

1.CHECK INTAKE AIR TEMPERATURE SENSOR

1. Turn ignition switch OFF.
2. Disconnect mass air flow sensor harness connector.
3. Check resistance between mass air flow sensor terminals as per the following.

Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	25 (77)	1.94 - 2.06

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace mass air flow sensor (with intake air temperature sensor). Refer to EM-35, "Removal and Installation".

P0130, P0150 A/F SENSOR 1

DTC Description

INFOID:0000000013798239

DTC DETECTION LOGIC

To judge malfunctions, the diagnosis checks that the A/F signal computed by ECM from the A/F sensor 1 signal fluctuates according to fuel feedback control.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0130	A/F SENSOR1 (B1) [Air fuel ratio (A/F) sensor 1 (bank 1) circuit]	A)	Diagnosis condition	—
			Signal (terminal)	Air fuel ratio sensor 1 signal
			Threshold	The A/F signal computed by ECM from the A/F sensor 1 signal is constantly in a range other than approx. 2.2 V
			Diagnosis delay time	—
		B)	Diagnosis condition	—
			Signal (terminal)	Air fuel ratio sensor 1 signal
			Threshold	The A/F signal computed by ECM from the A/F sensor 1 signal is constantly approx. 2.2 V
			Diagnosis delay time	—
P0150	A/F SENSOR1 (B2) [Air fuel ratio (A/F) sensor 1 (bank 2) circuit]	A)	Diagnosis condition	—
			Signal (terminal)	Air fuel ratio sensor 1 signal
			Threshold	The A/F signal computed by ECM from the A/F sensor 1 signal is constantly in a range other than approx. 2.2 V
			Diagnosis delay time	—

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 2.

2. PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION A

1. Start engine and warm it up to normal operating temperature.
2. Let engine idle for 2 minutes.
3. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1562, "Diagnosis Procedure".
NO-1 >> With CONSULT: GO TO 3.
NO-2 >> With GST: GO TO 7.

3. CHECK AIR FUEL RATIO (A/F) SENSOR 1 FUNCTION

WITH CONSULT
1. Start engine and warm it up to normal operating temperature.
2. Select “A/F SEN1 (B1)” or “A/F SEN1 (B2)” in “DATA MONITOR” mode with CONSULT.
3. Check “A/F SEN1 (B1)” or “A/F SEN1 (B2)” indication.

Does the indication fluctuate around 2.2 V?

YES >> GO TO 4.
NO >> Go to EC-1562, "Diagnosis Procedure".

4. PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION B-I

1. Select “A/F SEN1 (B1) P1276” (for DTC P0130) or “A/F SEN1 (B2) P1286” (for DTC P0150) of “A/F SEN1” in “DTC WORK SUPPORT” mode with CONSULT.
2. Touch “START”.
3. When the following conditions are met, “TESTING” will be displayed on the CONSULT screen.

ENG SPEED	1,000 - 3,200 rpm
VHCL SPEED SE	More than 64 km/h (40 mph)
B/FUEL SCHDL	1.0 - 8.0 msec
Selector lever	D position

If “TESTING” is not displayed after 20 seconds, retry from step 2.
CAUTION:
Always drive vehicle at a safe speed.

Is “TESTING” displayed on CONSULT screen?

YES >> GO TO 5.
NO >> Check A/F sensor 1 function again. GO TO 3.

5. PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION B-II

Release accelerator pedal fully.
NOTE:
Never apply brake when releasing the accelerator pedal.

Which does “TESTING” change to?

COMPLETED>>GO TO 6.
OUT OF CONDITION>>Retry DTC CONFIRMATION PROCEDURE. GO TO 4.

6. PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION B-III

Touch “SELF-DIAG RESULT”.

Is “OK” displayed on CONSULT screen?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> Go to EC-1562, "Diagnosis Procedure".

7. PERFORM COMPONENT FUNCTION CHECK FOR MALFUNCTION B

NOTE:

Use component function check to check the overall function of the A/F sensor 1 circuit. During this check, a 1st trip DTC might not be confirmed.

WITH GST

1. Start engine and warm it up to normal operating temperature.
2. Drive the vehicle at a speed of 80 km/h (50 MPH) for a few minutes in the suitable gear position.
3. Shift the selector lever position to D, then release the accelerator pedal fully until the vehicle speed decreases to 50 km/h (31 MPH).
   CAUTION:
   Always drive vehicle at a safe speed.
   NOTE:
   Never apply brake when releasing the accelerator pedal.
4. Repeat steps 2 and 3 for 5 times.
5. Stop the vehicle and turn ignition switch OFF.
6. Wait at least 10 seconds and turn ignition switch ON.
7. Turn ignition switch OFF and wait at least 10 seconds.
8. Restart engine.
9. Repeat steps 2 and 3 for 5 times.
10. Stop the vehicle.
11. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1562, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798241

1. CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect air fuel ratio (A/F) sensor 1 harness connector.
3. Turn ignition switch ON.
4. Check the voltage between A/F sensor 1 harness connector and ground.

DTC	A/F sensor 1			Ground	Voltage
	Bank	Connector	Terminal		
P0130	1	F25	1	Ground	Battery voltage
P0150	2	F16	1		

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2. CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between A/F sensor 1 harness connector and IPDM E/R harness connector.

DTC	A/F sensor 1			IPDM E/R		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0130	1	F25	1	E121	25	Existed
P0150	2	F16	1			

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Perform trouble diagnosis for power supply circuit.
NO >> Repair or replace malfunctioning part.

3. CHECK A/F SENSOR 1 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.

2. Disconnect ECM harness connector.
3. Check the continuity between A/F sensor 1 harness connector and ECM harness connector.

DTC	A/F sensor 1			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0130	1	F25	4	F79	79	Existed
			3		74	
P0150	2	F16	4	F79	69	
			3		70	

4. Check the continuity between A/F sensor 1 harness connector and ground, or ECM harness connector and ground.

DTC	A/F sensor 1			Ground	Continuity
	Bank	Connector	Terminal		
P0130	1	F25	4	Ground	Not Existed
			3		
P0150	2	F16	4		
			3		

DTC	ECM			Ground	Continuity
	Bank	Connector	Terminal		
P0130	1	F79	74	Ground	Not Existed
			79		
P0150	2	F79	69		
			70		

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace malfunctioning part.

4. REPLACE A/F SENSOR 1

Replace malfunctioning A/F sensor 1. Refer to EM-45, "Removal and Installation".

CAUTION:

- **Discard any A/F sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new A/F sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

P0131, P0151 A/F SENSOR 1

DTC Description

INFOID:0000000013798242

DTC DETECTION LOGIC

To judge the malfunction, the diagnosis checks that the A/F signal computed by ECM from the A/F sensor 1 signal is not inordinately low.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0131	A/F SENSOR1 (B1) [Air fuel ratio (A/F) sensor 1 (bank 1) circuit low voltage]	Diagnosis condition	—
		Signal (terminal)	Air fuel ratio sensor 1 signal
		Threshold	The A/F signal computed by ECM from the A/F sensor 1 signal is constantly approx. 0 V
		Diagnosis delay time	—
P0151	A/F SENSOR1 (B2) [Air fuel ratio (A/F) sensor 1 (bank 2) circuit low voltage]	Diagnosis condition	—
		Signal (terminal)	Air fuel ratio sensor 1 signal
		Threshold	The A/F signal computed by ECM from the A/F sensor 1 signal is constantly approx. 0 V
		Diagnosis delay time	—

POSSIBLE CAUSE

P0131
- Harness or connectors (The A/F sensor 1 circuit is open or shorted)
- A/F sensor 1

P0151
- Harness or connectors (The A/F sensor 1 circuit is open or shorted)
- A/F sensor 1

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 10.5 V or more at idle.

>> GO TO 2.

2.CHECK A/F SENSOR FUNCTION

WITH CONSULT

1. Start engine and warm it up to normal operating temperature.
2. Select “A/F SEN1 (B1)” or “A/F SEN1 (B2)” in “DATA MONITOR” mode with CONSULT.
3. Check “A/F SEN1 (B1)” or “A/F SEN1 (B2)” indication.

WITH GST

Follow the procedure “With CONSULT” above.

Is the indication constantly approx. 0 V?

YES >> Go to EC-1565, "Diagnosis Procedure".
NO >> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

WITH CONSULT
1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Restart engine.
5. Drive and accelerate vehicle to more than 40 km/h (25 MPH) within 20 seconds after restarting engine.
   CAUTION:
   Always drive vehicle at a safe speed.
6. Maintain the following conditions for approximately 20 consecutive seconds.

ENG SPEED	1,000 - 3,200 rpm
VHCL SPEED SE	More than 40 km/h (25 mph)
B/FUEL SCHDL	1.5 - 9.0 msec
Selector lever	Suitable position

NOTE:
- **Keep the accelerator pedal as steady as possible during cruising.**
- **If this procedure is not completed within 1 minute after restarting engine at step 1, return to step 1.**

7. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1565, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798243

1.CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect air fuel ratio (A/F) sensor 1 harness connector.
3. Turn ignition switch ON.
4. Check the voltage between A/F sensor 1 harness connector and ground.

DTC	A/F sensor 1			Ground	Voltage
	Bank	Connector	Terminal		
P0131	1	F25	1	Ground	Battery voltage
P0151	2	F16	1		

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between A/F sensor 1 harness connector and IPDM E/R harness connector.

DTC	A/F sensor 1			IPDM E/R		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0131	1	F25	1	E121	25	Existed
P0151	2	F16	1			

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Perform trouble diagnosis for power supply circuit.
NO >> Repair or replace malfunctioning part.

3. CHECK A/F SENSOR 1 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between A/F sensor 1 harness connector and ECM harness connector.

DTC	A/F sensor 1			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0131	1	F25	4	F79	79	Existed
			3		74	
P0151	2	F16	4	F79	69	
			3		70	

4. Check the continuity between A/F sensor 1 harness connector and ground, or ECM harness connector and ground.

DTC	A/F sensor 1			Ground	Continuity
	Bank	Connector	Terminal		
P0131	1	F25	4	Ground	Not Existed
			3		
P0151	2	F16	4		
			3		

DTC	ECM			Ground	Continuity
	Bank	Connector	Terminal		
P0131	1	F79	74	Ground	Not Existed
			79		
P0151	2	F79	69		
			70		

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace malfunctioning part.

4. REPLACE A/F SENSOR 1

Replace malfunctioning A/F sensor 1. Refer to EM-45, "Removal and Installation".

CAUTION:

- **Discard any A/F sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new A/F sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

P0132, P0152 A/F SENSOR 1

DTC Description

INFOID:0000000013798244

DTC DETECTION LOGIC

To judge the malfunction, the diagnosis checks that the A/F signal computed by ECM from the A/F sensor 1 signal is not inordinately low.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0132	A/F SENSOR1 (B1) [Air fuel ratio (A/F) sensor 1 (bank 1) circuit high voltage]	Diagnosis condition	—
		Signal (terminal)	Air fuel ratio sensor 1 signal
		Threshold	The A/F signal computed by ECM from the A/F sensor 1 signal is constantly approx. 5 V
		Diagnosis delay time	—
P0152	A/F SENSOR1 (B2) [Air fuel ratio (A/F) sensor 1 (bank 2) circuit high voltage]	Diagnosis condition	—
		Signal (terminal)	Air fuel ratio sensor 1 signal
		Threshold	The A/F signal computed by ECM from the A/F sensor 1 signal is constantly approx. 5 V
		Diagnosis delay time	—

POSSIBLE CAUSE

P0132
- Harness or connectors (The A/F sensor 1 circuit is open or shorted)
- A/F sensor 1

P0152
- Harness or connectors (The A/F sensor 1 circuit is open or shorted)
- A/F sensor 1

FAIL-SAFE

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 10.5 V or more at idle.

>> GO TO 2.

2.CHECK A/F SENSOR FUNCTION

WITH CONSULT

1. Start engine and warm it up to normal operating temperature.
2. Select “A/F SEN1 (B1)” or “A/F SEN1 (B2)” in “DATA MONITOR” mode with CONSULT.
3. Check “A/F SEN1 (B1)” or “A/F SEN1 (B2)” indication.

WITH GST

Follow the procedure “With CONSULT” above.

Is the indication constantly approx. 5 V?

YES >> Go to EC-1568, "Diagnosis Procedure".
NO >> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

WITH CONSULT
1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Restart engine.
5. Drive and accelerate vehicle to more than 40 km/h (25 MPH) within 20 seconds after restarting engine.
   CAUTION:
   Always drive vehicle at a safe speed.
6. Maintain the following conditions for approximately 20 consecutive seconds.

ENG SPEED	1,000 - 3,200 rpm
VHCL SPEED SE	More than 40 km/h (25 mph)
B/FUEL SCHDL	1.5 - 9.0 msec
Selector lever	Suitable position

NOTE:
- **Keep the accelerator pedal as steady as possible during cruising.**
- **If this procedure is not completed within 1 minute after restarting engine at step 1, return to step 1.**

7. Check 1st trip DTC.

WITH GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Go to EC-1568, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798245

1.CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect air fuel ratio (A/F) sensor 1 harness connector.
3. Turn ignition switch ON.
4. Check the voltage between A/F sensor 1 harness connector and ground.

DTC	A/F sensor 1			Ground	Voltage
	Bank	Connector	Terminal		
P0132	1	F25	1	Ground	Battery voltage
P0152	2	F16	1		

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between A/F sensor 1 harness connector and IPDM E/R harness connector.

DTC	A/F sensor 1			IPDM E/R		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0132	1	F25	1	E121	25	Existed
P0152	2	F16	1			

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Perform trouble diagnosis for power supply circuit.
NO >> Repair or replace malfunctioning part.

3. CHECK A/F SENSOR 1 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between A/F sensor 1 harness connector and ECM harness connector.

DTC	A/F sensor 1			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal

	Bank	Connector	Terminal		
P0132	1	F79	74	Ground	Not Existed
			79		
P0152	2	F79	69		
			70		

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace malfunctioning part.

4. REPLACE A/F SENSOR 1

Replace malfunctioning A/F sensor 1. Refer to EM-45, "Removal and Installation".

CAUTION:

- **Discard any A/F sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new A/F sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

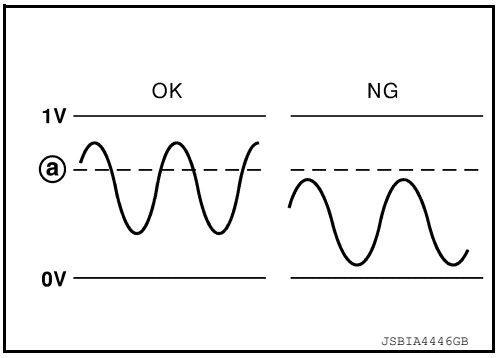
P0137, P0157 HO2S2

DTC Description

INFOID:0000000013798246

DTC DETECTION LOGIC

The heated oxygen sensor 2 has a much longer switching time between rich and lean than the air fuel ratio (A/F) sensor 1. The oxygen storage capacity of the three way catalyst (manifold) causes the longer switching time. To judge the malfunctions of heated oxygen sensor 2, ECM monitors whether the maximum voltage of the sensor is sufficiently high during various driving conditions such as fuel cut.
ⓐ: 0.73 V



DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0137	HO2S2 (B1) [Heated oxygen sensor 2 (bank 1) circuit low voltage]	Diagnosis condition	—
		Signal (terminal)	Heated oxygen sensor 2 signal
		Threshold	The maximum voltage from the sensor does not reach the specified voltage
		Diagnosis delay time	—
P0157	HO2S2 (B2) [Heated oxygen sensor 2 (bank 2) circuit low voltage]	Diagnosis condition	—
		Signal (terminal)	Heated oxygen sensor 2 signal
		Threshold	The maximum voltage from the sensor does not reach the specified voltage
		Diagnosis delay time	—

POSSIBLE CAUSE

P0137
- Harness or connectors (The heated oxygen sensor 2 circuit is open or shorted)
- Heated oxygen sensor 2
- Fuel pressure
- Fuel injector
- Intake air leaks

P0157
- Harness or connectors (The heated oxygen sensor 2 circuit is open or shorted)
- Heated oxygen sensor 2
- Fuel pressure
- Fuel injector
- Intake air leaks

FAIL-SAFE

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

Will CONSULT be used?

YES >> GO TO 2.

NO >> GO TO 4.

2. PERFORM DTC CONFIRMATION PROCEDURE

WITH CONSULT

TESTING CONDITION:

For better results, perform "DTC WORK SUPPORT" at a temperature of 0 to 30°C (32 to 86°F).

1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Restart engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
6. Let engine idle for 1 minute.
7. Select "DATA MONITOR" mode with CONSULT.
8. Check that "COOLAN TEMP/S" indicates more than 70°C (158°F).
   If not, warm up engine and go to next step when "COOLAN TEMP/S" indication reaches 70°C (158°F).
9. Open engine hood.
10. Select "HO2S2 (B1) P1147" (for DTC P0137) or "HO2S2 (B2) P1167" (for DTC P0157) of "HO2S2" in "DTC WORK SUPPORT" mode with CONSULT.
11. Follow the instruction of CONSULT display.
    NOTE:
    It will take at most 10 minutes until "COMPLETED" is displayed.
12. Touch "SELF-DIAG RESULTS".

Is "OK" displayed on CONSULT screen?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO-1 >> "NG" is displayed: Proceed to EC-1572, "Diagnosis Procedure".
NO-2 >> "CAN NOT BE DIAGNOSED" is displayed: GO TO 3.

3. PERFORM DTC CONFIRMATION PROCEDURE AGAIN

1. Turn ignition switch OFF and leave the vehicle in a cool place (soak the vehicle).
2. Perform DTC confirmation procedure again.

>> GO TO 2.

4. PERFORM COMPONENT FUNCTION CHECK-I

NOTE:

Use component function check to check the overall function of the heated oxygen sensor 2 circuit. During this check, a 1st trip DTC might not be confirmed.

WITH GST

1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Restart engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
6. Let engine idle for 1 minute.
7. Check the voltage between ECM harness connector terminals under the following conditions.

DTC	ECM				Condition	Voltage
	+		–			
	Connector	Terminal	Connector	Terminal		
P0137	F79	84	F78	43	Revving up to 4,000 rpm under no load at least 10 times	The voltage should be above 0.73 V at least once during this procedure.
P0157		77				

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END

NO >> GO TO 5.

5.PERFORM COMPONENT FUNCTION CHECK-II

Check the voltage between ECM harness connector terminals under the following conditions.

DTC	ECM				Condition	Voltage
	+		–			
	Connector	Terminal	Connector	Terminal		
P0137	F79	84	F78	43	Keeping engine at idle for 10 minutes	The voltage should be above 0.73 V at least once during this procedure.
P0157		77				

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> GO TO 6.

6.PERFORM COMPONENT FUNCTION CHECK-III

Check the voltage between ECM harness connector terminals under the following conditions.

DTC	ECM				Condition	Voltage
	+		–			
	Connector	Terminal	Connector	Terminal		
P0137	F79	84	F78	43	Coasting from 80 km/h (50 MPH) with selector lever in the D position	The voltage should be above 0.73 V at least once during this procedure.
P0157		77				

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> Proceed to EC-1572, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798248

1.CLEAR THE MIXTURE RATIO SELF-LEARNING VALUE

1. Clear the mixture ratio self-learning value. Refer to EC-1434, "Description".
2. Run engine for at least 10 minutes at idle speed.

Is the 1st trip DTC P0171 or P0174 detected? Is it difficult to start engine?

YES >> Perform trouble diagnosis for DTC P0171 or P0174. Refer to EC-1597, "DTC Description".
NO >> GO TO 2.

2.CHECK HEATED OXYGEN SENSOR 2 GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect heated oxygen sensor 2 (HO2S2) harness connector.
3. Disconnect ECM harness connector.
4. Check the continuity between HO2S2 harness connector and ECM harness connector.

DTC	HO2S2			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0137	1	F57	1	F78	43	Existed
P0157	2	F54	1			

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

3.CHECK HO2S2 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between HO2S2 harness connector and ECM harness connector.

DTC	HO2S2			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0137	1	F57	2	F79	84	Existed
P0157	2	F54	2		77	

2. Check the continuity between HO2S2 harness connector and ground, or ECM harness connector and ground.

DTC	HO2S2			ECM		Ground	Continuity
	Bank	Connector	Terminal	Connector	Terminal		
P0137	1	F57	2	F79	84	Ground	Not existed
P0157	2	F54	2		77		

3. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4.CHECK HEATED OXYGEN SENSOR 2

Refer to EC-1573, "Component Inspection (HO2 sensor 2)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 5.

5.REPLACE HEATED OXYGEN SENSOR 2

Replace malfunctioning heated oxygen sensor 2. Refer to EM-45, "Exploded View".

CAUTION:

- **Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new oxygen sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

Component Inspection (HO2 sensor 2)

INFOID:0000000013798249

1.INSPECTION START

Will CONSULT be used?

Will CONSULT be used?

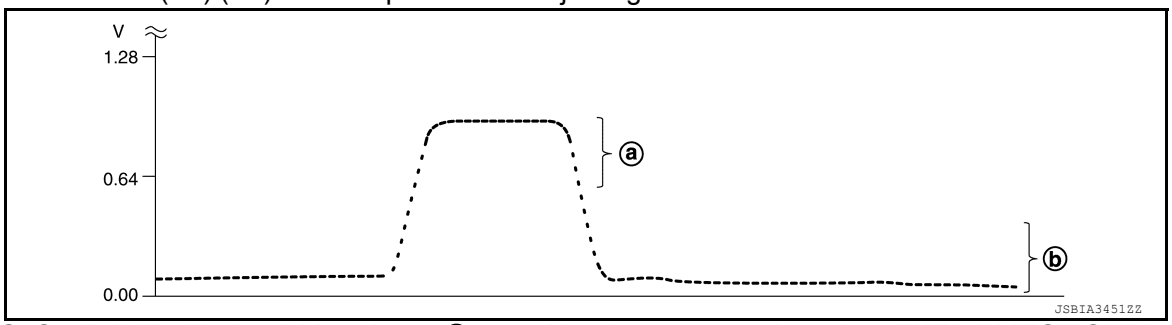
YES >> GO TO 2.
NO >> GO TO 3.

2.CHECK HEATED OXYGEN SENSOR 2

With CONSULT

1. Start engine and warm it up to the normal operating temperature.
2. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
3. Let engine idle for 1 minute.
4. Select “FUEL INJECTION” in “ACTIVE TEST” mode, and select “HO2S2 (B1)/(B2)” as the monitor item with CONSULT.

5. Check “HO2S2 (B1)/(B2)” at idle speed when adjusting “FUEL INJECTION” to ±25%.



“HO2S2 (B1)/(B2)” should be above ⓐ: 0.73 V at least once when the “FUEL INJECTION” is +25%.
“HO2S2 (B1)/(B2)” should be below ⓑ: 0.18 V at least once when the “FUEL INJECTION” is −25%.

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 6.

3. CHECK HEATED OXYGEN SENSOR 2-I

Ⓧ Without CONSULT

1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
4. Let engine idle for 1 minute.
5. Check the voltage between ECM harness connector terminals under the following conditions.

ECM				Condition	Voltage
+		–			
Connector	Terminal	Connector	Terminal		
F79	84 [HO2S2 (bank 1)]	F78	43	Revving up to 4,000 rpm under no load at least 10 times	The voltage should be above 0.73 V at least once during this procedure. The voltage should be below 0.18 V at least once during this procedure.
	77 [HO2S2 (bank 2)]				

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 4.

4. CHECK HEATED OXYGEN SENSOR 2-II

Check the voltage between ECM harness connector terminals under the following conditions.

ECM				Condition	Voltage
+		–			
Connector	Terminal	Connector	Terminal		
F79	84 [HO2S2 (bank 1)]	F78	43	Keeping engine at idle for 10 minutes	The voltage should be above 0.73 V at least once during this procedure. The voltage should be below 0.18 V at least once during this procedure.
	77 [HO2S2 (bank 2)]				

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 5.

5. CHECK HEATED OXYGEN SENSOR 2-III

Check the voltage between ECM harness connector terminals under the following conditions.

ECM				Condition	Voltage
+		–			
Connector	Terminal	Connector	Terminal		
F79	84 [HO2S2 (bank 1)]	F78	43	Coasting from 80 km/h (50 MPH) with selector lever in the D position	The voltage should be above 0.73 V at least once during this procedure. The voltage should be below 0.18 V at least once during this procedure.
	77 [HO2S2 (bank 2)]				

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 6.

6. REPLACE HEATED OXYGEN SENSOR 2

Replace malfunctioning heated oxygen sensor 2. Refer to EM-45, "Exploded View".

CAUTION:

- **Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new oxygen sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

P0138, P0158 HO2S2

DTC Description

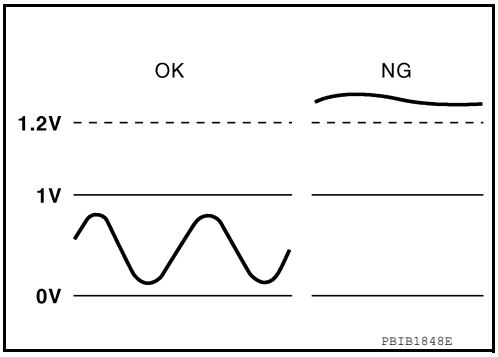
INFOID:0000000013798250

DTC DETECTION LOGIC

The heated oxygen sensor 2 has a much longer switching time between rich and lean than the air fuel ratio (A/F) sensor 1. The oxygen storage capacity of the three way catalyst (manifold) causes the longer switching time.

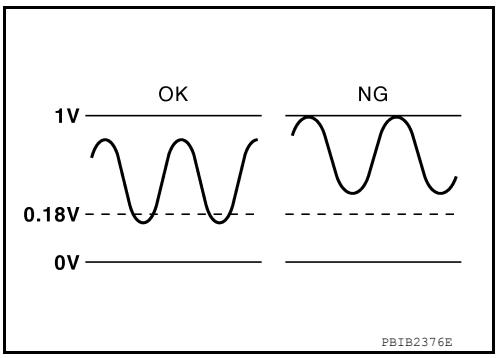
MALFUNCTION A

To judge the malfunctions of heated oxygen sensor 2, ECM monitors whether the voltage is unusually high during various driving conditions such as fuel cut.



MALFUNCTION B

To judge the malfunctions of heated oxygen sensor 2, ECM monitors whether the minimum voltage of sensor is sufficiently low during various driving conditions such as fuel cut.



DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0138	HO2S2 (B1) [Heated oxygen sensor 2 (bank 1) circuit high voltage]	A)	Diagnosis condition	—
			Signal (terminal)	Heated oxygen sensor 2 signal
			Threshold	An excessively high voltage from the sensor is sent to ECM
			Diagnosis delay time	—
		B)	Diagnosis condition	—
			Signal (terminal)	Heated oxygen sensor 2 signal
			Threshold	The minimum voltage from the sensor is not reached to the specified voltage
			Diagnosis delay time	—

P0158	HO2S2 (B2) [Heated oxygen sensor 2 (bank 2) circuit high voltage]	A)	Diagnosis condition	—
			Signal (terminal)	Heated oxygen sensor 2 signal
			Threshold	An excessively high voltage from the sensor is sent to ECM
			Diagnosis delay time	—
		B)	Diagnosis condition	—
			Signal (terminal)	Heated oxygen sensor 2 signal
			Threshold	The minimum voltage from the sensor is not reached to the specified voltage.
			Diagnosis delay time	—

POSSIBLE CAUSE

P0138-A, P0158-A
- Harness or connectors (The heated oxygen sensor 2 circuit is open or shorted)
- Heated oxygen sensor 2

P0138-B, P0158-B
- Harness or connectors (The heated oxygen sensor 2 circuit is open or shorted)
- Heated oxygen sensor 2
- Fuel pressure
- Fuel injector

FAIL-SAFE

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION A

1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
6. Let engine idle for 2 minutes.
7. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1579, "Diagnosis Procedure".
NO-1 >> With CONSULT: GO TO 3.
NO-2 >> With GST: GO TO 5.

3.PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION B

WITH CONSULT

NOTE:
For better results, perform “DTC WORK SUPPORT” at a temperature of 0 to 30°C (32 to 86°F).

1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
6. Let engine idle for 1 minute.
7. Select “DATA MONITOR” mode with CONSULT.

8. Check that “COOLAN TEMP/S” indicates more than 70°C (158°F).
   If not, warm up engine and go to next step when “COOLAN TEMP/S” indication reaches 70°C (158°F).
9. Open engine hood.
10. Select “HO2S2 (B1) P1146” (for DTC P0138) or “HO2S2 (B2) P1166” (for DTC P0158) of “HO2S2” in “DTC WORK SUPPORT” mode with CONSULT.
11. Follow the instruction of CONSULT display.
    NOTE:
    It will take at most 10 minutes until “COMPLETED” is displayed.
12. Touch “SELF-DIAG RESULTS”.

Is “OK” displayed on CONSULT screen?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO-1 >> “NG” is displayed: Proceed to EC-1579, "Diagnosis Procedure".
NO-2 >> “CAN NOT BE DIAGNOSED” is displayed: GO TO 4.

4. PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION B AGAIN

1. Turn ignition switch OFF and leave the vehicle in a cool place (soak the vehicle).
2. Perform DTC confirmation procedure again.

>> GO TO 3.

5. PERFORM COMPONENT FUNCTION CHECK FOR MALFUNCTION B-I

NOTE:
Use component function check to check the overall function of the heated oxygen sensor 2 circuit. During this check, a 1st trip DTC might not be confirmed.

WITH GST
1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
6. Let engine idle for 1 minute.
7. Check the voltage between ECM harness connector terminals under the following conditions.

DTC	ECM				Condition	Voltage
	+		–			
	Connector	Terminal	Connector	Terminal		
P0138	F79	84	F78	43	Revving up to 4,000 rpm under no load at least 10 times	The voltage should be below 0.18 V at least once during this procedure.
P0158		77				

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> GO TO 6.

6. PERFORM COMPONENT FUNCTION CHECK FOR MALFUNCTION B-II

Check the voltage between ECM harness connector terminals under the following conditions.

DTC	ECM				Condition	Voltage
	+		–			
	Connector	Terminal	Connector	Terminal		
P0138	F79	84	F78	43	Keeping engine at idle for 10 minutes	The voltage should be below 0.18 V at least once during this procedure.
P0158		77				

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END

NO >> GO TO 7.

7. PERFORM COMPONENT FUNCTION CHECK FOR MALFUNCTION B-III

Check the voltage between ECM harness connector terminals under the following conditions.

DTC	ECM				Condition	Voltage
	+		–			
	Connector	Terminal	Connector	Terminal		
P0138	F79	84	F78	43	Coasting from 80 km/h (50 MPH) with selector lever in the D position	The voltage should be below 0.18 V at least once during this procedure.
P0158		77				

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> Proceed to EC-1579, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798252

1. INSPECTION START

Confirm the detected malfunction (A or B). Refer to EC-1576, "DTC Description".

Which malfunction is detected?

A >> GO TO 2
B >> GO TO 7.

2. CHECK HEATED OXYGEN SENSOR 2 CONNECTOR

1. Disconnect heated oxygen sensor 2 (HO2S2) harness connector.
2. Check that water is not inside connectors.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace harness or connectors.

3. CHECK HO2S2 GROUND CIRCUIT FOR OPEN AND SHORT

1. Disconnect ECM harness connector.
2. Check the continuity between HO2S2 harness connector and ECM harness connector.

DTC	HO2S2			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0138	1	F57	1	F78	43	Existed
P0158	2	F54	1			

3. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4. CHECK HO2S2 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between HO2S2 harness connector and ECM harness connector.

DTC	HO2S2			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0138	1	F57	2	F79	84	Existed
P0158	2	F54	2		77	

2. Check the continuity between HO2S2 harness connector and ground, or ECM harness connector and ground.

DTC	HO2S2			ECM		Ground	Continuity
	Bank	Connector	Terminal	Connector	Terminal		
P0138	1	F57	2	F79	84	Ground	Not existed
P0158	2	F54	2		77		

3. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK HEATED OXYGEN SENSOR 2

Refer to EC-1581, "Component Inspection (HO2 sensor 2)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 6.

6.REPLACE HEATED OXYGEN SENSOR 2

Replace malfunctioning heated oxygen sensor 2. Refer to EM-45, "Exploded View".

CAUTION:

- **Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new oxygen sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

7.CLEAR THE MIXTURE RATIO SELF-LEARNING VALUE

1. Clear the mixture ratio self-learning value. Refer to EC-1434, "Description".
2. Run engine for at least 10 minutes at idle speed.

Is the 1st trip DTC P0172 or P0175 detected? Is it difficult to start engine?

YES >> Perform trouble diagnosis for DTC P0172, P0175. Refer to EC-1601, "DTC Description".
NO >> GO TO 8.

8.CHECK HEATED OXYGEN SENSOR 2 GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect heated oxygen sensor 2 (HO2S2) harness connector.
3. Disconnect ECM harness connector.
4. Check the continuity between HO2S2 harness connector and ECM harness connector.

DTC	HO2S2			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0138	1	F57	1	F78	43	Existed
P0158	2	F54	1			

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

9.CHECK HO2S2 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between HO2S2 harness connector and ECM harness connector.

DTC	HO2S2			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0138	1	F57	2	F79	84	Existed
P0158	2	F54	2		77	

2. Check the continuity between HO2S2 harness connector and ground, or ECM harness connector and ground.

DTC	HO2S2			ECM		Ground	Continuity
	Bank	Connector	Terminal	Connector	Terminal		
P0138	1	F57	2	F79	84	Ground	Not existed
P0158	2	F54	2		77		

3. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

10.CHECK HEATED OXYGEN SENSOR 2

Refer to EC-1581, "Component Inspection (HO2 sensor 2)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 11.

11.REPLACE HEATED OXYGEN SENSOR 2

Replace malfunctioning heated oxygen sensor 2. Refer to EM-45, "Exploded View".

CAUTION:

- **Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new oxygen sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

Component Inspection (HO2 sensor 2)

INFOID:0000000013798253

1.INSPECTION START

Will CONSULT be used?

Will CONSULT be used?

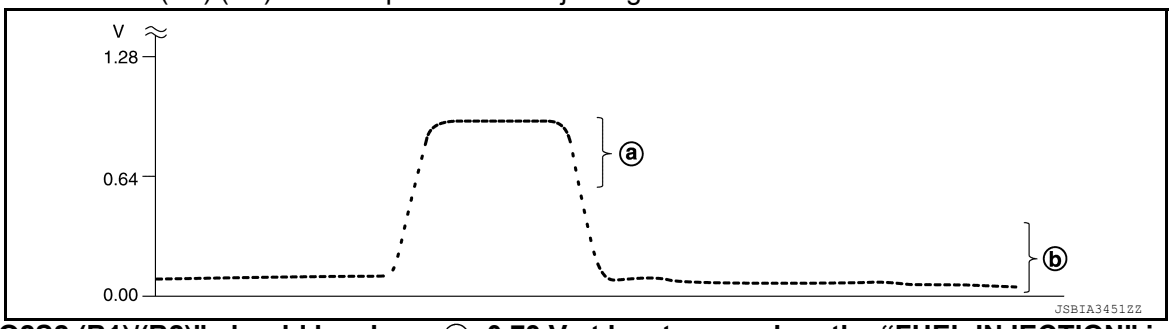
YES >> GO TO 2.
NO >> GO TO 3.

2.CHECK HEATED OXYGEN SENSOR 2

With CONSULT

1. Start engine and warm it up to the normal operating temperature.
2. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
3. Let engine idle for 1 minute.
4. Select “FUEL INJECTION” in “ACTIVE TEST” mode, and select “HO2S2 (B1)/(B2)” as the monitor item with CONSULT.

5. Check “HO2S2 (B1)/(B2)” at idle speed when adjusting “FUEL INJECTION” to ±25%.



“HO2S2 (B1)/(B2)” should be above ⓐ: 0.73 V at least once when the “FUEL INJECTION” is +25%.
“HO2S2 (B1)/(B2)” should be below ⓑ: 0.18 V at least once when the “FUEL INJECTION” is −25%.

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 6.

3. CHECK HEATED OXYGEN SENSOR 2-I

Ⓧ Without CONSULT

1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
4. Let engine idle for 1 minute.
5. Check the voltage between ECM harness connector terminals under the following conditions.

ECM				Condition	Voltage
+		–			
Connector	Terminal	Connector	Terminal		
F79	84 [HO2S2 (bank 1)]	F78	43	Revving up to 4,000 rpm under no load at least 10 times	The voltage should be above 0.73 V at least once during this procedure. The voltage should be below 0.18 V at least once during this procedure.
	77 [HO2S2 (bank 2)]				

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 4.

4. CHECK HEATED OXYGEN SENSOR 2-II

Check the voltage between ECM harness connector terminals under the following conditions.

ECM				Condition	Voltage
+		–			
Connector	Terminal	Connector	Terminal		
F79	84 [HO2S2 (bank 1)]	F78	43	Keeping engine at idle for 10 minutes	The voltage should be above 0.73 V at least once during this procedure. The voltage should be below 0.18 V at least once during this procedure.
	77 [HO2S2 (bank 2)]				

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 5.

5. CHECK HEATED OXYGEN SENSOR 2-III

Check the voltage between ECM harness connector terminals under the following conditions.

ECM				Condition	Voltage
+		–			
Connector	Terminal	Connector	Terminal		
F79	84 [HO2S2 (bank 1)]	F78	43	Coasting from 80 km/h (50 MPH) with selector lever in the D position	The voltage should be above 0.73 V at least once during this procedure. The voltage should be below 0.18 V at least once during this procedure.
	77 [HO2S2 (bank 2)]				

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 6.

6. REPLACE HEATED OXYGEN SENSOR 2

Replace malfunctioning heated oxygen sensor 2. Refer to EM-45, "Exploded View".

CAUTION:

- **Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new oxygen sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

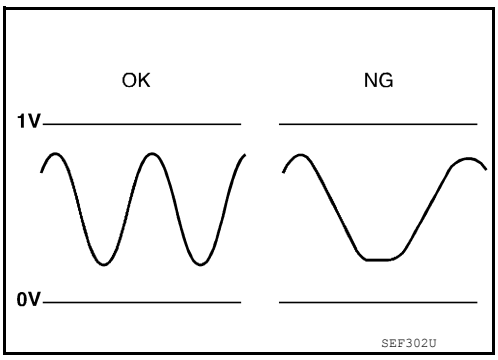
P0139, P0159 HO2S2

DTC Description

INFOID:0000000013798254

DTC DETECTION LOGIC

The heated oxygen sensor 2 has a much longer switching time between rich and lean than the air fuel ratio (A/F) sensor 1. The oxygen storage capacity of the three way catalyst 1 causes the longer switching time. To judge the malfunctions of heated oxygen sensor 2, ECM monitors whether the switching response of the sensor's voltage is faster than specified during various driving conditions such as fuel cut.



DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0139	HO2S2 (B1) [Heated oxygen sensor 2 (bank 1) circuit slow response]	Diagnosis condition	—
		Signal (terminal)	Heated oxygen sensor 2 signal
		Threshold	The switching time between rich and lean of a heated oxygen sensor 2 signal delays more than the specified time computed by ECM
		Diagnosis delay time	—
P0159	HO2S2 (B2) [Heated oxygen sensor 2 (bank 2) circuit slow response]	Diagnosis condition	—
		Signal (terminal)	Heated oxygen sensor 2 signal
		Threshold	The switching time between rich and lean of a heated oxygen sensor 2 signal delays more than the specified time computed by ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

P0139
- Harness or connectors (The sensor circuit is open or shorted)
- Heated oxygen sensor 2
- Fuel system
- EVAP system
- Intake air system

P0159
- Harness or connectors (The sensor circuit is open or shorted)
- Heated oxygen sensor 2
- Fuel system
- EVAP system
- Intake air system

DTC CONFIRMATION PROCEDURE

1.INSPECTION START

Do you have CONSULT?

Do you have CONSULT?

YES >> GO TO 2.

NO >> GO TO 7.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
For better results, perform "DTC WORK SUPPORT" at a temperature of 0 to 30°C (32 to 86°F).

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

With CONSULT

1. Turn ignition switch ON and select "DATA MONITOR" mode with CONSULT.
2. Start engine and warm it up to the normal operating temperature.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Turn ignition switch OFF and wait at least 10 seconds.
6. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
7. Let engine idle for 1 minute.
8. Make sure that "COOLAN TEMP/S" indicates more than 70°C (158°F).
9. Drive the vehicle in a proper gear at 60 km/h (38MPH) and maintain the speed.
   CAUTION:
   Always drive vehicle at a safe speed.
10. Release the accelerator pedal fully at least 5 seconds.
    CAUTION:
    - **Enable the engine brake.**
    - **Always drive carefully.**
    - **Never apply brake when releasing the accelerator pedal.**
11. Repeat step 9 and 10 at least 8 times.
12. Check the following item of "DATA MONITOR".

DTC	Data monitor item	Status
P0139	HO2 S2 DIAG1 (B1)	CMPLT
	HO2 S2 DIAG2 (B1)	
P0159	HO2 S2 DIAG1 (B2)	
	HO2 S2 DIAG2 (B2)	

Is "CMPLT" displayed on CONSULT screen?

YES >> GO TO 6.
NO-1: "CMPLT" is not displayed on DIAG 1>>Perform DTC confirmation procedure again.
NO-2: "CMPLT" is not displayed on DIAG 2>>GO TO 4.

4.PERFORM DTC WORK SUPPORT

1. Open engine hood.
2. Select "HO2S2 (B1) P0139" or "HO2S2 (B2) P0159" of "HO2S2" in "DTC WORK SUPPORT" mode with CONSULT.
3. Start engine and follow the instruction of CONSULT display.
   NOTE:
   It will take at most 10 minutes until "COMPLETED" is displayed.

Is "COMPLETED" displayed on CONSULT screen?

YES >> GO TO 6.
NO >> GO TO 5.

5.PERFORM DTC CONFIRMATION PROCEDURE AGAIN

1. Turn ignition switch OFF and leave the vehicle in a cool place (soak the vehicle).
2. Perform DTC confirmation procedure again.

>> GO TO 3.

6.PERFORM SELF-DIAGNOSIS

With CONSULT
Perform ECM self-diagnosis.

Is DTC “P0139” or “P0159” detected?

YES >> Proceed to EC-1587, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

7.PERFORM COMPONENT FUNCTION CHECK-I

NOTE:
Use component function check to check the overall function of the heated oxygen sensor 2 circuit. During this check, a 1st trip DTC might not be confirmed.

WITH GST
1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Restart engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
6. Let engine idle for 1 minute.
7. Check the voltage between ECM harness connector terminals under the following conditions.

DTC	ECM				Condition	Voltage
	+		–			
	Connector	Terminal	Connector	Terminal		
P0139	F79	84	F78	43	Revving up to 4,000 rpm under no load at least 10 times	A change of voltage should be more than 0.29 V for 1 second during this procedure.
P0159		77				

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> GO TO 8.

8.PERFORM COMPONENT FUNCTION CHECK-II

Check the voltage between ECM harness connector terminals under the following conditions.

DTC	ECM				Condition	Voltage
	+		–			
	Connector	Terminal	Connector	Terminal		
P0139	F79	84	F78	43	Keeping engine at idle for 10 minutes	A change of voltage should be more than 0.29 V for 1 second during this procedure.
P0159		77				

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> GO TO 9.

9.PERFORM COMPONENT FUNCTION CHECK-III

Check the voltage between ECM harness connector terminals under the following conditions.

DTC	ECM				Condition	Voltage
	+		–			
	Connector	Terminal	Connector	Terminal		
P0139	F79	84	F78	43	Coasting from 80 km/h (50 MPH) with selector lever in the D position	A change of voltage should be more than 0.29 V for 1 second during this procedure.
P0159		77				

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> Proceed to EC-1587, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798256

1. CLEAR THE MIXTURE RATIO SELF-LEARNING VALUE

1. Clear the mixture ratio self-learning value. Refer to EC-1434, "Work Procedure".
2. Run engine for at least 10 minutes at idle speed.

Is the 1st trip DTC P0171, P0172, P0174 or P0175 detected? Is it difficult to start engine?

YES >> Perform trouble diagnosis for DTC P0171, P0174 or P0172, P0175. Refer to EC-1597, "DTC Description" or EC-1601, "DTC Description".
NO >> GO TO 2.

2. CHECK HEATED OXYGEN SENSOR 2 GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect heated oxygen sensor 2 (HO2S2) harness connector.
3. Disconnect ECM harness connector.
4. Check the continuity between HO2S2 harness connector and ECM harness connector.

DTC	HO2S2			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0139	1	F57	1	F78	43	Existed
P0159	2	F54	1			

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

3. CHECK HO2S2 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between HO2S2 harness connector and ECM harness connector.

DTC	HO2S2			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0139	1	F57	2	F79	84	Existed
P0159	2	F54	2		77	

2. Check the continuity between HO2S2 harness connector and ground, or ECM harness connector and ground.

DTC	HO2S2			ECM		Ground	Continuity
	Bank	Connector	Terminal	Connector	Terminal		
P0139	1	F57	2	F79	84	Ground	Not existed
P0159	2	F54	2		77		

3. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4. CHECK HEATED OXYGEN SENSOR 2

Refer to EC-1588, "Component Inspection (HO2 sensor 2)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 5.

5. REPLACE HEATED OXYGEN SENSOR 2

Replace malfunctioning heated oxygen sensor 2. Refer to EM-45, "Exploded View".

CAUTION:

- **Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new oxygen sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

Component Inspection (HO2 sensor 2)

INFOID:0000000013798257

1. INSPECTION START

Will CONSULT be used?

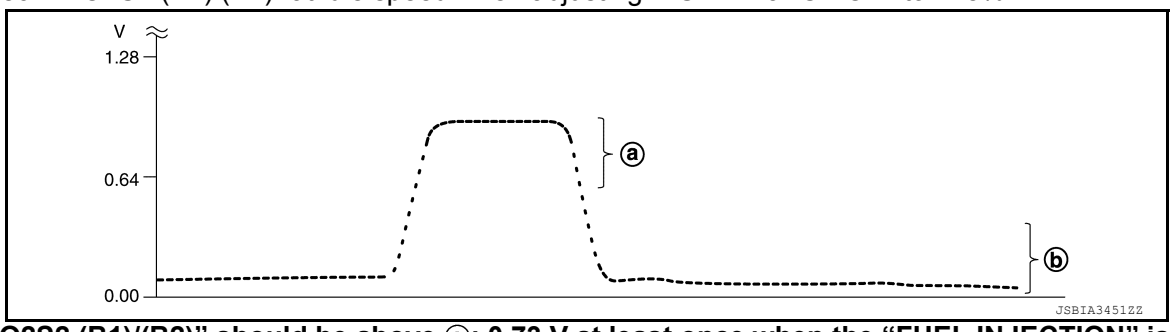
Will CONSULT be used?

YES >> GO TO 2.
NO >> GO TO 3.

2. CHECK HEATED OXYGEN SENSOR 2

With CONSULT

1. Start engine and warm it up to the normal operating temperature.
2. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
3. Let engine idle for 1 minute.
4. Select “FUEL INJECTION” in “ACTIVE TEST” mode, and select “HO2S2 (B1)/(B2)” as the monitor item with CONSULT.
5. Check “HO2S2 (B1)/(B2)” at idle speed when adjusting “FUEL INJECTION” to ±25%.



“HO2S2 (B1)/(B2)” should be above ⓐ: 0.73 V at least once when the “FUEL INJECTION” is +25%.
“HO2S2 (B1)/(B2)” should be below ⓑ: 0.18 V at least once when the “FUEL INJECTION” is −25%.

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 6.

3. CHECK HEATED OXYGEN SENSOR 2-I

Without CONSULT

1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.

4. Let engine idle for 1 minute.
5. Check the voltage between ECM harness connector terminals under the following conditions.

ECM				Condition	Voltage
+		–			
Connector	Terminal	Connector	Terminal		
F79	84 [HO2S2 (bank 1)]	F78	43	Revving up to 4,000 rpm under no load at least 10 times	The voltage should be above 0.73 V at least once during this procedure. The voltage should be below 0.18 V at least once during this procedure.
	77 [HO2S2 (bank 2)]				

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 4.

4. CHECK HEATED OXYGEN SENSOR 2-II

Check the voltage between ECM harness connector terminals under the following conditions.

ECM				Condition	Voltage
+		–			
Connector	Terminal	Connector	Terminal		
F79	84 [HO2S2 (bank 1)]	F78	43	Keeping engine at idle for 10 minutes	The voltage should be above 0.73 V at least once during this procedure. The voltage should be below 0.18 V at least once during this procedure.
	77 [HO2S2 (bank 2)]				

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 5.

5. CHECK HEATED OXYGEN SENSOR 2-III

Check the voltage between ECM harness connector terminals under the following conditions.

ECM				Condition	Voltage
+		–			
Connector	Terminal	Connector	Terminal		
F79	84 [HO2S2 (bank 1)]	F78	43	Coasting from 80 km/h (50 MPH) with selector lever in the D position	The voltage should be above 0.73 V at least once during this procedure. The voltage should be below 0.18 V at least once during this procedure.
	77 [HO2S2 (bank 2)]				

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 6.

6. REPLACE HEATED OXYGEN SENSOR 2

Replace malfunctioning heated oxygen sensor 2. Refer to EM-45, "Exploded View".

CAUTION:

- **Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**

- **Before installing new oxygen sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

P014C, P014D, P014E, P014F, P015A, P015B, P015C, P015D A/F SENSOR 1

DTC Description

INFOID:0000000013798262

DTC DETECTION LOGIC

To judge malfunctions, this diagnosis measures response time of the A/F signal computed by ECM from the A/F sensor 1 signal. The time is compensated by engine operating (speed and load), fuel feedback control constant, and the A/F sensor 1 temperature index. Judgment is based on whether the compensated time (the A/F signal cycling time index) is inordinately long or not.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition

		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (The A/F sensor 1 circuit is open or shorted)
- A/F sensor 1

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 11 V at idle.

Do you have CONSULT?

YES >> GO TO 2.
NO >> GO TO 6.

2.PERFORM DTC CONFIRMATION PROCEDURE-1

With CONSULT

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1minute under no load.
6. Let engine idle for 1 minute.
7. Increase the engine speed up to about 3,600 rpm and keep it for 10 seconds.
8. Fully release accelerator pedal and then let engine idle for about 1 minute.
9. Check the items status of “DATA MONITOR” as follows.
   NOTE:
   If “PRSNT” changed to “ABSNT”, proceed to EC-1450, "Component Function Check".

DTC	Data monitor item	Status
• P014C • P014D • P015A • P015B	A/F SEN1 DIAG3 (B1)	PRSNT
• P014E • P014F • P015C • P015D	A/F SEN1 DIAG3 (B2)	

Is “PRSNT” displayed on CONSULT screen?

YES >> GO TO 4.
NO >> GO TO 3.

3. PERFORM DTC CONFIRMATION PROCEDURE-2

With CONSULT
Perform DTC confirmation procedure-1 again.
Is “PRSNT” displayed on CONSULT screen?

YES >> GO TO 4.
NO >> Proceed to EC-1594, "Diagnosis Procedure".

4. PERFORM DTC CONFIRMATION PROCEDURE-2

With CONSULT
1. Wait for about 20 seconds at idle.
2. Check the items status of “DATA MONITOR” as follows.
   NOTE:
   If “CMPLT” changed to “INCMP”, proceed to EC-1450, "Component Function Check".

DTC	Data monitor item	Status
• P014C • P014D • P015A • P015B	A/F SEN1 DIAG1 (B1)	CMPLT
	A/F SEN1 DIAG2 (B1)	
• P014E • P014F • P015C • P015D	A/F SEN1 DIAG1 (B2)	
	A/F SEN1 DIAG2 (B2)	

Is “CMPLT” displayed on CONSULT screen?

YES >> GO TO 5.
NO >> Proceed to EC-1594, "Diagnosis Procedure".

5. PERFORM SELF-DIAGNOSIS

With CONSULT
Check the “SELF-DIAG RESULT”.
Is any DTC detected?

YES >> Proceed to EC-1594, "Diagnosis Procedure".
NO >> INSPECTION END

6. CHECK AIR-FUEL RATIO SELF-LEARNING VALUE

With GST
1. Start engine and warm it up to normal operating temperature.
2. Select Service $01 with GST.
3. Calculate the total value of “Short term fuel trim” and “Long term fuel trim” indications.

Is the total percentage within ±15%?

YES >> GO TO 8.
NO >> GO TO 7.

7. DETECT MALFUNCTIONING PART

Check the following.
- Intake air leaks
- Exhaust gas leaks
- Incorrect fuel pressure
- Lack of fuel
- Fuel injector
- Incorrect PCV hose connection
- PCV valve
- Mass air flow sensor

>> Repair or replace malfunctioning part.

8. PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
5. Let engine idle for 1 minute.
6. Increase the engine speed up to about 3,600 rpm and keep it for 10 seconds.
7. Fully release accelerator pedal and then let engine idle for about 1 minute.
8. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1594, "Diagnosis Procedure".
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013798263

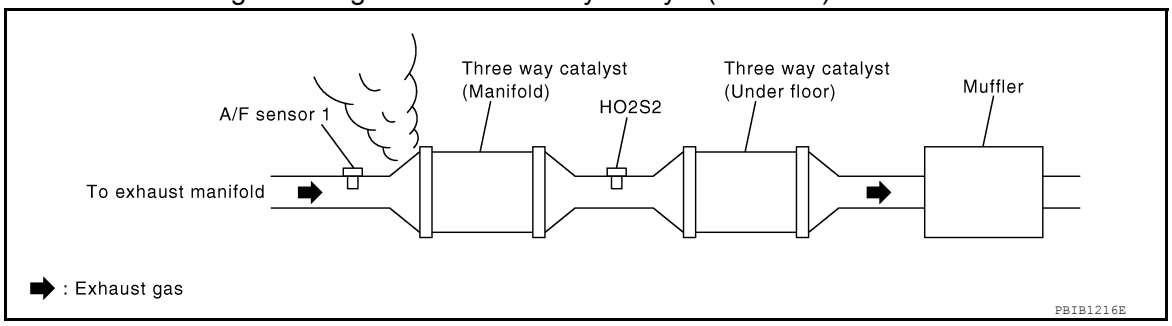
1. RETIGHTEN AIR FUEL RATIO SENSOR 1

Loosen and retighten the air fuel ratio (A/F) sensor 1. Refer to EM-45, "Exploded View".

>> GO TO 2.

2. CHECK EXHAUST GAS LEAKAGE

1. Start engine and run it at idle.
2. Listen for an exhaust gas leakage before three way catalyst (manifold).



Is exhaust gas leakage detected?

YES >> Repair or replace malfunctioning part.
NO >> GO TO 3.

3. CHECK FOR INTAKE AIR LEAKAGE

Listen for an intake air leakage after the mass air flow sensor.

Is intake air leakage detected?

YES >> Repair or replace malfunctioning part.
NO >> GO TO 4.

4. CLEAR THE MIXTURE RATIO SELF-LEARNING VALUE

1. Clear the mixture ratio self-learning value. Refer to EC-1434, "Description".
2. Run engine for at least 10 minutes at idle speed.

Is the 1st trip DTC P0171, P172, P0174 or P0175 detected? Is it difficult to start engine?

YES >> Perform trouble diagnosis for DTC P0171, P0174 or P0172, P0175. Refer to EC-1597, "DTC Description" or EC-1601, "DTC Description".
NO >> GO TO 5.

5. CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect air fuel ratio (A/F) sensor 1 harness connector.
3. Turn ignition switch ON.
4. Check the voltage between A/F sensor 1 harness connector and ground.

DTC	A/F sensor 1			Ground	Voltage
	Bank	Connector	Terminal		
P014C P014D P015A P015B	1	F25	1	Ground	Battery voltage
P014E P014F P015C P015D	2	F16	1		

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6. CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between A/F sensor 1 harness connector and IPDM E/R harness connector.

DTC	A/F sensor 1			IPDM E/R		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P014C P014D P015A P015B	1	F25	1	E121	25	Existed
P014E P014F P015C P015D	2	F16	1			

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Perform trouble diagnosis for power supply circuit.
NO >> Repair or replace malfunctioning part.

7. CHECK A/F SENSOR 1 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between A/F sensor 1 harness connector and ECM harness connector.

DTC	A/F sensor 1			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P014C P014D P015A P015B	1	F25	4	F79	79	Existed
			3		74	
P014E P014F P015C P015D	2	F16	4	F79	69	
			3		70	

4. Check the continuity between A/F sensor 1 harness connector and ground, or ECM harness connector and ground.

DTC	A/F sensor 1			Ground	Continuity
	Bank	Connector	Terminal		
P014C P014D P015A P015B	1	F25	4	Ground	Not Existed
			3		
P014E P014F P015C P015D	2	F16	4		
			3		

DTC	ECM			Ground	Continuity
	Bank	Connector	Terminal		
P014C P014D P015A P015B	1	F79	79	Ground	Not Existed
			74		
P014E P014F P015C P015D	2	F79	69		
			70		

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace malfunctioning part.

8.CHECK A/F SENSOR 1 HEATER

Refer to EC-1510, "Component Inspection (A/F Sensor 1 Heater)".

Is the inspection result normal?

YES >> GO TO 9.
NO >> GO TO 11.

9.CHECK MASS AIR FLOW SENSOR

Check mass air flow sensor.
Refer to EC-1540, "Component Inspection (MAF Sensor)".

Is the inspection result normal?

YES >> GO TO 10.
NO >> Replace malfunctioning mass air flow sensor. Refer to EM-35, "Removal and Installation".

10.CHECK PCV VALVE

Refer to EC-1932, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Repair or replace PCV valve.

11.REPLACE A/F SENSOR 1

Replace malfunctioning A/F sensor 1. Refer to EM-45, "Exploded View".

CAUTION:

- **Discard any A/F sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new A/F sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

>> INSPECTION END

P0171, P0174 FUEL INJECTION SYSTEM FUNCTION

DTC Description

INFOID:0000000013798264

DTC DETECTION LOGIC

With the Air/Fuel Mixture Ratio Self-Learning Control, the actual mixture ratio can be brought closely to the theoretical mixture ratio based on the mixture ratio feedback signal from A/F sensor 1. The ECM calculates the necessary compensation to correct the offset between the actual and the theoretical ratios.
In case the amount of the compensation value is extremely large (the actual mixture ratio is too lean), the ECM judges the condition as the fuel injection system malfunction and illuminates the MIL (2 trip detection logic).

Sensor	Input signal to ECM	ECM function	Actuator
A/F sensor 1	Density of oxygen in exhaust gas (Mixture ratio feedback signal)	Fuel injection control	Fuel injector

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0171	FUEL SYS-LEAN-B1 [Fuel injection system too lean (bank 1)]	1	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	Fuel injection system does not operate properly
			Diagnosis delay time	—
		2	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	The amount of mixture ratio compensation is too large (The mixture ratio is too lean)
			Diagnosis delay time	—
P0174	FUEL SYS-LEAN-B2 [Fuel injection system too lean (bank 2)]	1	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	Fuel injection system does not operate properly
			Diagnosis delay time	—
		2	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	The amount of mixture ratio compensation is too large (The mixture ratio is too lean)
			Diagnosis delay time	—

POSSIBLE CAUSE

P0171
- Intake air leakage
- A/F sensor 1
- Fuel injector
- Exhaust gas leakage
- Incorrect fuel pressure
- Lack of fuel
- Mass air flow sensor
- Incorrect PCV hose connection

P0174
- Intake air leakage
- A/F sensor 1

- Fuel injector
- Exhaust gas leakage
- Incorrect fuel pressure
- Lack of fuel
- Mass air flow sensor
- Incorrect PCV hose connection

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE-I

1. Clear the mixture ratio self-learning value. Refer to EC-1434, "Description".
2. Start engine.

Is it difficult to start engine?

YES >> GO TO 3.
NO >> GO TO 4.

3.RESTART ENGINE

If it is difficult to start engine, the fuel injection system has a malfunction, too.
Crank engine while depressing accelerator pedal.

NOTE:
When depressing accelerator pedal three fourths (3/4) or more, the control system does not start the engine. Do not depress accelerator pedal too much.

Does engine start?

YES >> Proceed to EC-1599, "Diagnosis Procedure".
NO >> Check exhaust and intake air leakage visually.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

1. Keep engine idle for at least 5 minutes.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1599, "Diagnosis Procedure".
NO >> GO TO 5.

5.PERFORM DTC CONFIRMATION PROCEDURE-III

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Start engine.
5. Maintain the following conditions for at least 10 consecutive minutes.
   Hold the accelerator pedal as steady as possible.

Vehicle speed	50 - 120 km/h (31 - 75 MPH)

CAUTION:
Always drive vehicle at a safe speed.

6. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1599, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".

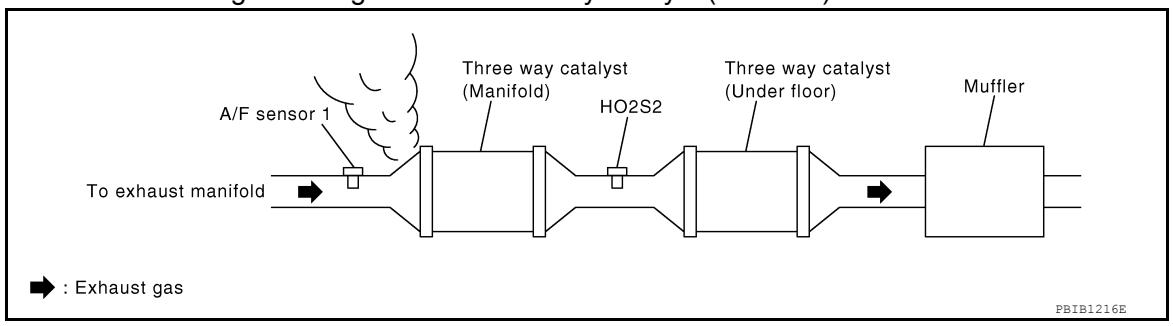
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798265

1.CHECK EXHAUST GAS LEAKAGE

1. Start engine and run it at idle.
2. Listen for an exhaust gas leakage before three way catalyst (manifold).



Is exhaust gas leakage detected?

YES >> Repair or replace malfunctioning part.
NO >> GO TO 2.

2.CHECK FOR INTAKE AIR LEAKAGE

1. Listen for an intake air leakage after the mass air flow sensor.
2. Check PCV hose connection.

Is intake air leakage detected?

YES >> Repair or replace malfunctioning part.
NO >> GO TO 3.

3.CHECK A/F SENSOR 1 CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect corresponding A/F sensor 1 harness connector.
3. Disconnect ECM harness connector.
4. Check the continuity between A/F sensor 1 harness connector and ECM harness connector.

DTC	A/F sensor 1			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0171	1	F25	4	F79	79	Existed
			3		74	
P0174	2	F16	4	F79	69	
			3		70	

5. Check the continuity between A/F sensor 1 harness connector and ground, or ECM harness connector and ground.

DTC	A/F sensor 1			Ground	Continuity
	Bank	Connector	Terminal		
P0171	1	F25	4	Ground	Not Existed
			3		
P0174	2	F16	4		
			3		

DTC	ECM			Ground	Continuity
	Bank	Connector	Terminal		
P0171	1	F79	79	Ground	Not Existed
			74		
P0174	2	F79	69		
			70		

6. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4. CHECK FUEL PRESSURE

Check fuel pressure. Refer to EC-1435, "Work Procedure".

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5. DETECT MALFUNCTIONING PART

Check fuel hoses and fuel tubes for clogging.

Is the inspection result normal?

YES >> Replace “fuel filter and fuel pump assembly”. Refer to FL-6, "Removal and Installation".
NO >> Repair or replace malfunctioning part.

6. CHECK MASS AIR FLOW SENSOR

WITH CONSULT
1. Install all removed parts.
2. Check “MASS AIR FLOW” in “DATA MONITOR” mode with CONSULT.
   For specification, refer to EC-1936, "Mass Air Flow Sensor".

WITH GST
1. Install all removed parts.
2. Check mass air flow sensor signal in Service $01 with GST.
   For specification, refer to EC-1936, "Mass Air Flow Sensor".

Is the measurement value within the specification?

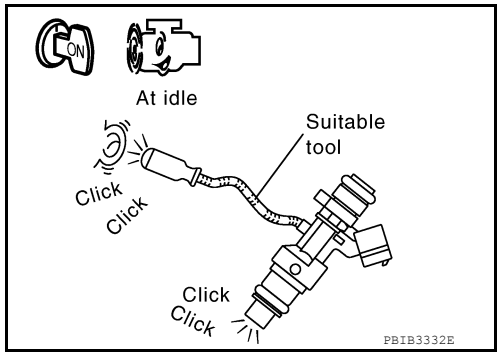
YES >> GO TO 7.
NO >> Check connectors for rusted terminals or loose connections in the mass air flow sensor circuit or grounds. Refer to EC-1539, "Diagnosis Procedure".

7. CHECK FUNCTION OF FUEL INJECTOR

WITH CONSULT
1. Start engine.
2. Perform “POWER BALANCE” in “ACTIVE TEST” mode with CONSULT.
3. Check that each circuit produces a momentary engine speed drop.

WITHOUT CONSULT
1. Start engine and let it idle.
2. Listen to each fuel injector operating sound.

Clicking sound should be heard.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Perform trouble diagnosis for fuel injector, refer to EC-1891, "Diagnosis Procedure".

P0172, P0175 FUEL INJECTION SYSTEM FUNCTION

DTC Description

INFOID:0000000013798266

DTC DETECTION LOGIC

With the Air/Fuel Mixture Ratio Self-Learning Control, the actual mixture ratio can be brought closely to the theoretical mixture ratio based on the mixture ratio feedback signal from A/F sensor 1. The ECM calculates the necessary compensation to correct the offset between the actual and the theoretical ratios.
In case the amount of the compensation value is extremely large (the actual mixture ratio is too rich), the ECM judges the condition as the fuel injection system malfunction and illuminates the MIL (2 trip detection logic).

Sensor	Input signal to ECM	ECM function	Actuator
A/F sensor 1	Density of oxygen in exhaust gas (Mixture ratio feedback signal)	Fuel injection control	Fuel injector

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0172	FUEL SYS-RICH-B1 [Fuel injection system too rich (bank 1)]	1	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	Fuel injection system does not operate properly
			Diagnosis delay time	—
		2	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	The amount of mixture ratio compensation is too large (The mixture ratio is too rich)
			Diagnosis delay time	—
P0175	FUEL SYS-RICH-B2 [Fuel injection system too rich (bank 2)]	1	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	Fuel injection system does not operate properly
			Diagnosis delay time	—
		2	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	The amount of mixture ratio compensation is too large (The mixture ratio is too rich)
			Diagnosis delay time	—

POSSIBLE CAUSE

P0172
- A/F sensor 1
- Fuel injector
- Exhaust gas leakage
- Incorrect fuel pressure
- Mass air flow sensor

P0175
- A/F sensor 1
- Fuel injector
- Exhaust gas leakage
- Incorrect fuel pressure
- Mass air flow sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE-I

1. Clear the mixture ratio self-learning value. Refer to EC-1434, "Description".
2. Start engine.

Is it difficult to start engine?

YES >> GO TO 3.
NO >> GO TO 4.

3.RESTART ENGINE

If it is difficult to start engine, the fuel injection system has a malfunction, too.
Crank engine while depressing accelerator pedal.

NOTE:
When depressing accelerator pedal three fourths (3/4) or more, the control system does not start the engine. Do not depress accelerator pedal too much.

Does engine start?

YES >> Proceed to EC-1602, "Diagnosis Procedure".
NO >> Remove spark plugs and check for fouling, etc.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

1. Keep engine idle for at least 5 minutes.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1602, "Diagnosis Procedure".
NO >> GO TO 5.

5.PERFORM DTC CONFIRMATION PROCEDURE-III

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Start engine.
5. Maintain the following conditions for at least 10 consecutive minutes.
   Hold the accelerator pedal as steady as possible.

Vehicle speed	50 - 120 km/h (31 - 75 MPH)

CAUTION:
Always drive vehicle at a safe speed.

6. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1602, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

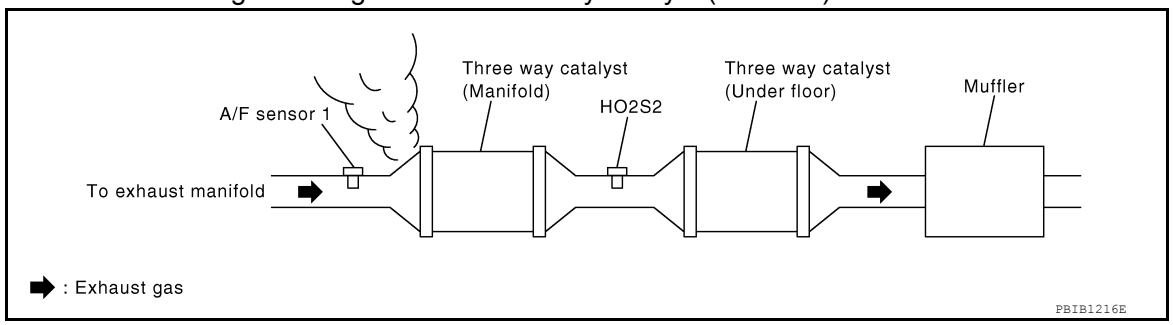
Diagnosis Procedure

INFOID:0000000013798267

1.CHECK EXHAUST GAS LEAKAGE

1. Start engine and run it at idle.

2. Listen for an exhaust gas leakage before three way catalyst (manifold).



Is exhaust gas leakage detected?

YES >> Repair or replace malfunctioning part.
NO >> GO TO 2.

2. CHECK FOR INTAKE AIR LEAKAGE

Listen for an intake air leakage after the mass air flow sensor.

Is intake air leakage detected?

YES >> Repair or replace malfunctioning part.
NO >> GO TO 3.

3. CHECK A/F SENSOR 1 CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect corresponding A/F sensor 1 harness connector.
3. Disconnect ECM harness connector.
4. Check the continuity between A/F sensor 1 harness connector and ECM harness connector.

DTC	A/F sensor 1			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0172	1	F25	4	F79	79	Existed
			3		74	
P0175	2	F16	4	F79	69	
			3		70	

5. Check the continuity between A/F sensor 1 harness connector and ground, or ECM harness connector and ground.

DTC	A/F sensor 1			Ground	Continuity
	Bank	Connector	Terminal		
P0172	1	F25	4	Ground	Not Existed
			3		
P0175	2	F16	4		
			3		

DTC	ECM			Ground	Continuity
	Bank	Connector	Terminal		
P0172	1	F79	79	Ground	Not Existed
			74		
P0175	2	F79	69		
			70		

6. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 4.

NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4. CHECK FUEL PRESSURE

Check fuel pressure. Refer to EC-1435, "Work Procedure".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace fuel filter and fuel pump assembly". Refer to FL-6, "Removal and Installation".

5. CHECK MASS AIR FLOW SENSOR

WITH CONSULT
1. Install all removed parts.
2. Check "MASS AIR FLOW" in "DATA MONITOR" mode with CONSULT.
   For specification, refer to EC-1936, "Mass Air Flow Sensor".

WITH GST
1. Install all removed parts.
2. Check mass air flow sensor signal in "Service $01" with GST.
   For specification, refer to EC-1936, "Mass Air Flow Sensor".

Is the measurement value within the specification?

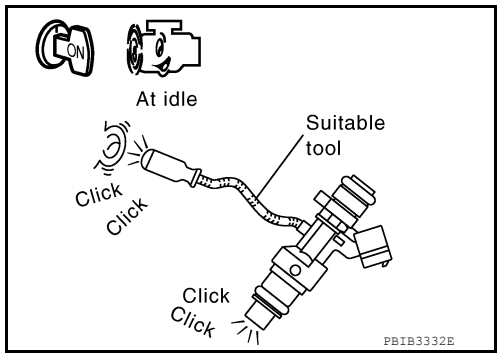
YES >> GO TO 6.
NO >> Check connectors for rusted terminals or loose connections in the mass air flow sensor circuit or grounds. Refer to EC-1539, "Diagnosis Procedure".

6. CHECK FUNCTION OF FUEL INJECTOR

WITH CONSULT
1. Start engine.
2. Perform "POWER BALANCE" in "ACTIVE TEST" mode with CONSULT.
3. Check that each circuit produces a momentary engine speed drop.

WITHOUT CONSULT
1. Start engine and let it idle.
2. Listen to each fuel injector operating sound.

Clicking sound should be heard.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Perform trouble diagnosis for fuel injector, refer to EC-1891, "Diagnosis Procedure".

P0181 FTT SENSOR

DTC Description

INFOID:0000000013798268

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0181	FTT SENSOR [Fuel tank temperature (FTT) sensor circuit range/performance]	A)	Diagnosis condition	—
			Signal (terminal)	FTT sensor signal
			Threshold	Rationally incorrect voltage from the sensor is sent to ECM, compared with the voltage signals from ECT sensor 1 and intake air temperature sensor
			Diagnosis delay time	—
		B)	Diagnosis condition	Engine is started with its cold state
			Signal (terminal)	FTT sensor signal
			Threshold	The comparison result of signals transmitted to ECM from each temperature sensor (IAT sensor, ECT sensor 1, EOT sensor, and FTT sensor) shows that the voltage signal of the FTT sensor is higher/lower than that of other temperature sensors
			Diagnosis delay time	—

POSSIBLE CAUSE

P0181-A
- Harness or connectors (The FTT sensor circuit is open or shorted)
- FTT sensor
- Combination meter

P0181-B
- Harness or connectors (High or low resistance in the FTT sensor circuit)
- FTT sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.INSPECTION START

Is it necessary to erase permanent DTC?

YES >> GO TO 7.
NO >> GO TO 2.

2.PRECONDITIONING

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.
1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION A-I

1. Turn ignition switch ON and wait at least 10 seconds.

2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1607, "Diagnosis Procedure".
NO >> GO TO 4.

4. CHECK ENGINE COOLANT TEMPERATURE

With CONSULT
1. Select “COOLAN TEMP/S” in “DATA MONITOR” with CONSULT.
2. Check “COOLAN TEMP/S” value.

With GST
Follow the procedure “With CONSULT” above.

“COOLAN TEMP/S” less than 60°C (140°F)?

YES >> INSPECTION END
NO >> GO TO 5.

5. PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION A-II

With CONSULT
1. Cool engine down until “COOLAN TEMP/S” is less than 60°C (140°F).
2. Wait at least 10 seconds.
3. Check 1st trip DTC.

With GST
Follow the procedure “With CONSULT” above.

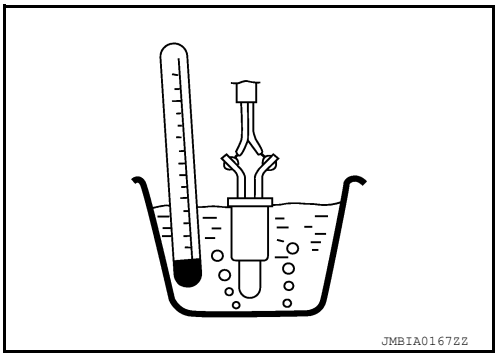
Is 1st trip DTC detected?

YES >> Proceed to EC-1607, "Diagnosis Procedure".
NO >> GO TO 6.

6. PERFORM COMPONENT FUNCTION CHECK (FOR MALFUNCTION B)

NOTE:
Use the component function check to check the overall function of the FTT sensor circuit. During this check, a 1st trip DTC might not be confirmed.

1. Turn ignition switch OFF.
2. Disconnect fuel level sensor unit and fuel pump harness connector.
3. Remove fuel level sensor unit. Refer to FL-6, "Removal and Installation".
4. Check resistance between fuel level sensor unit and fuel pump terminals by heating with hot water as shown in the figure.



Terminals	Condition		Resistance (kΩ)
3 and 4	Temperature [°C (°F)]	20 (68)	2.3 – 2.7
		50 (122)	0.79 – 0.90

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> Proceed to EC-1607, "Diagnosis Procedure".

7. PRECONDITIONING

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
- **Before performing the following procedure, do not add fuel.**
- **Before performing the following procedure, check that fuel level is between 1/4 and 4/4.**
- **Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.**

>> GO TO 8.

8. PERFORM DTC CONFIRMATION PROCEDURE B

1. Move the vehicle to a cool place.
   NOTE:
   Cool the vehicle in an environment of ambient air temperature between −10°C (14°F) and 35°C (95°F).
2. Turn ignition switch OFF and leave the vehicle for 12 hours.
   CAUTION:
   Never turn ignition switch ON during this procedure.
   NOTE:
   The vehicle must be cooled with the hood open.
3. Start engine and let it idle for 5 minutes or more.
   CAUTION:
   Never turn ignition switch OFF during idling.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1607, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798270

1. INSPECTION START

Confirm the detected malfunction (A or B). Refer to EC-1605, "DTC Description".

Which malfunction is detected?

A >> GO TO 2.
B >> GO TO 7.

2. CHECK FUEL TANK TEMPERATURE (FTT) SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect fuel level sensor unit and fuel pump harness connector.
3. Turn ignition switch ON.
4. Check the voltage between fuel level sensor unit and fuel pump harness connector and ground.

Fuel level sensor unit and fuel pump		Ground	Voltage (V)
Connector	Terminal		
C37	3	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and fuel level sensor unit and fuel pump
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connector.

4. CHECK FUEL TANK TEMPERATURE SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between fuel tank temperature sensor harness connector and ECM harness connector.

Fuel level sensor unit and fuel pump		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C37	3	E16	128	Existed

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK FUEL TANK TEMPERATURE SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between fuel level sensor unit and fuel pump harness connector and ECM harness connector.

Fuel level sensor unit and fuel pump		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C37	4	E16	148	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair open circuit, short to ground or short to power in harness or connector.

6.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between fuel level sensor unit and fuel pump and combination meter
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connector.

7.CHECK FTT SENSOR

Check FTT sensor. Refer to EC-1608, "Component Inspection".

Is the inspection result normal?

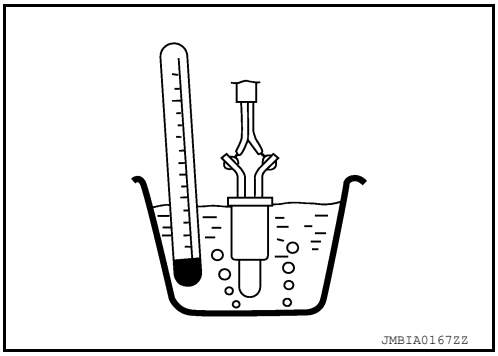
YES >> INSPECTION END
NO >> Replace fuel level sensor unit and fuel pump. Refer to FL-6, "Removal and Installation".

Component Inspection

INFOID:0000000013798271

1.CHECK FUEL TANK TEMPERATURE (FTT) SENSOR

1. Turn ignition switch OFF.
2. Disconnect fuel level sensor unit and fuel pump harness connector.
3. Remove fuel level sensor unit. Refer to FL-6, "Removal and Installation".
4. Check resistance between fuel level sensor unit and fuel pump terminals by heating with hot water as shown in the figure.



Terminals	Condition		Resistance (kΩ)
3 and 4	Temperature [°C (°F)]	20 (68)	2.3 – 2.7
		50 (122)	0.79 – 0.90

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace fuel level sensor unit and fuel pump. Refer to FL-6, "Removal and Installation".

P0182, P0183 FTT SENSOR

DTC Description

INFOID:0000000013798272

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0182	FTT SEN/CIRCUIT (Fuel temperature sensor “A” circuit low)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Fuel tank temperature sensor signal
		Threshold	An excessively low voltage from the sensor is sent to ECM
		Diagnosis delay time	—
P0183	FTT SEN/CIRCUIT (Fuel temperature sensor “A” circuit high)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Fuel tank temperature sensor signal
		Threshold	An excessively high voltage from the sensor is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

P0182
- Harness or connectors (The FTT sensor circuit is open or shorted)
- Fuel tank temperature sensor
- Combination meter

P0183
- Harness or connectors (The FTT sensor circuit is open or shorted)
- Fuel tank temperature sensor
- Combination meter

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 5 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1609, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798273

1.CHECK FUEL TANK TEMPERATURE SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect “fuel level sensor unit and fuel pump” harness connector.
3. Turn ignition switch ON.
4. Check the voltage between “fuel level sensor unit and fuel pump” harness connector and ground.

Fuel level sensor unit and fuel pump		Ground	Voltage (V)
Connector	Terminal		
C37	3	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and “fuel level sensor unit and fuel pump”
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connector.

3.CHECK FUEL TANK TEMPERATURE SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between fuel tank temperature sensor harness connector and ECM harness connector.

Fuel level sensor unit and fuel pump		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C37	3	E16	128	Existed

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK FUEL TANK TEMPERATURE SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between fuel level sensor unit and fuel pump harness connector and ECM harness connector.

Fuel level sensor unit and fuel pump		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C37	4	E16	148	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between “fuel level sensor unit and fuel pump” and “combination meter”
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connector.

6.CHECK FUEL TANK TEMPERATURE SENSOR

Refer to EC-1611, "Component Inspection (Fuel Tank Temperature Sensor)".

Is the inspection result normal?

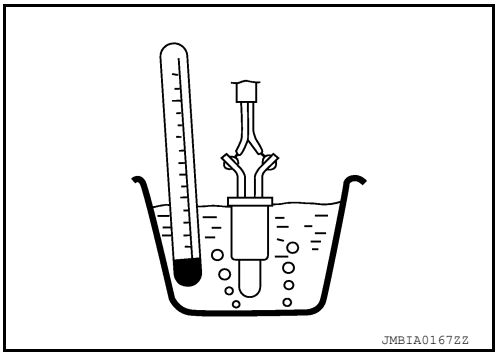
YES >> INSPECTION END
NO >> Replace “fuel level sensor unit and fuel pump”. Refer to FL-6, "Removal and Installation".

Component Inspection (Fuel Tank Temperature Sensor)

INFOID:0000000013798274

1. CHECK FUEL TANK TEMPERATURE SENSOR

1. Turn ignition switch OFF.
2. Disconnect “fuel level sensor unit and fuel pump” harness connector.
3. Remove fuel level sensor unit.
4. Check resistance between “fuel level sensor unit and fuel pump ” terminals by heating with hot water as shown in the figure.



Terminals	Condition		Resistance (kΩ)
3 and 4	Temperature [°C (°F)]	20 (68)	2.3 - 2.7
		50 (122)	0.79 - 0.90

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace “fuel level sensor unit and fuel pump”.

P0190, P0192, P0193 FRP SENSOR

DTC Description

INFOID:0000000013798275

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0190	FUEL PRES SEN/CIRCUIT (Fuel rail pressure sensor “A” circuit)	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Fuel rail pressure sensor signal
		Threshold	Signal voltage from the fuel rail pressure sensor remains at more than 4.84 V / less than 0.2 V
		Diagnosis delay time	5 seconds or more
P0192	FRP SEN/CIRC (Fuel rail pressure sensor “A” circuit low)	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Fuel rail pressure sensor signal
		Threshold	Signal voltage from the fuel rail pressure sensor remains at less than 0.37 V
		Diagnosis delay time	5 seconds or more
P0193	FRP SEN/CIRC (Fuel rail pressure sensor “A” circuit high)	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Fuel rail pressure sensor signal
		Threshold	Signal voltage from the fuel rail pressure sensor remains at more than 3.46 V
		Diagnosis delay time	5 seconds or more

POSSIBLE CAUSE

P0190
- Harness or connectors (Fuel rail pressure sensor circuit is open or shorted)
- Fuel rail pressure sensor
- Sensor power supply 3

P0192
- Harness or connectors (Fuel rail pressure sensor circuit is open or shorted)
- Fuel rail pressure sensor
- Sensor power supply 3

P0193
- Harness or connectors (Fuel rail pressure sensor circuit is open or shorted)
- Fuel rail pressure sensor
- Sensor power supply 3

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0190	FRP sensor	• Engine speed is limited. • High pressure fuel pump is activated at maximum discharge pressure.

P0192 and P0193
Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the engine ON and wait at least 60 seconds.
2. Check DTC or 1st trip DTC.

Is DTC or 1st trip DTC detected?

YES >> Proceed to EC-1613, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798276

NOTE:
Turning the ignition switch ON with FRP sensor harness connector disconnected causes ECM to detect DTC P0190. Be sure to erase the DTC when the diagnosis procedure.

1.CHECK FRP SENSOR POWER SUPPLY-I

1. Turn ignition switch OFF.
2. Disconnect FRP sensor connector.
3. Turn ignition switch ON.
4. Check the voltage between FRP sensor harness connector terminals.

FRP sensor			Voltage (Approx.)
Connector	+	–	
	terminal		
F91	1	3	5 V

Inspection result normal?

YES >> GO TO 4.
NO >> GO TO 2.

2.CHECK FRP SENSOR POWER SUPPLY-II

Check the voltage between FRP sensor harness connector and the ground.

+		–	Voltage (Approx.)
FRP sensor			
Connector	Terminal		
F91	1	Ground	5 V

Is inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK SENSOR POWER SUPPLY 3 CIRCUIT

Perform EC-1920, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

4.CHECK FRP SENSOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between FRP sensor harness connector and ECM harness connector.

+		–		Continuity
FRP sensor		ECM		
Connector	Terminal	Connector	Terminal	
F91	3	F78	13	Existed

Is inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK ECM GROUND CIRCUIT

Check the continuity between ECM harness connector and the ground.

ECM		Ground	Continuity
Connector	Terminal		
E16	147	Ground	Existed
	149		
	152		

Is inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK FRP SENSOR SIGNAL CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between FRP sensor harness connector and ECM harness connector.

+		–		Continuity
FRP sensor		ECM		
Connector	Terminal	Connector	Terminal	
F91	2	F78	25	Existed

4. Also check harness for short to ground and to power.

Is inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7.CHECK FRP SENSOR

Refer to EC-1614, "Component Inspection (Fuel Rail Pressure Sensor)".

Is inspection result normal?

YES >> INSPECTION END
NO >> Repair or replace error-detected parts.

Component Inspection (Fuel Rail Pressure Sensor)

INFOID:0000000013798277

1.CHECK FRP SENSOR

WITH CONSULT

1. Turn ignition switch OFF.
2. Reconnect harness connector disconnected.
3. Start the engine.
4. Select “DATA MONITOR” mode with CONSULT.
5. Check that the “FUEL PRES SEN V” indication.

Monitor Item	Condition	Values/Status
FUEL PRES SEN V	Engine speed: Idle	820 – 1,220 mV
	Engine speed: Revving engine from idle to 4,000 rpm quickly	820 – 3,060 mV

WITHOUT CONSULT
1. Turn ignition switch OFF.
2. Reconnect harness connector disconnected.
3. Start the engine.
4. Check FRP sensor signal voltage.

+		–		Condition	Value (Approx.)
ECM					
Connector	Terminal	Connector	Terminal		
F78	25	F78	13	[Engine is running] • Warm-up condition • Idle speed	0.82 – 1.22 V
				[Engine is running] • Warm-up condition • Revving engine from idle to 4,000 rpm quickly	0.82 – 3.06 V

Is the inspection result normal?

YES >> INSPECTION END.
NO >> Replace FRP sensor. Refer to EM-54, "Exploded View".

P0191 FRP SENSOR

DTC Description

INFOID:0000000013798278

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0191	FRP SENSOR A (Fuel rail pressure sensor “A” circuit range/performance)	Diagnosis condition	—
		Signal (terminal)	Fuel rail pressure sensor signal
		Threshold	Fuel rail pressure remains at more than 14.5 MPa (147.9 kg/cm^2, 2102.5 psi)
		Diagnosis delay time	0.2 seconds or more

POSSIBLE CAUSE

- Harness or connectors (Fuel rail pressure sensor circuit is open or shorted)
- Fuel rail pressure sensor
- Sensor power supply 3

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the engine and warm it up to the normal operating temperature.
   NOTE:
   Warm up the engine until “COOLAN TEMP/S” on “DATA MONITOR” of CONSULT reaches at least 70°C (158°F).
2. Turn the ignition switch OFF and cool the engine until the engine coolant temperature reaches 35°C (95°F) or less.
   CAUTION:
   - **The difference between air temperature and engine coolant temperature must be 5°C (9°F) or less.**
   - **Do not turn ignition switch ON.**
3. Turn ignition switch ON and wait at least 60 seconds.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1616, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798279

NOTE:
Turning the ignition switch ON with FRP sensor harness connector disconnected causes ECM to detect DTC P0190. Be sure to erase the DTC when the diagnosis procedure.

1.CHECK FRP SENSOR POWER SUPPLY-I

1. Turn ignition switch OFF.

2. Disconnect FRP sensor connector.
3. Turn ignition switch ON.
4. Check the voltage between FRP sensor harness connector terminals.

FRP sensor			Voltage (Approx.)
Connector	+	–	
	terminal		
F91	1	3	5 V

Inspection result normal?

YES >> GO TO 4.
NO >> GO TO 2.

2.CHECK FRP SENSOR POWER SUPPLY-II

Check the voltage between FRP sensor harness connector and the ground.

+		–	Voltage (Approx.)
FRP sensor			
Connector	Terminal		
F91	1	Ground	5 V

Is inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK SENSOR POWER SUPPLY 3 CIRCUIT

Perform EC-1920, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

4.CHECK FRP SENSOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between FRP sensor harness connector and ECM harness connector.

+		–		Continuity
FRP sensor		ECM		
Connector	Terminal	Connector	Terminal	
F91	3	F78	13	Existed

Is inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK ECM GROUND CIRCUIT

Check the continuity between ECM harness connector and the ground.

ECM		Ground	Continuity
Connector	Terminal		
E16	147	Ground	Existed
	149		
	152		

Is inspection result normal?

YES >> GO TO 6.

NO >> Repair or replace error-detected parts.

6.CHECK FRP SENSOR SIGNAL CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between FRP sensor harness connector and ECM harness connector.

+		–		Continuity
FRP sensor		ECM		
Connector	Terminal	Connector	Terminal	
F91	2	F78	25	Existed

4. Also check harness for short to ground and to power.

Is inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7.CHECK FRP SENSOR

Refer to EC-1614, "Component Inspection (Fuel Rail Pressure Sensor)".

Is inspection result normal?

YES >> INSPECTION END
NO >> Repair or replace error-detected parts.

Component Inspection (Fuel Rail Pressure Sensor)

INFOID:0000000013798280

1.CHECK FRP SENSOR

WITH CONSULT

1. Turn ignition switch OFF.
2. Reconnect harness connector disconnected.
3. Start the engine.
4. Select “DATA MONITOR” mode with CONSULT.
5. Check that the “FUEL PRES SEN V” indication.

Monitor Item	Condition	Values/Status
FUEL PRES SEN V	Engine speed: Idle	820 – 1,220 mV
	Engine speed: Revving engine from idle to 4,000 rpm quickly	820 – 3,060 mV

WITHOUT CONSULT

1. Turn ignition switch OFF.
2. Reconnect harness connector disconnected.
3. Start the engine.
4. Check FRP sensor signal voltage.

+		–		Condition	Value (Approx.)
ECM					
Connector	Terminal	Connector	Terminal		
F78	25	F78	13	[Engine is running] • Warm-up condition • Idle speed	0.82 – 1.22 V
				[Engine is running] • Warm-up condition • Revving engine from idle to 4,000 rpm quickly	0.82 – 3.06 V

Is the inspection result normal?

YES >> INSPECTION END.
NO >> Replace FRP sensor. Refer to EM-54, "Exploded View".

P0196 EOT SENSOR

DTC Description

INFOID:0000000013798281

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0196	EOT SENSOR [Engine oil temperature (EOT) sensor circuit range/performance]	A)	Diagnosis condition	—
			Signal (terminal)	Engine oil temperature sensor signal
			Threshold	Rationally incorrect voltage from the sensor is sent to ECM, compared with the voltage signals from EOT sensor and intake air temperature sensor
			Diagnosis delay time	—
		B)	Diagnosis condition	Engine is started with its cold state
			Signal (terminal)	Engine oil temperature sensor signal
			Threshold	The comparison result of signals transmitted to ECM from each temperature sensor (IAT sensor, ECT sensor 1, FTT sensor, and EOT sensor) shows that the signal voltage of the EOT sensor is higher/lower than that of other temperature sensors
			Diagnosis delay time	—

POSSIBLE CAUSE

P0196-A
- Harness or connectors (The EOT sensor circuit is open or shorted)
- EOT sensor

P0196-B
- Harness or connectors (High or low resistance in the EOT sensor circuit)
- EOT sensor

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0196	Engine oil temperature sensor	Exhaust valve timing control does not function.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0196 is displayed with DTC P0197 or P0198, first perform the confirmation procedure for DTC P0197 or P0198.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1623, "DTC Description".
NO >> GO TO 2.

2.INSPECTION START

Is it necessary to erase permanent DTC?

YES >> GO TO 7.
NO >> GO TO 3.

3.PRECONDITIONING

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.
1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 4.

4. PERFORM DTC CONFIRMATION PROCEDURE FOR MULFUNCTION A-I

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start engine and let it idle for 5 minutes and 10 seconds.
6. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1621, "Diagnosis Procedure".
NO >> GO TO 5.

5. PERFORM DTC CONFIRMATION PROCEDURE FOR MULFUNCTION A-II

With CONSULT
1. Select “DATA MONITOR” mode with CONSULT.
2. Check that “COOLAN TEMP/S” indicates above 60°C (140°F).
   If it is above 80°C (176°F), go to the following steps.
   If it is below 60°C (140°F), warm engine up until “COOLAN TEMP/S” indicates more than 60°C (140°F). Then perform the following steps.
3. Turn ignition switch OFF and soak the vehicle in a cool place.
4. Turn ignition switch ON.
   NOTE:
   Do not turn ignition switch OFF until step 8.
5. Select “DATA MONITOR” mode with CONSULT.
6. Check the following.

COOLAN TEMP/S	Below 40°C (104°F)
INT/A TEMP SE	Below 40°C (104°F)
Difference between “COOLAN TEMP/S” and “INT/A TEMP SE”	Within 6°C (11°F)

   If they are within the specified range, perform the following steps.
   If they are out of the specified range, soak the vehicle to meet the above conditions. Then perform the following steps.
   NOTE:
   - **Do not turn ignition switch OFF.**
   - **If it is supposed to need a long period of time, do not deplete the battery.**
7. Start engine and let it idle for 5 minutes.
8. Check 1st trip DTC.

With GST
Follow the procedure “With CONSULT” above.

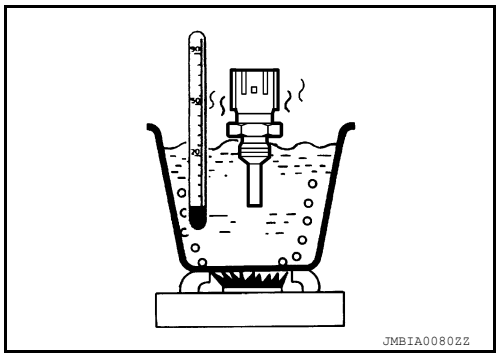
Is 1st trip DTC detected?

YES >> Proceed to EC-1621, "Diagnosis Procedure".
NO >> GO TO 6.

6. PERFORM COMPONENT FUNCTION CHECK (FOR MULFUNCTION B)

NOTE:
Use the component function check to check the overall function of the EOT sensor circuit. During this check, a 1st trip DTC might not be confirmed.
1. Turn ignition switch OFF.
2. Disconnect EOT sensor harness connector.

3. Remove EOT sensor. Refer to EM-61, "Exploded View".
4. Check resistance between EOT sensor terminals by heating with hot water as shown in the figure.



Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	20 (68)	2.35 – 2.73
		50 (122)	0.68 – 1.00
		90 (194)	0.236 – 0.260

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> Proceed to EC-1621, "Diagnosis Procedure".

7. PRECONDITIONING

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

- **Before performing the following procedure, do not add fuel.**
- **Before performing the following procedure, check that fuel level is between 1/4 and 4/4.**
- **Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.**

>> GO TO 8.

8. PERFORM DTC CONFIRMATION PROCEDURE B

1. Move the vehicle to a cool place.
   NOTE:
   Cool the vehicle in an environment of ambient air temperature between −10°C (14°F) and 35°C (95°F).
2. Turn ignition switch OFF and soak the vehicle for 12 hours.
   CAUTION:
   Never turn ignition switch ON during soaking.
   NOTE:
   The vehicle must be cooled with the hood open.
3. Start engine and let it idle for 5 minutes or more.
   CAUTION:
   Never turn ignition switch OFF during idling.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1621, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798283

1. CHECK DTC PRIORITY

If DTC P0196 is displayed with DTC P0197 or P0198, first perform the confirmation procedure for DTC P0197 or P0198.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1623, "DTC Description".
NO >> GO TO 2.

2. CHECK ENGINE OIL TEMPERATURE (EOT) SENSOR

Check EOT sensor. Refer to EC-1622, "Component Inspection".

Is the inspection result normal?

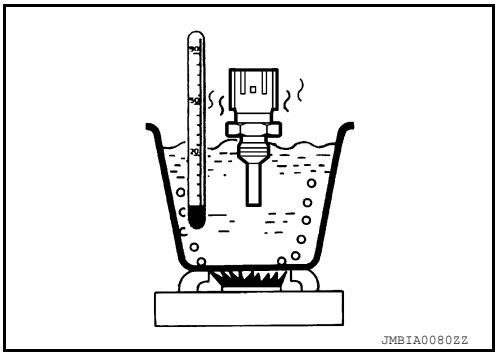
YES >> INSPECTION END
NO >> Replace EOT sensor. Refer to EM-61, "Exploded View".

Component Inspection

INFOID:0000000013798284

1. CHECK ENGINE OIL TEMPERATURE (EOT) SENSOR

1. Turn ignition switch OFF.
2. Disconnect EOT sensor harness connector.
3. Remove EOT sensor. Refer to EM-61, "Exploded View".
4. Check resistance between EOT sensor terminals by heating with hot water as shown in the figure.



Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	20 (68)	2.35 – 2.73
		50 (122)	0.68 – 1.00
		90 (194)	0.236 – 0.260

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace EOT sensor. Refer to EM-61, "Exploded View".

P0197, P0198 EOT SENSOR

DTC Description

INFOID:0000000013798285

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0197	EOT SEN/CIRC (Engine oil temperature sensor circuit low input)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Engine oil temperature sensor signal
		Threshold	An excessively low voltage from the sensor is sent to ECM
		Diagnosis delay time	—
P0198	EOT SEN/CIRC (Engine oil temperature sensor circuit high input)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Engine oil temperature sensor signal
		Threshold	An excessively high voltage from the sensor is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

P0197
- Harness or connectors (The engine oil temperature sensor circuit is open or shorted)
- Engine oil temperature sensor

P0198
- Harness or connectors (The engine oil temperature sensor circuit is open or shorted)
- Engine oil temperature sensor

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0197	Engine oil temperature sensor	Exhaust valve timing control does not function.
P0198	Engine oil temperature sensor	Exhaust valve timing control does not function.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and wait at least 5 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1623, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798286

1.CHECK ENGINE OIL TEMPERATURE SENSOR POWER SUPPLY CIRCUIT

1. Disconnect engine oil temperature (EOT) sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between EOT sensor harness connector and ground.

EOT sensor		Ground	Voltage (V)
Connector	Terminal		
F56	1	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

2.CHECK EOT SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EOT sensor harness connector and ECM harness connector.

EOT sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F56	2	F78	43	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

3.CHECK ENGINE OIL TEMPERATURE SENSOR

Refer to EC-1624, "Component Inspection (Engine Oil Temperature Sensor)".

Is the inspection result normal?

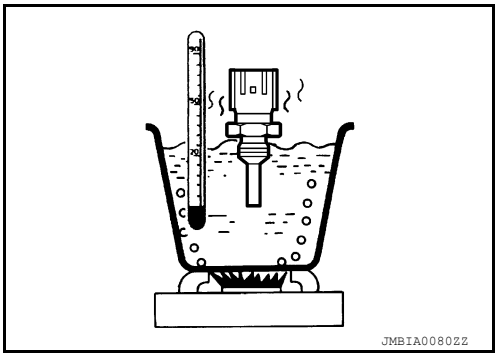
YES >> INSPECTION END
NO >> Replace engine oil temperature sensor. Refer to EM-61, "Exploded View".

Component Inspection (Engine Oil Temperature Sensor)

INFOID:0000000013798287

1.CHECK ENGINE OIL TEMPERATURE SENSOR

1. Turn ignition switch OFF.
2. Disconnect engine oil temperature sensor harness connector.
3. Remove engine oil temperature sensor.
4. Check resistance between engine oil temperature sensor terminals by heating with hot water as shown in the figure.



Terminals	Condition		Resistance (kΩ)
1 and 2	Temperature [°C (°F)]	20 (68)	2.35 - 2.73
		50 (122)	0.68 - 1.00
		90 (194)	0.236 - 0.260

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace engine oil temperature sensor. Refer to EM-61, "Exploded View".

P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208 INJECTOR

DTC Description

INFOID:0000000013798288

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0201	EOT SEN/CIRC (Engine oil temperature sensor circuit low input)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	No. 1 fuel injector signal
		Threshold	ECM detects No. 1 injector circuit is open or shorted
		Diagnosis delay time	—
P0202	EOT SEN/CIRC (Engine oil temperature sensor circuit high input)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	No. 2 fuel injector signal
		Threshold	ECM detects No. 2 injector circuit is open or shorted
		Diagnosis delay time	—
P0203	EOT SEN/CIRC (Engine oil temperature sensor circuit low input)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	No. 3 fuel injector signal
		Threshold	ECM detects No. 3 injector circuit is open or shorted
		Diagnosis delay time	—
P0204	EOT SEN/CIRC (Engine oil temperature sensor circuit high input)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	No. 4 fuel injector signal
		Threshold	ECM detects No. 4 injector circuit is open or shorted
		Diagnosis delay time	—
P0205	EOT SEN/CIRC (Engine oil temperature sensor circuit low input)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	No. 5 fuel injector signal
		Threshold	ECM detects No. 5 injector circuit is open or shorted
		Diagnosis delay time	—
P0206	EOT SEN/CIRC (Engine oil temperature sensor circuit high input)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	No. 6 fuel injector signal
		Threshold	ECM detects No. 6 injector circuit is open or shorted
		Diagnosis delay time	—
P0207	EOT SEN/CIRC (Engine oil temperature sensor circuit low input)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	No. 7 fuel injector signal
		Threshold	ECM detects No. 7 injector circuit is open or shorted
		Diagnosis delay time	—
P0208	EOT SEN/CIRC (Engine oil temperature sensor circuit high input)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	No. 8 fuel injector signal
		Threshold	ECM detects No. 8 injector circuit is open or shorted
		Diagnosis delay time	—

POSSIBLE CAUSE

- The fuel injector circuit is open or shorted
- Fuel injector
- ECM

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0201	Injector	• Engine torque is limited. • Fuel injection shut-off of malfunction cylinder. • Mixture ratio feedback control does not function. • Idle engine speed is increased.
P0202	Injector	• Engine torque is limited. • Fuel injection shut-off of malfunction cylinder. • Mixture ratio feedback control does not function. • Idle engine speed is increased.
P0203	Injector	• Engine torque is limited. • Fuel injection shut-off of malfunction cylinder. • Mixture ratio feedback control does not function. • Idle engine speed is increased.
P0204	Injector	• Engine torque is limited. • Fuel injection shut-off of malfunction cylinder. • Mixture ratio feedback control does not function. • Idle engine speed is increased.
P0205	Injector	• Engine torque is limited. • Fuel injection shut-off of malfunction cylinder. • Mixture ratio feedback control does not function. • Idle engine speed is increased.
P0206	Injector	• Engine torque is limited. • Fuel injection shut-off of malfunction cylinder. • Mixture ratio feedback control does not function. • Idle engine speed is increased.
P0207	Injector	• Engine torque is limited. • Fuel injection shut-off of malfunction cylinder. • Mixture ratio feedback control does not function. • Idle engine speed is increased.
P0208	Injector	• Engine torque is limited. • Fuel injection shut-off of malfunction cylinder. • Mixture ratio feedback control does not function. • Idle engine speed is increased.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Start the engine and let it idle at least 30 seconds.
3. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1627, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798289

1.PERFORM TROUBLE DIAGNOSIS FOR INJECTOR

Refer to EC-1891, "Component Function Check".

Is inspection result normal?

YES >> INSPECTION END
NO >> Repair or replace error-detected parts.

P0222, P0223 TP SENSOR

DTC Description

INFOID:0000000013798290

DTC DETECTION LOGIC

NOTE:
If DTC P0222 or P0223 is displayed with DTC P0643, perform the trouble diagnosis for DTC P0643. Refer to EC-1747, "DTC Description".

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0222	TP SEN 1/CIRC-B1 (Throttle pedal position sensor/switch “B” circuit low)	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	TP sensor 1 signal
		Threshold	An excessively low voltage from the TP sensor 1 is sent to ECM
		Diagnosis delay time	—
P0223	TP SEN 1/CIRC-B1 (Throttle pedal position sensor/switch “B” circuit high)	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	TP sensor 1 signal
		Threshold	An excessively high voltage from the TP sensor 1 is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

P0222
- Harness or connectors (TP sensor 1 circuit is open or shorted)
- Electric throttle control actuator (TP sensor 1)

P0223
- Harness or connectors (TP sensor 1 circuit is open or shorted)
- Electric throttle control actuator (TP sensor 1)

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0222	Throttle position sensor	The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees. The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. Therefore, the acceleration will be poor.
P0223	Throttle position sensor	The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees. The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. Therefore, the acceleration will be poor.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.
TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 8 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for 1 second.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1629, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798291

1.CHECK THROTTLE POSITION SENSOR 1 POWER SUPPLY CIRCUIT-I

1. Disconnect electric throttle control actuator harness connector.
2. Turn ignition switch ON.
3. Check the voltage between electric throttle control actuator harness connector and ground.

Electric throttle control actuator		Ground	Voltage (V)
Connector	Terminal		
F50	2	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

2.CHECK THROTTLE POSITION SENSOR 1 GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between electric throttle control actuator and ECM harness connector.

Electric throttle control actuator		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F50	4	F79	85	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

3.CHECK THROTTLE POSITION SENSOR 1 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between electric throttle control actuator and ECM harness connector.

Electric throttle control actuator		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F50	1	F79	78	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4.CHECK THROTTLE POSITION SENSOR

Refer to EC-1630, "Component Inspection (Throttle Position Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 5.

5.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

Component Inspection (Throttle Position Sensor)

INFOID:0000000013798292

1.CHECK THROTTLE POSITION SENSOR

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Perform EC-1429, "Description".
4. Turn ignition switch ON.
5. Set selector lever position to D.
6. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition		Voltage (V)
Connector	+	–			
	Terminal	Terminal			
F79	78 (TP sensor 1 signal)	85 (Sensor ground)	Accelerator pedal	Fully released	More than 0.36
				Fully depressed	Less than 4.75
	80 (TP sensor 2 signal)			Fully released	Less than 4.75
				Fully depressed	More than 0.36

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308 MISFIRE

DTC Description

INFOID:0000000013798293

DTC DETECTION LOGIC

When a misfire occurs, engine speed will fluctuate. If the engine speed fluctuates enough to cause the crankshaft position (CKP) sensor signal to vary, ECM can determine that a misfire is occurring.

Sensor	Input signal to ECM	ECM function
Crankshaft position sensor	Engine speed	On board diagnosis of misfire

The misfire detection logic consists of the following two conditions.

1. One Trip Detection Logic (Three Way Catalyst Damage)
   On the 1st trip that a misfire condition occurs that can damage the three way catalyst (TWC) due to overheating, the MIL will blink.
   When a misfire condition occurs, the ECM monitors the CKP sensor signal every 200 engine revolutions for a change.
   When the misfire condition decreases to a level that will not damage the TWC, the MIL will turn off.
   If another misfire condition occurs that can damage the TWC on a second trip, the MIL will blink.
   When the misfire condition decreases to a level that will not damage the TWC, the MIL will remain on.
   If another misfire condition occurs that can damage the TWC, the MIL will begin to blink again.
2. Two Trip Detection Logic (Exhaust quality deterioration)
   For misfire conditions that will not damage the TWC (but will affect vehicle emissions), the MIL will only light when the misfire is detected on a second trip. During this condition, the ECM monitors the CKP sensor signal every 1,000 engine revolutions.
   A misfire malfunction can be detected in any one cylinder or in multiple cylinders.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0300	MULTI CYL MISFIRE (Random/Multiple cylinder misfire detected)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	Multiple cylinders misfires
		Diagnosis delay time	—
P0301	CYL 1 MISFIRE (No.1 cylinder misfire detected)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	No.1 cylinder misfires
		Diagnosis delay time	—
P0302	CYL 2 MISFIRE (No.2 cylinder misfire detected)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	No.2 cylinder misfires
		Diagnosis delay time	—
P0303	CYL 3 MISFIRE (No.3 cylinder misfire detected)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	No.3 cylinder misfires
		Diagnosis delay time	—
P0304	CYL 4 MISFIRE (No.4 cylinder misfire detected)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	No.4 cylinder misfires
		Diagnosis delay time	—

P0305	CYL 5 MISFIRE (No.5 cylinder misfire detected)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	No.5 cylinder misfires
		Diagnosis delay time	—
P0306	CYL 6 MISFIRE (No.6 cylinder misfire detected)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	No.6 cylinder misfires
		Diagnosis delay time	—
P0307	CYL 7 MISFIRE (No.7 cylinder misfire detected)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	No.7 cylinder misfires
		Diagnosis delay time	—
P0308	CYL 8 MISFIRE (No.8 cylinder misfire detected)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	No.8 cylinder misfires
		Diagnosis delay time	—

POSSIBLE CAUSE

- Improper spark plug
- Insufficient compression
- Incorrect fuel pressure
- The fuel injector circuit is open or shorted
- Fuel injector
- Intake air leakage
- The ignition signal circuit is open or shorted
- Lack of fuel
- Signal plate
- A/F sensor 1
- Incorrect PCV hose connection

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE-I

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Restart engine and let it idle for about 15 minutes.
6. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1633, "Diagnosis Procedure".
NO >> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-II

1. Turn ignition switch OFF and wait at least 10 seconds.

2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Start engine and drive the vehicle under similar conditions to (1st trip) Freeze Frame Data for a certain time. Refer to the table below.
Hold the accelerator pedal as steady as possible.
Similar conditions to (1st trip) Freeze Frame Data mean that the following conditions should be satisfied at the same time.
CAUTION:
Always drive vehicle in safe manner according to traffic conditions and obey all traffic laws when driving.

Engine speed	Engine speed in the freeze frame data ± 400 rpm
Vehicle speed	Vehicle speed in the freeze frame data ± 10 km/h (6 MPH)
Base fuel schedule	Base fuel schedule in the freeze frame data × (1 ± 0.1)
Engine coolant temperature (T) condition	When the freeze frame data shows lower than 70°C (158°F), T should be lower than 70°C (158°F).
	When the freeze frame data shows higher than or equal to 70°C (158°F), T should be higher than or equal to 70°C (158°F).

Driving time varies according to the engine speed in the freeze frame data.

Engine speed	Time
Around 1,000 rpm	Approximately 10 minutes
Around 2,000 rpm	Approximately 5 minutes
More than 3,000 rpm	Approximately 3.5 minutes

5. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1633, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798294

1. CHECK GROUND CONNECTION

Check the following.
- Connection condition of the ground F94 and F95.
- Connection condition of the ground harness between engine assembly and vehicle body (If equipped).

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace error-detected parts.

2. CHECK FOR INTAKE AIR LEAKAGE AND PCV HOSE

1. Start engine and run it at idle speed.
2. Listen for the sound of the intake air leakage.
3. Check PCV hose connection.

Is intake air leakage detected?

YES >> Discover air leakage location and repair.
NO >> GO TO 3.

3. CHECK FOR EXHAUST SYSTEM CLOGGING

Stop engine and visually check exhaust tube, three way catalyst and muffler for dents.

Is the inspection result normal?

YES-1 >> With CONSULT: GO TO 4.
YES-2 >> Without CONSULT: GO TO 5.
NO >> Repair or replace malfunctioning part.

4. PERFORM POWER BALANCE TEST

WITH CONSULT
1. Start engine.
2. Perform “POWER BALANCE” in “ACTIVE TEST” mode with CONSULT.
3. Check that each circuit produces a momentary engine speed drop.

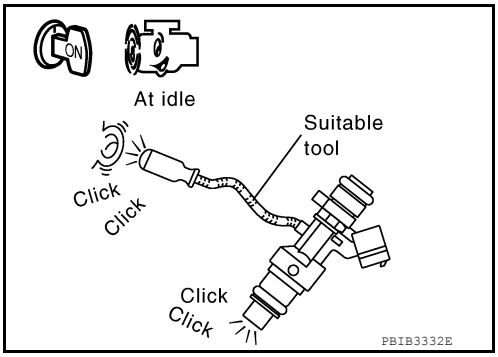
Is the inspection result normal?

YES >> GO TO 10.
NO >> GO TO 5.

5. CHECK FUNCTION OF FUEL INJECTOR-I

1. Start engine and let it idle.
2. Listen to each fuel injector operation.

Clicking sound should be heard.



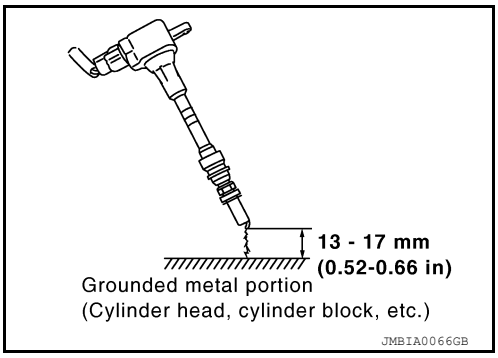
Is the inspection result normal?

YES >> GO TO 6.
NO >> Perform trouble diagnosis for FUEL INJECTOR, refer to EC-1891, "Diagnosis Procedure".

6. CHECK FUNCTION OF IGNITION COIL-I

CAUTION:
Perform the following procedure in a place with no combustible objects and good ventilation.

1. Turn ignition switch OFF.
2. Remove fuel pump fuse No. in IPDM E/R to release fuel pressure.
   NOTE:
   Do not use CONSULT to release fuel pressure, or fuel pressure applies again during the following procedure.
3. Start engine.
4. After engine stalls, crank it 2 or 3 times to release all fuel pressure.
5. Turn ignition switch OFF.
6. Remove all ignition coil harness connectors to avoid the electrical discharge from the ignition coils.
7. Remove ignition coil and spark plug of the cylinder to be checked.
8. Crank engine for 5 seconds or more to remove combustion gas in the cylinder.
9. Connect spark plug and harness connector to ignition coil.
10. Fix ignition coil using a rope etc. with gap of 13 - 17 mm (0.52 - 0.66 in) between the edge of the spark plug and grounded metal portion as shown in the figure.
11. Crank engine for approximately 3 seconds, and check whether spark is generated between the spark plug and the grounded metal portion.



Spark should be generated.

CAUTION:
- **Never place the spark plug and the ignition coil within 50 cm (19.7 in) each other. Be careful not to get an electrical shock while checking, because the electrical discharge voltage becomes 20 kV or more.**
- **It might damage the ignition coil if the gap of more than 17 mm (0.66 in) is made.**

NOTE:
When the gap is less than 13 mm (0.52 in), a spark might be generated even if the coil is malfunctioning.

Is the inspection result normal?

YES >> GO TO 10.
NO >> GO TO 7.

7. CHECK FUNCTION OF IGNITION COIL-II

1. Turn ignition switch OFF.
2. Disconnect spark plug and connect a non-malfunctioning spark plug.
3. Crank engine for approximately 3 seconds, and recheck whether spark is generated between the spark plug and the grounded metal portion.

Spark should be generated.

Is the inspection result normal?

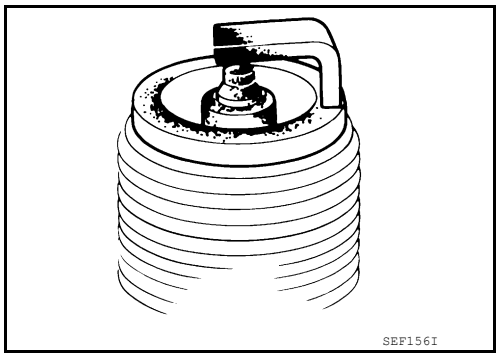
YES >> GO TO 8.
NO >> Check ignition coil, power transistor and their circuits. Refer to EC-1901, "Diagnosis Procedure".

8. CHECK SPARK PLUG

Check the initial spark plug for fouling, etc.

Is the inspection result normal?

YES >> Replace spark plug(s) with standard type one(s). For spark plug type, refer to EM-146, "Spark Plug".
NO >> Repair or clean spark plug. Then GO TO 9.



9. CHECK FUNCTION OF IGNITION COIL-III

1. Reconnect the initial spark plugs.
2. Crank engine for approximately 3 seconds, and recheck whether spark is generated between the spark plug and the grounded portion.

Spark should be generated.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace spark plug(s) with standard type one(s). For spark plug type, refer to EM-146, "Spark Plug".

10. CHECK COMPRESSION PRESSURE

Check compression pressure. Refer to EM-20, "Inspection".

Is the inspection result normal?

YES >> GO TO 11.
NO >> Check pistons, piston rings, valves, valve seats and cylinder head gaskets.

11. CHECK FUEL PRESSURE

1. Install all removed parts.
2. Check fuel pressure. Refer to EC-1435, "Work Procedure".

Is the inspection result normal?

YES >> GO TO 13.
NO >> GO TO 12.

12. DETECT MALFUNCTIONING PART

Check fuel hoses and fuel tubes for clogging.

Is the inspection result normal?

YES >> Replace “fuel filter and fuel pump assembly”.
NO >> Repair or replace malfunctioning part.

13. CHECK IDLE SPEED AND IGNITION TIMING

Check idle speed and ignition timing.

For procedure, refer to EC-1928, "Inspection" and EC-1929, "Inspection".
For specification, refer to EC-1936, "Idle Speed" and EC-1936, "Ignition Timing".

Is the inspection result normal?

YES >> GO TO 14.
NO >> Follow the EC-1420, "Work Procedure".

14. CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect air fuel ratio (A/F) sensor 1 harness connector.
3. Turn ignition switch ON.
4. Check the voltage between A/F sensor 1 harness connector and ground.

A/F sensor 1			Ground	Voltage
Bank	Connector	Terminal		
1	F25	1	Ground	Battery voltage
2	F16	1		

Is the inspection result normal?

YES >> GO TO 16.
NO >> GO TO 15.

15. CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between A/F sensor 1 harness connector and IPDM E/R harness connector.

A/F sensor 1			IPDM E/R		Continuity
Bank	Connector	Terminal	Connector	Terminal	
1	F25	1	E121	25	Existed
2	F16	1			

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Perform trouble diagnosis for power supply circuit.
NO >> Repair or replace malfunctioning part.

16. CHECK A/F SENSOR 1 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between A/F sensor 1 harness connector and ECM harness connector.

Bank	A/F sensor 1		ECM		Continuity
	Connector	Terminal	Connector	Terminal	
1	F25	4	F79	79	Existed
		3		74	
2	F16	4	F79	69	
		3		70	

4. Check the continuity between A/F sensor 1 harness connector and ground, or ECM harness connector and ground.

Bank	A/F sensor 1		Ground	Continuity
	Connector	Terminal		
1	F25	4	Ground	Not Existed
		3		
2	F16	4		
		3		

Bank	ECM		Ground	Continuity
	Connector	Terminal		
1	F79	79	Ground	Not Existed
		74		
2	F79	69		
		70		

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 17.
NO >> Repair or replace malfunctioning part.

17. CHECK A/F SENSOR 1 HEATER

Refer to EC-1510, "Component Inspection (A/F Sensor 1 Heater)".

Is the inspection result normal?

YES >> GO TO 18.
NO >> Replace malfunctioning A/F sensor 1. Refer to EX-6, "Exploded View".

18. CHECK MASS AIR FLOW SENSOR

WITH CONSULT
Check mass air flow sensor signal in “DATA MONITOR” mode with CONSULT.
For specification, refer to EC-1936, "Mass Air Flow Sensor".

WITH GST
Check mass air flow sensor signal in Service $01 with GST.
For specification, refer to EC-1936, "Mass Air Flow Sensor".

Is the measurement value within the specification?

YES >> GO TO 19.
NO >> Check connectors for rusted terminals or loose connections in the mass air flow sensor circuit or ground. Refer to EC-1539, "Diagnosis Procedure".

19. CHECK SYMPTOM MATRIX CHART

Check items on the rough idle symptom in EC-1922, "Symptom Table".

Is the inspection result normal?

YES >> GO TO 20.
NO >> Repair or replace malfunctioning part.

20. ERASE THE 1ST TRIP DTC

Some tests may cause a 1st trip DTC to be set.
Erase the 1st trip DTC from the ECM memory after performing the tests. Refer to EC-1325, "CONSULT Function" or EC-1322, "On Board Diagnosis Function".

>> INSPECTION END

P0327, P0328, P0332, P0333 KS

DTC Description

INFOID:0000000013798295

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0327	KNOCK SEN/CIRC-B1 [Knock sensor (bank 1) circuit low input]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Knock sensor signal
		Threshold	An excessively low voltage from the sensor is sent to ECM
		Diagnosis delay time	—
P0328	KNOCK SEN/CIRC-B1 [Knock sensor (bank 1) circuit high input]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Knock sensor signal
		Threshold	An excessively high voltage from the sensor is sent to ECM
		Diagnosis delay time	—
P0332	KNOCK SEN/CIRC-B2 [Knock sensor (bank 2) circuit low input]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Knock sensor signal
		Threshold	An excessively low voltage from the sensor is sent to ECM
		Diagnosis delay time	—
P0333	KNOCK SEN/CIRC-B2 [Knock sensor (bank 2) circuit high input]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Knock sensor signal
		Threshold	An excessively high voltage from the sensor is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

P0327
- Harness or connectors (The knock sensor circuit is open or shorted)
- Knock sensor

P0328
- Harness or connectors (The knock sensor circuit is open or shorted)
- Knock sensor

P0332
- Harness or connectors (The knock sensor circuit is open or shorted)
- Knock sensor

P0333
- Harness or connectors (The knock sensor circuit is open or shorted)
- Knock sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and run it for at least 5 seconds at idle speed.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1639, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798296

1.CHECK KNOCK SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Disconnect knock sensor harness connector and ECM harness connector.
2. Check the continuity between knock sensor harness connector and ECM harness connector.

DTC	Knock sensor			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0327, P0328	1	F207	2	F78	20	Existed
P0332, P0333	2	F208	2			

3. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between knock sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit or short to power in harness or connectors.

3.CHECK KNOCK SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between knock sensor harness connector and ECM harness connector.

DTC	Knock sensor			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0327, P0328	1	F207	1	F78	15	Existed
P0332, P0333	2	F208	1		18	

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and knock sensor
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK KNOCK SENSOR

Refer to EC-1640, "Component Inspection (Knock Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning knock sensor. Refer to EM-120, "Exploded View".

Component Inspection (Knock Sensor)

INFOID:0000000013798297

1. CHECK KNOCK SENSOR

1. Turn ignition switch OFF.
2. Disconnect knock sensor harness connector.
3. Check resistance between knock sensor terminals as per the following.
   NOTE:
   It is necessary to use an ohmmeter which can measure more than 10 MΩ.

Terminals	Resistance
1 and 2	Approx. 532 - 588 kΩ [at 20°C (68°F)]

CAUTION:
Never use any knock sensors that have been dropped or physically damaged. Use only new ones.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning knock sensor. Refer to EM-120, "Exploded View".

P0335 CKP SENSOR

DTC Description

INFOID:0000000013798298

DTC DETECTION LOGIC

Sensor	Input signal to ECM	ECM function	Actuator
A/F sensor 1	Density of oxygen in exhaust gas (Mixture ratio feedback signal)	Fuel injection control	Fuel injector

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0335	CKP SEN/CIRCUIT (Crankshaft position sensor “A” circuit)	1	Diagnosis condition	Start engine and let it idle
			Signal (terminal)	Crankshaft position sensor signal
			Threshold	The crankshaft position sensor signal is not detected by the ECM during the first few seconds of engine cranking
			Diagnosis delay time	—
		2	Diagnosis condition	Start engine and let it idle
			Signal (terminal)	Crankshaft position sensor signal
			Threshold	The proper pulse signal from the crankshaft position sensor is not sent to ECM while the engine is running
			Diagnosis delay time	—
		3	Diagnosis condition	Start engine and let it idle
			Signal (terminal)	Crankshaft position sensor signal
			Threshold	The crankshaft position sensor signal is not in the normal pattern during engine running
			Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (Crankshaft position sensor circuit is open or shorted)
- Crankshaft position sensor
- Signal plate

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0335 is displayed with DTC P0643, first perform the confirmation procedure for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10.5 V or more with ignition switch ON.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for at least 5 seconds.
   If engine does not start, crank engine for at least 2 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1642, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798299

1.CHECK DTC PRIORITY

If DTC P0335 is displayed with DTC P0643, first perform the confirmation procedure for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.CHECK CRANKSHAFT POSITION SENSOR POWER SUPPLY CIRCUIT-I

1. Disconnect crankshaft position (CKP) sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between CKP sensor harness connector and ground.

CKP sensor		Ground	Voltage (V)
Connector	Terminal		
F38	1	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.CHECK CKP SENSOR POWER SUPPLY CIRCUIT-II

1. Turn ignition switch ON.
2. Disconnect ECM harness connector.
3. Check the continuity between CKP sensor harness connector and ECM harness connector.

CKP sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F38	1	F78	27	Existed

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair open circuit.

4.CHECK CKP SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between CKP sensor harness connector and ECM harness connector.

CKP sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F38	2	F78	44	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK CKP SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between CKP sensor harness connector and ECM harness connector.

CKP sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F38	3	F78	33	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

6.CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 7.
NO >> Replace crankshaft position sensor.

7.CHECK GEAR TOOTH

Visually check for chipping signal plate gear tooth.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace the signal plate.

Component Inspection (Crankshaft Position Sensor)

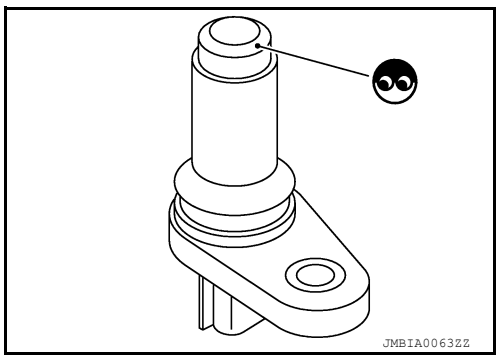
INFOID:0000000013798300

1.CHECK CRANKSHAFT POSITION SENSOR-I

1. Turn ignition switch OFF.
2. Loosen the fixing bolt of the sensor.
3. Disconnect crankshaft position sensor harness connector.
4. Remove the sensor.
5. Visually check the sensor for chipping.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace crankshaft position sensor. Refer to EM-64, "Exploded View".



2.CHECK CRANKSHAFT POSITION SENSOR-II

Check resistance between crankshaft position sensor terminals as per the following.

Terminals (Polarity)	Resistance
1 (+) - 2 (-)	Except 0 or ∞ Ω [at 25°C (77°F)]
1 (+) - 3 (-)	
2 (+) - 3 (-)	

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace crankshaft position sensor. Refer to EM-64, "Exploded View".

P0340, P0345 CMP SENSOR

DTC Description

INFOID:0000000013798301

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0340	CMP SEN/CIRC-B1 [Camshaft position sensor “A” circuit bank 1]	1	Diagnosis condition	Start engine and let it idle
			Signal (terminal)	Camshaft position sensor signal
			Threshold	The cylinder No. signal is not sent to ECM for the first few seconds during engine cranking
			Diagnosis delay time	—
		2	Diagnosis condition	Start engine and let it idle
			Signal (terminal)	Camshaft position sensor signal
			Threshold	The cylinder No. signal is not sent to ECM during engine running
			Diagnosis delay time	—
		3	Diagnosis condition	Start engine and let it idle
			Signal (terminal)	Camshaft position sensor signal
			Threshold	The cylinder No. signal is not in the normal pattern during engine running
			Diagnosis delay time	—
P0345	CMP SEN/CIRC-B1 [Camshaft position sensor “A” circuit bank 2]	1	Diagnosis condition	Start engine and let it idle
			Signal (terminal)	Camshaft position sensor signal
			Threshold	The cylinder No. signal is not sent to ECM for the first few seconds during engine cranking
			Diagnosis delay time	—
		2	Diagnosis condition	Start engine and let it idle
			Signal (terminal)	Camshaft position sensor signal
			Threshold	The cylinder No. signal is not sent to ECM during engine running
			Diagnosis delay time	—
		3	Diagnosis condition	Start engine and let it idle
			Signal (terminal)	Camshaft position sensor signal
			Threshold	The cylinder No. signal is not in the normal pattern during engine running
			Diagnosis delay time	—

POSSIBLE CAUSE

P0340
- Harness or connectors [Camshaft position sensor (bank 1) circuit is open or shorted]
- Camshaft position sensor (bank 1)
- Camshaft (INT)
- Starter motor
- Starting system circuit
- Dead (Weak) battery

P0345
- Harness or connectors [Camshaft position sensor (bank 2) circuit is open or shorted]
- Camshaft position sensor (bank 2)

- Camshaft (INT)
- Starter motor
- Starting system circuit
- Dead (Weak) battery
- Sensor power supply 2

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0340 is displayed with DTC P0643, first perform the confirmation procedure for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10.5 V or more with ignition switch ON.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

1. Start engine and let it idle for at least 5 seconds.
   If engine does not start, crank engine for at least 2 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1645, "Diagnosis Procedure".
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-I

1. Maintain engine speed at more than 800 rpm for at least 5 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1645, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798302

1.CHECK DTC PRIORITY

If DTC P0340 is displayed with DTC P0643, first perform the confirmation procedure for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.CHECK STARTING SYSTEM

Turn ignition switch to START position.

Does the engine turn over? Does the starter motor operate?

YES >> GO TO 3.
NO >> Check starting system. (Refer to STR-23, "Work Flow (With GR8-1200 NI)", or STR-27, "Work Flow (Without GR8-1200 NI)". For the details of the GR8-1200 NI, refer to EX-4, "Special Service Tool".)

3.CHECK CAMSHAFT POSITION SENSOR POWER SUPPLY CIRCUIT-I

1. Disconnect camshaft position (CMP) sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between CMP sensor harness connector and ground.

DTC	CMP sensor			Ground	Voltage (V)
	Bank	Connector	Terminal		
P0340	1	F66	1	Ground	Approx. 5
P0345	2	F67	1		

Is the inspection result normal?

YES >> GO TO 6.
NO-1 >> P0340: GO TO 4.
NO-2 >> P0345: GO TO 5.

4.CHECK CMP SENSOR POWER SUPPLY CIRCUIT-II

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between CMP sensor harness connector and ECM harness connector.

CMP sensor			ECM		Continuity
Bank	Connector	Terminal	Connector	Terminal	
1	F66	1	F78	28	Existed

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair open circuit.

5.CHECK SENSOR POWER SUPPLY 2 CIRCUIT

Perform EC-1918, "Diagnosis Procedure".

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

6.CHECK CMP SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between CMP sensor harness connector and ECM harness connector.

DTC	CMP sensor			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0340	1	F66	2	F78	45	Existed
P0345	2	F67	2	F79	63	

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

7.CHECK CMP SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between CMP sensor harness connector and ECM harness connector.

DTC	CMP sensor			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P0340	1	F66	3	F78	40	Existed
P0345	2	F67	3	F79	66	

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

8.CHECK CAMSHAFT POSITION SENSOR

Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

Is the inspection result normal?

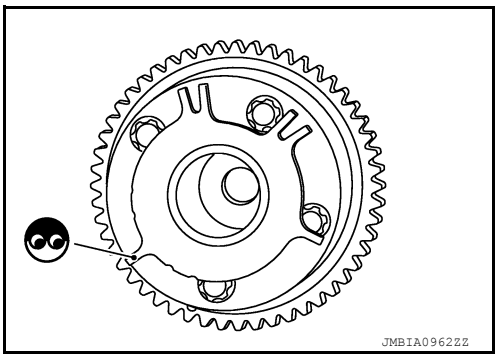
YES >> GO TO 9.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-68, "Exploded View".

9.CHECK CAMSHAFT (INT)

Check the following.
- Accumulation of debris to the signal plate of camshaft front end
- Chipping signal plate of camshaft front end

Is the inspection result normal?

YES >> INSPECTION END
NO >> Remove debris and clean the signal plate of camshaft front end or replace camshaft.



Component Inspection (Camshaft Position Sensor)

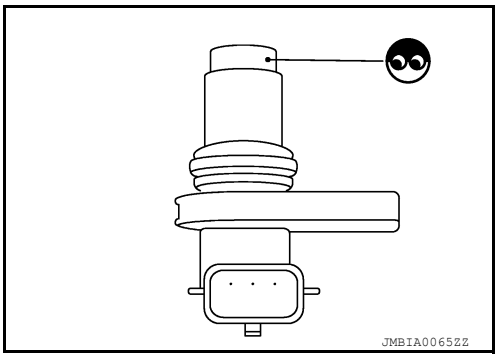
INFOID:0000000013798303

1.CHECK CAMSHAFT POSITION SENSOR-I

1. Turn ignition switch OFF.
2. Loosen the fixing bolt of the sensor.
3. Disconnect camshaft position sensor harness connector.
4. Remove the sensor.
5. Visually check the sensor for chipping.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning camshaft position sensor.



2.CHECK CAMSHAFT POSITION SENSOR-II

Check resistance camshaft position sensor terminals as per the following.

Terminals (Polarity)	Resistance
1 (+) - 2 (-)	Except 0 or ∞ Ω [at 25°C (77°F)]
1 (+) - 3 (-)	
2 (+) - 3 (-)	

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-68, "Exploded View".

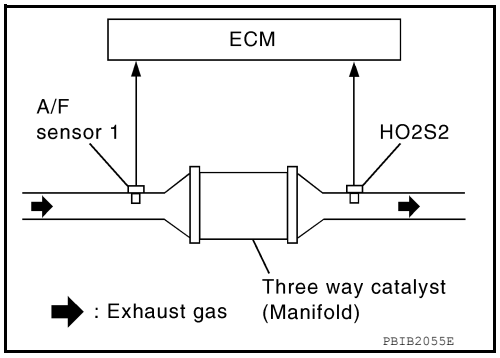
P0420, P0430 THREE WAY CATALYST FUNCTION

DTC Description

INFOID:0000000013798304

DTC DETECTION LOGIC

The ECM monitors the switching frequency ratio of air fuel ratio (A/F) sensor 1 and heated oxygen sensor 2.
A three way catalyst (manifold) with high oxygen storage capacity will indicate a low switching frequency of heated oxygen sensor 2. As oxygen storage capacity decreases, the heated oxygen sensor 2 switching frequency will increase.
When the frequency ratio of A/F sensor 1 and heated oxygen sensor 2 approaches a specified limit value, the three way catalyst (manifold) malfunction is diagnosed.



DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0420	TW CATALYST SYS-B1 [Catalyst system efficiency below threshold (bank 1)]	1	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	Three way catalyst (manifold) does not operate properly
			Diagnosis delay time	—
		2	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	Three way catalyst (manifold) does not have enough oxygen storage capacity
			Diagnosis delay time	—
P0430	TW CATALYST SYS-B2 [Catalyst system efficiency below threshold (bank 2)]	1	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	Three way catalyst (manifold) does not operate properly
			Diagnosis delay time	—
		2	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	Three way catalyst (manifold) does not have enough oxygen storage capacity
			Diagnosis delay time	—

POSSIBLE CAUSE

P0420
- Three way catalyst (manifold)
- Exhaust tube
- Intake air leakage
- Fuel injector
- Fuel injector leakage
- Spark plug
- Improper ignition timing

P0430
- Three way catalyst (manifold)
- Exhaust tube
- Intake air leakage

- Fuel injector
- Fuel injector leakage
- Spark plug
- Improper ignition timing

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.INSPECTION START

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

Will CONSULT be used?

YES >> GO TO 2.
NO >> GO TO 6.

2.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT

TESTING CONDITION:

Do not maintain engine speed for more than the specified minutes below.

1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
6. Let engine idle for 1 minute.
7. Select “DATA MONITOR” mode with CONSULT.
8. Check that “COOLAN TEMP/S” indicates more than 70°C (158°F).
   If not, warm up engine and go to next step when “COOLAN TEMP/S” indication reaches to 70°C (158°F).
9. Open engine hood.
10. Select “DTC & SRT CONFIRMATION” then “SRT WORK SUPPORT” mode with CONSULT.
11. Rev engine between 2,000 and 3,000 rpm and hold it for 3 consecutive minutes then release the accelerator pedal completely.
12. Check the indication of “CATALYST”.

Which is displayed on CONSULT screen?

CMPLT >> GO TO 5.
INCMP >> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-II

1. Wait 5 seconds at idle.
2. Rev engine between 2,000 and 3,000 rpm and maintain it until “INCMP” of “CATALYST” changes to “CMPLT” (It will take approximately 5 minutes).

Does the indication change to “CMPLT”?

YES >> GO TO 5.
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE AGAIN

1. Stop engine and cool it down to less than 70°C (158°F).
2. Perform DTC CONFIRMATION PROCEDURE again.

>> GO TO 2.

5.PERFORM DTC CONFIRMATION PROCEDURE-III

Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1651, "Diagnosis Procedure".
NO >> INSPECTION END

6. PERFORM COMPONENT FUNCTION CHECK

WITH GST
Perform component function check. Refer to EC-1651, "Component Function Check".
NOTE:
Use component function check to check the overall function of the three way catalyst (manifold). During this check, a 1st trip DTC might not be confirmed.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1651, "Diagnosis Procedure"

Component Function Check

INFOID:0000000013798305

1. PERFORM COMPONENT FUNCTION CHECK

WITH GST
1. Start engine and warm it up to the normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Start engine and keep the engine speed between 3,500 and 4,000 rpm for at least 1 minute under no load.
4. Let engine idle for 1 minute.
5. Open engine hood.
6. Check the voltage between ECM harness connector terminals under the following conditions.

DTC	ECM				Condition	Voltage
	+		–			
	Connector	Terminal	Connector	Terminal		
P0420	F79	84 [HO2S2 (bank 1)]	F78	43	Keeping engine speed at 2,500 rpm constant under no load	The voltage fluctuation cycle takes more than 5 seconds. • 1 cycle: 0.6 - 1.0 → 0 - 0.3 → 0.6 - 1.0
P0430		77 [HO2S2 (bank 2)]				

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1651, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798306

1. CHECK EXHAUST SYSTEM

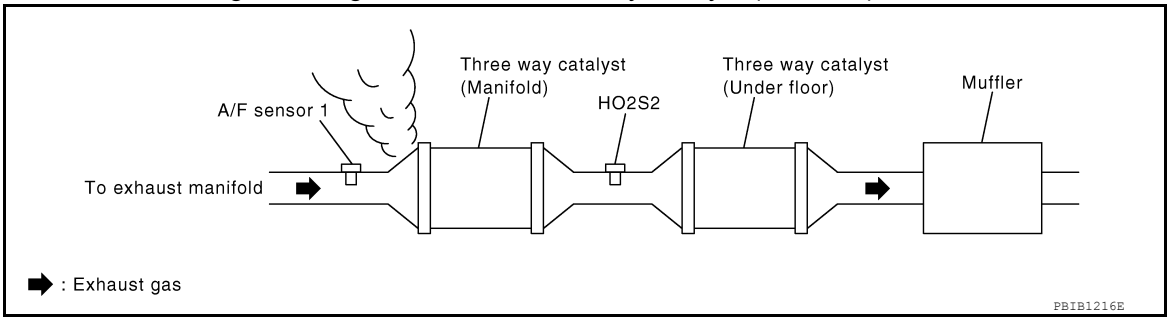
Visually check exhaust tubes and muffler for dents.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace malfunctioning part.

2. CHECK EXHAUST GAS LEAKAGE

1. Start engine and run it at idle.
2. Listen for an exhaust gas leakage before the three way catalyst (manifold).



Is exhaust gas leakage detected?

YES >> Repair or replace malfunctioning part.
NO >> GO TO 3.

3. CHECK INTAKE AIR LEAKAGE

Listen for an intake air leakage after the mass air flow sensor.

Is intake air leakage detected?

YES >> Repair or replace malfunctioning part.
NO >> GO TO 4.

4. CHECK IDLE SPEED AND IGNITION TIMING

Check idle speed and ignition timing.
For procedure, refer to EC-1928, "Inspection" and EC-1929, "Inspection".
For specification, refer to EC-1936, "Idle Speed" and EC-1936, "Ignition Timing".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Follow the EC-1420, "Work Procedure".

5. CHECK FUEL INJECTORS

Refer to EC-1891, "Component Function Check".

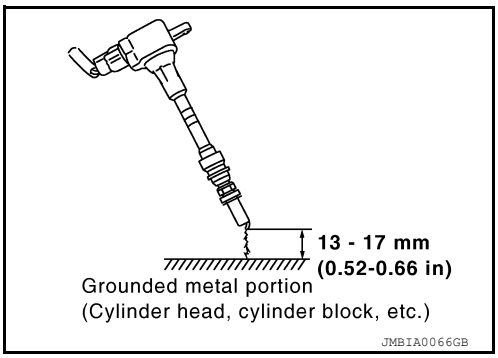
Is the inspection result normal?

YES >> GO TO 6.
NO >> Perform EC-1891, "Diagnosis Procedure".

6. CHECK FUNCTION OF IGNITION COIL-I

CAUTION:
Perform the following procedure in a place with no combustible objects and good ventilation.

1. Turn ignition switch OFF.
2. Remove fuel pump fuse in IPDM E/R to release fuel pressure.
   NOTE:
   - For the fuse number, refer to EC-1386, "Wiring Diagram".
   - For the fuse arrangement, refer to PG-154, "Terminal Arrangement".
   - Do not use CONSULT to release fuel pressure, or fuel pressure applies again during the following procedure.
3. Start engine.
4. After engine stalls, crank it 2 or 3 times to release all fuel pressure.
5. Turn ignition switch OFF.
6. Remove all ignition coil harness connectors to avoid the electrical discharge from the ignition coils.
7. Remove ignition coil and spark plug of the cylinder to be checked.
8. Crank engine for 5 seconds or more to remove combustion gas in the cylinder.
9. Connect spark plug and harness connector to ignition coil.
10. Fix ignition coil using a rope etc. with gap of 13 - 17 mm (0.52 - 0.66 in) between the edge of the spark plug and grounded metal portion as shown in the figure.
11. Crank engine for approximately 3 seconds, and check whether spark is generated between the spark plug and the grounded metal portion.



Spark should be generated.

CAUTION:
- **Never place the spark plug and the ignition coil within 50 cm (19.7 in) each other. Be careful not to get an electrical shock while checking, because the electrical discharge voltage becomes 20 kV or more.**
- **It might damage the ignition coil if the gap of more than 17 mm (0.66 in) is made.**

NOTE:
When the gap is less than 13 mm (0.52 in), a spark might be generated even if the coil is malfunctioning.

Is the inspection result normal?

YES >> GO TO 10.
NO >> GO TO 7.

7. CHECK FUNCTION OF IGNITION COIL-II

1. Turn ignition switch OFF.
2. Disconnect spark plug and connect a non-malfunctioning spark plug.
3. Crank engine for approximately 3 seconds, and recheck whether spark is generated between the spark plug and the grounded metal portion.

Spark should be generated.

Is the inspection result normal?

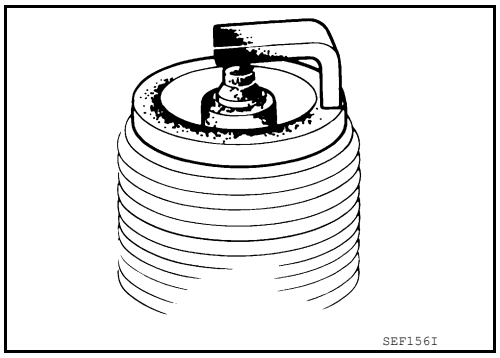
YES >> GO TO 8.
NO >> Check ignition coil, power transistor and their circuits. Refer to EC-1901, "Diagnosis Procedure".

8. CHECK SPARK PLUG

Check the initial spark plug for fouling, etc.

Is the inspection result normal?

YES >> Replace spark plug(s) with standard type one(s). For spark plug type, refer to EM-146, "Spark Plug".
NO >> Repair or clean spark plug. Then GO TO 9.



9. CHECK FUNCTION OF IGNITION COIL-III

1. Reconnect the initial spark plugs.
2. Crank engine for approximately 3 seconds, and recheck whether spark is generated between the spark plug and the grounded portion.

Spark should be generated.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace spark plug(s) with standard type one(s). For spark plug type, refer to EM-146, "Spark Plug".

10. PERFORM DTC CONFIRMATION PROCEDURE

1. Replace three way catalyst assembly. Refer to EM-45, "Removal and Installation".
2. Perform DTC confirmation procedure. Refer to EC-1649, "DTC Description".

Is DTC detected?

YES >> Replace fuel injecor. Refer to EM-54, "Removal and Installation".
NO >> INSPECTION END

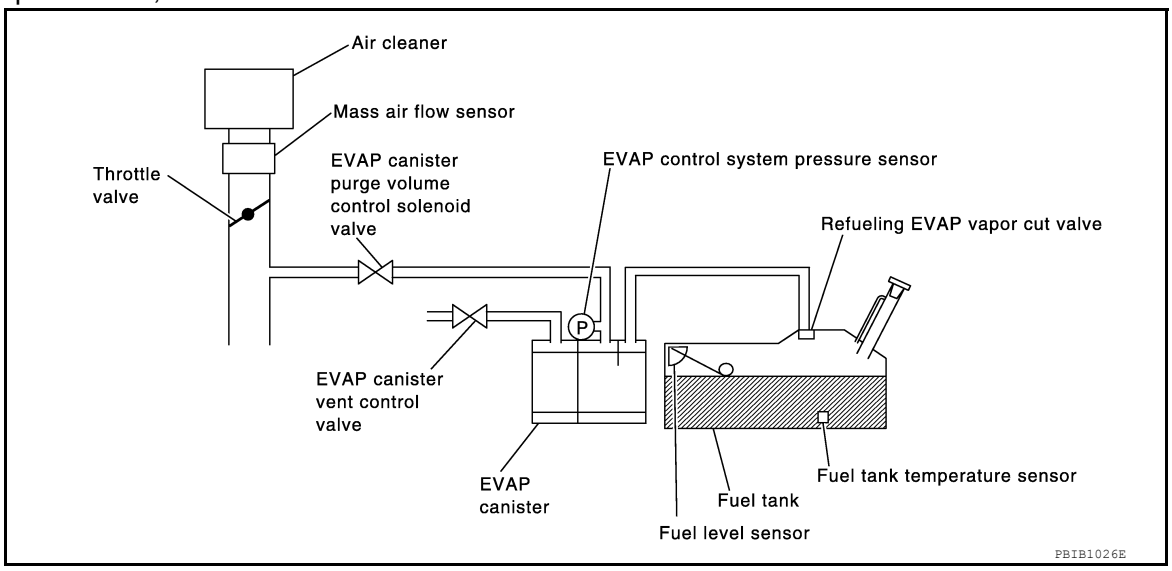
P0441 EVAP CONTROL SYSTEM

DTC Description

INFOID:0000000013798307

DTC DETECTION LOGIC

In this evaporative emission (EVAP) control system, purge flow occurs during non-closed throttle conditions. Purge volume is related to air intake volume. Under normal purge conditions (non-closed throttle), the EVAP canister purge volume control solenoid valve is open to admit purge flow. Purge flow exposes the EVAP control system pressure sensor to intake manifold vacuum.
Under normal conditions (non-closed throttle), sensor output voltage indicates if pressure drop and purge flow are adequate. If not, a malfunction is determined.



DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0441	EVAP PURG FLOW/MON (EVAP control system incorrect purge flow)	Diagnosis condition	—
		Signal (terminal)	Intake air temperature sensor signal
		Threshold	EVAP control system does not operate properly, EVAP control system has a leak between intake manifold and EVAP control system pressure sensor
		Diagnosis delay time	—

POSSIBLE CAUSE

- EVAP canister purge volume control solenoid valve stuck closed
- EVAP control system pressure sensor and the circuit
- Loose, disconnected or improper connection of rubber tube
- Blocked rubber tube
- Cracked EVAP canister
- EVAP canister purge volume control solenoid valve circuit
- Accelerator pedal position sensor
- Blocked purge port
- EVAP canister vent control valve

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0441 is displayed with other DTC such as P2122, P2123, P2127, P2128 or P2138, first perform trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

Will CONSULT be used?

YES >> GO TO 3.
NO >> GO TO 6.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT
TESTING CONDITION:
Always perform test at a temperature of 5°C (41°F) or more.
1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start engine and let it idle for at least 70 seconds.
6. Select “PURG FLOW P0441” of “EVAPORATIVE SYSTEM” in “DTC WORK SUPPORT” mode with CONSULT.
7. Touch “START”.

Is “COMPLETED” displayed on CONSULT screen?

YES >> GO TO 5.
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-II

When the following conditions are met, “TESTING” will be displayed on the CONSULT screen. Maintain the conditions continuously until “TESTING” changes to “COMPLETED”. (It will take at least 35 seconds.)

Selector lever	Suitable position
VHCL SPEED SE	32 - 120 km/h (20 - 75 MPH)
ENG SPEED	500 - 3,000 rpm
B/FUEL SCHDL	1.3 - 17.0 msec
COOLAN TEMP/S	More than 0°C (32°F)

CAUTION:
Always drive vehicle at a safe speed.
NOTE:
If “TESTING” does not change for a long time, retry from step 2.

Is “COMPLETED” displayed on CONSULT screen?

YES >> GO TO 5.
NO >> Perform DTC CONFIRMATION PROCEDURE again. GO TO 2.

5.PERFORM DTC CONFIRMATION PROCEDURE-III

Touch “SELF-DIAG RESULTS”.

Which is displayed on CONSULT screen?

OK >> INSPECTION END
NG >> Proceed to EC-1657, "Diagnosis Procedure".

6.PERFORM COMPONENT FUNCTION CHECK

WITH GST
Perform component function check. Refer to EC-1657, "Component Function Check".
NOTE:
Use component function check to check the overall monitoring function of the EVAP control system purge flow monitoring. During this check, a 1st trip DTC might not be confirmed.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Proceed to EC-1657, "Diagnosis Procedure".

Component Function Check

INFOID:0000000013798308

1.PERFORM COMPONENT FUNCTION CHECK

WITH GST

1. Lift up drive wheels.
2. Start engine (VDC switch OFF) and warm it up to normal operating temperature.
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Start engine and wait at least 70 seconds.
5. Set voltmeter probes to ECM harness connector terminals under the following conditions.

ECM		
Connector	+	–
	Terminal	Terminal
E16	121 (EVAP control system pressure sensor signal)	148

6. Check EVAP control system pressure sensor value at idle speed and note it.
7. Establish and maintain the following conditions for at least 1 minute.

Air conditioner switch	ON
Headlamp switch	ON
Rear window defogger switch	ON
Engine speed	Approx. 3,000 rpm
Gear position	Any position other than P, N or R

8. Verify that EVAP control system pressure sensor value stays 0.1 V less than the value at idle speed (measured at step 6) for at least 1 second.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Proceed to EC-1657, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798309

1.CHECK DTC PRIORITY

If DTC P0441 is displayed with other DTC such as P2122, P2123, P2127, P2128 or P2138, first perform trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK EVAP CANISTER

1. Turn ignition switch OFF.
2. Check EVAP canister for cracks.

Is the inspection result normal?

YES-1 >> With CONSULT: GO TO 3.
YES-2 >> Without CONSULT: GO TO 4.
NO >> Replace EVAP canister. Refer to FL-14, "Removal and Installation".

3.CHECK PURGE FLOW

WITH CONSULT

1. Disconnect vacuum hose connected to EVAP canister purge volume control solenoid valve at EVAP service port.

2. Start engine and let it idle.
3. Select “PURG VOL CONT/V” in “ACTIVE TEST” mode with CONSULT.
4. Touch “Qd” and “Qu” on CONSULT screen to adjust “PURG VOL CONT/V” opening and check vacuum existence.

PURG VOL CONT/V	Vacuum
100%	Existed
0%	Not existed

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 5.

4.CHECK PURGE FLOW

WITHOUT CONSULT

1. Start engine and warm it up to normal operating temperature.
2. Stop engine.
3. Disconnect vacuum hose connected to EVAP canister purge volume control solenoid valve at EVAP service port and install vacuum gauge. For the location of EVAP service port, refer to EC-1301, "EVAPORATIVE EMISSION SYSTEM : System Description".
4. Start engine and let it idle.
   Never depress accelerator pedal even slightly.
5. Check vacuum gauge indication before 60 seconds pass after starting engine.

Vacuum should not exist.

6. Rev engine up to 2,000 rpm after 100 seconds pass after starting engine.

Vacuum should exist.

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 5.

5.CHECK EVAP PURGE LINE

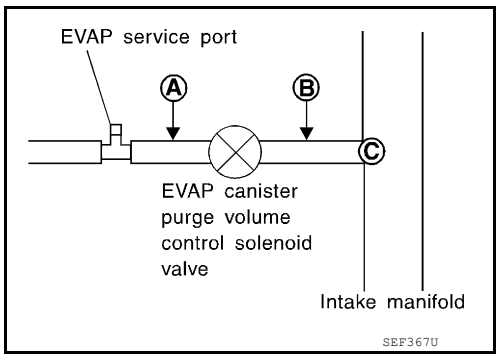
1. Turn ignition switch OFF.
2. Check EVAP purge line for improper connection or disconnection.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair EVAP purge line.

6.CHECK EVAP PURGE HOSE AND PURGE PORT

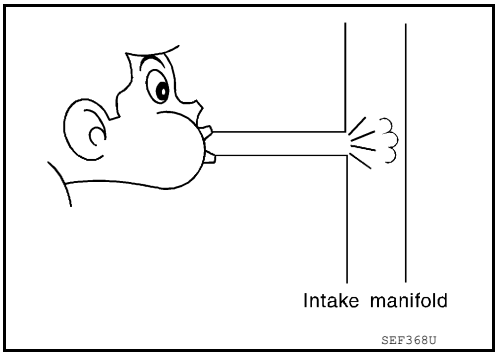
1. Disconnect purge hoses connected to EVAP service port (**A**) and EVAP canister purge volume control solenoid valve (**B**).
2. Blow air into each hose and EVAP purge port (**C**).



3. Check that air flows freely.

Is the inspection result normal?

YES-1 >> With CONSULT: GO TO 7.
YES-2 >> Without CONSULT: GO TO 8.
NO >> Repair or clean hoses and/or purge port.



7. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

WITH CONSULT
1. Start engine.
2. Perform “PURG VOL CONT/V” in “ACTIVE TEST” mode with CONSULT. Check that engine speed varies according to the valve opening.

Does engine speed vary according to the valve opening?

YES >> GO TO 9.
NO >> GO TO 8.

8. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

Refer to EC-1664, "Component Inspection (EVAP Canister Purge Volume Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 9.
NO >> Replace EVAP canister purge volume control solenoid valve. Refer to FL-14, "Exploded View".

9. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR CONNECTOR

1. Disconnect EVAP control system pressure sensor harness connector.
2. Check that water is not inside connectors.

Is the inspection result normal?

YES >> GO TO 10.
NO >> Replace EVAP control system pressure sensor. Refer to EM-35, "Exploded View".

10. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR FUNCTION

Refer to EC-1679, "DTC Description" for DTC P0452, EC-1683, "DTC Description" for DTC P0453.

Is the inspection result normal?

YES >> GO TO 11.
NO >> Replace EVAP control system pressure sensor.

11. CHECK RUBBER TUBE FOR CLOGGING

1. Disconnect rubber tube connected to EVAP canister vent control valve.
2. Check the rubber tube for clogging.

Is the inspection result normal?

YES >> GO TO 12.
NO >> Clean the rubber tube using an air blower.

12. CHECK EVAP CANISTER VENT CONTROL VALVE

Refer to EC-1670, "Component Inspection (EVAP Canister Vent Control Valve)".

Is the inspection result normal?

YES >> GO TO 13.
NO >> Replace EVAP canister vent control valve.

13. CHECK EVAP PURGE LINE

Inspect EVAP purge line (pipe and rubber tube). Check for evidence of leaks.

Is the inspection result normal?

YES >> GO TO 14.

NO >> Repair or replace malfunctioning part.

14. CLEAN EVAP PURGE LINE

Clean EVAP purge line (pipe and rubber tube) using air blower.

>> INSPECTION END

P0443 EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

DTC Description

INFOID:0000000013798310

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0443	PURG VOLUME CONT/V (EVAP canister purge volume control solenoid valve)	Diagnosis condition	—
		Signal (terminal)	EVAP canister purge volume control solenoid valve signal
		Threshold	The canister purge flow is detected during the specified driving conditions, even when EVAP canister purge volume control solenoid valve is completely closed
		Diagnosis delay time	—

POSSIBLE CAUSE

- EVAP control system pressure sensor
- EVAP canister purge volume control solenoid valve (The valve is stuck open)
- EVAP canister vent control valve
- EVAP canister
- Hoses (Hoses are connected incorrectly or clogged)

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Always perform test at a temperature of 5°C (41°F) or more.

Do you have CONSULT

YES >> GO TO 2.
NO >> GO TO 3.

2.PERFORM DTC CONFIRMATION PROCEDURE

WITH CONSULT

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Turn ignition switch ON.
6. Select “PURG VOL CN/V P1444” of “EVAPORATIVE SYSTEM” in “DTC WORK SUPPORT” mode with CONSULT.
7. Touch “START”.
8. Start engine and let it idle until “TESTING” on CONSULT changes to “COMPLETED”. (It will take approximately 10 seconds.)
   If “TESTING” is not displayed after 5 minutes, retry from step 2.
9. Touch “SELF-DIAG RESULTS”.

Which is displayed on CONSULT screen?

OK >> INSPECTION END
NG >> Proceed to EC-1662, "Diagnosis Procedure".

3.PERFORM DTC CONFIRMATION PROCEDURE

WITH GST

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start engine and let it idle for at least 20 seconds.
6. Check 1st trip DTC.

Is 1st trip DTC displayed?

YES >> Proceed to EC-1662, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798311

1. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect EVAP canister purge volume control solenoid valve harness connector.
3. Turn ignition switch ON.
4. Check the voltage between EVAP canister purge volume control solenoid valve harness connector and ground.

EVAP canister purge volume control solenoid valve		Ground	Voltage
Connector	Terminal		
F30	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between EVAP canister purge volume control solenoid valve and IPDM E/R
- Harness for open or short between EVAP canister purge volume control solenoid valve and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

3. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE OUTPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EVAP canister purge volume control solenoid valve harness connector and ECM harness connector.

EVAP canister purge volume control solenoid valve		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F30	2	F78	106	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR CONNECTOR

1. Disconnect EVAP control system pressure sensor harness connector.
2. Check that water is not inside connectors.

Is the inspection result normal?

YES >> GO TO 5.

NO >> Replace EVAP control system pressure sensor.

5. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR

Refer to EC-1678, "Component Inspection (EVAP Control System Pressure Sensor)".

Is the inspection result normal?

YES-1 >> With CONSULT: GO TO 6.
YES-2 >> Without CONSULT: GO TO 7.
NO >> Replace EVAP control system pressure sensor.

6. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

WITH CONSULT
1. Turn ignition switch OFF.
2. Reconnect harness connectors disconnected.
3. Start engine.
4. Perform “PURG VOL CONT/V” in “ACTIVE TEST” mode with CONSULT. Check that engine speed varies according to the valve opening.

Does engine speed vary according to the valve opening?

YES >> GO TO 8.
NO >> GO TO 7.

7. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

Refer to EC-1664, "Component Inspection (EVAP Canister Purge Volume Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 8.
NO >> Replace EVAP canister purge volume control solenoid valve. Refer to EM-35, "Exploded View".

8. CHECK RUBBER TUBE FOR CLOGGING

1. Disconnect rubber tube connected to EVAP canister vent control valve.
2. Check the rubber tube for clogging.

Is the inspection result normal?

YES >> GO TO 9.
NO >> Clean the rubber tube using an air blower.

9. CHECK EVAP CANISTER VENT CONTROL VALVE

Refer to EC-1670, "Component Inspection (EVAP Canister Vent Control Valve)".

Is the inspection result normal?

YES >> GO TO 10.
NO >> Replace EVAP canister vent control valve. Refer to FL-17, "Exploded View".

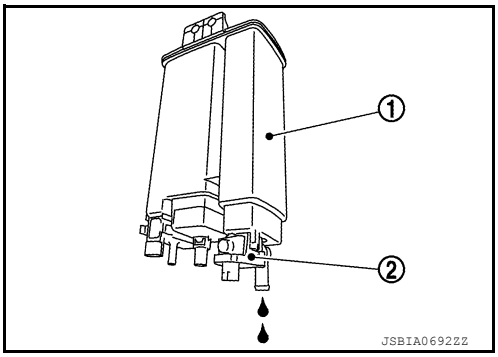
10. CHECK IF EVAP CANISTER IS SATURATED WITH WATER

1. Remove EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.
2. Check if water will drain from EVAP canister (1).

- EVAP canister vent control valve (2)

Does water drain from the EVAP canister?

YES >> GO TO 11.
NO >> INSPECTION END



11. CHECK EVAP CANISTER

Weigh the EVAP canister with the EVAP canister vent control valve and EVAP control system pressure sensor attached.

The weight should be less than 2.5 kg (5.5 lb).

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 12.

12. DETECT MALFUNCTIONING PART

Check the following.
- EVAP canister for damage
- EVAP hose between EVAP canister and vehicle frame for clogging or poor connection

>> Repair hose or replace EVAP canister. Refer to FL-14, "Exploded View".

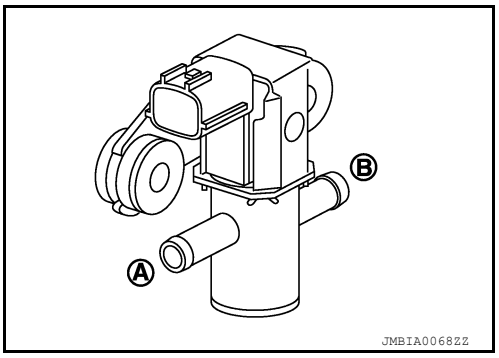
Component Inspection (EVAP Canister Purge Volume Control Solenoid Valve)

INFOID:0000000013798312

1. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

WITH CONSULT

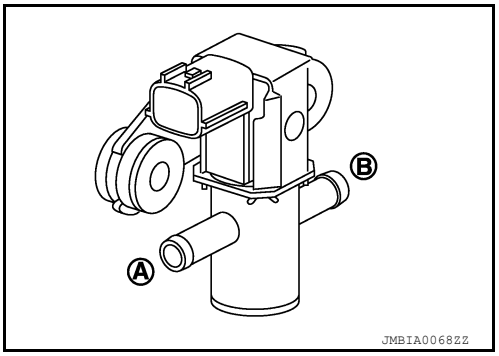
1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Disconnect EVAP purge hoses connected to EVAP canister purge volume control solenoid valve.
4. Start engine.
5. Select “PURG VOL CONT/V” in “ACTIVE TEST” mode with CONSULT.
6. Touch “Qd” and “Qu” on CONSULT screen to adjust “PURG VOL C/V” opening and check air passage continuity of EVAP canister purge volume control solenoid valve under the following conditions.



Condition (PURG VOL C/V value)	Air passage continuity between (A) and (B)
100%	Existed
0%	Not existed

WITHOUT CONSULT

1. Turn ignition switch OFF.
2. Disconnect EVAP canister purge volume control solenoid valve harness connector.
3. Disconnect EVAP purge hoses connected to EVAP canister purge volume control solenoid valve.
4. Check air passage continuity of EVAP canister purge volume control solenoid valve under the following conditions.



Condition	Air passage continuity between (A) and (B)
12 V direct current supply between terminals 1 and 2	Existed
No supply	Not existed

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace EVAP canister purge volume control solenoid valve. Refer to EM-35, "Exploded View".

P0444, P0445 EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

DTC Description

INFOID:0000000013798313

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0444	PURG VOLUME CONT/V (EVAP canister purge volume control solenoid valve circuit open)	Diagnosis condition	—
		Signal (terminal)	EVAP canister purge volume control solenoid valve signal
		Threshold	An excessively low voltage signal is sent to ECM through the valv
		Diagnosis delay time	—
P0445	PURG VOLUME CONT/V (EVAP canister purge volume control solenoid valve circuit shorted)	Diagnosis condition	—
		Signal (terminal)	EVAP canister purge volume control solenoid valve signal
		Threshold	An excessively high voltage signal is sent to ECM through the valve
		Diagnosis delay time	—

POSSIBLE CAUSE

P0444
- Harness or connectors (The solenoid valve circuit is open or shorted)
- EVAP canister purge volume control solenoid valve

P0445
- Harness or connectors (The solenoid valve circuit is shorted)
- EVAP canister purge volume control solenoid valve

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm battery voltage is 11 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for at least 13 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1665, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798314

1.CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect EVAP canister purge volume control solenoid valve harness connector.
3. Turn ignition switch ON.
4. Check the voltage between EVAP canister purge volume control solenoid valve harness connector and ground.

EVAP canister purge volume control solenoid valve		Ground	Voltage
Connector	Terminal		
F30	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2. DETECT MALFUNCTIONING PART

Check the following.
- Loose or poor connection for each connector and harness
- Harness for open or short between EVAP canister purge volume control solenoid valve and IPDM E/R
- Harness for open or short between EVAP canister purge volume control solenoid valve and ECM

>> Repair open circuit, short to ground or short to power in harness or connectors.

3. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE OUTPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EVAP canister purge volume control solenoid valve harness connector and ECM harness connector.

EVAP canister purge volume control solenoid valve		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F30	2	F79	106	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES-1 >> With CONSULT: GO TO 4.
YES-2 >> Without CONSULT: GO TO 5.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE OPERATION

WITH CONSULT
1. Reconnect all harness connectors disconnected.
2. Start engine.
3. Perform “PURG VOL CONT/V” in “ACTIVE TEST” mode with CONSULT. Check that engine speed varies according to the valve opening.

Does engine speed vary according to the valve opening?

YES >> INSPECTION END
NO >> GO TO 5.

5. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

Refer to EC-1664, "Component Inspection (EVAP Canister Purge Volume Control Solenoid Valve)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace EVAP canister purge volume control solenoid valve.

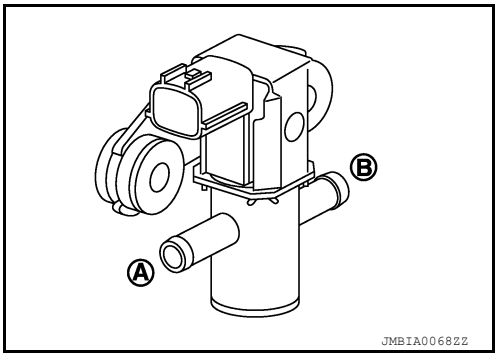
Component Inspection (EVAP Canister Purge Volume Control Solenoid Valve)

INFOID:0000000013798315

1. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

WITH CONSULT

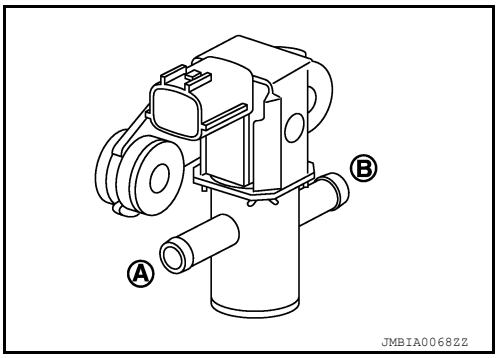
1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Disconnect EVAP purge hoses connected to EVAP canister purge volume control solenoid valve.
4. Start engine.
5. Select “PURG VOL CONT/V” in “ACTIVE TEST” mode with CONSULT.
6. Touch “Qd” and “Qu” on CONSULT screen to adjust “PURG VOL C/V” opening and check air passage continuity of EVAP canister purge volume control solenoid valve under the following conditions.



Condition (PURG VOL C/V value)	Air passage continuity between (A) and (B)
100%	Existed
0%	Not existed

WITHOUT CONSULT

1. Turn ignition switch OFF.
2. Disconnect EVAP canister purge volume control solenoid valve harness connector.
3. Disconnect EVAP purge hoses connected to EVAP canister purge volume control solenoid valve.
4. Check air passage continuity of EVAP canister purge volume control solenoid valve under the following conditions.



Condition	Air passage continuity between (A) and (B)
12 V direct current supply between terminals 1 and 2	Existed
No supply	Not existed

Is the inspection result normal?

YES >> INSPECTION END

NO >> Replace EVAP canister purge volume control solenoid valve. Refer to EM-35, "Exploded View".

P0447 EVAP CANISTER VENT CONTROL VALVE

DTC Description

INFOID:0000000013798316

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0447	VENT CONTROL VALVE (EVAP canister vent control valve circuit open)	Diagnosis condition	—
		Signal (terminal)	EVAP canister vent control valve signal
		Threshold	An improper voltage signal is sent to ECM through EVAP canister vent control valve
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (The valve circuit is open or shorted)
- EVAP canister vent control valve

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm battery voltage is 11 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and wait at least 8 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1668, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798317

1.INSPECTION START

Will CONSULT be used?

Will CONSULT be used?

YES >> GO TO 2.
NO >> GO TO 3.

2.CHECK EVAP CANISTER VENT CONTROL VALVE CIRCUIT

WITH CONSULT
1. Turn ignition switch OFF and then ON.
2. Select “VENT CONTROL/V” in “ACTIVE TEST” mode with CONSULT.
3. Touch “ON/OFF” on CONSULT screen.
4. Check for operating sound of the valve.

Clicking sound should be heard.

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 3.

3. CHECK EVAP CANISTER VENT CONTROL VALVE POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect EVAP canister vent control valve harness connector.
3. Turn ignition switch ON.
4. Check the voltage between EVAP canister vent control valve harness connector and ground.

EVAP canister vent control valve		Ground	Voltage
Connector	Terminal		
C38	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between EVAP canister vent control valve and IPDM E/R
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

5. CHECK EVAP CANISTER VENT CONTROL VALVE OUTPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EVAP canister vent control valve harness connector and ECM harness connector.

EVAP canister vent control valve		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C38	2	E16	141	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6. DETECT MALFUNCTIONING PART

Check the following.
- Loose or poor connection for each connector and harness
- Harness for open or short between EVAP canister vent control valve and ECM

>> Repair open circuit, short to ground or short to power in harness or connectors.

7. CHECK RUBBER TUBE FOR CLOGGING

1. Disconnect rubber tube connected to EVAP canister vent control valve.
2. Check the rubber tube for clogging.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Clean the rubber tube using an air blower.

8. CHECK EVAP CANISTER VENT CONTROL VALVE

Refer to EC-1670, "Component Inspection (EVAP Canister Vent Control Valve)".

Is the inspection result normal?

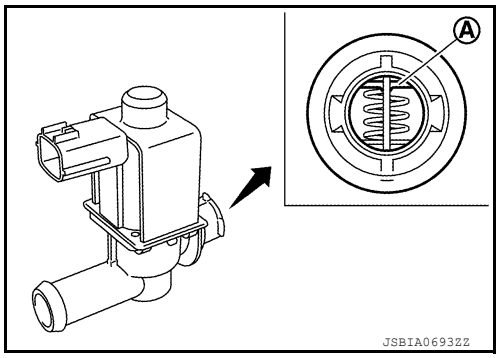
YES >> INSPECTION END
NO >> Replace EVAP canister vent control valve. Refer to FL-17, "Exploded View".

Component Inspection (EVAP Canister Vent Control Valve)

INFOID:0000000013798318

1. CHECK EVAP CANISTER VENT CONTROL VALVE-I

1. Turn ignition switch OFF.
2. Remove EVAP canister vent control valve from EVAP canister.
3. Check portion (A) of EVAP canister vent control valve for rust.



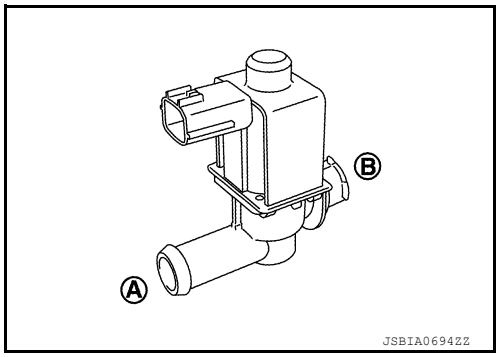
Is it rusted?

YES >> Replace EVAP canister vent control valve. Refer to FL-17, "Exploded View".
NO >> GO TO 2.

2. CHECK EVAP CANISTER VENT CONTROL VALVE-II

WITH CONSULT

1. Reconnect harness connectors disconnected.
2. Turn ignition switch ON.
3. Perform “VENT CONTROL/V” in “ACTIVE TEST” mode.
4. Check air passage continuity and operation delay time.
   Check that new O-ring is installed properly.



VENT CONTROL/V Condition	Air passage continuity between (A) and (B)
ON	Not existed
OFF	Existed

Operation takes less than 1 second.

WITHOUT CONSULT

1. Disconnect EVAP canister vent control valve harness connector.
2. Check air passage continuity and operation delay time under the following conditions.
   Check that new O-ring is installed properly.

Condition	Air passage continuity between (A) and (B)
12 V direct current supply between terminals 1 and 2	Not existed
OFF	Existed

Operation takes less than 1 second.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Replace EVAP canister vent control valve. Refer to FL-17, "Exploded View".

3. CHECK EVAP CANISTER VENT CONTROL VALVE-III

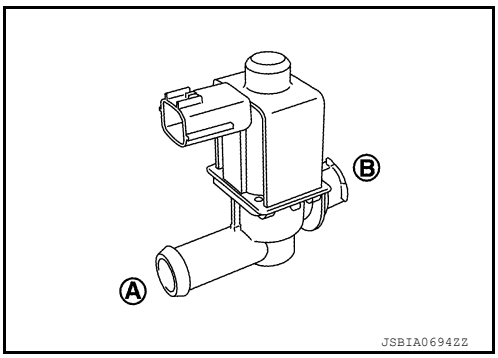
WITH CONSULT

1. Clean the air passage [portion (A) to (B)] of EVAP canister vent control valve using an air blower.
2. Perform “VENT CONTROL/V” in “ACTIVE TEST” mode.

3. Check air passage continuity and operation delay time.
Check that new O-ring is installed properly.

VENT CONTROL/V Condition	Air passage continuity between (A) and (B)
ON	Not existed
OFF	Existed

Operation takes less than 1 second.



WITHOUT CONSULT
1. Clean the air passage [portion (A) to (B)] of EVAP canister vent control valve using an air blower.
2. Check air passage continuity and operation delay time under the following conditions.
Check that new O-ring is installed properly.

Condition	Air passage continuity between (A) and (B)
12 V direct current supply between terminals 1 and 2	Not existed
OFF	Existed

Operation takes less than 1 second.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace EVAP canister vent control valve. Refer to FL-17, "Exploded View".

P0448 EVAP CANISTER VENT CONTROL VALVE

DTC Description

INFOID:0000000013798319

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0448	VENT CONTROL VALVE (EVAP canister vent control valve close)	Diagnosis condition	—
		Signal (terminal)	EVAP canister vent control valve signal
		Threshold	EVAP canister vent control valve remains closed under specified driving conditions
		Diagnosis delay time	—

POSSIBLE CAUSE

- EVAP canister vent control valve
- EVAP control system pressure sensor and the circuit
- Blocked rubber tube to EVAP canister vent control valve
- EVAP canister is saturated with water

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 5 seconds.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Start engine and let it idle for at least 1 minute.
4. Repeat next procedures 3 times.

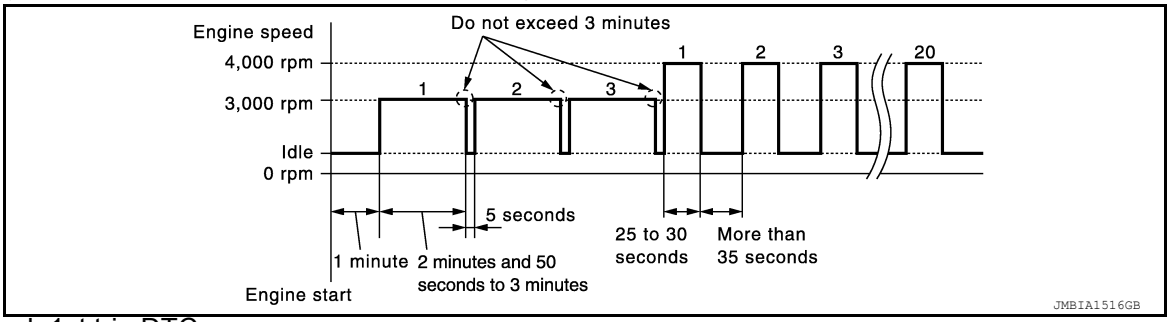
- Increase the engine speed up to between 3,000 and 3,500 rpm and maintain that speed for 2 minutes and 50 seconds to 3 minutes.

Do not exceed 3 minutes.

- Fully released accelerator pedal and keep engine idle for approximately 5 seconds.

5. Repeat next procedure 20 times.

- Quickly increase the engine speed up to between 4,000 and 4,500 rpm and maintain that speed for 25 to 30 seconds.
- Fully released accelerator pedal and keep engine idle for at least 35 seconds.



6. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1673, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".

NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798320

1.CHECK RUBBER TUBE

1. Turn ignition switch OFF.
2. Disconnect rubber tube connected to EVAP canister vent control valve.
3. Check the rubber tube for clogging.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Clean rubber tube using an air blower.

2.CHECK EVAP CANISTER VENT CONTROL VALVE

Refer to EC-1670, "Component Inspection (EVAP Canister Vent Control Valve)".

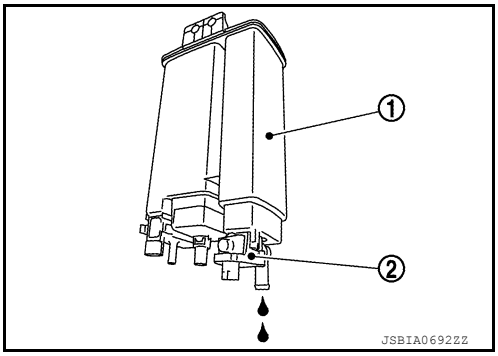
Is the inspection result normal?

YES >> GO TO 3.
NO >> Replace EVAP canister vent control valve. Refer to FL-17, "Exploded View".

3.CHECK IF EVAP CANISTER IS SATURATED WITH WATER

1. Remove EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.
2. Check if water will drain from the EVAP canister (1).

2 : EVAP canister vent control valve



Does water drain from EVAP canister?

YES >> GO TO 4.
NO >> GO TO 6.

4.CHECK EVAP CANISTER

Weigh the EVAP canister with the EVAP canister vent control valve and EVAP control system pressure sensor attached.

The weight should be less than 2.5 kg (5.5 lb).

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5.DETECT MALFUNCTIONING PART

Check the following.

- EVAP canister for damage
- EVAP hose between EVAP canister and vehicle frame for clogging or poor connection

>> Repair hose or replace EVAP canister. Refer to FL-14, "Exploded View".

6.CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR CONNECTOR

1. Disconnect EVAP control system pressure sensor harness connector.
2. Check that water is not inside connectors.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Replace EVAP control system pressure sensor. Refer to FL-19, "Exploded View".

7.CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR

Refer to EC-1678, "Component Inspection (EVAP Control System Pressure Sensor)".

Is the inspection result normal?

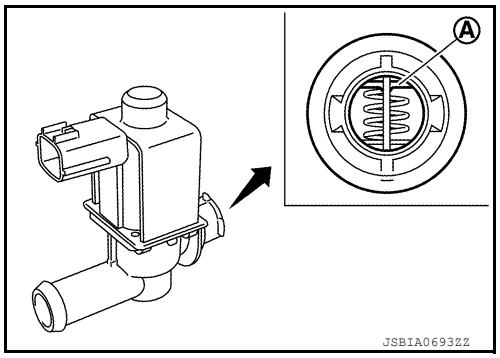
YES >> INSPECTION END
NO >> Replace EVAP control system pressure sensor. Refer to FL-19, "Exploded View".

Component Inspection (EVAP Canister Vent Control Valve)

INFOID:0000000013798321

1. CHECK EVAP CANISTER VENT CONTROL VALVE-I

1. Turn ignition switch OFF.
2. Remove EVAP canister vent control valve from EVAP canister.
3. Check portion (A) of EVAP canister vent control valve for rust.



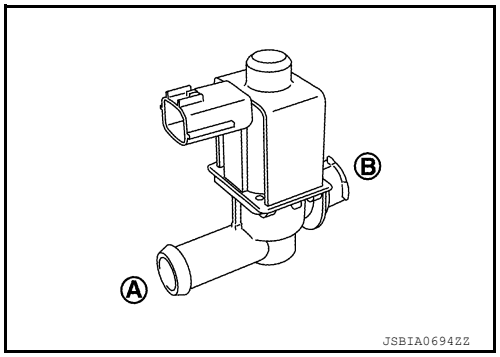
Is it rusted?

YES >> Replace EVAP canister vent control valve. Refer to FL-17, "Exploded View".
NO >> GO TO 2.

2. CHECK EVAP CANISTER VENT CONTROL VALVE-II

WITH CONSULT

1. Reconnect harness connectors disconnected.
2. Turn ignition switch ON.
3. Perform “VENT CONTROL/V” in “ACTIVE TEST” mode.
4. Check air passage continuity and operation delay time.
   Check that new O-ring is installed properly.



VENT CONTROL/V Condition	Air passage continuity between (A) and (B)
ON	Not existed
OFF	Existed

Operation takes less than 1 second.

WITHOUT CONSULT

1. Disconnect EVAP canister vent control valve harness connector.
2. Check air passage continuity and operation delay time under the following conditions.
   Check that new O-ring is installed properly.

Condition	Air passage continuity between (A) and (B)
12 V direct current supply between terminals 1 and 2	Not existed
OFF	Existed

Operation takes less than 1 second.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Replace EVAP canister vent control valve. Refer to FL-17, "Exploded View".

3. CHECK EVAP CANISTER VENT CONTROL VALVE-III

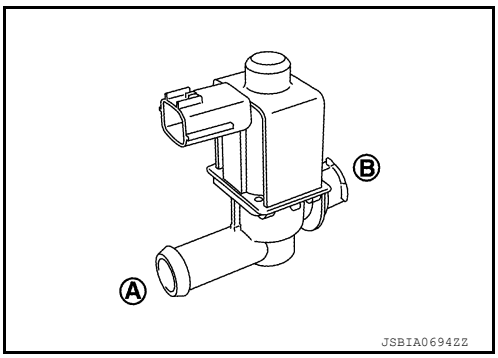
WITH CONSULT

1. Clean the air passage [portion (A) to (B)] of EVAP canister vent control valve using an air blower.
2. Perform “VENT CONTROL/V” in “ACTIVE TEST” mode.

3. Check air passage continuity and operation delay time.
Check that new O-ring is installed properly.

VENT CONTROL/V Condition	Air passage continuity between (A) and (B)
ON	Not existed
OFF	Existed

Operation takes less than 1 second.



WITHOUT CONSULT
1. Clean the air passage [portion (A) to (B)] of EVAP canister vent control valve using an air blower.
2. Check air passage continuity and operation delay time under the following conditions.
Check that new O-ring is installed properly.

Condition	Air passage continuity between (A) and (B)
12 V direct current supply between terminals 1 and 2	Not existed
OFF	Existed

Operation takes less than 1 second.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace EVAP canister vent control valve. Refer to FL-17, "Exploded View".

P0451 EVAP CONTROL SYSTEM PRESSURE SENSOR

DTC Description

INFOID:0000000013798322

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0451	EVAP SYS PRES SEN (EVAP control system pressure sensor performance)	Diagnosis condition	—
		Signal (terminal)	EVAP control system pressure sensor signal
		Threshold	ECM detects a sloshing signal from the EVAP control system pressure sensor
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (EVAP control system pressure sensor circuit is shorted)
- EVAP control system pressure sensor
- Sensor power supply 3

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

NOTE:
Never remove fuel filler cap during DTC confirmation procedure.

1. PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

With CONSULT>>GO TO 2.
Without CONSULT>>GO TO 5.

2. PERFORM DTC CONFIRMATION PROCEDURE-1

With CONSULT

1. Start engine and let it idle for least 40 seconds.
   NOTE:
   Do not depress accelerator pedal even slightly.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1677, "Diagnosis Procedure".
NO >> GO TO 3.

3. PERFORM DTC CONFIRMATION PROCEDURE-2

With CONSULT

1. Select “EVAP DIAG READY” in “DATA MONITOR” mode of “ENGINE”.
2. Let it idle until “OFF” of “EVAP DIAG READY” changes to “ON”.
   NOTE:
   It will take at most 2 hours until “OFF” of “EVAP DIAG READY” changes to “ON”.
3. Turn ignition switch OFF and wait at least 90 minutes.
   NOTE:
   Never turn ignition switch ON during 90 minutes.
4. Turn ignition switch ON.
5. Select “EVAP LEAK DIAG” in “DATA MONITOR” mode of “ENGINE”.
6. Check that “EVAP LEAK DIAG” indication.

Which is displayed on CONSULT?

CMPLT >> GO TO 4.
YET >> 1. Perform DTC CONFIRMATION PROCEDURE again.
2. GO TO 1.

4.PERFORM DTC CONFIRMATION PROCEDURE-3

With CONSULT
Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1677, "Diagnosis Procedure".
NO >> INSPECTION END

5.PERFORM DTC CONFIRMATION PROCEDURE-4

With GST
1. Start engine and let it idle for least 40 seconds.
NOTE:
Do not depress accelerator pedal even slightly.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1677, "Diagnosis Procedure".
NO >> GO TO 6.

6.PERFORM DTC CONFIRMATION PROCEDURE-5

With GST
1. Let it idle for at least 2 hours.
2. Turn ignition switch OFF and wait at least 90 minutes.
NOTE:
Never turn ignition switch ON during 90 minutes.
3. Turn ignition switch ON.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1677, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798323

1.CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR CONNECTOR

1. Disconnect EVAP control system pressure sensor harness connector.
2. Check that water is not inside connectors.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace harness connector.

2.CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch ON.
2. Check the voltage between EVAP control system pressure sensor harness connector and ground.

EVAP control system pressure sensor		Ground	Voltage (V)
Connector	Terminal		
C32	3	Ground	Approx. 5 V

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.CHECK SENSOR POWER SUPPLY 3 CIRCUIT

Perform EC-1920, "Diagnosis Procedure".

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

4. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR

Refer to EC-1678, "Component Inspection (EVAP Control System Pressure Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace EVAP control system pressure sensor.

Component Inspection (EVAP Control System Pressure Sensor)

INFOID:0000000013798324

1. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR

1. Turn ignition switch OFF.
2. Remove EVAP control system pressure sensor with its harness connector.
   Always replace O-ring with a new one.
3. Install a vacuum pump to EVAP control system pressure sensor.
4. Turn ignition switch ON and check output voltage between ECM harness connector terminals under the following conditions.

ECM			Condition [Applied vacuum kPa (kg/cm^2, psi)]	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
E16	121	148	Not applied	1.8 - 4.8
			-26.7 (-0.272, -3.87)	2.1 to 2.5 lower than above value

CAUTION:

- **Always calibrate the vacuum pump gauge when using it.**
- **Never apply below -93.3 kPa (-0.952 kg/cm^2, -13.53 psi) or pressure over 101.3 kPa (1.033 kg/cm^2, 14.69 psi).**

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace EVAP control system pressure sensor.

P0452 EVAP CONTROL SYSTEM PRESSURE SENSOR

DTC Description

INFOID:0000000013798325

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0452	EVAP SYS PRES SEN (EVAP control system pressure sensor low input)	Diagnosis condition	—
		Signal (terminal)	EVAP control system pressure sensor signal
		Threshold	An excessively low voltage from the sensor is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (EVAP control system pressure sensor circuit is shorted)
- EVAP control system pressure sensor
- Sensor power supply 3

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Always perform test at a temperature of 5°C (41°F) or more.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

WITH CONSULT

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Turn ignition switch ON.
6. Select “DATA MONITOR” mode with CONSULT.
7. Check that “FUEL T/TMP SE” is more than 0°C (32°F).
8. Start engine and wait at least 20 seconds.
9. Check 1st trip DTC.

WITH GST

1. Start engine and warm it up to normal operating temperature.
2. Set voltmeter probes to ECM harness connector terminals under the following conditions.

ECM		
Connector	+	–
	Terminal	Terminal
E16	128 (Fuel tank temperature sensor signal)	152

3. Check that the voltage is less than 4.2 V.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Turn ignition switch ON.
6. Turn ignition switch OFF and wait at least 10 seconds.

7. Start engine and wait at least 20 seconds.
8. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1680, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798326

1. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR CONNECTOR

1. Disconnect EVAP control system pressure sensor harness connector.
2. Check that water is not inside connectors.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace harness connector.

2. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR POWER SUPPLY CIRCUIT-I

1. Turn ignition switch ON.
2. Check the voltage between EVAP control system pressure sensor harness connector and ground.

EVAP control system pressure sensor		Ground	Voltage (V)
Connector	Terminal		
C32	3	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 3.

3. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR POWER SUPPLY CIRCUIT-II

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EVAP control system pressure sensor harness connector and ECM harness connector.

EVAP control system pressure sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C32	3	E16	125	Existed

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open between ECM and EVAP control system pressure sensor
- Loose or poor connection for each connector and harness

>> Repair open circuit.

5. CHECK SENSOR POWER SUPPLY 3 CIRCUIT

Perform EC-1920, "Diagnosis Procedure".

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

6. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EVAP control system pressure sensor harness connector and ECM harness connector.

EVAP control system pressure sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C32	1	E16	148	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between EVAP control system pressure sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

8. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between EVAP control system pressure sensor harness connector and ECM harness connector.

EVAP control system pressure sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C32	2	E16	121	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 10.
NO >> GO TO 9.

9. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between EVAP control system pressure sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

10. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR

Refer to EC-1678, "Component Inspection (EVAP Control System Pressure Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace EVAP control system pressure sensor. Refer to FL-19, "Exploded View".

Component Inspection (EVAP Control System Pressure Sensor)

INFOID:0000000013798327

1. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR

1. Turn ignition switch OFF.
2. Remove EVAP control system pressure sensor with its harness connector.

Always replace O-ring with a new one.

3. Install a vacuum pump to EVAP control system pressure sensor.
4. Turn ignition switch ON and check output voltage between ECM harness connector terminals under the following conditions.

ECM			Condition [Applied vacuum kPa (kg/cm^2, psi)]	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
E16	121	148	Not applied	1.8 - 4.8
			-26.7 (-0.272, -3.87)	2.1 to 2.5 lower than above value

CAUTION:

- **Always calibrate the vacuum pump gauge when using it.**
- **Never apply below -93.3 kPa (-0.952 kg/cm^2, -13.53 psi) or pressure over 101.3 kPa (1.033 kg/cm^2, 14.69 psi).**

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace EVAP control system pressure sensor.

P0453 EVAP CONTROL SYSTEM PRESSURE SENSOR

DTC Description

INFOID:0000000013798328

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0453	EVAP SYS PRES SEN (EVAP control system pressure sensor high input)	Diagnosis condition	—
		Signal (terminal)	EVAP control system pressure sensor signal
		Threshold	An excessively high voltage from the sensor is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (EVAP control system pressure sensor circuit is shorted)
- EVAP control system pressure sensor
- EVAP canister vent control valve
- EVAP canister
- Rubber hose from EVAP canister vent control valve to vehicle frame
- Sensor power supply 3

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Always perform test at a temperature of 5°C (41°F) or more.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

WITH CONSULT

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Turn ignition switch ON.
6. Select “DATA MONITOR” mode with CONSULT.
7. Check that “FUEL T/TMP SE” is more than 0°C (32°F).
8. Start engine and wait at least 20 seconds.
9. Check 1st trip DTC.

WITH GST

1. Start engine and warm it up to normal operating temperature.
2. Set voltmeter probes to ECM harness connector terminals under the following conditions.

ECM		
Connector	+	–
	Terminal	Terminal
E16	128 (Fuel tank temperature sensor signal)	152

3. Check that the voltage is less than 4.2 V.

4. Turn ignition switch OFF and wait at least 10 seconds.
5. Turn ignition switch ON.
6. Turn ignition switch OFF and wait at least 10 seconds.
7. Start engine and wait at least 20 seconds.
8. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1684, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798329

1.CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR CONNECTOR

1. Disconnect EVAP control system pressure sensor harness connector.
2. Check that water is not inside connectors.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace harness connector.

2.CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch ON.
2. Check the voltage between EVAP control system pressure sensor harness connector and ground.

EVAP control system pressure sensor		Ground	Voltage (V)
Connector	Terminal		
C32	3	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 3.

3.CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR POWER SUPPLY CIRCUIT-II

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EVAP control system pressure sensor harness connector and ECM harness connector.

EVAP control system pressure sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C32	3	E16	125	Existed

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open between ECM and EVAP control system pressure sensor
- Loose or poor connection for each connector and harness

>> Repair open circuit.

5.CHECK SENSOR POWER SUPPLY 3 CIRCUIT

Perform EC-1920, "Diagnosis Procedure".

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

6. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EVAP control system pressure sensor harness connector and ECM harness connector.

EVAP control system pressure sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C32	1	E16	148	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between EVAP control system pressure sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

8. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between EVAP control system pressure sensor harness connector and ECM harness connector.

EVAP control system pressure sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C32	2	E16	121	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 10.
NO >> GO TO 9.

9. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between EVAP control system pressure sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

10. CHECK RUBBER TUBE

1. Disconnect rubber tube connected to EVAP canister vent control valve. Refer to FL-17, "Exploded View".
2. Check the rubber tube for clogging.

Is the inspection result normal?

YES >> GO TO 11.
NO >> Clean the rubber tube using an air blower, repair or replace rubber tube.

11. CHECK EVAP CANISTER VENT CONTROL VALVE

Refer to EC-1670, "Component Inspection (EVAP Canister Vent Control Valve)".

Is the inspection result normal?

YES >> GO TO 12.

NO >> Replace EVAP canister vent control valve. Refer to FL-17, "Exploded View".

12. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR

Refer to EC-1678, "Component Inspection (EVAP Control System Pressure Sensor)".

Is the inspection result normal?

YES >> GO TO 13.
NO >> Replace EVAP control system pressure sensor. Refer to FL-19, "Exploded View".

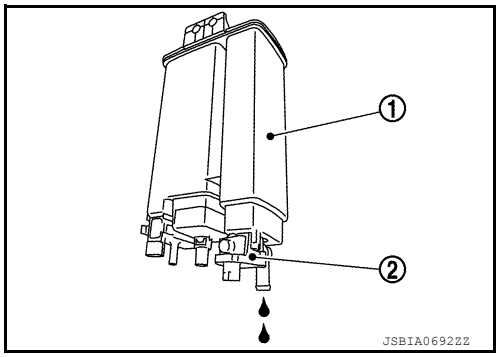
13. CHECK IF EVAP CANISTER IS SATURATED WITH WATER

1. Remove EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.
2. Check if water will drain from the EVAP canister (1).

- EVAP canister vent control valve (2)

Does water drain from EVAP canister?

YES >> GO TO 14.
NO >> INSPECTION END



14. CHECK EVAP CANISTER

Weigh the EVAP canister with the EVAP canister vent control valve and EVAP control system pressure sensor attached.

The weight should be less than 2.5 kg (5.5 lb).

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 15.

15. DETECT MALFUNCTIONING PART

Check the following.

- EVAP canister for damage
- EVAP hose between EVAP canister and vehicle frame for clogging or poor connection

>> Repair hose or replace EVAP canister. Refer to FL-14, "Exploded View".

Component Inspection (EVAP Control System Pressure Sensor)

INFOID:0000000013798330

1. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR

1. Turn ignition switch OFF.
2. Remove EVAP control system pressure sensor with its harness connector.
   Always replace O-ring with a new one.
3. Install a vacuum pump to EVAP control system pressure sensor.
4. Turn ignition switch ON and check output voltage between ECM harness connector terminals under the following conditions.

ECM			Condition [Applied vacuum kPa (kg/cm^2, psi)]	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
E16	121	148	Not applied	1.8 - 4.8
			-26.7 (-0.272, -3.87)	2.1 to 2.5 lower than above value

CAUTION:

- **Always calibrate the vacuum pump gauge when using it.**

- **Never apply below -93.3 kPa (-0.952 kg/cm^2, -13.53 psi) or pressure over 101.3 kPa (1.033 kg/cm^2, 14.69 psi).**

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace EVAP control system pressure sensor.

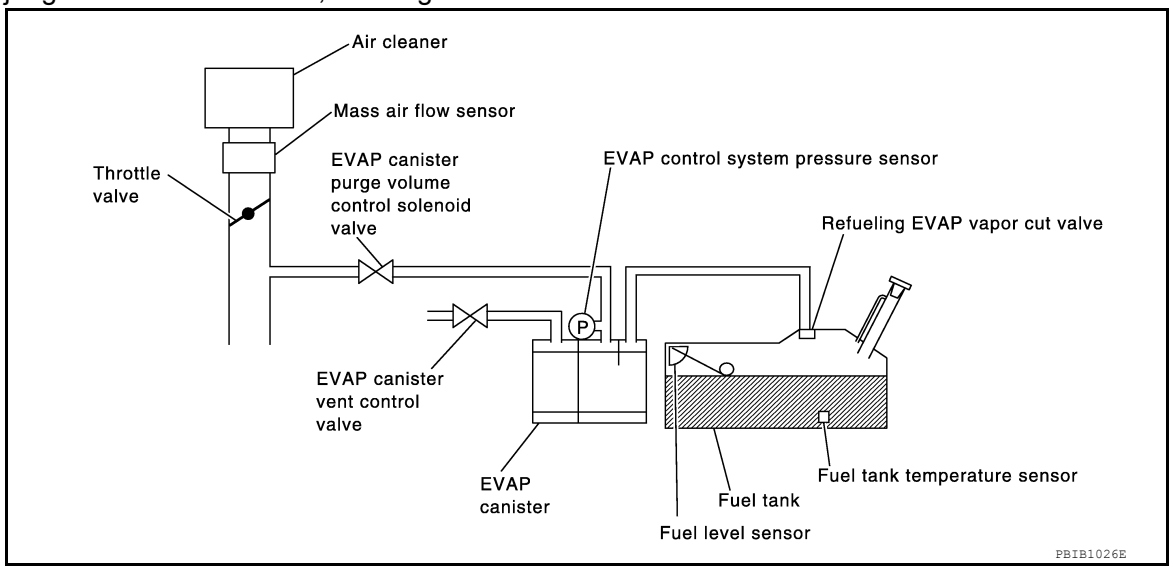
P0456 EVAP CONTROL SYSTEM

DTC Description

INFOID:0000000013798331

DTC DETECTION LOGIC

This diagnosis detects leaks in the EVAP line between fuel tank and EVAP canister purge volume control solenoid valve, using the negative pressure caused by decrease of fuel temperature in the fuel tank after turning ignition switch OFF.
If ECM judges there are no leaks, the diagnosis will be OK.



DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0456	EVAP VERY SML LEAK [Evaporative emission control system leak detected (very small leak)]	1	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	EVAP system has a leak
			Diagnosis delay time	—
		2	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	EVAP system does not operate properly
			Diagnosis delay time	—

CAUTION:

- **Use only a genuine NISSAN fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may illuminate.**
- **If the fuel filler cap is not tightened properly, the MIL may illuminate.**
- **Use only a genuine NISSAN rubber tube as a replacement.**

POSSIBLE CAUSE

- Incorrect fuel tank vacuum relief valve
- Incorrect fuel filler cap used
- Fuel filler cap remains open or does not close
- Foreign matter caught in fuel filler cap
- Leak is in line between intake manifold and EVAP canister purge volume control solenoid valve
- Foreign matter caught in EVAP canister vent control valve
- EVAP canister or fuel tank leaks
- EVAP purge line (pipe and rubber tube) leaks
- EVAP purge line rubber tube bent
- Loose or disconnected rubber tube
- EVAP canister vent control valve and the circuit
- EVAP canister purge volume control solenoid valve and the circuit

- Fuel tank temperature sensor
- O-ring of EVAP canister vent control valve is missing or damaged
- EVAP canister is saturated with water
- EVAP control system pressure sensor
- Refueling EVAP vapor cut valve
- ORVR system leaks
- Fuel level sensor and the circuit
- Foreign matter caught in EVAP canister purge volume control solenoid valve

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

Do you have CONSULT?

YES >> GO TO 2.
NO >> GO TO 4.

2.PERFORM DTC CONFIRMATION PROCEDURE-I

WITH CONSULT

1. Turn ignition switch ON and select “EVAP DIAG READY” in “DATA MONITOR” mode with CONSULT.
2. Start engine and wait at idle until “OFF” of “EVAP DIAG READY” changes to “ON”.
   NOTE:
   It will take at most 2 hours until “OFF” of “EVAP DIAG READY” changes to “ON”.
3. Turn ignition switch OFF and wait at least 90 minutes.
   NOTE:
   Never turn ignition switch ON during 90 minutes.
4. Turn ignition switch ON and select “EVAP LEAK DIAG” in “DATA MONITOR” mode with CONSULT.
5. Check that “EVAP LEAK DIAG” indication.

Which is displayed on CONSULT?

CMPLT >> GO TO 3.
YET >> Perform DTC CONFIRMATION PROCEDURE again. GO TO 1.

3.PERFORM DTC CONFIRMATION PROCEDURE-II

Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed toEC-1689, "Diagnosis Procedure".
NO >> INSPECTION END.

4.PERFORM DTC CONFIRMATION PROCEDURE

WITH GST

1. Start engine and wait engine idle for at least 2 hours.
2. Turn ignition switch OFF and wait at least 90 minutes.
   NOTE:
   Never turn ignition switch ON during 90 minutes.
3. Turn ignition switch ON.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1689, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

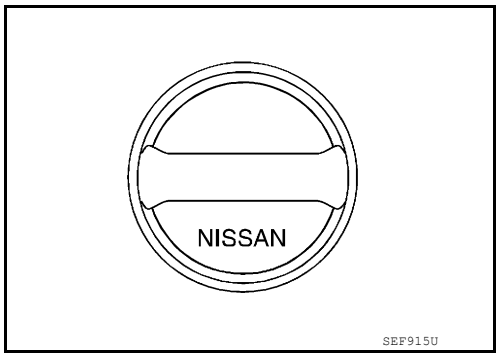
INFOID:0000000013798332

1.CHECK FUEL FILLER CAP DESIGN

1. Turn ignition switch OFF.
2. Check for genuine NISSAN fuel filler cap design.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace with genuine NISSAN fuel filler cap.



2.CHECK FUEL FILLER CAP INSTALLATION

Check that the cap is tightened properly by rotating the cap clockwise.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Open fuel filler cap, then clean cap and fuel filler neck threads using air blower. Then retighten until reteaching sound is heard.

3.CHECK FUEL FILLER CAP FUNCTION

Check for air releasing sound while opening the fuel filler cap.

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.CHECK FUEL TANK VACUUM RELIEF VALVE

Refer to EC-1693, "Component Inspection (Fuel Filler Cap)".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Replace fuel filler cap with a genuine one.

5.CHECK FOR EVAP LEAK

Refer to FL-15, "Inspection".

Is there any leak in EVAP line?

YES >> Repair or replace.
NO >> GO TO 6.

6.CHECK EVAP CANISTER VENT CONTROL VALVE

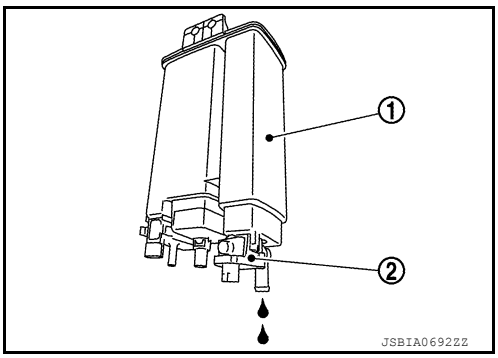
Check the following.
- EVAP canister vent control valve is installed properly.
  Refer to FL-17, "Exploded View".
- EVAP canister vent control valve.
  Refer to EC-1670, "Component Inspection (EVAP Canister Vent Control Valve)".

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace EVAP canister vent control valve and O-ring. Refer to FL-17, "Exploded View".

7.CHECK IF EVAP CANISTER SATURATED WITH WATER

1. Remove EVAP canister (1) with EVAP canister vent control valve (2) and EVAP control system pressure sensor attached.
2. Check if water will drain from the EVAP canister.



Does water drain from EVAP canister?

YES >> GO TO 8.
NO-1 >> With CONSULT: GO TO 10.
NO-2 >> Without CONSULT: GO TO 11.

8. CHECK EVAP CANISTER

Weigh the EVAP canister assembly with the EVAP canister vent control valve and EVAP control system pressure sensor attached. Refer to FL-17, "Exploded View" (EVAP canister vent control valve), FL-19, "Exploded View" (EVAP control system pressure sensor).

The weight should be less than 2.5 kg (5.5 lb).

Is the inspection result normal?

YES-1 >> With CONSULT: GO TO 10.
YES-2 >> Without CONSULT: GO TO 11.
NO >> GO TO 9.

9. DETECT MALFUNCTIONING PART

Check the following.

- EVAP canister for damage
- EVAP hose between EVAP canister and vehicle frame for clogging or poor connection

>> Repair hose or replace EVAP canister. Refer to FL-14, "Exploded View".

10. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE OPERATION

WITH CONSULT

1. Disconnect vacuum hose to EVAP canister purge volume control solenoid valve at EVAP service port.
2. Start engine and let it idle.
3. Select “PURG VOL CONT/V” in “ACTIVE TEST” mode.
4. Touch “Qu” on CONSULT screen to increase “PURG VOL CONT/V” opening to 100%.
5. Check vacuum hose for vacuum.

Vacuum should exist.

Is the inspection result normal?

YES >> GO TO 13.
NO >> GO TO 12.

11. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE OPERATION

WITHOUT CONSULT

1. Start engine and warm it up to normal operating temperature.
2. Stop engine.
3. Disconnect vacuum hose to EVAP canister purge volume control solenoid valve at EVAP service port.
4. Start engine and let it idle for at least 80 seconds.
5. Check vacuum hose for vacuum when revving engine up to 2,000 rpm.

Vacuum should exist.

Is the inspection result normal?

YES >> GO TO 13.
NO >> GO TO 12.

12. CHECK VACUUM HOSE

Check vacuum hoses for clogging or disconnection.

Is the inspection result normal?

YES >> GO TO 13.
NO >> Repair or reconnect the hose.

13. CHECK EVAP CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

Refer to EC-1664, "Component Inspection (EVAP Canister Purge Volume Control Solenoid Valve)".

Is the inspection result normal?

YES >> GO TO 14.
NO >> Replace EVAP canister purge volume control solenoid valve. Refer to EM-35, "Exploded View".

14. CHECK FUEL TANK TEMPERATURE SENSOR

Refer to EC-1608, "Component Inspection".

Is the inspection result normal?

YES >> GO TO 15.
NO >> Replace fuel level sensor unit. Refer to FL-6, "Removal and Installation".

15. CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR

Refer to EC-1678, "Component Inspection (EVAP Control System Pressure Sensor)".

Is the inspection result normal?

YES >> GO TO 16.
NO >> Replace EVAP control system pressure sensor. Refer to EC-1678, "Component Inspection (EVAP Control System Pressure Sensor)".

16. CHECK EVAP PURGE LINE

Check EVAP purge line (pipe, rubber tube, fuel tank and EVAP canister) for cracks or improper connection. Refer to FL-14, "Exploded View".

Is the inspection result normal?

YES >> GO TO 17.
NO >> Repair or reconnect the hose.

17. CLEAN EVAP PURGE LINE

Clean EVAP purge line (pipe and rubber tube) using air blower.

>> GO TO 18.

18. CHECK EVAP/ORVR LINE

Check EVAP/ORVR line between EVAP canister and fuel tank for clogging, kink, looseness and improper connection.

Is the inspection result normal?

YES >> GO TO 19.
NO >> Repair or replace hoses and tubes.

19. CHECK RECIRCULATION LINE

Check recirculation line between fuel filler tube and fuel tank for clogging, kink, cracks, looseness and improper connection.

Is the inspection result normal?

YES >> GO TO 20.
NO >> Repair or replace hose, tube or fuel filler tube. Refer to FL-9, "Exploded View".

20. CHECK REFUELING EVAP VAPOR CUT VALVE

Refer to EC-1914, "Component Inspection (EVAP Vapor Cut Valve)".

Is the inspection result normal?

YES >> GO TO 21.
NO >> Replace refueling EVAP vapor cut valve with fuel tank. Refer to FL-14, "Exploded View".

21. CHECK FUEL LEVEL SENSOR

Refer to MWI-94, "Component Inspection (Cummins 5.0L)" (TYPE A), MWI-172, "Component Inspection" (TYPE B).

Is the inspection result normal?

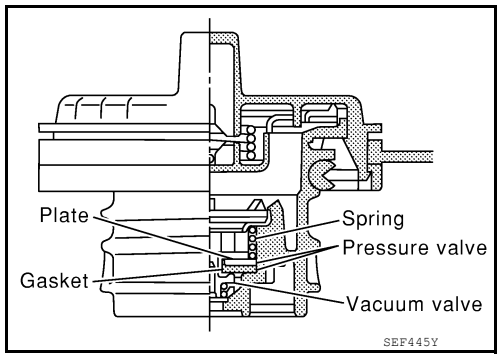
YES >> INSPECTION END
NO >> Replace fuel level sensor unit. Refer to FL-6, "Removal and Installation".

Component Inspection (Fuel Filler Cap)

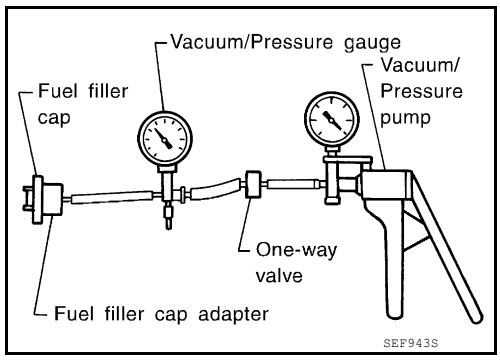
INFOID:0000000013798333

1. CHECK FUEL FILLER CAP

1. Turn ignition switch OFF.
2. Remove fuel filler cap.
3. Wipe clean valve housing.



4. Install fuel filler cap adapter (commercial service tool) to fuel filler cap.
5. Check valve opening pressure and vacuum.



Pressure: **15.3 - 20.0 kPa (0.156 - 0.204 kg/cm^2, 2.22 - 2.90 psi)**

Vacuum: **−6.0 to −3.3 kPa (−0.061 to −0.034 kg/cm^2, −0.87 to −0.48 psi)**

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2. REPLACE FUEL FILLER CAP

Replace fuel filler cap.

CAUTION:

Use only a genuine fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may illuminate.

>> INSPECTION END

P0460 FUEL LEVEL SENSOR

DTC Description

INFOID:0000000013798334

DTC DETECTION LOGIC

When the vehicle is parked, the fuel level in the fuel tank is naturally stable. It means that output signal of the fuel level sensor does not change. If ECM senses sloshing signal from the sensor, fuel level sensor malfunction is detected.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0460	FUEL LEV SEN SLOSH (Fuel level sensor “A” circuit)	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	Fuel level sensor signal
		Threshold	Even though the vehicle is parked, a signal being varied is sent from the fuel level sensor to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (The CAN communication line is open or shorted)
- Harness or connectors (The sensor circuit is open or shorted)
- Combination meter
- Fuel level sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P0460 is displayed with DTC UXXXX, first perform the trouble diagnosis for DTC UXXXX.
- If DTC P0460 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and wait maximum of 2 consecutive minutes.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1694, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798335

1.CHECK DTC PRIORITY

- If DTC P0460 is displayed with DTC UXXXX, first perform the trouble diagnosis for DTC UXXXX.
- If DTC P0460 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".

NO >> GO TO 2.

2.CHECK DTC WITH “COMBINATION METER”

Refer to MWI-27, "CONSULT Function (METER/M&A)" (TYPE A), MWI-131, "CONSULT Function (METER/M&A)" (TYPE B).

Is any DTC detected?

YES >> Perform trouble diagnosis of detected DTC.
NO >> GO TO 3.

3.CHECK FUEL LEVEL SENSOR SIGNAL CIRCUIT

Check fuel level sensor signal circuit. Refer to MWI-91, "Component Function Check (Cummins 5.0L)" (TYPE A), MWI-171, "Component Function Check" (TYPE B).

Is the inspection result normal?

YES >> INSPECTION END
NO >> Perform trouble diagnosis of fuel level sensor signal circuit. Refer to MWI-91, "Diagnosis Procedure (Cummins 5.0L)" (TYPE A), MWI-171, "Diagnosis Procedure" (TYPE B).

P0461 FUEL LEVEL SENSOR

DTC Description

INFOID:0000000013798336

DTC DETECTION LOGIC

Driving long distances naturally affect fuel gauge level.
This diagnosis detects the fuel gauge malfunction of the gauge not moving even after a long distance has been driven.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0461	FUEL LEVEL SENSOR (Fuel level sensor “A” circuit range/performance)	Diagnosis condition	—
		Signal (terminal)	Fuel level sensor signal
		Threshold	The output signal of the fuel level sensor does not change within the specified range even though the vehicle has been driven a long distance
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (The CAN communication line is open or shorted)
- Harness or connectors (The sensor circuit is open or shorted)
- Combination meter
- Fuel level sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P0461 is displayed with DTC UXXXX, first perform the trouble diagnosis for DTC UXXXX.
- If DTC P0461 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PERFORM COMPONENT FUNCTION CHECK

Perform Component Function Check. Refer to EC-1696, "Component Function Check".
Use component function check to check the overall function of the fuel level sensor. During this check, a 1st trip DTC might not be confirmed.

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> Proceed to EC-1697, "Diagnosis Procedure".

Component Function Check

INFOID:0000000013798337

1.CHECK DTC PRIORITY

- If DTC P0461 is displayed with DTC UXXXX, first perform the trouble diagnosis for DTC UXXXX.
- If DTC P0461 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

WARNING:

When performing the following procedure, always observe the handling of the fuel. Refer to FL-3, "General Precautions".
TESTING CONDITION:
Before starting component function check, preparation of draining fuel and refilling fuel is required.

>> GO TO 3.

3.PERFORM COMPONENT FUNCTION CHECK

NOTE:
Start from step 8, if it is possible to confirm that the fuel cannot be drained by 30 ℓ (7-7/8 US gal, 6-5/8 Imp gal) in advance.
1. Prepare a fuel container and a spare hose.
2. Release fuel pressure from fuel line. Refer to EC-1435, "Work Procedure".
3. Remove the fuel feed hose on the fuel level sensor unit. Refer to FL-6, "Removal and Installation".
4. Connect a spare fuel hose where the fuel feed hose was removed.
5. Turn ignition switch ON.
6. Drain fuel by 30 ℓ (7-7/8 US gal, 6-5/8 Imp gal) from the fuel tank using proper equipment.
7. Confirm that the fuel gauge indication varies.
8. Fill fuel into the fuel tank for 30 ℓ (7-7/8 US gal, 6-5/8 Imp gal).
9. Confirm that the fuel gauge indication varies.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Proceed to EC-1697, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798338

1.CHECK DTC PRIORITY

- If DTC P0461 is displayed with DTC UXXXX, first perform the trouble diagnosis for DTC UXXXX.
- If DTC P0461 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC WITH “COMBINATION METER”

Refer to MWI-27, "CONSULT Function (METER/M&A)" (TYPE A), MWI-131, "CONSULT Function (METER/M&A)" (TYPE B).

Is any DTC detected?

YES >> Perform trouble diagnosis of detected DTC.
NO >> GO TO 3.

3.CHECK FUEL LEVEL SENSOR SIGNAL CIRCUIT

Check fuel level sensor signal circuit. Refer to MWI-91, "Component Function Check (Cummins 5.0L)" (TYPE A), MWI-171, "Component Function Check" (TYPE B).

Is the inspection result normal?

YES >> INSPECTION END
NO >> Perform trouble diagnosis of fuel level sensor signal circuit. Refer to MWI-91, "Diagnosis Procedure (Cummins 5.0L)" (TYPE A), MWI-171, "Diagnosis Procedure" (TYPE B).

P0462, P0463 FUEL LEVEL SENSOR

DTC Description

INFOID:0000000013798339

DTC DETECTION LOGIC

This diagnosis indicates the former, to detect open or short circuit malfunction.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0462	FUEL LEVL SEN/CIRC (Fuel level sensor “A” circuit low)	Diagnosis condition	—
		Signal (terminal)	Fuel level sensor signal
		Threshold	An excessively low voltage from the sensor is sent to ECM
		Diagnosis delay time	—
P0463	FUEL LEVL SEN/CIRC (Fuel level sensor circuit “A” high)	Diagnosis condition	—
		Signal (terminal)	Fuel level sensor signal
		Threshold	An excessively high voltage from the sensor is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

P0462
- Harness or connectors (The CAN communication line is open or shorted)
- Harness or connectors (The sensor circuit is open or shorted)
- Combination meter
- Fuel level sensor

P0463
- Harness or connectors (The CAN communication line is open or shorted)
- Harness or connectors (The sensor circuit is open or shorted)
- Combination meter
- Fuel level sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P0462 or P0463 is displayed with DTC UXXXX, first perform the trouble diagnosis for DTC UXXXX.
- If DTC P0462 or P0463 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at ignition switch ON.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 5 seconds.

2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1699, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798340

1.CHECK DTC PRIORITY

- If DTC P0462 or P0463 is displayed with DTC UXXXX, first perform the trouble diagnosis for DTC UXXXX.
- If DTC P0462 or P0463 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform the diagnosis of the applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC WITH “COMBINATION METER”

Refer to MWI-27, "CONSULT Function (METER/M&A)" (TYPE A), MWI-131, "CONSULT Function (METER/M&A)" (TYPE B).

Is any DTC detected?

YES >> Perform trouble diagnosis of detected DTC.
NO >> GO TO 3.

3.CHECK FUEL LEVEL SENSOR SIGNAL CIRCUIT

Check fuel level sensor signal circuit. Refer to MWI-91, "Component Function Check (Cummins 5.0L)" (TYPE A), MWI-171, "Component Function Check" (TYPE B).

Is the inspection result normal?

YES >> INSPECTION END
NO >> Perform trouble diagnosis of fuel level sensor signal circuit. Refer to MWI-91, "Diagnosis Procedure (Cummins 5.0L)" (TYPE A), MWI-171, "Diagnosis Procedure" (TYPE B).

P0500 VSS

DTC Description

INFOID:0000000013798342

DTC DETECTION LOGIC

ECM receives vehicle speed signals from two different paths via CAN communication line: One is from the ABS actuator and electric unit (control unit) via the combination unit and the other is from TCM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0500	VEH SPEED SEN/CIRC (Vehicle speed sensor)	Diagnosis condition	• Selector lever: D position • Vehicle speed: 20 km/h (13 MPH) or more
		Signal (terminal)	—
		Threshold	At 20 km/h (13 MPH), ECM detects the following status continuouse: The difference between vehicle speed calculated by output speed sensor transmitted from TCM to ECM via CAN communication and vehicle speed indicated on the combination meter exceeds 15km/h (10 MPH).
		Diagnosis delay time	5 seconds or mor

POSSIBLE CAUSE

- Harness or connector
  (The CAN communication line is open or shorted.)
- Combination meter
- ABS actuator and electric unit (control unit)
- Wheel sensor
- TCM
- Output speed sensor

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0500	Vehicle speed sensor	The cooling fan operates (Highest) while engine is running.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P0500 is displayed with DTC UXXXX, first perform the trouble diagnosis for DTC UXXXX.
- If DTC P0500 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC CONFIRMATION PROCEDURE has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine.
2. Shift the selector lever to D range and wait at least for 2 seconds.

3. Drive the vehicle at least 5 seconds at 20 km/h (13 MPH) or more.
CAUTION:
Always drive vehicle at a safe speed.
NOTE:
This procedure may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1701, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798343

1.CHECK DTC PRIORITY

- If DTC P0500 is displayed with DTC UXXXX, first perform the trouble diagnosis for DTC UXXXX.
- If DTC P0500 is displayed with DTC P0607, first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC WITH TCM

Check DTC with TCM. Refer to TM-316, "CONSULT Function".

Is the inspection result normal?

YES >> GO TO 3.
NO >> Perform trouble shooting relevant to DTC indicated.

3.CHECK DTC WITH ABS ACTUATOR AND ELECTRIC UNIT (CONTROL UNIT)

Check DTC with ABS actuator and electric unit (control unit). Refer to BRC-55, "DTC Index".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Perform trouble shooting relevant to DTC indicated.

4.CHECK DTC WITH COMBINATION METER

Check DTC with combination meter. Refer to MWI-27, "CONSULT Function (METER/M&A)" (TYPE A), MWI-131, "CONSULT Function (METER/M&A)" (TYPE B).

Is the inspection result normal?

YES >> GO TO 5.
NO >> Perform trouble shooting relevant to DTC indicated.

5.CHECK OUTPUT SPEED SENSOR

Check output speed sensor. Refer to TM-380, "Diagnosis Procedure".

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace or replace error-detected parts.

6.CHECK WHEEL SENSOR

Check wheel sensor. Refer to BRC-91, "DTC Description".

Is the inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Replace or replace error-detected parts.

P0506 ISC SYSTEM

DTC Description

INFOID:0000000013798345

DTC DETECTION LOGIC

The ECM controls the engine idle speed to a specified level through the fine adjustment of the air, which is let into the intake manifold, by operating the electric throttle control actuator. The operating of the throttle valve is varied to allow for optimum control of the engine idling speed. The crankshaft position sensor detects the actual engine speed and sends a signal to the ECM.
The ECM controls the electric throttle control actuator so that the engine speed coincides with the target value memorized in the ECM. The target engine speed is the lowest speed at which the engine can operate steadily. The optimum value stored in the ECM is determined by taking into consideration various engine conditions, such as during warming up, deceleration and engine load (air conditioner, power steering and cooling fan operation, etc.).

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0506	ISC SYSTEM (Idle speed control system RPM lower than expected)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The idle speed is less than the target idle speed by 100 rpm or more.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Electric throttle control actuator
- Intake air leakage

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0506 is displayed with other DTC, first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

If the target idle speed is out of the specified value, perform EC-1430, "Description", before conducting DTC Confirmation Procedure.
TESTING CONDITION:

- **Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.**
- **Always perform the test at a temperature above −10°C (14°F).**

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Restart engine and run it for at least 1 minute at idle speed.
6. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1703, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798346

1.CHECK DTC PRIORITY

If DTC P0506 is displayed with other DTC, first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK INTAKE AIR LEAKAGE

1. Start engine and let it idle.
2. Listen for an intake air leakage after the mass air flow sensor.

Is intake air leakage detected?

YES >> Discover air leakage location and repair.
NO >> GO TO 3.

3.REPLACE ECM

1. Stop engine.
2. Replace ECM.
3. Perform additional service when replacing ECM. Refer to EC-1424, "Description".

>> INSPECTION END

P0507 ISC SYSTEM

DTC Description

INFOID:0000000013798348

DTC DETECTION LOGIC

The ECM controls the engine idle speed to a specified level through the fine adjustment of the air, which is let into the intake manifold, by operating the electric throttle control actuator. The operating of the throttle valve is varied to allow for optimum control of the engine idling speed. The crankshaft position sensor detects the actual engine speed and sends a signal to the ECM.
The ECM controls the electric throttle control actuator so that the engine speed coincides with the target value memorized in the ECM. The target engine speed is the lowest speed at which the engine can operate steadily. The optimum value stored in the ECM is determined by taking into consideration various engine conditions, such as during warming up, deceleration and engine load (air conditioner, power steering and cooling fan operation, etc.).

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0507	ISC SYSTEM (Idle speed control system RPM higher than expected)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The idle speed is more than the target idle speed by 200 rpm or more.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Electric throttle control actuator
- Intake air leakage
- PCV system

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P0507 is displayed with other DTC, first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

If the target idle speed is out of the specified value, perform EC-1430, "Description", before conducting DTC Confirmation Procedure.

TESTING CONDITION:

- **Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.**
- **Always perform the test at a temperature above −10°C (14°F).**

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and warm it up to normal operating temperature.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start engine and run it for at least 1 minute at idle speed.
6. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1705, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798349

1.CHECK DTC PRIORITY

If DTC P0507 is displayed with other DTC, first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK PCV HOSE CONNECTION

Confirm that PCV hose is connected correctly.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace malfunctioning part.

3.CHECK INTAKE AIR LEAKAGE

1. Start engine and let it idle.
2. Listen for an intake air leakage after the mass air flow sensor.

Is intake air leakage detected?

YES >> Discover air leakage location and repair.
NO >> GO TO 4.

4.REPLACE ECM

1. Stop engine.
2. Replace ECM.
3. Perform additional service when replacing ECM. Refer to EC-1424, "Description".

>> INSPECTION END

P050A, P050B, P050E COLD START CONTROL

DTC Description

INFOID:0000000013798351

DTC DETECTION LOGIC

ECM controls ignition timing and engine idle speed when engine is started with pre-warming up condition. This control promotes the activation of three way catalyst by heating the catalyst and reduces emissions.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P050A	Cold start idle air control system performance	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	ECM does not control engine idle speed properly when engine is started with pre-warming up condition.
		Diagnosis delay time	—
P050B	Cold start ignition timing performance	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	ECM does not control ignition timing properly when engine is started with pre-warming up condition.
		Diagnosis delay time	—
P050E	Cold start engine exhaust temperature too low	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The temperature of the catalyst inlet does not rise to the proper temperature when the engine is started with pre-warming up condition.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Lack of intake air volume
- Fuel injection system
- ECM

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P050A, P050B or P050E is displayed with other DTC, first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 11 V at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

With CONSULT
1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Select “DATA MONITOR” mode with CONSULT.
4. Check the indication of “COOLAN TEMP/S”.

With GST
Follow the procedure “With CONSULT” above.

Is the value of “COOLAN TEMP/S” between 4°C (39°F) and 36°C (97°F)?

YES >> GO TO 4.
NO-1 [If it is below 4°C (39°F)]>>Warm up the engine until the value of “COOLAN TEMP/S” reaches 15°C (59°F) or more. Retry from step 1.
NO-2 [If it is above 36°C (97°F)]>>Cool engine down to less than 36°C (97°F). Retry from step 1.

4. PERFORM DTC CONFIRMATION PROCEDURE-II

With CONSULT
1. Set the select lever in N range.
2. Start the engine and warm up in idle with the value of “COOLAN TEMP/S” between 4°C (39°F) and 40°C (104°F) for more than 15 seconds.
3. Check 1st trip DTC.

With GST
Follow the procedure “With CONSULT” above.

Is 1st trip DTC detected?

YES >> Proceed to EC-1707, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798352

1. CHECK DTC PRIORITY

If DTC P050A, P050B or P050E is displayed with other DTC, first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2. PERFORM IDLE AIR VOLUME LEARNING

Perform EC-1430, "Description".

Is Idle Air Volume Learning carried out successfully?

YES >> GO TO 3.
NO >> Follow the instruction of Idle Air Volume Learning.

3. CHECK INTAKE SYSTEM

Check for the cause of intake air volume lacking. Refer to the following.
- Crushed intake air passage
- Intake air passage clogging
- Clogging of throttle body

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace malfunctioning part

4. CHECK FUEL INJECTION SYSTEM FUNCTION

Perform DTC Confirmation Procedure for DTC P0171, P0174. Refer to EC-1597, "DTC Description".

Is the inspection result normal?

YES >> GO TO 5.
NO >> Go to EC-1599, "Diagnosis Procedure" for DTC P0171, P0174.

5. PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.

2. Erase DTC.
3. Perform DTC Confirmation Procedure.
   See EC-1706, "DTC Description".

Is the 1st trip DTC P050A, P050B or P050E displayed again?

YES >> GO TO 6.
NO >> INSPECTION END

6. REPLACE ECM

1. Replace ECM.
2. Go to EC-1933, "Removal and Installation".

>> INSPECTION END

P0520 EOP SENSOR

DTC Description

INFOID:0000000013798353

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0520	EOP sensor circuit	Diagnosis condition	Ignition switch ON
		Signal (terminal)	EOP sensor signal
		Threshold	Signal voltage from the EOP sensor remains at more than 4.9 V / less than 0.26 V.
		Diagnosis delay time	5 seconds or more

POSSIBLE CAUSE

- Harness or connectors
  (EOP sensor circuit is open or shorted.)
- Engine oil level abnormality
- EOP sensor
- Power steering pressure sensor
- FRP sensor
- Sensor power suplly 3

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 5 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1709, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798354

1.CHECK ENGINE OIL

1. Turn ignition switch OFF.
2. Check engine oil level and pressure. Refer to LU-9, "Inspection".

Is inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace error-detected parts.

2.CHECK EOP SENSOR POWER SUPPLY-I

1. Disconnect EOP sensor connector.
2. Turn ignition switch ON.
3. Check the voltage between EOP sensor harness connector terminals.

EOP sensor			Voltage (Approx.)
Connector	+	–	
	terminal		
F229	3	1	5 V

Inspection result normal?

YES >> GO TO 7.
NO >> GO TO 3.

3.CHECK EOP SENSOR POWER SUPPLY-II

Check the voltage between EOP sensor harness connector and the ground.

+		–	Voltage (Approx.)
EOP sensor			
Connector	Terminal		
F229	3	Ground	5 V

Is inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.CHECK SENSOR POWER SUPPLY 3 CIRCUIT

Perform EC-1920, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

5.CHECK EOP SENSOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EOP sensor harness connector and ECM harness connector.

+		–		Continuity
EOP sensor		ECM		
Connector	Terminal	Connector	Terminal	
F229	1	F78	13	Existed

Is inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK ECM GROUND CIRCUIT

Check the continuity between ECM harness connector and ground.

ECM		Ground	Continuity
Connector	Terminal		
E16	147	Ground	Existed
	149		
	152		

Is inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

7.CHECK EOP SENSOR SIGNAL CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EOP sensor harness connector and ECM harness connector.

+		–		Continuity
EOP sensor		ECM		
Connector	Terminal	Connector	Terminal	
F229	2	F78	23	Existed

4. Also check harness for short to ground and to power.

Is inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.CHECK EOP SENSOR

Refer to EC-1711, "Component Inspection (EOP sensor)".

Is inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

Component Inspection (EOP sensor)

INFOID:0000000013798355

1.CHECK EOP SENSOR

1. Turn ignition switch OFF.
2. Disconnect EOP sensor harness connector.
3. Check resistance between EOP sensor connector terminals.

+	–	Condition	Resistance (kΩ)
EOP sensor			
Terminal			
1	2	None	4 kΩ – 10 kΩ
	3		2 kΩ – 8 kΩ
2	1		4 kΩ – 10 kΩ
	3		1 kΩ – 3 kΩ
3	1		2 kΩ – 8 kΩ
	2		1 kΩ – 3 kΩ

Is the inspection result normal?

YES >> INSPECTION END.
NO >> Replace EOP sensor. Refer to EM-64, "Exploded View".

P0527 COOLING FAN SPEED SENSOR

DTC Description

INFOID:0000000013798356

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0527	Coofan clutch assemblyling fan speed sensor circuit range/performance	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	Cooling fan speed sensor signal
		Threshold	The number of fan speed signals is 16 rpm or less during engine rev.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
  (The fan clutch assembly circuit is open or shorted)
- Fan clutch assembly
- Cooling fan
- IPDM E/R
- Sensor power supply 2

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and warm it up to the normal operating temperature.
2. Keep the engine speed approximately 1,000 rpm at no load.
3. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1712, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798357

1.CHECK COOLING FAN SPEED SENSOR POWER SUPPLY CIRCUIT-I

1. Turn ignition switch OFF.
2. Disconnect the fan clutch assembly harness connector.
3. Turn ignition switch ON.
4. Check the voltage between the fan clutch assembly harness connector terminals.

Fan clutch assembly			Voltage (Approx.)
Connector	+	–	
	terminal		
F152	2	4	5 V

Is inspection result normal?

YES >> GO TO 6.
NO >> GO TO 2.

2.CHECK COOLING FAN SPEED SENSOR POWER SUPPLY CIRCUIT-II

1. Check the voltage between the fan clutch assembly harness connector and the ground.

+		–	Voltage (Approx.)
Fan clutch assembly			
Connector	terminal		
F152	2	Ground	5 V

Is inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.CHECK SENSOR POWER SUPPLY 2 CIRCUIT

Perform EC-1918, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

4.CHECK COOLING FAN SPEED SENSOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between the fan clutch assembly harness connector and ECM harness connector.

+		–		Continuity
Fan clutch assembly		ECM		
Connector	Terminal	Connector	Terminal	
F152	4	F78	43	Existed

Is inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK ECM GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between ECM harness connector and the ground.

+		–	Continuity
ECM			
Connector	Terminal		
E16	147	Ground	Existed
	149		
	152		

Is inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

6.CHECK COOLING FAN SPEED SENSOR SIGNAL CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between fan clutch assembly harness connector and ECM harness connector.

+		–		Continuity
Fan clutch assembly		ECM		
Connector	Terminal	Connector	Terminal	
F152	5	F78	31	Existed

4. Also check harness for short to ground and to power.

Is inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7.CHECK COOLING FAN SPEED SENSOR

1. Reconnect all harness connectors disconnected.
2. Perform cooling fan speed sensor component inspection. Refer to EC-1714, "Component Inspection (Cooling Fan Speed Sensor)".

Is inspection result normal?

YES >> GO TO 8.
NO >> Replace the fan clutch assembly.

8.CHECK COOLING FAN ROTATIONAL CONDITION

Rotate the cooling fan by hand.

Dose the cooling fan rotates smoothly?

YES >> GO TO 9.
NO >> Check that the cooling fan is not interfered with other parts.

9.CHECK FAN CLUTCH ASSEMBLY CLUTCH ASSEMBLY SYSTEM

Refer to EC-1886, "Diagnosis Procedure".

Is inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

Component Inspection (Cooling Fan Speed Sensor)

INFOID:0000000013798358

1.CHECK COOLING FAN SPEED SENSOR

1. Turn ignition switch OFF.
2. Disconnect fan clutch assembly harness connector.
3. Rotate the fan clutch assembly slowly with hand and check the voltage between fan clutch assembly connector terminals under the following conditions.

+	–	Condition	Voltage (V) (Approx.)
Fan clutch assembly			
Terminal			
5	4	• 5V direct current supply to terminal 2 • Terminal 4 connect to ground	0 ⇔ 5 **NOTE:** The voltage is in waveform

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace the fan clutch assembly.

P0544, P0545 EXHAUST GAS TEMPERATURE SENSOR

DTC Description

INFOID:0000000013798359

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0544	EXHAUST GAS TEMP SENSOR 1 B1 (Exhaust gas temperature sensor circuit bank 1 sensor 1)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Exhaust gas temperature sensor signal
		Threshold	ECM detects that a voltage signal from exhaust gas temperature sensor is less than 0.025 V.
		Diagnosis delay time	5 seconds or more
P0545	EXHAUST GAS TEMP SENSOR 1 B1 (Exhaust gas temperature sensor circuit low bank 1 sensor 1)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Exhaust gas temperature sensor signal
		Threshold	ECM detects that a voltage signal from exhaust gas temperature sensor is less than 0.209 V.
		Diagnosis delay time	5 seconds or more

POSSIBLE CAUSE

- Harness or connectors
  (Exhaust gas temperature sensor circuit is shorted.)
- Exhaust gas temperature sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TEST CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 11 V.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 5 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1715, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798360

1.CHECK EXHAUST GAS TEMPERATURE SENSOR

With CONSULT

1. Turn ignition switch ON.
2. Select “EXHAUST GAS TEMP SEN 1 B1” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
3. Start engine and warm it up to normal operating temperature.

4. Check that “EXHAUST GAS TEMP SEN 1 B1” indication as follows.

Monitor item	Condition	Value
EXHAUST GAS TEMP SEN 1 B1	• Warm-up condition • Idle speed	1,290 – 2,940 mV

Without CONSULT

1. Start engine and warm it up to normal operating temperature.
2. Check that voltage between ECM harness connector terminals as follows.

ECM			Condition	Voltage
Connector	+	–		
	Terminal			
F78	19	43	• Warm-up condition • Idle speed	1.29 – 2.94 V

Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace exhaust gas temperature sensor. Refer to EM-45, "Exploded View".

2.CHECK EXHAUST GAS TEMPERATURE SENSOR POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect exhaust gas temperature sensor harness connector.
3. Turn ignition switch ON.
4. Check the voltage between exhaust gas temperature sensor harness connector terminal and ground.

+		–	Voltage (Approx.)
Exhaust gas temperature sensor			
Connector	Terminal		
F100	1	Ground	5 V

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 4.

3.CHECK EXHAUST GAS TEMPERATURE SENSOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between exhaust gas temperature sensor harness connector and ECM harness connector.

+		–		Continuity
Exhaust gas temperature sensor		ECM		
Connector	Terminal	Connector	Terminal	
F100	2	F78	43	Existed

4. Also check harness for short to power.

Is the inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

4.CHECK EXHAUST GAS TEMPERATURE SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between exhaust gas temperature sensor harness connector and ECM harness connector.

+		–		
Exhaust gas temperature sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F100	1	F78	19	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for ECM power supply circuit. Refer to EC-1457, "Diagnosis Procedure".

NO >> Repair or replace error-detected parts.

P0546, P2081 EXHAUST GAS TEMPERATURE SENSOR

DTC Description

INFOID:0000000013798361

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0546	EXHAUST GAS TEMP SENSOR 1 B1 (Exhaust gas temperature sensor circuit high bank 1 sensor 1)	Diagnosis condition	—
		Signal (terminal)	Exhaust gas temperature sensor signal
		Threshold	ECM detects that a voltage signal from exhaust gas temperature sensor is more than 4.84 V.
		Diagnosis delay time	5 seconds or more
P2081	EXHAUST GAS TEMP SENSOR 1 B1 (Exhaust gas temperature sensor circuit intermittent bank 1 sensor 1)	Diagnosis condition	—
		Signal (terminal)	Exhaust gas temperature sensor signal
		Threshold	ECM detects that a voltage signal from exhaust gas temperature sensor is 4.84 V or more.
		Diagnosis delay time	5 seconds or more

POSSIBLE CAUSE

- Harness or connectors
  (Exhaust gas temperature sensor circuit is open.)
- Exhaust gas temperature sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING-1

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TEST CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 11 V at idle.

>> GO TO 2.

2.PRECONDITIONING-2

With CONSULT

1. Turn ignition switch ON.
2. Select “COOLANT TEMP/S” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
3. Check the following conditions:

COOLANT TEMP/S	More than −30°C (−22°F)

With GST

Follow the procedure “With CONSULT” above.

Is the condition satisfied?

YES >> GO TO 4.
NO >> GO TO 3.

3.PRECONDITIONING-3

With CONSULT
1. Start the engine until the following condition is satisfied.

COOLANT TEMP/S	More than −30°C (−22°F)

2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.

With GST
Follow the procedure “With CONSULT” above.

>> GO TO 4.

4. PERFORM DTC CONFIRMATION PROCEDURE

1. Shift the selector lever to P range.
2. Start engine and let it idle for at least 20 seconds.
3. Depress the accelerator pedal for 5 seconds or more.
   NOTE:
   Do not release the accelerator pedal during DTC confirmation procedure.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1719, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798362

1. CHECK EXHAUST GAS TEMPERATURE SENSOR

With CONSULT
1. Turn ignition switch ON.
2. Select “EXHAUST GAS TEMP SEN 1 B1” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
3. Start engine and warm it up to normal operating temperature.
4. Check that “EXHAUST GAS TEMP SEN 1 B1” indication as follows.

Monitor item	Condition	Value
EXHAUST GAS TEMP SEN 1 B1	• Warm-up condition • Idle speed	1,290 – 2,940 mV

Without CONSULT
1. Start engine and warm it up to normal operating temperature.
2. Check that voltage between ECM harness connector terminals as follows.

ECM			Condition	Voltage
Connector	+	–		
	Terminal			
F78	19	43	• Warm-up condition • Idle speed	1.29 – 2.94 V

Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace exhaust gas temperature sensor. Refer to EM-45, "Exploded View".

2. CHECK EXHAUST GAS TEMPERATURE SENSOR POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect exhaust gas temperature sensor harness connector.
3. Turn ignition switch ON.
4. Check the voltage between exhaust gas temperature sensor harness connector terminal and ground.

+		–	Voltage (Approx.)
Exhaust gas temperature sensor			
Connector	Terminal		
F100	1	Ground	5 V

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 4.

3. CHECK EXHAUST GAS TEMPERATURE SENSOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between exhaust gas temperature sensor harness connector and ECM harness connector.

+		–		Continuity
Exhaust gas temperature sensor		ECM		
Connector	Terminal	Connector	Terminal	
F100	2	F78	43	Existed

4. Also check harness for short to power.

Is the inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

4. CHECK EXHAUST GAS TEMPERATURE SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between exhaust gas temperature sensor harness connector and ECM harness connector.

+		–		Continuity
Exhaust gas temperature sensor		ECM		
Connector	Terminal	Connector	Terminal	
F100	1	F78	19	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for ECM power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

P0547, P0548 EXHAUST GAS TEMPERATURE SENSOR

DTC Description

INFOID:0000000013798363

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0547	EXHAUST GAS TEMP SENSOR 1 B2 (Exhaust gas temperature sensor circuit bank 2 sensor 1)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Exhaust gas temperature sensor signal
		Threshold	ECM detects that a voltage signal from exhaust gas temperature sensor is less than 0.025 V.
		Diagnosis delay time	5 seconds or more
P0548	EXHAUST GAS TEMP SENSOR 1 B2 (Exhaust gas temperature sensor circuit low bank 2 sensor 1)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	Exhaust gas temperature sensor signal
		Threshold	ECM detects that a voltage signal from exhaust gas temperature sensor is less than 0.209 V.
		Diagnosis delay time	5 seconds or more

POSSIBLE CAUSE

- Harness or connectors
  (Exhaust gas temperature sensor circuit is shorted.)
- Exhaust gas temperature sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TEST CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 11 V.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 5 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1721, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798364

1.CHECK EXHAUST GAS TEMPERATURE SENSOR

With CONSULT

1. Turn ignition switch ON.
2. Select “EXHAUST GAS TEMP SEN 1 B2” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
3. Start engine and warm it up to normal operating temperature.

4. Check that “EXHAUST GAS TEMP SEN 1 B2” indication as follows.

Monitor item	Condition	Value
EXHAUST GAS TEMP SEN 1 B2	• Warm-up condition • Idle speed	1,290 – 2,940 mV

Without CONSULT

1. Start engine and warm it up to normal operating temperature.
2. Check that voltage between ECM harness connector terminals as follows.

ECM			Condition	Voltage
Connector	+	–		
	Terminal			
F78	17	43	• Warm-up condition • Idle speed	1.29 – 2.94 V

Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace exhaust gas temperature sensor. Refer to EM-45, "Exploded View".

2.CHECK EXHAUST GAS TEMPERATURE SENSOR POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect exhaust gas temperature sensor harness connector.
3. Turn ignition switch ON.
4. Check the voltage between exhaust gas temperature sensor harness connector terminal and ground.

+		–	Voltage (Approx.)
Exhaust gas temperature sensor			
Connector	Terminal		
F89	1	Ground	5 V

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 4.

3.CHECK EXHAUST GAS TEMPERATURE SENSOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between exhaust gas temperature sensor harness connector and ECM harness connector.

+		–		Continuity
Exhaust gas temperature sensor		ECM		
Connector	Terminal	Connector	Terminal	
F89	2	F78	43	Existed

4. Also check harness for short to power.

Is the inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

4.CHECK EXHAUST GAS TEMPERATURE SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between exhaust gas temperature sensor harness connector and ECM harness connector.

+		–		
Exhaust gas temperature sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F89	1	F78	17	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for ECM power supply circuit. Refer to EC-1457, "Diagnosis Procedure".

NO >> Repair or replace error-detected parts.

P0549, P2083 EXHAUST GAS TEMPERATURE SENSOR

DTC Description

INFOID:0000000013798365

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0549	EXHAUST GAS TEMP SENSOR 1 B2 (Exhaust gas temperature sensor circuit high bank 2 sensor 1)	Diagnosis condition	—
		Signal (terminal)	Exhaust gas temperature sensor signal
		Threshold	ECM detects that a voltage signal from exhaust gas temperature sensor is more than 4.84 V.
		Diagnosis delay time	5 seconds or more
P2083	EXHAUST GAS TEMP SENSOR 1 B2 (Exhaust gas temperature sensor circuit intermittent bank 2 sensor 1)	Diagnosis condition	—
		Signal (terminal)	Exhaust gas temperature sensor signal
		Threshold	ECM detects that a voltage signal from exhaust gas temperature sensor is 4.84 V or more.
		Diagnosis delay time	5 seconds or more

POSSIBLE CAUSE

- Harness or connectors
  (Exhaust gas temperature sensor circuit is open.)
- Exhaust gas temperature sensor

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING-1

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TEST CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 11 V at idle.

>> GO TO 2.

2.PRECONDITIONING-2

With CONSULT

1. Turn ignition switch ON.
2. Select “COOLANT TEMP/S” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
3. Check the following conditions:

COOLANT TEMP/S	More than −30°C (−22°F)

With GST

Follow the procedure “With CONSULT” above.

Is the condition satisfied?

YES >> GO TO 4.
NO >> GO TO 3.

3.PRECONDITIONING-3

With CONSULT
1. Start the engine until the following condition is satisfied.

COOLANT TEMP/S	More than −30°C (−22°F)

2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.

With GST
Follow the procedure “With CONSULT” above.

>> GO TO 4.

4. PERFORM DTC CONFIRMATION PROCEDURE

1. Shift the selector lever to P range.
2. Start engine and let it idle for at least 20 seconds.
3. Depress the accelerator pedal for 5 seconds or more.
   NOTE:
   Do not release the accelerator pedal during DTC confirmation procedure.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1725, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798366

1. CHECK EXHAUST GAS TEMPERATURE SENSOR

With CONSULT
1. Turn ignition switch ON.
2. Select “EXHAUST GAS TEMP SEN 1 B2” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
3. Start engine and warm it up to normal operating temperature.
4. Check that “EXHAUST GAS TEMP SEN 1 B2” indication as follows.

Monitor item	Condition	Value
EXHAUST GAS TEMP SEN 1 B2	• Warm-up condition • Idle speed	1,290 – 2,940 mV

Without CONSULT
1. Start engine and warm it up to normal operating temperature.
2. Check that voltage between ECM harness connector terminals as follows.

ECM			Condition	Voltage
Connector	+	–		
	Terminal			
F78	17	43	• Warm-up condition • Idle speed	1.29 – 2.94 V

Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace exhaust gas temperature sensor. Refer to EM-45, "Exploded View".

2. CHECK EXHAUST GAS TEMPERATURE SENSOR POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect exhaust gas temperature sensor harness connector.
3. Turn ignition switch ON.
4. Check the voltage between exhaust gas temperature sensor harness connector terminal and ground.

+		–	Voltage (Approx.)
Exhaust gas temperature sensor			
Connector	Terminal		
F89	1	Ground	5 V

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 4.

3. CHECK EXHAUST GAS TEMPERATURE SENSOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between exhaust gas temperature sensor harness connector and ECM harness connector.

+		–		Continuity
Exhaust gas temperature sensor		ECM		
Connector	Terminal	Connector	Terminal	
F89	2	F78	43	Existed

4. Also check harness for short to power.

Is the inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

4. CHECK EXHAUST GAS TEMPERATURE SENSOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between exhaust gas temperature sensor harness connector and ECM harness connector.

+		–		Continuity
Exhaust gas temperature sensor		ECM		
Connector	Terminal	Connector	Terminal	
F89	1	F78	17	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for ECM power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

P0550 PSP SENSOR

DTC Description

INFOID:0000000013798367

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0550	PW ST P SEN/CIRC (Power steering pressure sensor circuit)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	Power steering pressure sensor signal
		Threshold	An excessively low or high voltage from the sensor is sent to ECM.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
  (The Power steering pressure sensor circuit is open or shorted)
- Power steering pressure sensor
- Sensor power supply 3

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the engine and let it idle for at least 5 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1727, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798368

1.CHECK POWER STEERING PRESSURE SENSOR POWER SUPPLY CIRCUIT-I

1. Turn ignition switch OFF.
2. Disconnect power steering pressure (PSP) sensor harness connector.
3. Turn ignition switch ON.
4. Check the voltage between PSP sensor harness connector terminals.

PSP sensor			Voltage (Approx.)
Connector	+	–	
	terminal		
F82	3	1	5 V

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 2.

2.CHECK POWER STEERING PRESSURE SENSOR POWER SUPPLY CIRCUIT-II

1. Check the voltage between PSP sensor harness connector and the ground.

+		–	Voltage (Approx.)
PSP sensor			
Connector	terminal		
F82	3	Ground	5 V

Is inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.CHECK SENSOR POWER SUPPLY 3 CIRCUIT

Perform EC-1920, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

4.CHECK PSP SENSOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between PSP sensor harness connector and ECM harness connector.

+		–		Continuity
PSP sensor		ECM		
Connector	Terminal	Connector	Terminal	
F82	1	F78	13	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK ECM GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between ECM harness connector and the ground.

+		–	Continuity
ECM			
Connector	Terminal		
E16	147	Ground	Existed
	149		
	152		

Is inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Repair or replace error-detected parts.

6.CHECK PSP SENSOR SIGNAL CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between PSP sensor harness connector and ECM harness connector.

+		–		Continuity
PSP sensor		ECM		
Connector	Terminal	Connector	Terminal	
F82	2	F78	24	Existed

4. Also check harness for short to ground and to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7.CHECK PSP SENSOR

Refer to EC-1729, "Component Inspection (Power Steering Pressure Sensor)".

Is the inspection result normal?

YES >> GO TO 8.
NO >> Replace PSP sensor.

8.CHECK INTERMITTENT INCIDENT

Refer to GI-43, "Intermittent Incident".

>> INSPECTION END

Component Inspection (Power Steering Pressure Sensor)

INFOID:0000000013798369

1.CHECK POWER STEERING PRESSURE SENSOR

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Start engine and let it idle.
4. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition		Voltage (V)
Connector	+	–			
	Terminal	Terminal			
F78	24	13	Steering wheel	Being turned	0.5 - 4.5
				Not being turned	0.4 - 0.8

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace power steering pressure sensor.

P0603 ECM

DTC Description

INFOID:0000000013798370

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P0603	ECM BACK UP CIRCUIT [Internal control module keep alive memory (KAM) error]	1	Diagnosis condition	Ignition switch ON
			Signal (terminal)	—
			Threshold	Malfunction in the internal back up RAM of ECM
			Diagnosis delay time	—
		2	Diagnosis condition	Ignition switch ON
			Signal (terminal)	—
			Threshold	Malfunction in the internal EEP-ROM system of ECM
			Diagnosis delay time	—

POSSIBLE CAUSE

- ECM power supply
- ECM

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0603	ECM	Engine torque may be limited.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more with ignition switch ON.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 1 second.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Repeat step 1 and 2 for 10 times.
4. Turn ignition switch ON.
5. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1730, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798371

1.CHECK ECM POWER SUPPLY AND GROUND CIRCUIT

Perform trouble diagnosis for ECM power supply and ground circuit. Refer to EC-1457, "Diagnosis Procedure".

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace error-detected parts.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC confirmation procedure. Refer to EC-1730, "DTC Description".

Is the 1st trip DTC P0603 displayed again?

YES >> Replace ECM. Refer to EC-1933, "Removal and Installation".
NO >> INSPECTION END

P0604 ECM

DTC Description

INFOID:0000000013798372

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0604	ECM [Internal control module random access memory (RAM) error]	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	Malfunction in the internal RAM of ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

ECM

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0604	ECM	• ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (Approx. 5 decrees) by the return spring. • The position of the following components is fixed. - Intake valve timing control solenoid valve - Exhaust valve timing control solenoid valve • ASCD operation may be deactivated.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more with ignition switch ON.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON (engine stopped) and wait least 20 minutes.
   CAUTION:
   Never start engine during this procedure.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1732, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798373

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC confirmation procedure. Refer to EC-1732, "DTC Description".

Is the 1st trip DTC P0604 displayed again?

YES >> Replace ECM. Refer to EC-1933, "Removal and Installation".

NO >> INSPECTION END

P0605 ECM

DTC Description

INFOID:0000000013798374

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0605	ECM [Internal control module read only memory (ROM) error]	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	Malfunction in the internal ROM of ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

ECM

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0605	ECM	**NOTE:** Fail-safe may not occur depending on malfunction type. • ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (Approx. 5 decrees) by the return spring. • The position of the following components is fixed. - Intake valve timing control solenoid valve - Exhaust valve timing control solenoid valve • ASCD operation may be deactivated.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more with ignition switch ON.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON (engine stopped) and wait least 20 minutes.
   CAUTION:
   Never start engine during this procedure.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1734, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798375

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC confirmation procedure. Refer to EC-1734, "DTC Description".

Is the 1st trip DTC P0605 displayed again?

YES >> Replace ECM. Refer to EC-1933, "Removal and Installation".
NO >> INSPECTION END

P0606 ECM

DTC Description

INFOID:0000000013798376

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0606	CONTROL MODULE (Control module processor)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	Malfunction in ECM processor
		Diagnosis delay time	—

POSSIBLE CAUSE

ECM

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0606	ECM	**NOTE:** Fail-safe may not occur depending on malfunction type. • ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (Approx. 5 decrees) by the return spring. • The position of the following components is fixed. - Intake valve timing control solenoid valve - Exhaust valve timing control solenoid valve • ASCD operation may be deactivated.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more with ignition switch ON.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE-I

1. Turn ignition switch ON (engine stopped) and wait at least 10 seconds.
   CAUTION:
   Never start engine during this procedure.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1737, "Diagnosis Procedure".
NO >> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-II

1. Start engine.
2. Rev up the engine quickly to approximately 3,000 rpm under unloaded condition and completely release the accelerator pedal.
3. Let the engine idle and wait at least 10 seconds.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Turn ignition switch ON.
6. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1737, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798377

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC confirmation procedure for 3 times. Refer to EC-1736, "DTC Description".

Is the 1st trip DTC P0606 displayed again?

YES >> Replace ECM. Refer to EC-1933, "Removal and Installation".
NO >> INSPECTION END

P0607 ECM

DTC Description

INFOID:0000000013798378

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0607	ECM (Control module performance)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	ECM internal communication system is malfunctioning
		Diagnosis delay time	—

POSSIBLE CAUSE

ECM

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0607	ECM	Engine torque may be limited.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 11 V or more with ignition switch ON.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON (engine stopped) and wait least 10 seconds.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1738, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798379

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC confirmation procedure. Refer to EC-1738, "DTC Description".

Is the 1st trip DTC P0607 displayed again?

YES >> Replace ECM. Refer to EC-1933, "Removal and Installation".
NO >> INSPECTION END

P060A ECM

DTC Description

INFOID:0000000013798380

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P060A	CONTROL MODULE (Internal control module monitoring processor performance)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	ECM internal monitoring processor is malfunctioning
		Diagnosis delay time	—

POSSIBLE CAUSE

ECM

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P060A	ECM	**NOTE:** Fail-safe may not occur depending on malfunction type. • ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (Approx. 5 decrees) by the return spring. • The position of the following components is fixed. - Intake valve timing control solenoid valve - Exhaust valve timing control solenoid valve • Engine torque may be limited. • ASCD operation may be deactivated.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 11 V or more with ignition switch ON.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and wait at least 10 seconds.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Repeat step 1 and 2 for 5 times.
4. Turn ignition switch ON.
5. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1739, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798381

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC confirmation procedure. Refer to EC-1739, "DTC Description".

Is the 1st trip DTC P060A displayed again?

YES >> Replace ECM. Refer to EC-1933, "Removal and Installation".
NO >> INSPECTION END

P060B ECM

DTC Description

INFOID:0000000013798382

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P060B	CONTROL MODULE (Internal control module A/D processing performance)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	ECM internal analog/digital conversion processing system is malfunctioning
		Diagnosis delay time	—

POSSIBLE CAUSE

ECM

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P060B	ECM	**NOTE:** Fail-safe may not occur depending on malfunction type. • ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (Approx. 5 decrees) by the return spring. • The position of the following components is fixed. - Intake valve timing control solenoid valve - Exhaust valve timing control solenoid valve • ASCD operation may be deactivated.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 11 V or more with ignition switch ON.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON (engine stopped) and wait least 10 seconds.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1741, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798383

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC confirmation procedure. Refer to EC-1741, "DTC Description".

Is the 1st trip DTC P060B displayed again?

YES >> Replace ECM. Refer to EC-1933, "Removal and Installation".
NO >> INSPECTION END

P0611 ECM PROTECTION

DTC Description

INFOID:0000000013798385

DTC DETECTION LOGIC

This DTC is detected when the ECM protective function is activated due to an extreme temperature increase in ECM, resulting from severe conditions such as heavy load driving.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0611	FIC MODULE (ECM protection)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	ECM overheat protection control is activated
		Diagnosis delay time	—

POSSIBLE CAUSE

ECM overheated

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

This DTC is displayed as protection function history. If no malfunction is detected after the diagnosis, the customer must be informed of the activation of the protection function.

>> Proceed to EC-1743, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798386

1.INSPECTION START

1. Perform DTC confirmation procedure. Refer to EC-1743, "DTC Description".
2. Check 1st trip DTC.

Is DTC P0605 detected?

YES >> Proceed to EC-1734, "Diagnosis Procedure".
NO >> Explain the customer about the activation of the protection function.

P062B ECM

DTC Description

INFOID:0000000013798388

DTC DETECTION LOGIC

This DTC is detected when the ECM-integrated injector driver unit has a malfunction. For injector driver unit, refer to EC-1276, "ECM".

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P062B	ECM (Internal control module fuel injector control performance)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	Injector driver unit is malfunctioning
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness and connectors (Injector circuit is open or shorted)
- Battery power supply
- ECM (injector driver unit)

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P062B	ECM	Type1 • Engine torque is limited. • Idle engine speed is increased. • Fuel injector power supply shut-off. • High fuel pressure limitation.
		Type2 • Engine torque is limited. • Fuel injection shut-off of malfunction cylinder. • Mixture ratio feedback control does not function. • Idle engine speed is increased.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the engine and keep the engine speed at idle for 30 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1744, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798389

1.CHECK FUEL INJECTOR

Perform fuel injector. Refer to EC-1891, "Component Function Check".

Is inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace error-detected parts.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC confirmation procedure again. Refer to EC-1744, "DTC Description".
4. Check 1st trip DTC.

Is the DTC P062B displayed again?

YES >> Replace ECM. Refer to EC-1933, "Removal and Installation".
NO >> INSPECTION END

P062F CONTROL MODULE

DTC Description

INFOID:0000000013798390

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P062F	CONTROL MODULE (Internal control module EEPROM error)	Diagnosis condition	Ignition switch ON
		Signal (terminal)	—
		Threshold	ECM calculation is function malfunctioning
		Diagnosis delay time	—

POSSIBLE CAUSE

ECM

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure is previously conducted, always turn ignition switch OFF and wait at least 30 seconds before conducting the next test.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 10 seconds.
2. Check the DTC.

Is the DTC detected?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> Proceed to EC-1746, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798391

1.INSPECTION START

1. Perform DTC Confirmation Procedure. Refer to EC-1746, "DTC Description".
2. Erase DTC.

Is DTC erased?

YES >> INSPECTION END
NO >> GO TO 2.

2.REPLACE ECM

1. Replace ECM. Refer to EC-1933, "Removal and Installation".
2. Perform EC-1424, "Description".

>> INSPECTION END

P0643 SENSOR POWER SUPPLY

DTC Description

INFOID:0000000013798392

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0643	SENSOR POWER/CIRC (Sensor power supply circuit short)	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	—
		Threshold	ECM detects that the voltage of power source for sensor is excessively low or high
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
  (Accelerator pedal position sensor 1 circuit is shorted)
  [Camshaft position sensor (bank 1) circuit is shorted]
  [Exhaust valve timing control position sensor (bank 1) circuit is shorted]
  (Throttle position sensor circuit is shorted)
  (Crankshaft position sensor circuit is shorted)
- Accelerator pedal position sensor 1
- Camshaft position sensor (bank 1)
- Exhaust valve timing control position sensor (bank 1)
- Throttle position sensor
- Crankshaft position sensor

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P0643	Sensor power supply	• ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (Approx. 5 decrees) by the return spring. • The position of the following components is fixed. - Intake valve timing control solenoid valve - Exhaust valve timing control solenoid valve

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 8 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for 1 second.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1747, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798393

1.CHECK ACCELERATOR PEDAL POSITION SENSOR 1 POWER SUPPLY CIRCUIT

1. Disconnect accelerator pedal position (APP) sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between APP sensor harness connector and ground.

APP sensor		Ground	Voltage (V)
Connector	Terminal		
E20	2	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 2.

2.CHECK SENSOR POWER SUPPLY CIRCUIT

Check harness for short to power and short to ground, between the following terminals.

ECM		Sensor		
Connector	Terminal	Name	Connector	Terminal
F78	27	Crankshaft position sensor	F38	1
	28	Camshaft position sensor (bank 1)	F66	1
		Exhaust valve timing control position sensor (bank 1)	F71	1
F79	83	Electric throttle control actuator	F50	2
E16	146	APP sensor 1	E20	2

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair short to ground or short to power in harness or connectors.

3.CHECK COMPONENTS

Check the following.
- Crankshaft position sensor (Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".)
- Camshaft position sensor (bank 1) (Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".)
- Exhaust valve timing control position sensor (bank 1) (Refer to EC-1759, "Component Inspection (Exhaust Valve Timing Control Position Sensor)".)
- Throttle position sensor (Refer to EC-1850, "Component Inspection (Throttle Position Sensor)".)
- APP sensor 1 (Refer to EC-1853, "Component Inspection (Accelerator Pedal Position Sensor)".)

Is the inspection result normal?

YES >> GO TO 4.
NO >> Replace malfunctioning component.

4.CHECK THROTTLE POSITION SENSOR

Refer to EC-1555, "Component Inspection (Throttle Position Sensor)".

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 5.

5.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

6.CHECK ACCELERATOR PEDAL POSITION SENSOR

Refer to EC-1844, "Component Inspection (Accelerator Pedal Position Sensor)".

Is the inspection result normal?

YES >> GO TO 8.

NO >> GO TO 7.

7. REPLACE ACCELERATOR PEDAL ASSEMBLY

Replace accelerator pedal assembly. Refer to ACC-3, "Removal and Installation".

>> INSPECTION END

8. CHECK INTERMITTENT INCIDENT

Refer to GI-43, "Intermittent Incident".

>> INSPECTION END

P0850 PNP SWITCH

DTC Description

INFOID:0000000013798395

DTC DETECTION LOGIC

When the selector lever position is P or N, park/neutral position (PNP) signal is sent to ECM from TCM.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P0850	P-N POS SW/CIRCUIT (Park/neutral position switch)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The signal of the park/neutral position (PNP) signal does not change during driving after the engine is started.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
  [The park/neutral position (PNP) signal circuit is open or shorted]
- TCM

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.INSPECTION START

Will CONSULT be used?

Will CONSULT be used?

YES >> GO TO 2.
NO >> GO TO 5.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 3.

3.CHECK PNP SIGNAL

WITH CONSULT
1. Turn ignition switch ON.
2. Select “P/N POSI SW” in “DATA MONITOR” mode with CONSULT. Then check the “P/N POSI SW” signal under the following conditions.

Position (Selector lever)	Known-good signal
N or P position	ON
Except above position	OFF

Is the inspection result normal?

YES >> GO TO 4.
NO >> Go to EC-1751, "Diagnosis Procedure".

4.PERFORM DTC CONFIRMATION PROCEDURE

1. Select “DATA MONITOR” mode with CONSULT.
2. Start engine and warm it up to normal operating temperature.
3. Maintain the following conditions for at least 50 consecutive seconds.
   CAUTION:

Always drive vehicle at a safe speed.

ENG SPEED	1,000 - 6,375 rpm
COOLAN TEMP/S	More than 70°C (158°F)
B/FUEL SCHDL	2.0 - 31.8 msec
VHCL SPEED SE	More than 64 km/h (40 mph)
Selector lever	Suitable position

4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1751, "Diagnosis Procedure".
NO >> INSPECTION END

5.PERFORM COMPONENT FUNCTION CHECK

WITH GST
Perform Component Function Check. Refer to EC-1751, "Component Function Check".
NOTE:
Use Component Function Check to check the overall function of the park/neutral position (PNP) signal circuit. During this check, a 1st trip DTC might not be confirmed.

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> Go to EC-1751, "Diagnosis Procedure".

Component Function Check

INFOID:0000000013798396

1.PERFORM COMPONENT FUNCTION CHECK

WITH GST
1. Turn ignition switch ON.
2. Check the voltage between ECM harness connector terminals under the following conditions.

ECM				Condition		Voltage (V)
+		–				
Connector	Terminal	Connector	Terminal			
F79	62	E16	152	Selector lever	P or N position	Battery voltage
					Except above position	Approx. 0

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1751, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798397

1.CHECK DTC WITH TCM

Refer to TM-316, "CONSULT Function".

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace malfunctioning part.

2.CHECK STARTING SYSTEM

Turn ignition switch OFF, then turn it to START.

Does starter motor operate?

YES >> GO TO 3.
NO >> Check DTC with BCM. Refer to BCS-52, "DTC Index".

3. CHECK PNP SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect A/T assembly harness connector.
3. Disconnect ECM harness connector.
4. Check the continuity between A/T assembly harness connector and ECM harness connector.

A/T assembly		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F46	9	F79	62	Existed

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 4.

4. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between A/T assembly and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

P100A, P100B VVEL SYSTEM

DTC Description

INFOID:0000000013798398

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P100A	VVEL SYSTEM-B1 [VVEL response malfunction (bank 1)]	Diagnosis condition	—
		Signal (terminal)	—
P100B	VVEL SYSTEM-B1 [VVEL response malfunction (bank 1)]	Threshold	Actual event response to target is poor
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (VVEL actuator motor assembly circuit is open or shorted)
- VVEL actuator motor assembly
- VVEL actuator housing assembly
- VVEL ladder assembly
- VVEL control module

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P100A or P100B is displayed with DTC P1090 or P1093 first perform the trouble diagnosis for DTC P1090 or P1093.
- If DTC P100A or P100B is displayed with DTC P0101, first perform the trouble diagnosis for DTC P0101.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine.
2. Depress the accelerator pedal rapidly half or more under no load conditions, and then release it.
3. Wait at idle for 5 seconds or more.
4. Repeat steps 2 to 3 for three times.
5. Check 1st trip DTC.

Is DTC detected?

YES >> Proceed to EC-1753, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798399

1.CHECK DTC PRIORITY

- If DTC P100A or P100B is displayed with DTC P1090 or P1093 first perform the trouble diagnosis for DTC P1090 or P1093.
- If DTC P100A or P100B is displayed with DTC P0101, first perform the trouble diagnosis for DTC P0101.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2. VVEL ACTUATOR MOTOR OUTPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Disconnect VVEL control module harness connector.
2. Disconnect VVEL actuator motor harness connector.
3. Check the continuity between VVEL control module harness connector and VVEL actuator motor harness connector.

DTC No.	VVEL control module			VVEL actuator motor		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P100A	1	F84	12	F88	1	Existed
					2	Not existed
			25		1	Not existed
					2	Existed
P100B	2		2	F85	1	Existed
					2	Not existed
			15		1	Not existed
					2	Existed

4. Also check harness for short to ground and power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between VVEL actuator motor and VVEL control module
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

4. CHECK VVEL ACTUATOR MOTOR

Refer to EC-1755, "Component Inspection (VVEL ACTUATOR MOTOR)".

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5. REPLACE VVEL ACTUATOR MOTOR ASSEMBLY

Replace VVEL actuator motor assembly. Refer to EM-41, "Removal and Installation".

>> INSPECTION END

6. CHECK INTERMITTENT INCIDENT

Refer to GI-43, "Intermittent Incident".

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace.

7. REPLACE VVEL CONTROL MODULE

Replace VVEL control module. Refer to EC-1934, "Removal and Installation".

>> GO TO 8.

8. PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase 1st trip DTC.
3. Perform DTC Confirmation Procedure.
   See EC-1753, "DTC Description".

Is the DTC P100A or P100B displayed again?

YES >> GO TO 9.
NO >> INSPECTION END

9. CHECK VVEL ACTUATOR HOUSING ASSEMBLY

Refer to EC-1756, "Component Inspection (VVEL ACTUATOR HOUSING ASSEMBLY)".

Is the inspection result normal?

YES >> GO TO 11.
NO >> GO TO 10.

10. REPLACE VVEL ACTUATOR HOUSING ASSEMBLY

Replace VVEL actuator housing assembly. Refer to EM-86, "Removal and Installation".

>> INSPECTION END

11. CHECK VVEL LADDER ASSEMBLY

Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> GO TO 13.
NO >> GO TO 12.

12. REPLACE CYLINDER HEAD AND VVEL LADDER ASSEMBLY

Replace cylinder head and VVEL ladder assembly.
Refer to EM-98, "Removal and Installation" (Cylinder head).
Refer to EM-86, "Removal and Installation" (VVEL ladder assembly)

>> INSPECTION END

13. CHECK INTERMITTENT INCIDENT

Refer to GI-43, "Intermittent Incident".

>> INSPECTION END

Component Inspection (VVEL ACTUATOR MOTOR)

INFOID:0000000013798400

1. CHECK VVEL ACTUATOR MOTOR

1. Turn ignition switch OFF.
2. Disconnect VVEL actuator motor harness connector.
3. Check resistance between VVEL actuator motor terminals as per the following.

VVEL actuator motor	Resistance
Terminal	
1 and 2	16 Ω or less

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2. REPLACE VVEL ACTUATOR MOTOR ASSEMBLY

Replace VVEL actuator motor assembly. Refer to EM-41, "Removal and Installation".

>> INSPECTION END

Component Inspection (VVEL ACTUATOR HOUSING ASSEMBLY)

INFOID:0000000013798401

1.CHECK VVEL ACTUATOR HOUSING ASSEMBLY

1. Turn ignition switch OFF.
2. Remove VVEL actuator housing assembly. Refer to EM-86, "Removal and Installation".
3. Turn the ball screw shaft to check that it works smoothly.

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.REPLACE VVEL ACTUATOR HOUSING ASSEMBLY

Replace VVEL actuator housing assembly. Refer to EM-86, "Removal and Installation".

>> INSPECTION END

P1078, P1084 EVT CONTROL POSITION SENSOR

DTC Description

INFOID:0000000013798402

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1078	EXH TIM SEN/CIRC-B1 [Exhaust valve timing (EVT) control position sensor (bank 1) circuit]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	EVT control position sensor signal
P1084	EXH TIM SEN/CIRC-B2 [Exhaust valve timing control position sensor (bank 2) circuit]	Threshold	An excessively high or low voltage from the sensor is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
  [Exhaust valve timing control position sensor (bank 1/ bank 2) circuit is open or shorted)
- Exhaust valve timing control position sensor (bank 1/ bank 2)
- Crankshaft position sensor
- Camshaft position sensor (bank 1/ bank 2)
- Accumulation of debris to the signal pick-up portion of the camshaft

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P1078 or P1084 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the engine and let it idle for 10 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1757, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798403

1.CHECK DTC PRIORITY

If DTC P1078 or P1084 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.CHECK EXHAUST VALVE TIMING CONTROL POSITION SENSOR POWER SUPPLY CIRCUIT-I

1. Disconnect exhaust valve timing (EVT) control position sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between exhaust valve timing control position sensor harness connector and ground.

DTC	EVT control position sensor			Ground	Voltage (V)
	Bank	Connector	Terminal		
P1078	1	F71	1	Ground	Approx. 5
P1084	2	F72	1		

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair open circuit, short to ground in harness or connectors.

3.CHECK EVT CONTROL POSITION SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EVT control position sensor harness connector and ECM harness connector.

DTC	EVT control position sensor			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P1078	1	F71	2	F78	45	Existed
P1084	2	F72	2	F79	63	

4. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to power in harness or connectors.

4.CHECK EVT CONTROL POSITION SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between EVT control position sensor harness connector and ECM harness connector.

DTC	EVT control position sensor			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P1078	1	F71	3	F78	41	Existed
P1084	2	F72	3	F79	68	

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK EXHAUST VALVE TIMING CONTROL POSITION SENSOR

Refer to EC-1759, "Component Inspection (Exhaust Valve Timing Control Position Sensor)".

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace malfunctioning exhaust valve timing control position sensor. Refer to EM-68, "Exploded View".

6.CHECK CRANKSHAFT POSITION SENSOR

Refer to EC-1643, "Component Inspection (Crankshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 7.

NO >> Replace crankshaft position sensor. Refer to EM-120, "Exploded View".

7.CHECK CAMSHAFT POSITION SENSOR

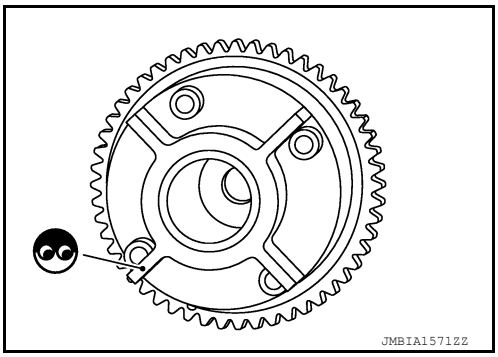
Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".

Is the inspection result normal?

YES >> GO TO 8.
NO >> Replace malfunctioning camshaft position sensor. Refer to EM-68, "Exploded View".

8.CHECK CAMSHAFT SPROCKET (SIGNAL PLATE)

Check the following.
- Accumulation of debris to the signal plate of ccamshaft sprocket (EXH)
- Chipping signal plate of camshaft sprocket (EXH)



Is the inspection result normal?

YES >> GO TO 9.
NO >> Remove debris and clean the signal plate of camshaft sprocket (EXH) or replace camshaft sprocket (EXH). Refer to EM-68, "Exploded View".

9.CHECK INTERMITTENT INCIDENT

Refer to GI-43, "Intermittent Incident".

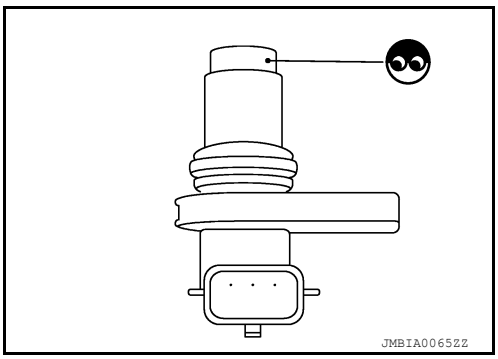
>> INSPECTION END

Component Inspection (Exhaust Valve Timing Control Position Sensor)

INFOID:0000000013798404

1.EXHAUST VALVE TIMING CONTROL POSITION SENSOR-I

1. Turn ignition switch OFF.
2. Disconnect exhaust valve timing control position sensor harness connector.
3. Loosen the fixing bolt of the sensor.
4. Remove the sensor. Refer to EM-68, "Exploded View".
5. Visually check the sensor for chipping.



Is the inspection result normal?

YES >> GO TO 2.
NO >> Replace malfunctioning exhaust valve timing control position sensor. Refer to EM-68, "Exploded View".

2.EXHAUST VALVE TIMING CONTROL POSITION SENSOR-II

Check resistance exhaust valve timing control position sensor terminals as shown below.

Terminals	Resistance
1 (+) - 2 (-)	Except 0 or ∞ Ω [at 25°C (77°F)]
1 (+) - 3 (-)	
2 (+) - 3 (-)	

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning exhaust valve timing control position sensor. Refer to EM-68, "Exploded View".

P1087, P1088 VVEL SYSTEM

DTC Description

INFOID:0000000013798405

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1087	VVEL SYSTEM-B1 [VVEL small event angle malfunction (bank 1)]	Diagnosis condition	Start engine and let it idle
		Signal (terminal)	EVT control position sensor signal
P1088	VVEL SYSTEM-B2 [VVEL small event angle malfunction (bank 2)]	Threshold	The event angle of VVEL control shaft is always small
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (VVEL actuator motor assembly circuit is open or shorted)
- VVEL actuator motor assembly
- VVEL actuator housing assembly
- VVEL ladder assembly
- VVEL control module

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P1087 P1088	VVEL control function	VVEL of normal bank is controlled at VVEL angle of abnormal bank. Engine speed will not rise more than 3,500 rpm due to the fuel cut.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P1087 or P1088 is displayed with DTC P1090 or P1093, first perform the trouble diagnosis for DTC P1090 or P1093.

Is applicable DTC detected?

>> Perform diagnosis of applicable. Refer to EC-1764, "DTC Description".

Diagnosis Procedure

INFOID:0000000013798406

1.CHECK DTC PRIORITY

If P1087 or P1088 is displayed with DTC P1090 or P1093, first perform the trouble diagnosis for DTC P1090 or P1093.

Is applicable DTC detected?

>> Perform diagnosis of applicable. Refer to EC-1764, "DTC Description".

P1089, P1092 VVEL CONTROL SHAFT POSITION SENSOR

DTC Description

INFOID:0000000013798407

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1089	VVEL POS SEN/CIRC-B1 [VVEL control shaft position sensor (bank 1) circuit]	Diagnosis condition	—
		Signal (terminal)	—
P1092	VVEL POS SEN/CIRC-B2 [VVEL control shaft position sensor (bank 2) circuit]	Threshold	• An excessively low voltage from the sensor is sent to VVEL control module. • An excessively high voltage from the sensor is sent to VVEL control module. • Rationally incorrect voltage is sent to VVEL control module compared with the signals from VVEL control shaft position sensor 1 and VVEL control shaft position sensor 2
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (VVEL control shaft position sensor circuit is open or shorted)
- VVEL control shaft position sensor
- VVEL control module

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P1089 P1092	VVEL control shaft position sensor	VVEL value is maintained at a fixed angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P1089 or P1092 is displayed with DTC P1608 first perform the trouble diagnosis for DTC P1608.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1816, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for 1 second.
2. Check DTC.

Is DTC detected?

YES >> Proceed to EC-1762, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798408

1.CHECK DTC PRIORITY

If DTC P1089 or P1092 is displayed with DTC P1608 first perform the trouble diagnosis for DTC P1608.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1816, "DTC Description".
NO >> GO TO 2.

2.VVEL CONTROL SHAFT POSITION SENSOR POWER SUPPLY CIRCUIT

1. Disconnect VVEL control shaft position sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between VVEL control shaft position sensor harness connector and ground.

DTC No.	VVEL control shaft position sensor			Ground	Voltage (V)
	Bank	Connector	Terminal		
P1089	1	F83	3	Ground	Approx. 5
			6		
P1092	2	F86	3		
			6		

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between VVEL control shaft position sensor and VVEL control module
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

4.CHECK VVEL CONTROL SHAFT POSITION SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect VVEL control module harness connector.
3. Check the continuity between VVEL control shaft position sensor harness connector and VVEL control module harness connector.

DTC No.	VVEL control shaft position sensor			VVEL control module		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P1089	1	F83	2	F84	6	Existed
			5		19	
P1092	2	F86	2		4	
			5		17	

4. Also check harness for short to ground and power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between VVEL control shaft position sensor and VVEL control module
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

6. VVEL CONTROL SHAFT POSITION SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between VVEL control shaft position sensor harness connector and VVEL control module harness connector.

DTC No.	VVEL control shaft position sensor			VVEL control module		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P1089	1	F83	1	F84	3	Existed
			4		16	
P1092	2	F86	1		5	
			4		18	

2. Also check harness for short to ground and power.

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between VVEL control shaft position sensor and VVEL control module
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

8. REPLACE VVEL CONTROL MODULE

1. Replace VVEL control module.
2. Perform additional service when replacing VVEL control module. Refer to EC-1426, "Description".

>> GO TO 9.

9. PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC Confirmation Procedure.
   See EC-1761, "DTC Description".

Is the DTC P1089 or P1092 displayed again?

YES >> GO TO 10.
NO >> INSPECTION END

10. REPLACE VVEL ACTUATOR LADDER ASSEMBLY

Replace VVEL actuator ladder assembly. Refer to EM-86, "Removal and Installation".

>> INSPECTION END

P1090, P1093 VVEL ACTUATOR MOTOR

DTC Description

INFOID:0000000013798409

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1090	VVEL ACTR MOT-B1 [VVEL system performance (bank 1)]	Diagnosis condition	—
		Signal (terminal)	—
P1093	VVEL ACTR MOT-B2 [VVEL system performance (bank 2)]	Threshold	• Event angle difference between the actual and the target is detected. • Abnormal current is sent to VVEL actuator motor assembly
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (VVEL actuator motor assembly circuit is open or shorted)
- VVEL actuator motor assembly
- VVEL actuator housing assembly
- VVEL ladder assembly
- VVEL control module

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P1090 P1093	VVEL actuator motor	VVEL of normal bank is controlled at VVEL angle of abnormal bank. Engine speed will not rise more than 3,500 rpm due to the fuel cut.
		VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P1090 or P1093 is displayed with DTC P1091 first perform the trouble diagnosis for DTC P1091.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1816, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for 10 second.
2. Keep the engine speed at approximately 3,500 rpm for at least 10 seconds under no load.
3. Check DTC.

Is DTC detected?

YES >> Proceed to EC-1765, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".

NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798410

1.CHECK DTC PRIORITY

If DTC P1090 or P1093 is displayed with DTC P1091 first perform the trouble diagnosis for DTC P1091.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1816, "DTC Description".
NO >> GO TO 2.

2.VVEL ACTUATOR MOTOR ASSEMBLY OUTPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Disconnect VVEL control module harness connector.
2. Disconnect VVEL actuator motor assembly harness connector.
3. Check the continuity between VVEL control module harness connector and VVEL actuator motor assembly harness connector.

DTC No.	VVEL control module			VVEL actuator motor assembly		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P1090	1	F84	12	F88	1	Existed
					2	Not existed
			25		1	Not existed
					2	Existed
P1093	2		2	F85	1	Existed
					2	Not existed
			15		1	Not existed
					2	Existed

4. Also check harness for short to ground and power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between VVEL actuator motor assembly and VVEL control module
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

4.CHECK VVEL ACTUATOR MOTOR ASSEMBLY

Refer to EC-1766, "Component Inspection (VVEL ACTUATOR MOTOR ASSEMBLY)".

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5.REPLACE VVEL ACTUATOR MOTOR ASSEMBLY

Replace VVEL actuator motor assembly. Refer to EM-86, "Removal and Installation".

>> INSPECTION END

6.REPLACE VVEL CONTROL MODULE

1. Replace VVEL control module.
2. Perform additional service when replacing VVEL control module. Refer to EC-1426, "Description".

>> GO TO 7.

7.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC Confirmation Procedure.
   See EC-1764, "DTC Description".

Is the DTC P1090 or P1093 displayed again?

YES >> GO TO 8.
NO >> INSPECTION END

8.CHECK VVEL ACTUATOR HOUSING ASSEMBLY

Refer to EC-1766, "Component Inspection (VVEL ACTUATOR MOTOR ASSEMBLY)".

Is the inspection result normal?

YES >> GO TO 10.
NO >> GO TO 9.

9.REPLACE VVEL ACTUATOR HOUSING ASSEMBLY

Replace VVEL actuator housing assembly. Refer to EM-86, "Removal and Installation".

>> INSPECTION END

10.CHECK VVEL LADDER ASSEMBLY

Refer to EM-88, "Inspection".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 11.

11.REPLACE VVEL LADDER ASSEMBLY

Replace VVEL ladder assembly. Refer to EM-86, "Removal and Installation".

>> INSPECTION END

Component Inspection (VVEL ACTUATOR MOTOR ASSEMBLY)

INFOID:0000000013798411

1.CHECK VVEL ACTUATOR MOTOR

1. Turn ignition switch OFF.
2. Disconnect VVEL actuator motor harness connector.
3. Check resistance between VVEL actuator motor terminals as per the following.

VVEL actuator motor	Resistance
Terminal	
1 and 2	16Ω or less

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.REPLACE VVEL ACTUATOR SUB ASSEMBLY

Replace VVEL actuator sub assembly. Refer to EM-86, "Removal and Installation".

>> INSPECTION END

Component Inspection (VVEL ACTUATOR HOUSING ASSEMBLY)

INFOID:0000000013798412

1.CHECK VVEL ACTUATOR HOUSING ASSEMBLY

1. Turn ignition switch OFF.
2. Remove VVEL actuator housing assembly. Refer to EM-86, "Removal and Installation".

3. Turn the ball screw shaft to check that it works smoothly.

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.REPLACE VVEL ACTUATOR HOUSING ASSEMBLY

Replace VVEL actuator housing assembly. Refer to EM-86, "Removal and Installation".

>> INSPECTION END

P1091 VVEL ACTUATOR MOTOR RELAY

DTC Description

INFOID:0000000013798413

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1091	VVEL ACTR MOT PWR [VVEL actuator motor relay circuit]	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	• VVEL control module detects the VVEL actuator motor relay is stuck OFF • VVEL control module detects the VVEL actuator motor relay is stuck ON
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
  (VVEL actuator motor relay circuit is open or shorted)
  (Abort circuit is open or shorted)
- VVEL actuator motor relay
- VVEL control module
- ECM

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P1091	VVEL actuator motor relay	VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 1 second.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON and wait at least 1 second.
4. Check 1st trip DTC.

Is DTC detected?

YES >> Proceed to EC-1768, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798414

1.VVEL ACTUATOR MOTOR RELAY POWER SUPPLY CIRCUIT-I

1. Turn ignition switch OFF.

2. Disconnect VVEL actuator motor relay.
3. Check the voltage between VVEL actuator motor relay harness connector and ground.

VVEL actuator motor relay		Ground	Voltage
Connector	Terminal		
E100	1	Ground	Battery voltage
	3		

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2. DETECT MALFUNCTIONING PART

Check the following.
- 50A fusible link (letter Z)
- Harness for open or short between VVEL actuator motor relay and battery

>> Repair open circuit, short to ground or short to power in harness or connectors.

3. VVEL ACTUATOR MOTOR RELAY POWER SUPPLY CIRCUIT-II

1. Disconnect VVEL control module harness connector.
2. Check the continuity between VVEL actuator motor relay harness connector and VVEL control module harness connector.

VVEL control module		VVEL actuator motor relay		Continuity
Connector	Terminal	Connector	Terminal	
F84	23	E100	2	Existed

3. Also check harness for short to ground and power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit or short to ground or short to power in harness or connectors.

4. VVEL ACTUATOR MOTOR RELAY INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between VVEL actuator motor relay harness connector and VVEL control module harness connector.

VVEL control module			VVEL actuator motor relay		Continuity
Bank	Connector	Terminal	Connector	Terminal	
1	F84	13	E100	5	Existed
2		1			

2. Also check harness for short to ground and power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

5. CHECK VVEL ACTUATOR MOTOR RELAY

Refer to EC-1770, "Component Inspection (VVEL Actuator Motor Relay)".

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace VVEL actuator motor relay.

6. CHECK ABORT CIRCUIT FOR OPEN AND SHORT

1. Disconnect ECM harness connector.
2. Check the continuity between VVEL control module harness connector and ECM harness connector.

VVEL control module		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F84	21	F79	90	Existed

3. Also check harness for short to ground and power.

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open and short between ECM and VVEL control module
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

8. REPLACE VVEL CONTROL MODULE

1. Replace VVEL control module.
2. Perform additional service when replacing VVEL control module. Refer to EC-1426, "Description".

>> GO TO 9.

9. PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC Confirmation Procedure.
   See EC-1768, "DTC Description".

Is the DTC P1091 displayed again?

YES >> Replace ECM. Refer to EC-1933, "Removal and Installation".
NO >> INSPECTION END

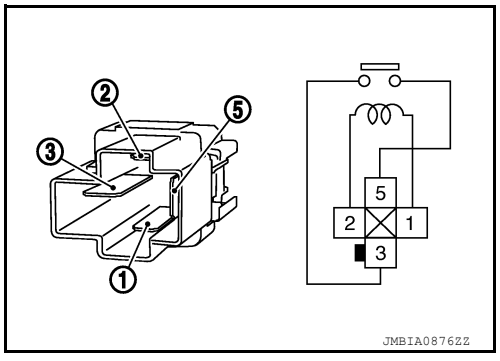
Component Inspection (VVEL Actuator Motor Relay)

INFOID:0000000013798415

1. CHECK VVEL ACTUATOR MOTOR RELAY

1. Turn ignition switch OFF.
2. Remove VVEL actuator motor relay.
3. Check the continuity between VVEL actuator motor relay terminals under the following conditions.

Terminal	Condition	Continuity
3 and 5	12V direct current supply between terminals 1 and 2	Existed
	No current supply	Not existed



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace VVEL actuator motor relay.

P1148, P1168 CLOSED LOOP CONTROL

DTC Description

INFOID:0000000013798416

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1148	CLOSED LOOP-B1 [Closed loop control function (bank 1)]	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The closed loop control function for bank 1 does not operate even when vehicle is being driven in the specified condition.
		Diagnosis delay time	—
P1168	CLOSED LOOP-B2 [Closed loop control function (bank 2)]	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The closed loop control function for bank 2 does not operate even when vehicle is being driven in the specified condition.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
  (The A/F sensor 1 circuit is open or shorted.)
- A/F sensor 1
- A/F sensor 1 heater

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P1148 or P1168 is displayed with DTC for A/F sensor 1 first perform the trouble diagnosis for DTC for A/F sensor 1.

Is applicable DTC detected?

>> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".

Diagnosis Procedure

INFOID:0000000013798417

1.CHECK DTC PRIORITY

If DTC P1148 or P1168 is displayed with DTC for A/F sensor 1 first perform the trouble diagnosis for DTC for A/F sensor 1.

Is applicable DTC detected?

>> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".

P1197 OUT OF GAS

DTC Description

INFOID:0000000013798419

DTC DETECTION LOGIC

This diagnosis result is detected when the fuel level of the fuel tank is extremely low and the engine does not run normally.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1197	FUEL RUN OUT (Out of gas)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	• Fuel rail pressure remains at 1.5 MPa (15 bar, 15.3 kg/cm^2, 217.5 psi) or less for 3 seconds or more with the fuel level too low • Fuel rail pressure remains 2.7 MPa (27 bar, 27.5 kg/cm^2, 392 psi) lower than a target fuel pressure for 5 seconds or more with the fuel level too low • Fuel rail pressure remains at 0.23 MPa (2.3 bar, 2.346 kg/cm^2, 33.35 psi) or less for 5 seconds or more with the fuel level too low **NOTE:** Allow engine coolant temperature to reach 70°C (158°F) or more once.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Out of gas
- Harness or connectors (The low pressure fuel pump circuit is open or shorted.)
- Low pressure fuel pump
- Fuel pressure regulator
- Low pressure fuel system
- Harness or connectors (The high pressure fuel pump circuit is shorted.)
- High pressure fuel pump
- High pressure fuel system
- Fuel rail pressure sensor
- Disconnection of the fuel hose

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P1197	Out of gas	• Engine torque is limited. • VVEL value is maintained at a fixed angle.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE-I

Start the engine.

Does the engine start?

YES >> GO TO 3.
NO >> Proceed to EC-1773, "Diagnosis Procedure".

3.PERFORM DTC CONFIRMATION PROCEDURE-II

1. Warm up the engine to the normal operating temperature.
   NOTE:
   For best results, warm up the engine until “COOLAN TEMP/S” on “DATA MONITOR” of CONSULT reaches at least 70°C (158°F).
2. Keep the engine speed at 3,500 rpm for 5 seconds and let it idle at least 60 seconds.
3. Check the 1st trip DTC.
   NOTE:
   If the fuel tank has sufficient fuel, this diagnosis result may not be detected.

Is 1st trip DTC detected?

YES >> Proceed to EC-1773, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798420

1.REFUEL THE VEHICLE

1. Refuel 10 liter (10 US qt, 8 imp qt).
   CAUTION:
   Never refuel more than 10 liter.
2. Start the engine and keep the engine speed at 3,000 rpm for 30 seconds.
   NOTE:
   For best results, warm up the engine until “COOLAN TEMP/S” on “DATA MONITOR” of CONSULT reaches at least 70°C (158°F).
3. Turn ignition switch OFF and wait at least 10 seconds.
4. Turn ignition switch ON.
5. Turn ignition switch OFF and wait at least 10 seconds.
6. Turn ignition switch ON.
7. Erase the DTC.
8. Start the engine and let it idle at least 60 seconds.
9. Perform the confirmation procedure again. Refer to EC-1772, "DTC Description".

Is 1st trip DTC detected?

YES >> GO TO 2.
NO >> INSPECTION END

2.CHECK LOW PRESSURE FUEL PUMP

Refer to EC-1907, "Component Function Check".

Is inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK HIGH PRESSURE FUEL PUMP

Refer to EC-1897, "Component Function Check".

Is inspection result normal?

YES >> Check the fuel hose for disconnection and looseness.
NO >> Repair or replace error-detected parts.

P1212 TCS COMMUNICATION LINE

DTC Description

INFOID:0000000013798422

DTC DETECTION LOGIC

This CAN communication line is used to control the smooth engine operation during the TCS operation. Pulse signals are exchanged between ECM and “ABS actuator and electric unit (control unit)”.

Be sure to erase the malfunction information such as DTC not only for “ABS actuator and electric unit (control unit)” but also for ECM after TCS related repair.

NOTE:

Freeze frame data is not stored in the ECM for this self-diagnosis.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1212	TCS/CIRC (TCS communication line)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	ECM cannot receive the information from “ABS actuator and electric unit (control unit)” continuously
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (The CAN communication line is open or shorted)
- ABS actuator and electric unit (control unit)
- Dead (Weak) battery

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P1212 is displayed with DTC UXXXX first perform the trouble diagnosis for DTC UXXXX.
- If DTC P1212 is displayed with DTC P0607 first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 10.5 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for at least 10 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1774, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798423

1.CHECK DTC PRIORITY

- If DTC P1212 is displayed with DTC UXXXX first perform the trouble diagnosis for DTC UXXXX.
- If DTC P1212 is displayed with DTC P0607 first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> Perform the trouble diagnosis for TCS. Refer to TM-353, "Work Flow".

P1217 ENGINE OVER TEMPERATURE

DTC Description

INFOID:0000000013798424

DTC DETECTION LOGIC

NOTE:

If the cooling fan or any of other components in the cooling system has a malfunction, engine coolant temperature increases.

When the engine coolant temperature reaches an abnormally high temperature condition, a malfunction is indicated.

CAUTION:

When a malfunction is indicated, always replace the coolant. Refer to CO-11, "Changing Engine Coolant". Also, replace the engine oil. Refer to LU-10, "Draining" and LU-10, "Refilling".

1. **Fill radiator with coolant up to specified level with a filling speed of 2 liters per minute. Always use coolant with the proper mixture ratio. Refer to MA-14, "Anti-Freeze Coolant Mixture Ratio".**
2. **After refilling coolant, run engine to ensure that no water-flow noise is emitted.**

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1217	Engine over temperature (Overheat)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	• Cooling fan does not operate properly (Overheat) • Cooling fan system does not operate properly (Overheat) • Engine coolant is not within the specified quantity.
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (The cooling fan circuit is open or shorted)
- IPDM E/R
- Fan clutch assembly
- Cooling fan speed sensor
- Radiator hose
- Radiator
- Reservoir tank cap
- Water pump
- Multi-way control valve

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P1217 is displayed with DTC DTC UXXXX first perform the trouble diagnosis for DTC UXXXX.
- If DTC P1217 is displayed with DTC P0607 first perform the trouble diagnosis for DTC P0607.
- If DTC P1217 is displayed with DTC P0527 first perform the trouble diagnosis for DTC P0527.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PERFORM COMPONENT FUNCTION CHECK

Perform component function check. Refer to EC-1777, "Component Function Check".

NOTE:

Use component function check to check the overall function of the cooling fan. During this check, a DTC might not be confirmed.

Is the inspection result normal?

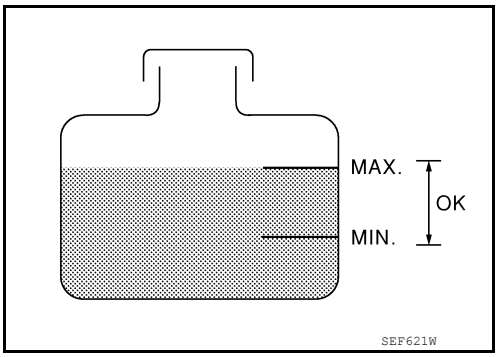
YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> Go to EC-1777, "Diagnosis Procedure".

Component Function Check

INFOID:0000000013798425

1.PERFORM COMPONENT FUNCTION CHECK-I

WARNING:
Never remove the reservoir tank cap when the engine is hot. Serious burns could be caused by high pressure fluid escaping from the radiator.
Wrap a thick cloth around cap. Carefully remove the cap by turning it a quarter turn to allow built-up pressure to escape. Then turn the cap all the way off.
Check the coolant level in the reservoir tank and radiator.
Allow engine to cool before checking coolant level.



Is the coolant level in the reservoir tank and/or radiator below the proper range?

YES >> Proceed to EC-1777, "Diagnosis Procedure".
NO >> GO TO 2.

2.PERFORM COMPONENT FUNCTION CHECK-II

Confirm whether customer filled the coolant or not.

Did customer fill the coolant?

YES >> Proceed to EC-1777, "Diagnosis Procedure".
NO >> GO TO 3.

3.PERFORM COMPONENT FUNCTION CHECK-III

WITH CONSULT
1. Start the engine.
2. Perform “FAN DUTY CONTROL” in “ACTIVE TEST” mode with CONSULT.
3. Check that cooling fan speed varies according to the percentage.
   NOTE:
   Fan speed changes as the percentage changes.

WITHOUT CONSULT
1. Start the engine.
2. Perform IPDM E/R auto active test. Refer to PCS-10, "Diagnosis Description".
3. Check that cooling fan speed increase.
   NOTE:
   Speed changes gradually when performing the auto active test.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Proceed to EC-1777, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798426

1.CHECK DTC PRIORITY

- If DTC P1217 is displayed with DTC DTC UXXXX first perform the trouble diagnosis for DTC UXXXX.
- If DTC P1217 is displayed with DTC P0607 first perform the trouble diagnosis for DTC P0607.
- If DTC P1217 is displayed with DTC P0527 first perform the trouble diagnosis for DTC P0527.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK COOLING FAN OPERATION

WITH CONSULT
1. Start the engine.
2. Perform “FAN DUTY CONTROL” in “ACTIVE TEST” mode with CONSULT.
3. Check that cooling fan speed varies according to the percentage.
NOTE:
Speed changes gradually as the percentage changes.

WITHOUT CONSULT
1. Start the engine.
2. Perform IPDM E/R auto active test and check cooling fan operation, refer to PCS-10, "Diagnosis Description".
3. Check that cooling fan speed increase.
NOTE:
Speed changes gradually when performing the auto active test.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Proceed to EC-1886, "Diagnosis Procedure".

3.CHECK ENGINE COOLANT LEAKAGE-I

Check cooling system for leakage. Refer to CO-9, "System Inspection".

Is leakage detected?

YES >> GO TO 4.
NO >> GO TO 5.

4.CHECK ENGINE COOLANT LEAKAGE-II

Check the following for leakage.
- Hose
- Radiator
- Water pump

>> Repair or replace malfunctioning part.

5.CHECK RESERVOIR TANK CAP

Check reservoir tank cap. Refer to CO-9, "System Inspection".

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace reservoir tank cap.

6.CHECK MULTI-WAY CONTROL VALVE

Check multi-way control valve. Refer to EC-1870, "Component Inspection (Multi-way Control Valve)".

Is the inspection result normal?

YES >> GO TO 7.
NO >> Replace multi-way control valve. Refer to CO-23, "Removal and Installation".

7.CHECK ENGINE COOLANT TEMPERATURE SENSOR 1

Refer to EC-1551, "Component Inspection (Engine Coolant Temperature Sensor 1)".

Is the inspection result normal?

YES >> GO TO 8.
NO >> Replace engine coolant temperature sensor 1. Refer to EM-97, "Exploded View".

8.CHECK MAIN 12 CAUSES

If the cause cannot be isolated, check the CO-5, "Troubleshooting Chart".

>> INSPECTION END

P1220 FUEL PUMP CONTROL MODULE (FPCM)

DTC Description

INFOID:0000000013798427

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1220	FPCM (Fuel pump control module)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	During engine cranking, the signal voltage of the FPCM to the ECM is too low
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors
  (FPCM circuit is open or shorted)
  (Fuel pump circuit is open or shorted)
- FPCM

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

- **Before performing the following procedure, confirm that battery voltage is between 12 - 15 V at idle.**
- **Before performing the following procedure, check that the engine coolant temperature is −10°C (14°F) or more.**

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for at least 5 seconds.
   If engine does not start, crank engine for at least 5 seconds.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1779, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798428

1.CHECK FUEL PUMP RELAY POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Turn ignition switch ON.
4. Check the voltage between ECM harness connector terminals.

ECM				Voltage
Connector	+	Connector	-	
	Terminal		Terminal	
F79	93	E16	152	Battery voltage

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.CHECK FUEL PUMP RELAY POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between ECM harness connector and IPDM E/R harness connector.

+		–		Continuity
ECM		IPDM E/R		
Connector	Terminal	Connector	Terminal	
F79	93	E122	45	Existed

4. Also check harness for short to ground.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit.
NO >> Repair or replace error-detected parts.

3.CHECK FPCM POWER SUPPLY

1. Turn ignition switch OFF.
2. Reconnect ECM harness connector.
3. Disconnect FPCM harness connector.
4. Turn ignition switch ON.
5. Check the voltage between FPCM harness connector and ground.

FPCM		Ground	Voltage
Connector	Terminal		
C12	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.CHECK FPCM POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between FPCM harness connector and IPDM E/R harness connector.

+		–		Continuity
FPCM		IPDM E/R		
Connector	Terminal	Connector	Terminal	
C12	1	E124	58	Existed

4. Also check harness for short to ground.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit.
NO >> Repair or replace error-detected parts.

5.CHECK FPCM GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Check the continuity between FPCM harness connector and ground.

FPCM		Ground	Continuity
Connector	Terminal		
C12	4	Ground	Existed

3. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair open circuit or short to power in harness or connectors.

6.CHECK FPCM INPUT AND OUTPUT CIRCUITS FOR OPEN AND SHORT

1. Disconnect ECM harness connector.
2. Check the continuity between FPCM harness connector and ECM harness connector.

FPCM		ECM		Continuity
Connector	Terminal	Connector	Terminal	
C12	3	E16	130	Existed
	2		136	

3. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between FPCM and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

8.CHECK FUEL PUMP CONTROL CIRCUIT FOR OPEN AND SHORT

1. Disconnect fuel level sensor unit and fuel pump harness connector.
2. Check the continuity between FPCM harness connector and fuel level sensor unit and fuel pump harness connector.

FPCM		Fuel level sensor unit and fuel pump		Continuity
Connector	Terminal	Connector	Terminal	
C12	6	C37	1	Existed
	5		2	

3. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

9.CHECK FPCM

Refer to EC-1781, "Component Inspection (FPCM)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace FPCM.

Component Inspection (FPCM)

INFOID:0000000013798429

1.CHECK FUEL PUMP CONTROL MODULE (FPCM)

1. Check the voltage between FPCM terminals under the following conditions.

FPCM			Condition	Voltage
Connector	+	–		
	Terminal	Terminal		
C12	6	5	For 1 second after turning ignition switch ON	Approx. 8.5 V
			More than 1 second after turning ignition switch ON	Approx. 0 V
			Idle speed	Approx. 8.5 V

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace FPCM.

P1225 TP SENSOR

DTC Description

INFOID:0000000013798430

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1225	CTP LEARNING-B1 (Closed throttle position learning performance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	Closed throttle position learning value is excessively low
		Diagnosis delay time	—

POSSIBLE CAUSE

Electric throttle control actuator (TP sensor 1 and 2)

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Check 1st trip DTC.

Is DTC detected?

YES >> Proceed to EC-1783, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798431

1.CHECK ELECTRIC THROTTLE CONTROL ACTUATOR VISUALLY

1. Turn ignition switch OFF.
2. Remove the intake air duct.
3. Check if foreign matter is caught between the throttle valve and the housing.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Remove the foreign matter and clean the electric throttle control actuator inside, then perform throttle valve closed position learning. Refer to EC-1429, "Description".

2.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

P1226 TP SENSOR

DTC Description

INFOID:0000000013798432

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1226	CTP LEARNING-B1 (Closed throttle position learning performance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	Closed throttle position learning is not performed successfully, repeatedly
		Diagnosis delay time	—

POSSIBLE CAUSE

Electric throttle control actuator (TP sensor 1 and 2)

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Repeat steps 2 and 3 for 32 times.
5. Check 1st trip DTC.

Is DTC detected?

YES >> Proceed to EC-1784, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798433

1.CHECK ELECTRIC THROTTLE CONTROL ACTUATOR VISUALLY

1. Turn ignition switch OFF.
2. Remove the intake air duct.
3. Check if foreign matter is caught between the throttle valve and the housing.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Remove the foreign matter and clean the electric throttle control actuator inside, then perform throttle valve closed position learning. Refer to EC-1429, "Description".

2.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

P1423, P1424 COLD START CONTROL

DTC Description

INFOID:0000000013798435

DTC DETECTION LOGIC

ECM controls fuel injection timing and fuel injection quantity when engine is started with the engine cold. This control promotes the activation of three way catalyst by heating the catalyst and reduces emissions.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1423	COLD START CONTROL (Cold start emission reduction strategy monitoring)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	ECM does not control fuel injection timing properly when engine is started with the engine cold
		Diagnosis delay time	—
P1424	COLD START CONTROL (Cold start emission reduction strategy monitoring)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	ECM does not control fuel injection quantity properly when engine is started with with the engine cold
		Diagnosis delay time	—

POSSIBLE CAUSE

ECM

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P1423 or P1424 is displayed with other DTC first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

WITH CONSULT

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Select “DATA MONITOR” mode with CONSULT.
4. Check that “COOLAN TEMP/S”.

- If it is between 5°C (41°F) and 40°C (104°F) go to the following steps.
- If it is below 5°C (41°F) warm engine up to more than 5°C (41°F) and retry from step 1.
- If it is above 40°C (104°F) cool engine down to less than 40°C (104°F) and retry from step 1.

5. Start engine and let it idle for 5 minutes.
6. Check 1st trip DTC.

WITH GST

Follow the procedure “With CONSULT” above.

Is DTC detected?

YES >> Proceed to EC-1786, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798436

1.CHECK DTC PRIORITY

If DTC P1423 or P1424 is displayed with other DTC first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.INSPECTION START

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC confirmation procedure. Refer to EC-1785, "DTC Description".
4. Check 1st trip DTC.

Is the 1st trip DTC P1423 or P1424 displayed again?

YES >> GO TO 3.
NO >> INSPECTION END

3.REPLACE ECM

Replace ECM. Refer to EC-1933, "Removal and Installation".

>> INSPECTION END

P1550 BATTERY CURRENT SENSOR

DTC Description

INFOID:0000000013798437

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1550	BAT CURRENT SENSOR (Battery current sensor circuit range/ performance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The output voltage of the battery current sensor remains within the specified range while engine is running
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (Battery current sensor circuit is open or shorted)
- Battery current sensor
- Sensor power supply 2

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 8 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for at least 10 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1787, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798438

1.CHECK BATTERY CURRENT SENSOR POWER SUPPLY CIRCUIT-I

1. Disconnect battery current sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between battery current sensor harness connector and ground.

Battery current sensor		Ground	Voltage (V)
Connector	Terminal		
E161	1	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.CHECK SENSOR POWER SUPPLY 2 CIRCUIT

Perform EC-1918, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

3.CHECK BATTERY CURRENT SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between battery current sensor harness connector and ECM harness connector.

Battery current sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E161	3	F78	43	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between battery current sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK BATTERY CURRENT SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between battery current sensor harness connector and ECM harness connector.

Battery current sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E161	4	F78	38	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between battery current sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

7.CHECK BATTERY CURRENT SENSOR

Refer to EC-1788, "Component Inspection (Battery Current Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace battery negative cable assembly.

Component Inspection (Battery Current Sensor)

INFOID:0000000013798439

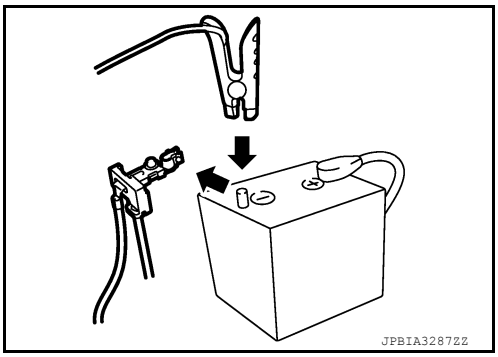
1.CHECK BATTERY CURRENT SENSOR

1. Turn ignition switch OFF.

2. Reconnect harness connectors disconnected.
3. Disconnect battery negative cable.

⬅: To body ground

4. Install jumper cable between battery negative terminal and body ground.
5. Turn ignition switch ON.
6. Check the voltage between ECM harness connector terminals under the following conditions.



ECM			Voltage (V)
Connector	+	–	
	Terminal	Terminal	
F78	38 (Battery current sensor signal)	43	Approx. 2.5

Before measuring the terminal voltage, confirm that the battery is fully charged. Refer to PG-164, "How to Handle Battery".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace battery negative cable assembly.

P1551, P1552 BATTERY CURRENT SENSOR

DTC Description

INFOID:0000000013798440

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1551	BAT CURRENT SENSOR (Battery current sensor circuit low input)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	An excessively low voltage from the sensor is sent to ECM
		Diagnosis delay time	—
P1552	Battery current sensor circuit high input (BAT CURRENT SENSOR)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	An excessively high voltage from the sensor is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (Battery current sensor circuit is open or shorted)
- Battery current sensor
- Sensor power supply 2

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 8 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for at least 10 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1790, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798441

1.CHECK BATTERY CURRENT SENSOR POWER SUPPLY CIRCUIT-I

1. Disconnect battery current sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between battery current sensor harness connector and ground.

Battery current sensor		Ground	Voltage (V)
Connector	Terminal		
E161	1	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.CHECK SENSOR POWER SUPPLY 2 CIRCUIT

Perform EC-1918, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

3.CHECK BATTERY CURRENT SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between battery current sensor harness connector and ECM harness connector.

Battery current sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E161	3	F78	43	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between battery current sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK BATTERY CURRENT SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between battery current sensor harness connector and ECM harness connector.

Battery current sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E161	4	F78	38	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between battery current sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

7.CHECK BATTERY CURRENT SENSOR

Refer to EC-1792, "Component Inspection (Battery Current Sensor)".

Is the inspection result normal?

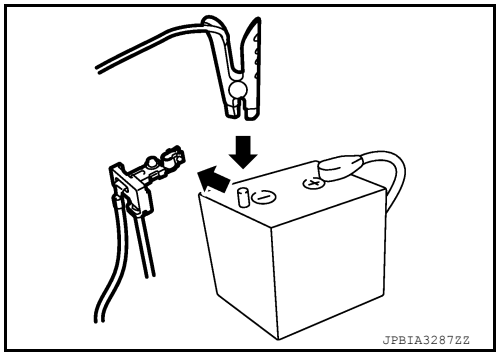
YES >> INSPECTION END
NO >> Replace battery negative cable assembly.

Component Inspection (Battery Current Sensor)

INFOID:0000000013798442

1. CHECK BATTERY CURRENT SENSOR

1. Turn ignition switch OFF.
2. Reconnect harness connectors disconnected.
3. Disconnect battery negative cable.



⬅: To body ground

4. Install jumper cable between battery negative terminal and body ground.
5. Turn ignition switch ON.
6. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Voltage (V)
Connector	+	–	
	Terminal	Terminal	
F78	38 (Battery current sensor signal)	43	Approx. 2.5

Before measuring the terminal voltage, confirm that the battery is fully charged. Refer to PG-164, "How to Handle Battery".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace battery negative cable assembly.

P1553 BATTERY CURRENT SENSOR

DTC Description

INFOID:0000000013798443

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1553	BAT CURRENT SENSOR (Battery current sensor performance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The signal voltage transmitted from the sensor to ECM is higher than the amount of the maximum power generation
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (Battery current sensor circuit is open or shorted)
- Battery current sensor
- Sensor power supply 2

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 8 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for at least 10 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1793, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798444

1.CHECK BATTERY CURRENT SENSOR POWER SUPPLY CIRCUIT-I

1. Disconnect battery current sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between battery current sensor harness connector and ground.

Battery current sensor		Ground	Voltage (V)
Connector	Terminal		
E161	1	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.CHECK SENSOR POWER SUPPLY 2 CIRCUIT

Perform EC-1918, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

3.CHECK BATTERY CURRENT SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between battery current sensor harness connector and ECM harness connector.

Battery current sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E161	3	F78	43	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between battery current sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK BATTERY CURRENT SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between battery current sensor harness connector and ECM harness connector.

Battery current sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E161	4	F78	38	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between battery current sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

7.CHECK BATTERY CURRENT SENSOR

Refer to EC-1794, "Component Inspection (Battery Current Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace battery negative cable assembly.

Component Inspection (Battery Current Sensor)

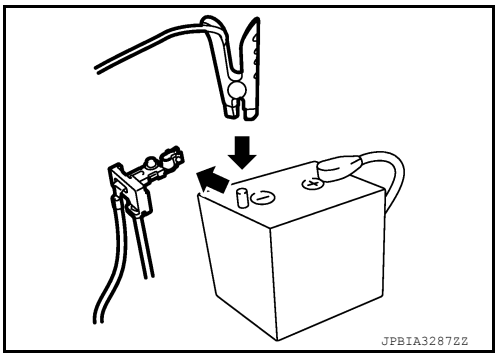
INFOID:0000000013798445

1.CHECK BATTERY CURRENT SENSOR

1. Turn ignition switch OFF.

2. Reconnect harness connectors disconnected.
3. Disconnect battery negative cable.

⬅: To body ground



4. Install jumper cable between battery negative terminal and body ground.
5. Turn ignition switch ON.
6. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Voltage (V)
Connector	+	–	
	Terminal	Terminal	
F78	38 (Battery current sensor signal)	43	Approx. 2.5

Before measuring the terminal voltage, confirm that the battery is fully charged. Refer to PG-164, "How to Handle Battery".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace battery negative cable assembly.

P1554 BATTERY CURRENT SENSOR

DTC Description

INFOID:0000000013798446

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1554	BAT CURRENT SENSOR (Battery current sensor performance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The output voltage of the battery current sensor is lower than the specified value while the battery voltage is high enough
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (Battery current sensor circuit is open or shorted)
- Battery current sensor
- Sensor power supply 2

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PERFORM COMPONENT FUNCTION CHECK

Perform Component Function Check. Refer to EC-1796, "Component Function Check".

NOTE:

Use Component Function Check to check the overall function of the battery current sensor circuit. During this check, a 1st trip DTC might not be confirmed.

Is the inspection result normal?

YES-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
YES-2 >> Confirmation after repair: INSPECTION END
NO >> Go to EC-1797, "Diagnosis Procedure".

Component Function Check

INFOID:0000000013798447

1.PRECONDITIONING

TESTING CONDITION:

- **Before performing the following procedure, confirm that battery voltage is 12.8 V or more at idle.**
- **Before performing the following procedure, confirm that all load switches and A/C switch are turned OFF.**

>> GO TO 2.

2.PERFORM COMPONENT FUNCTION CHECK

WITH CONSULT

1. Start engine and let it idle.
2. Select “BAT CUR SEN” in “DATA MONITOR” mode with CONSULT.
3. Check “BAT CUR SEN” indication for 10 seconds.
   “BAT CUR SEN” should be above 2,300 mV at least once.

WITHOUT CONSULT

1. Start engine and let it idle.
2. Check the voltage between ECM harness connector terminals as per the following.

ECM			Voltage (V)
Connector	+	–	
	Terminal	Terminal	
F78	38 (Battery current sensor signal)	43	Approx. 2.5

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1797, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798448

1.CHECK BATTERY CURRENT SENSOR POWER SUPPLY CIRCUIT-I

1. Disconnect battery current sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between battery current sensor harness connector and ground.

Battery current sensor		Ground	Voltage (V)
Connector	Terminal		
E161	1	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.CHECK SENSOR POWER SUPPLY 2 CIRCUIT

Perform EC-1918, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

3.CHECK BATTERY CURRENT SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between battery current sensor harness connector and ECM harness connector.

Battery current sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E161	3	F78	43	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between battery current sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK BATTERY CURRENT SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between battery current sensor harness connector and ECM harness connector.

Battery current sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E161	4	F78	38	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between battery current sensor and ECM
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

7. CHECK BATTERY CURRENT SENSOR

Refer to EC-1798, "Component Inspection (Battery Current Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace battery negative cable assembly.

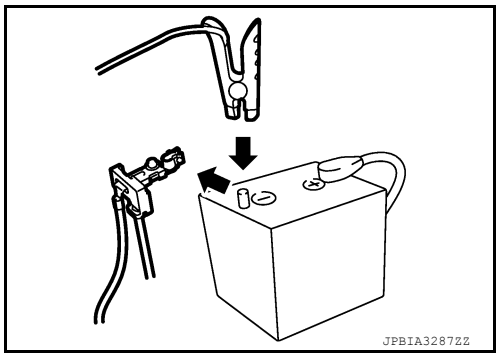
Component Inspection (Battery Current Sensor)

INFOID:0000000013798449

1. CHECK BATTERY CURRENT SENSOR

1. Turn ignition switch OFF.
2. Reconnect harness connectors disconnected.
3. Disconnect battery negative cable.

: To body ground



4. Install jumper cable between battery negative terminal and body ground.
5. Turn ignition switch ON.
6. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Voltage (V)
Connector	+	–	
	Terminal	Terminal	
F78	38 (Battery current sensor signal)	43	Approx. 2.5

Before measuring the terminal voltage, confirm that the battery is fully charged. Refer to PG-164, "How to Handle Battery".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace battery negative cable assembly.

P1556, P1557 BATTERY TEMPERATURE SENSOR

DTC Description

INFOID:0000000013798450

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1556	BAT TMP SEN/CIRC (Battery temperature sensor circuit low input)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	Voltage signal transmitted from battery temperature sensor
		Threshold	Signal voltage from Battery temperature sensor remains 0.16V or less
		Diagnosis delay time	5 seconds or more
P1557	BAT TMP SEN/CIRC (Battery temperature sensor circuit high input)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	Voltage signal transmitted from battery temperature sensor
		Threshold	Signal voltage from Battery temperature sensor remains 4.84V or more
		Diagnosis delay time	5 seconds or more

POSSIBLE CAUSE

- Harness or connectors
  [Battery current sensor (Battery temperature sensor) circuit is shorted.]
- Battery current sensor (Battery temperature sensor)

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P1556 or P1557 is displayed with DTC P0643 first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start the engine and let it idle at least 10 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1800, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798451

1.CHECK DTC PRIORITY

If DTC P1556 or P1557 is displayed with DTC P0643 first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.CHECK BATTERY TEMPERATURE SENSOR INPUT SIGNAL CIRCUIT-I

1. Disconnect battery current sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between battery current sensor harness connector and ground.

Battery current sensor		Ground	Voltage (V)
Connector	Terminal		
E161	2	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.CHECK BATTERY TEMPERATURE SENSOR INPUT SIGNAL CIRCUIT-II

1. Turn ignition switch ON.
2. Disconnect ECM harness connector.
3. Check the continuity between battery current sensor harness connector and ECM harness connector.

Battery current sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E161	2	F78	32	Existed

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair open circuit.

4.CHECK BATTERY TEMPERATURE SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between battery current sensor harness connector and ECM harness connector.

Battery current sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E161	3	F78	43	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK BATTERY TEMPERATURE SENSOR

Refer to EC-1801, "Component Inspection (Battery Temperature Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace battery negative cable assembly.

Component Inspection (Battery Temperature Sensor)

INFOID:0000000013798452

1. CHECK BATTERY TEMPERATURE SENSOR

1. Turn ignition switch OFF.
2. Disconnect battery current sensor.
3. Check the resistance between battery current sensor connector terminals.

Battery current sensor		Resistance
+	–	
Terminal		
2	3	continuity with the resistance value 100 Ω or more

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace battery negative cable assembly.

P1564 ASCD STEERING SWITCH

DTC Description

INFOID:0000000013798453

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1564	ASCD SW (ASCD steering switch)	Diagnosis condition	—
		Signal (terminal)	ASCD steering switch signal
		Threshold	• An excessively high voltage signal from the ASCD steering switch is sent to ECM • ECM detects that input signal from the ASCD steering switch is out of the specified range • ECM detects that the ASCD steering switch is stuck ON
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (The switch circuit is open or shorted)
- ASCD steering switch
- ECM

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P1564 is displayed with DTC P0605 first perform the trouble diagnosis for DTC P0605.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1734, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 10 seconds.
2. Press MAIN switch for at least 10 seconds, then release it and wait at least 10 seconds.
3. Press CANCEL switch for at least 10 seconds, then release it and wait at least 10 seconds.
4. Press ACCELERATE/RESUME switch for at least 10 seconds, then release it and wait at least 10 seconds.
5. Press COAST/SET switch for at least 10 seconds, then release it and wait at least 10 seconds.
6. Check DTC.

Is DTC detected?

YES >> Proceed to EC-1803, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798454

1.CHECK DTC PRIORITY

If DTC P1564 is displayed with DTC P0605 first perform the trouble diagnosis for DTC P0605.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1734, "DTC Description".
NO >> GO TO 2.

2.CHECK ASCD STEERING SWITCH CIRCUIT

WITH CONSULT

1. Turn ignition switch ON.
2. Select “MAIN SW”, “CANCEL SW”, “RESUME/ACC SW” and “SET SW” in “DATA MONITOR” mode with CONSULT.
3. Check each item indication under the following conditions.

Monitor item	Condition		Indication
MAIN SW	MAIN switch	Pressed	ON
		Released	OFF
CANCEL SW	CANCEL switch	Pressed	ON
		Released	OFF
RESUME/ACC SW	ACCELERATE/RESUME switch	Pressed	ON
		Released	OFF
SET SW	COAST/SET switch	Pressed	ON
		Released	OFF

WITHOUT CONSULT

1. Turn ignition switch ON.
2. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition	Voltage (V)
Connector	+	–		
	Terminal	Terminal		
E16	134 (ASCD steering switch signal)	135	MAIN switch: Pressed	Approx. 0
			CANCEL switch: Pressed	Approx. 1
			COAST/SET switch: Pressed	Approx. 2
			ACCELERATE/RESUME switch: Pressed	Approx. 3
			All ASCD steering switches: Released	Approx. 4

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 3.

3.CHECK ASCD STEERING SWITCH GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Disconnect combination switch harness connector.
4. Check the continuity between combination switch and ECM harness connector.

Combination switch		ECM		Continuity
Connector	Terminal	Connector	Terminal	
—	7[*1] 13[*2]	E16	135	Existed

*1: With heated steering wheel
*2: Without heated steering wheel

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.DETECT MALFUNCTIONING PART

Check the following.
- Combination switch (spiral cable)
- Harness for open and short between ECM and combination switch

>> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK ASCD STEERING SWITCH INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between combination switch and ECM harness connector.

Combination switch		ECM		Continuity
Connector	Terminal	Connector	Terminal	
—	10*1 9*2	E16	134	Existed

*1: With heated steering wheel
*2: Without heated steering wheel

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6.DETECT MALFUNCTIONING PART

Check the following.
- Combination switch (spiral cable)
- Harness for open and short between ECM and combination switch

>> Repair open circuit, short to ground or short to power in harness or connectors.

7.CHECK ASCD STEERING SWITCH

Refer to EC-1804, "Component Inspection (ASCD Steering Switch)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace ASCD steering switch. Refer to ST-34, "Removal and Installation".

Component Inspection (ASCD Steering Switch)

INFOID:0000000013798455

1.CHECK ASCD STEERING SWITCH

1. Turn ignition switch OFF.
2. Disconnect combination switch (spiral cable) harness connector M199.
3. Check resistance between combination switch harness connector terminals under the following conditions.

Combination switch		Condition	Resistance (Ω)
Connector	Terminals		
M199	15 and 18	MAIN switch: Pressed	Approx. 0
		CANCEL switch: Pressed	Approx. 250
		COAST/SET switch: Pressed	Approx. 660
		ACCELERATE/RESUME switch: Pressed	Approx. 1,480
		All ASCD steering switches: Released	Approx. 4,000

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace ASCD steering switch. Refer to ST-34, "Removal and Installation".

P1572 BRAKE PEDAL POSITION SWITCH

DTC Description

INFOID:0000000013798461

DTC DETECTION LOGIC

NOTE:

This self-diagnosis has the one trip detection logic. When malfunction A is detected, DTC is not stored in ECM memory. And in that case, 1st trip DTC and 1st trip freeze frame data are displayed. 1st trip DTC is erased when ignition switch is turned OFF. And even when malfunction A is detected in two consecutive trips, DTC is not stored in ECM memory.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P1572	ASCD BRAKE SW (ASCD brake switch)	A	Diagnosis condition	—
			Signal (terminal)	• Brake pedal position switch signal • Stop lamp switch signal
			Threshold	When the vehicle speed is above 30 km/h (19 MPH), ON signals from the stop lamp switch and the brake pedal position switch are sent to the ECM at the same time
			Diagnosis delay time	—
		B	Diagnosis condition	—
			Signal (terminal)	Brake pedal position switch signal
			Threshold	Brake pedal position switch signal is not sent to ECM for extremely long time while the vehicle is being driven
			Diagnosis delay time	Extremely long time

POSSIBLE CAUSE

- Harness or connectors (The stop lamp switch circuit is shorted)
- Harness or connectors (The brake pedal position switch circuit is shorted)
- Stop lamp switch
- Brake pedal position switch
- Incorrect stop lamp switch installation
- Incorrect brake pedal position switch installation
- ECM

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P1572 is displayed with DTC P0605 first perform the trouble diagnosis for DTC P0605.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1734, "DTC Description".

NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

NOTE:

The procedure for malfunction B is not described. It takes an extremely long time to complete the procedure for malfunction B. By performing the procedure for malfunction A, the condition that causes malfunction B can be detected.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION A

1. Start engine (VDC switch OFF).
2. Press MAIN switch and check that CRUISE indicator is displayed in combination meter.
3. Drive the vehicle for at least 5 consecutive seconds under the following conditions.
   CAUTION:
   Always drive vehicle at a safe speed.
   NOTE:
   This procedure may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.

Vehicle speed	More than 30 km/h (19 mph)
Selector lever	Suitable position

4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1807, "Diagnosis Procedure".
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE

1. Drive the vehicle for at least 5 consecutive seconds under the following conditions.
   CAUTION:
   Always drive vehicle at a safe speed.
   NOTE:
   This procedure may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.

Vehicle speed	More than 30 km/h (19 mph)
Selector lever	Suitable position
Driving location	Depress the brake pedal for more than 5 seconds so as not to come off from the above-mentioned vehicle speed.

2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1807, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798462

1.CHECK DTC PRIORITY

If DTC P1572 is displayed with DTC P0605 first perform the trouble diagnosis for DTC P0605.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1734, "DTC Description".
NO >> GO TO 2.

2.CHECK OVERALL FUNCTION-I

WITH CONSULT

1. Turn ignition switch ON.
2. Select “BRAKE SW1” in “DATA MONITOR” mode with CONSULT.
3. Check “BRAKE SW1” indication under the following conditions.

Monitor item	Condition		Indication
BRAKE SW1 (Brake pedal position switch)	Brake pedal	Slightly depressed	OFF
		Fully released	ON

WITHOUT CONSULT

1. Turn ignition switch ON.
2. Check the voltage between ECM harness connector terminals as per the following.

ECM			Condition		Voltage (V)
Connector	+	–			
	Terminal	Terminal			
E16	140 (Brake pedal position switch signal)	152	Brake pedal	Slightly depressed	Approx. 0
				Fully released	Battery voltage

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 4.

3.CHECK OVERALL FUNCTION-II

WITH CONSULT
Select “BRAKE SW2” and check indication under the following conditions.

Monitor item	Condition		Indication
BRAKE SW2 (Stop lamp switch)	Brake pedal	Slightly depressed	ON
		Fully released	OFF

WITHOUT CONSULT
Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition		Voltage (V)
Connector	+	–			
	Terminal	Terminal			
E16	139 (Stop lamp switch signal)	152	Brake pedal	Slightly depressed	Battery voltage
				Fully released	Approx. 0

Is the inspection result normal?

YES >> GO TO 13.
NO >> GO TO 9.

4.CHECK BRAKE PEDAL POSITION SWITCH POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect brake pedal position switch harness connector.
3. Turn ignition switch ON.
4. Check the voltage between brake pedal position switch harness connector and ground.

Brake pedal position switch		Ground	Voltage
Connector	Terminal		
E170	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5.DETECT MALFUNCTIONING PART

Check the following.
- 10 A fuse (No. 30)
- Harness for open or short between brake pedal position switch and fuse
- Loose or poor connection for each connector and harness

>> Repair open circuit or short to ground in harness or connectors.

6. CHECK BRAKE PEDAL POSITION SWITCH INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between brake pedal position switch harness connector and ECM harness connector.

Brake pedal position switch		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E170	2	E16	140	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and brake pedal position switch
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

8. CHECK BRAKE PEDAL POSITION SWITCH

Refer to EC-1810, "Component Inspection (Brake Pedal Position Switch)"

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace brake pedal position switch.

9. CHECK STOP LAMP SWITCH POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect stop lamp switch harness connector.
3. Check the voltage between stop lamp switch harness connector and ground.

Stop lamp switch		Ground	Voltage
Connector	Terminal		
E38	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 11.
NO >> GO TO 10.

10. DETECT MALFUNCTIONING PART

Check the following.
- 10 A fuse (No. 10)
- Harness for open or short between stop lamp switch and battery
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

11. CHECK STOP LAMP SWITCH INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Disconnect ECM harness connector.
2. Check the continuity between stop lamp switch harness connector and ECM harness connector.

Stop lamp switch		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E38	2	E16	139	Existed

3. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 13.
NO >> GO TO 12.

12. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and stop lamp switch
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

13. CHECK STOP LAMP SWITCH

Refer to EC-1810, "Component Inspection (Stop Lamp Switch)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace stop lamp switch.

Component Inspection (Brake Pedal Position Switch)

INFOID:0000000013798463

1. CHECK BRAKE PEDAL POSITION SWITCH-I

1. Turn ignition switch OFF.
2. Disconnect brake pedal position switch harness connector.
3. Check the continuity between brake pedal position switch terminals under the following conditions.

Terminals	Condition		Continuity
1 and 2	Brake pedal	Fully released	Existed
		Slightly depressed	Not existed

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2. CHECK BRAKE PEDAL POSITION SWITCH-II

1. Adjust brake pedal position switch installation. Refer to BR-10, "Inspection".
2. Check the continuity between brake pedal position switch terminals under the following conditions.

Terminals	Condition		Continuity
1 and 2	Brake pedal	Fully released	Existed
		Slightly depressed	Not existed

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace brake pedal position switch. Refer to BR-20, "Removal and Installation".

Component Inspection (Stop Lamp Switch)

INFOID:0000000013798464

1. CHECK STOP LAMP SWITCH-I

1. Turn ignition switch OFF.
2. Disconnect stop lamp switch harness connector.
3. Check the continuity between stop lamp switch terminals under the following conditions.

Terminals	Condition		Continuity
1 and 2	Brake pedal	Fully released	Not existed
		Slightly depressed	Existed

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.CHECK STOP LAMP SWITCH-II

1. Adjust stop lamp switch installation. Refer to BR-10, "Inspection".
2. Check the continuity between stop lamp switch terminals under the following conditions.

Terminals	Condition		Continuity
1 and 2	Brake pedal	Fully released	Not existed
		Slightly depressed	Existed

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace stop lamp switch. Refer to BR-20, "Removal and Installation".

P1574 ASCD VEHICLE SPEED SENSOR

DTC Description

INFOID:0000000013798471

DTC DETECTION LOGIC

The ECM receives two vehicle speed signals by the CAN communication line. One is sent from “combination meter”, and the other is from TCM (Transmission control module). The ECM uses these signals for ASCD control. Refer to EC-1307, "AUTOMATIC SPEED CONTROL DEVICE (ASCD) : System Description" for ASCD functions.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1574	ASCD VHL SPD SEN (ASCD vehicle speed sensor)	Diagnosis condition	—
		Signal (terminal)	ASCD steering switch signal
		Threshold	ECM detects a difference between two vehicle speed signals is out of the specified range
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (The CAN communication line is open or shorted)
- Combination meter
- ABS actuator and electric unit (control unit)
- Wheel sensor
- TCM
- ECM

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine (VDC switch OFF).
2. Drive the vehicle at more than 40 km/h (25 MPH).
   CAUTION:
   Always drive vehicle at a safe speed.
   NOTE:
   This procedure may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.
3. Check DTC.

Is DTC detected?

YES >> Proceed to EC-1813, "Diagnosis Procedure".
NO >> INSPECTION END

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P1574 is displayed with DTC UXXXX first perform the trouble diagnosis for DTC UXXXX.
- If DTC P1574 is displayed with DTC P0500 first perform the trouble diagnosis for DTC P0500.
- If DTC P1574 is displayed with DTC P0605 first perform the trouble diagnosis for DTC P0605.
- If DTC P1574 is displayed with DTC P0607 first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.

2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine (VDC switch OFF).
2. Drive the vehicle at more than 40 km/h (25 MPH).
   CAUTION:
   Always drive vehicle at a safe speed.
   NOTE:
   This procedure may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.
3. Check DTC.

Is DTC detected?

YES >> Proceed to EC-1807, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798472

1.CHECK DTC PRIORITY

- If DTC P1574 is displayed with DTC UXXXX first perform the trouble diagnosis for DTC UXXXX.
- If DTC P1574 is displayed with DTC P0500 first perform the trouble diagnosis for DTC P0500.
- If DTC P1574 is displayed with DTC P0605 first perform the trouble diagnosis for DTC P0605.
- If DTC P1574 is displayed with DTC P0607 first perform the trouble diagnosis for DTC P0607.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK DTC WITH TCM

Check DTC with TCM. Refer to TM-316, "CONSULT Function".

Is the inspection result normal?

YES >> GO TO 3.
NO >> Perform Diagnosis Procedure corresponding to the DTC indicated.

3.CHECK DTC WITH “ABS ACTUATOR AND ELECTRIC UNIT (CONTROL UNIT)”

Refer to BRC-43, "CONSULT Function (ABS)".

Is the inspection result normal?

YES >> GO TO 4.
NO >> Perform Diagnosis Procedure corresponding to the DTC indicated.

4.CHECK DTC WITH “COMBINATION METER”

Refer to MWI-27, "CONSULT Function (METER/M&A)" (TYPE A), MWI-131, "CONSULT Function (METER/M&A)" (TYPE B).

>> INSPECTION END

P1606 VVEL CONTROL MODULE

DTC Description

INFOID:0000000013798476

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1606	VVEL CONTROL MODULE	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	• VVEL control module calculation function is malfunctioning • VVEL EEP-ROM system is malfunctioning
		Diagnosis delay time	—

POSSIBLE CAUSE

VVEL control module

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P1606	VVEL control module	VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 1 second.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1814, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798477

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC Confirmation Procedure.
   See EC-1814, "DTC Description".

Is the DTC P1606 displayed again?

YES >> Replace VVEL control module. Refer to EC-1934, "Removal and Installation".
NO >> INSPECTION END

P1607 VVEL CONTROL MODULE

DTC Description

INFOID:0000000013798478

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1607	VVEL CONTROL MODULE (VVEL control module circuit)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The internal circuit of the VVEL control module is malfunctioning
		Diagnosis delay time	—

POSSIBLE CAUSE

VVEL control module

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for at least 1 second.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1815, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798479

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Erase DTC.
3. Perform DTC Confirmation Procedure.
   See EC-1815, "DTC Description".

Is the DTC P1607 displayed again?

YES >> Replace VVEL control module. Refer to EC-1934, "Removal and Installation".
NO >> INSPECTION END

P1608 VVEL SENSOR POWER SUPPLY

DTC Description

INFOID:0000000013798480

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1608	VVEL SENSOR POWER/CIRC (VVEL sensor power supply circuit)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	VVEL control module detects a voltage of power source for sensor is excessively low or high
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (VVEL control shaft position sensor power supply circuit is open or shorted)
- VVEL control shaft position sensor
- VVEL control module

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P1608	VVEL control shaft position sensor	VVEL actuator motor relay is turned off, and VVEL value is become at a minimum angle. Engine speed will not rise more than 3,500 rpm due to the fuel cut.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 10 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 1 second.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1816, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798481

1.CHECK VVEL CONTROL SHAFT POSITION SENSOR POWER SUPPLY CIRCUIT-I

1. Disconnect VVEL control shaft position sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between VVEL control shaft position sensor harness connector and ground.

VVEL control shaft position sensor			Ground	Voltage
Bank	Connector	Terminal		
1	F83	3	Ground	Approx. 5V
		6		
2	F86	3		
		6		

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 2.

2.CHECK VVEL CONTROL SHAFT POSITION SENSOR POWER SUPPLY CIRCUIT-II

1. Turn ignition switch OFF.
2. Disconnect VVEL control module harness connector.
3. Check the continuity between VVEL control shaft position sensor harness connector and VVEL control module harness connector.

VVEL control shaft position sensor			VVEL control module		Continuity
Bank	Connector	Terminal	Connector	Terminal	
1	F83	3	F84	7	Existed
		6		20	
2	F86	3		9	
		6		22	

4. Also check harness for short to ground and power.

Is the inspection result normal?

YES >> Replace VVEL control module. Refer to EC-1934, "Removal and Installation".
NO >> GO TO 3.

3.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between VVEL control shaft position sensor and VVEL control module
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

4.REPLACE VVEL LADDER ASSEMBLY

Replace VVEL ladder assembly. Refer to EM-86, "Removal and Installation".

>> NSPECTION END

P1805 BRAKE SWITCH

DTC Description

INFOID:0000000013798482

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P1805	BRAKE SW/CIRCUIT (Brake switch)	Diagnosis condition	—
		Signal (terminal)	Stop lamp switch signal
		Threshold	A brake switch signal is not sent to ECM for extremely long time while the vehicle is being driven
		Diagnosis delay time	Extremely long time

POSSIBLE CAUSE

- Harness or connectors (Stop lamp switch circuit is open or shorted)
- Stop lamp switch

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode	
P1805	Brake switch	ECM controls the electric throttle control actuator by regulating the throttle opening to a small range. Therefore, acceleration will be poor.	
		Vehicle condition	Driving condition
		When engine is idling	Normal
		When accelerating	Poor acceleration

DTC CONFIRMATION PROCEDURE

1.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON.
2. Fully depress the brake pedal for at least 5 seconds.
3. Erase the DTC.
4. Check 1st trip DTC.

Is DTC detected?

YES >> Go to EC-1818, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798483

1.CHECK STOP LAMP SWITCH CIRCUIT

1. Turn ignition switch OFF.
2. Check for stop lamp illumination under the following conditions.

Condition		Stop lamp
Brake pedal	Fully released	Not illuminated
	Slightly depressed	Illuminated

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 2.

2.CHECK STOP LAMP SWITCH POWER SUPPLY CIRCUIT

1. Disconnect stop lamp switch harness connector.
2. Check the voltage between stop lamp switch harness connector and ground.

Stop lamp switch		Ground	Voltage
Connector	Terminal		
E38	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.DETECT MALFUNCTIONING PART

Check the following.
- 10 A fuse (No. 10)
- Harness for open or short between stop lamp switch and battery
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

4.CHECK STOP LAMP SWITCH INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Disconnect stop lamp switch harness connector.
2. Disconnect ECM harness connector.
3. Check the continuity between stop lamp switch harness connector and ECM harness connector.

Stop lamp switch		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E38	2	E16	139	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and stop lamp switch
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

6.CHECK STOP LAMP SWITCH

Refer to EC-1819, "Component Inspection (Stop Lamp Switch)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace stop lamp switch. Refer to BR-20, "Removal and Installation".

Component Inspection (Stop Lamp Switch)

INFOID:0000000013798484

1.CHECK STOP LAMP SWITCH-I

1. Turn ignition switch OFF.
2. Disconnect stop lamp switch harness connector.
3. Check the continuity between stop lamp switch terminals under the following conditions.

Terminals	Condition		Continuity
1 and 2	Brake pedal	Fully released	Not existed
		Slightly depressed	Existed

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2. CHECK STOP LAMP SWITCH-II

1. Adjust stop lamp switch installation. Refer to BR-20, "Removal and Installation".
2. Check the continuity between stop lamp switch terminals under the following conditions.

Terminals	Condition		Continuity
1 and 2	Brake pedal	Fully released	Not existed
		Slightly depressed	Existed

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace stop lamp switch. Refer to BR-20, "Removal and Installation".

P2080 EXHAUST GAS TEMPERATURE SENSOR

DTC Description

INFOID:0000000013798485

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P2080	EXHAUST GAS TEMP SENSOR 1 B1 (Exhaust gas temperature sensor circuit range/performance bank 1 sensor 1)	1	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	The difference between estimated exhaust gas temperature calculated by ECM and temperature sent from exhaust gas temperature sensor is approx. 200°C (392°F) or more
			Diagnosis delay time	20 seconds or more
		2	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	The difference between exhaust gas temperature sent from exhaust gas temperature sensor and estimated exhaust gas temperature calculated by ECM is 300°C (572°F) or more
			Diagnosis delay time	20 seconds or more

POSSIBLE CAUSE

- Exhaust gas temperature sensor
- Exhaust gas leaks

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- DTC P2080 is displayed with DTCs related to following items, first perform the trouble diagnosis of DTCs.
- Crankshaft position sensor
- Misfire
- Fuel system
- A/F sensor 1
- A/F sensor 1 heater
- Mass air flow sensor
- Engine coolant temperature sensor 1
- Intake air temperature sensor
- Vehicle speed sensor
- DTC P2080 is displayed with DTC P0544, P0545, P0546, or P2081, first perform the trouble diagnosis for DTC P0544, P0545, P0546, or P2081.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TEST CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 11 V at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

With CONSULT
1. Turn ignition switch ON.
2. Select “DATA MONITOR” mode of “ENGINE” using CONSULT.
3. Start engine and warm it up to normal operating temperature.
4. Maintain the following conditions for at least 20 consecutive seconds.

CAUTION:
Always drive vehicle at a safe speed.

INT/A TEMP SE	• More than 0°C (32°F) • Less than 50°C (122°F)
COOLANT TEMP/S	More than 65°C (149°F)
VHCL SPEED SE	More than 80 km/h (50 MPH)

NOTE:
Keep the accelerator pedal as steady as possible during cruising.

5. Check 1st trip DTC.

With GST
Follow the procedure “With CONSULT” above.

Is DTC detected?

YES >> Go to EC-1822, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798486

1.CHECK DTC PRIORITY

- DTC P2080 is displayed with DTCs related to following items, first perform the trouble diagnosis of DTCs.
- Crankshaft position sensor
- Misfire
- Fuel system
- A/F sensor 1
- A/F sensor 1 heater
- Mass air flow sensor
- Engine coolant temperature sensor 1
- Intake air temperature sensor
- Vehicle speed sensor
- DTC P2080 is displayed with DTC P0544, P0545, P0546, or P2081, first perform the trouble diagnosis for DTC P0544, P0545, P0546, or P2081.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR EXHAUST GAS LEAKS

1. Start the engine and let it idle.
2. Listen for an exhaust gas leak upstream the three way catalyst.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK EXHAUST GAS TEMPERATURE SENSOR

With CONSULT
1. Start engine and warm it up to normal operating temperature.
2. Select “EXHAUST GAS TEMP SEN 1 B1” in “DATA MONITOR” mode of “ENGINE” using CONSULT.

3. Check that “EXHAUST GAS TEMP SEN 1 B1” indication as follows.

Monitor item	Condition	Value
EXHAUST GAS TEMP SEN 1 B1	• Warm-up condition • Idle speed	1,290 – 2,940 mV

Without CONSULT
1. Start engine and warm it up to normal operating temperature.
2. Check that voltage between ECM harness connector terminals as follows.

ECM			Condition	Voltage
Connector	+	–		
	Terminal			
F78	19	43	• Warm-up condition • Idle speed	1.29 – 2.94 V

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace exhaust gas temperature sensor. Refer to EM-45, "Exploded View".

P2082 EXHAUST GAS TEMPERATURE SENSOR

DTC Description

INFOID:0000000013798487

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2082	EXHAUST GAS TEMP SENSOR 1 B2 (Exhaust gas temperature sensor circuit range/performance bank 2 sensor 1)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The difference between estimated exhaust gas temperature calculated by ECM and temperature sent from exhaust gas temperature sensor is approx. 200°C (392°F) or more
		Diagnosis delay time	20 seconds or more
P2082	EXHAUST GAS TEMP SENSOR 1 B2 (Exhaust gas temperature sensor circuit range/performance bank 2 sensor 1)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The difference between exhaust gas temperature sent from exhaust gas temperature sensor and estimated exhaust gas temperature calculated by ECM is 300°C (572°F) or more
		Diagnosis delay time	20 seconds or more

POSSIBLE CAUSE

- Exhaust gas temperature sensor
- Exhaust gas leaks

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- DTC P2082 is displayed with DTCs related to following items, first perform the trouble diagnosis of DTCs.
- Crankshaft position sensor
- Misfire
- Fuel system
- A/F sensor 1
- A/F sensor 1 heater
- Mass air flow sensor
- Engine coolant temperature sensor 1
- Intake air temperature sensor
- Vehicle speed sensor
- DTC P2082 is displayed with DTC P0547, P0548, P0549, or P2083, first perform the trouble diagnosis for DTC P0547, P0548, P0549, or P2083.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TEST CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 11 V at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

With CONSULT
1. Turn ignition switch ON.
2. Select “DATA MONITOR” mode of “ENGINE” using CONSULT.
3. Start engine and warm it up to normal operating temperature.
4. Maintain the following conditions for at least 20 consecutive seconds.
   CAUTION:
   Always drive vehicle at a safe speed.

INT/A TEMP SE	• More than 0°C (32°F) • Less than 50°C (122°F)
COOLANT TEMP/S	More than 65°C (149°F)
VHCL SPEED SE	More than 80 km/h (50 MPH)

   NOTE:
   Keep the accelerator pedal as steady as possible during cruising.
5. Check 1st trip DTC.

With GST
Follow the procedure “With CONSULT” above.

Is DTC detected?

YES >> Go to EC-1825, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798488

1.CHECK DTC PRIORITY

- DTC P2082 is displayed with DTCs related to following items, first perform the trouble diagnosis of DTCs.
- Crankshaft position sensor
- Misfire
- Fuel system
- A/F sensor 1
- A/F sensor 1 heater
- Mass air flow sensor
- Engine coolant temperature sensor 1
- Intake air temperature sensor
- Vehicle speed sensor
- DTC P2082 is displayed with DTC P0547, P0548, P0549, or P2083, first perform the trouble diagnosis for DTC P0547, P0548, P0549, or P2083.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR EXHAUST GAS LEAKS

1. Start the engine and let it idle.
2. Listen for an exhaust gas leak upstream the three way catalyst.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK EXHAUST GAS TEMPERATURE SENSOR

With CONSULT
1. Start engine and warm it up to normal operating temperature.
2. Select “EXHAUST GAS TEMP SEN 1 B2” in “DATA MONITOR” mode of “ENGINE” using CONSULT.

3. Check that “EXHAUST GAS TEMP SEN 1 B2” indication as follows.

Monitor item	Condition	Value
EXHAUST GAS TEMP SEN 1 B2	• Warm-up condition • Idle speed	1,290 – 2,940 mV

Without CONSULT

1. Start engine and warm it up to normal operating temperature.
2. Check that voltage between ECM harness connector terminals as follows.

ECM			Condition	Voltage
Connector	+	–		
	Terminal			
F78	17	43	• Warm-up condition • Idle speed	1.29 – 2.94 V

Is the inspection result normal?

YES >> INSPECTION END

NO >> Replace exhaust gas temperature sensor. Refer to EM-45, "Exploded View".

P2096, P2097, P2098, P2099 A/F SENSOR 1

DTC Description

INFOID:0000000013798489

DTC DETECTION LOGIC

To judge the malfunction, the A/F signal computed by ECM from the A/F sensor 1 signal is monitored so it will not shift to LEAN side or RICH side.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2096	POST CAT FUEL TRIM SYS B1 (Post catalyst fuel trim system too lean bank 1)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The output voltage computed by ECM from the A/F sensor 1 signal is shifts to the lean side for a specified period
		Diagnosis delay time	—
P2097	POST CAT FUEL TRIM SYS B1 (Post catalyst fuel trim system too rich bank 1)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The A/F signal computed by ECM from the A/F sensor 1 signal is shifts to the rich side for a specified period
		Diagnosis delay time	—
P2098	POST CAT FUEL TRIM SYS B2 (Post catalyst fuel trim system too lean bank 2)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The output voltage computed by ECM from the A/F sensor 1 signal is shifts to the lean side for a specified period
		Diagnosis delay time	—
P2099	POST CAT FUEL TRIM SYS B2 (Post catalyst fuel trim system too rich bank 2)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The A/F signal computed by ECM from the A/F sensor 1 signal is shifts to the rich side for a specified period
		Diagnosis delay time	—

POSSIBLE CAUSE

- A/F sensor 1 (bank 1/ bank 2)
- A/F sensor 1 heater
- Heated oxygen sensor 2 (bank 1/ bank 2)
- Fuel pressure
- Fuel injector
- Intake air leaks
- Exhaust gas leaks

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Clear the mixture ratio self-learning value. Refer to EC-1434, "Description".
2. Turn ignition switch OFF and wait at least 10 seconds.
3. Turn ignition switch ON.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start the engine and keep the engine speed between 3,500 and 4,000 rpm for 1 minute under no load.
6. Let engine idle for 1 minute.
7. Keep engine speed between 2,500 and 3,000 rpm for 20 minutes.
8. Check 1st trip DTC.

Is DTC detected?

YES >> Go to EC-1828, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798490

1.RETIGHTEN A/F SENSOR 1 AND HEATED OXYGEN SENSOR 2

Loosen and retighten the A/F sensor 1 and heated oxygen sensor 2. Refer to EX-6, "Exploded View".

>> GO TO 2.

2.CHECK FOR EXHAUST GAS LEAK

1. Start engine and run it at idle.
2. Listen for an exhaust gas leak before the three way catalyst 2.

Is exhaust gas leak detected?

YES >> Repair or replace.
NO >> GO TO 3.

3.CHECK A/F SENSOR 1 CONNECTOR

1. Disconnect A/F sensor 1 harness connector.
2. Check that water is not inside connectors.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace harness connector.

4.CHECK FOR INTAKE AIR LEAKAGE

1. Reconnect A/F sensor 1 harness connector.
2. Start engine and run it at idle.
3. Listen for an intake air leakage after the mass air flow sensor.

Is intake air leakage detected?

YES >> Repair or replace malfunctioning part.
NO >> GO TO 5.

5.CLEAR THE MIXTURE RATIO SELF-LEARNING VALUE

1. Clear the mixture ratio self-learning value. Refer to EC-1434, "Description".
2. Run engine for at least 10 minutes at idle speed.

Is the 1st trip DTC P0171, P0172, P0174 or P0175 detected? Is it difficult to start engine?

YES >> Perform trouble diagnosis for DTC P0171, P0174 or P0172, P0175. Refer to EC-1599, "Diagnosis Procedure" or EC-1602, "Diagnosis Procedure".
NO >> GO TO 6.

6.CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect air fuel ratio (A/F) sensor 1 harness connector.
3. Turn ignition switch ON.

4. Check the voltage between A/F sensor 1 harness connector and ground.

DTC	A/F sensor 1			Ground	Voltage
	Bank	Connector	Terminal		
P2096 P2097	1	F25	1	Ground	Battery voltage
P2098 P2099	2	F16	1		

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7. CHECK AIR FUEL RATIO SENSOR 1 POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between A/F sensor 1 harness connector and IPDM E/R harness connector.

DTC	A/F sensor 1			IPDM E/R		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P2096 P2097	1	F25	1	E121	25	Existed
P2098 P2099	2	F16	1			

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Perform trouble diagnosis for power supply circuit.
NO >> Repair or replace malfunctioning part.

8. CHECK A/F SENSOR 1 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between A/F sensor 1 harness connector and ECM harness connector.

DTC	A/F sensor 1			ECM		Continuity
	Bank	Connector	Terminal	Connector	Terminal	
P2096 P2097	1	F25	4	F79	79	Existed
			3		74	
P2098 P2099	2	F16	4	F79	69	
			3		70	

4. Check the continuity between A/F sensor 1 harness connector and ground, or ECM harness connector and ground.

DTC	A/F sensor 1			Ground	Continuity
	Bank	Connector	Terminal		
P2096 P2097	1	F25	4	Ground	Not Existed
			3		
P2098 P2099	2	F16	4		
			3		

DTC	ECM			Ground	Continuity
	Bank	Connector	Terminal		
P2096 P2097	1	F79	79	Ground	Not Existed
			74		
P2098 P2099	2	F79	69		
			70		

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace malfunctioning part.

9.CHECK A/F SENSOR 1 HEATER

Refer to EC-1510, "Component Inspection (A/F Sensor 1 Heater)".

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair or replace malfunctioning part.

10.CHECK HEATED OXYGEN SENSOR 2

Check heated oxygen sensor 2. Refer to EC-1588, "Component Inspection (HO2 sensor 2)".

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace malfunctioning part.

11.REPLACE AIR FUEL RATIO (A/F) SENSOR 1

Replace air fuel ratio (A/F) sensor 1. Refer to EX-6, "Exploded View".

CAUTION:

- **Discard any A/F sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.**
- **Before installing new A/F sensor, clean exhaust system threads using Oxygen Sensor Thread Cleaner [commercial service tool (J-43897-18 or J-43897-12)] and approved anti-seize lubricant (commercial service tool).**

Will CONSULT be used?

YES >> GO TO 12.
NO >> GO TO 13.

12.CONFIRM A/F ADJUSTMENT DATA

WITH CONSULT

1. Turn ignition switch ON.
2. Select “A/F ADJ-B1” and “A/F ADJ-B2” in “DATA MONITOR” mode with CONSULT.
3. Check that “0.000” is displayed on CONSULT screen.

Is “0.000” displayed?

YES >> INSPECTION END
NO >> GO TO 13.

13.CLEAR THE MIXTURE RATIO SELF-LEARNING VALUE

Clear the mixture ratio self-learning value. Refer to EC-1434, "Description".

Will CONSULT be used?

YES >> GO TO 14.
NO >> INSPECTION END

14.CONFIRM A/F ADJUSTMENT DATA

WITH CONSULT

1. Turn ignition switch ON.
2. Select “A/F ADJ-B1” and “A/F ADJ-B2” in “DATA MONITOR” mode with CONSULT.

3. Check that “0.000” is displayed on CONSULT screen.

>> INSPECTION END

P2100, P2103 THROTTLE CONTROL MOTOR RELAY

DTC Description

INFOID:0000000013798491

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2100	ETC MOT PWR-B1 [Throttle control motor relay circuit open (bank 1)]	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	Throttle control motor relay signal
		Threshold	ECM detects that the voltage of power source for throttle control motor is excessively low
		Diagnosis delay time	—
P2103	ETC MOT PWR (Throttle control motor relay circuit short)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	Throttle control motor relay signal
		Threshold	ECM detects that the throttle control motor relay is stuck ON
		Diagnosis delay time	—

POSSIBLE CAUSE

P2100
- Harness or connectors (Throttle control motor relay circuit is open)
- Throttle control motor relay

P2103
- Harness or connectors (Throttle control motor relay circuit is shorted)
- Throttle control motor relay

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P2100 P2103	Throttle control motor relay	ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 8 V or more at idle.

Which DTC is detected?

P2100 >> GO TO 2.
P2103 >> GO TO 3.

2.PERFORM DTC CONFIRMATION PROCEDURE FOR DTC P2100

1. Turn ignition switch ON and wait at least 2 seconds.
2. Start engine and let it idle for 5 seconds.
3. Check DTC.

Is DTC detected?

YES >> Go to EC-1833, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

3.PERFORM DTC CONFIRMATION PROCEDURE FOR DTC P2103

1. Turn ignition switch ON and wait at least 1 second.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1833, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798492

1.CHECK THROTTLE CONTROL MOTOR RELAY POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Disconnect IPDM E/R harness connector E119.
4. Check the continuity between IPDM E/R harness connector and ECM harness connector.

IPDM E/R		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E119	16	F79	99	Existed

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace error-detected parts.

2.CHECK THROTTLE CONTROL MOTOR RELAY INPUT SIGNAL CIRCUIT

1. Check the continuity between IPDM E/R sensor harness connector and ECM harness connector.

IPDM E/R		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E119	11	F79	111	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for IPDM E/R power supply circuit.
NO >> Repair or replace error-detected parts.

P2101 ELECTRIC THROTTLE CONTROL FUNCTION

DTC Description

INFOID:0000000013798494

DTC DETECTION LOGIC

Electric throttle control actuator consists of throttle control motor, throttle position sensor, etc.
The throttle control motor is operated by the ECM and it opens and closes the throttle valve.
The current opening angle of the throttle valve is detected by the throttle position sensor and it provides feedback to the ECM. ECM controls the throttle valve opening angle in response to driving condition via the throttle control motor.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2101	ETC FNCTN/CIRC-B1 (Throttle actuator “A” control motor circuit range/performance)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	—
		Threshold	Electric throttle control function does not operate properly
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (Throttle control motor circuit is open or shorted)
- Electric throttle control actuator

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P2101	Electric throttle control function	ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P2101 is displayed with DTC P2100, first perform the trouble diagnosis for DTC P2100.
- If DTC P2101 is displayed with DTC P2119, first perform the trouble diagnosis for DTC P2119.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 2 seconds.
2. Start engine and let it idle for 5 seconds.
3. Check DTC.

Is DTC detected?

YES >> Proceed to EC-1835, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798495

1.CHECK DTC PRIORITY

- If DTC P2101 is displayed with DTC P2100, first perform the trouble diagnosis for DTC P2100.
- If DTC P2101 is displayed with DTC P2119, first perform the trouble diagnosis for DTC P2119.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK THROTTLE CONTROL MOTOR RELAY INPUT SIGNAL CIRCUIT-I

1. Check the voltage between ECM harness connector and ground under the following conditions.

ECM		Ground	Condition	Voltage
Connector	Terminal			
F79	111	Ground	Ignition switch: OFF	Approx. 0 V
			Ignition switch: ON	Battery voltage

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.CHECK THROTTLE CONTROL MOTOR RELAY POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Disconnect IPDM E/R harness connector.
4. Check the continuity between ECM harness connector and IPDM E/R harness connector.

IPDM E/R		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E119	16	F79	99	Existed

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK THROTTLE CONTROL MOTOR RELAY INPUT SIGNAL CIRCUIT-II

1. Check the continuity between ECM harness connector and IPDM E/R harness connector.

IPDM E/R		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E119	11	F79	111	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Perform the trouble diagnosis for IPDM E/R power supply circuit.

5.CHECK THROTTLE CONTROL MOTOR OUTPUT SIGNAL CIRCUIT FOR OPEN OR SHORT

1. Turn ignition switch OFF.
2. Disconnect electric throttle control actuator harness connector.
3. Disconnect ECM harness connector.
4. Check the continuity between electric throttle control actuator harness connector and ECM harness connector.

Electric throttle control actuator		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F50	5	F79	107	Not existed
			108	Existed
	6		107	Existed
			108	Not existed

5. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace.

6.CHECK ELECTRIC THROTTLE CONTROL ACTUATOR VISUALLY

1. Remove the intake air duct.
2. Check if foreign matter is caught between the throttle valve and the housing.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Remove the foreign matter and clean the electric throttle control actuator inside, then perform throttle valve closed position learning. Refer to EC-1429, "Description".

7.CHECK THROTTLE CONTROL MOTOR

Refer to EC-1836, "Component Inspection".

Is the inspection result normal?

YES >> GO TO 8.
NO >> INSPECTION END

8.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

1. Replace malfunction electric throttle control actuator. Refer to EM-35, "Removal and Installation".
2. Perform EC-1836, "Special Repair Requirement".

>> INSPECTION END

Component Inspection

INFOID:0000000013798496

1.CHECK THROTTLE CONTROL MOTOR

1. Turn ignition switch OFF.
2. Disconnect electric throttle control actuator harness connector.
3. Check the resistance between electric throttle control actuator terminals as per the following.

Terminals	Resistance
5 and 6	Approx. 1 - 15 Ω [at 25°C (77°F)]

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

1. Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".
2. Perform EC-1836, "Special Repair Requirement".

>> INSPECTION END

Special Repair Requirement

INFOID:0000000013798497

1.PERFORM THROTTLE VALVE CLOSED POSITION LEARNING

Refer to EC-1429, "Description".

>> GO TO 2.

2.PERFORM IDLE AIR VOLUME LEARNING

Refer to EC-1430, "Description".

>> END

P2118 THROTTLE CONTROL MOTOR

DTC Description

INFOID:0000000013798498

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2118	ETC MOT-B1 (Throttle control motor circuit short)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	—
		Threshold	ECM detects short in both circuits between ECM and throttle control motor
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (Throttle control motor circuit is shorted)
- Electric throttle control actuator (Throttle control motor)

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P2118	Throttle control motor	ECM stops the electric throttle control actuator control, throttle valve is maintained at a fixed opening (approx. 5 degrees) by the return spring.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 2 seconds.
2. Start engine and let it idle for 5 seconds.
3. Check DTC.

Is DTC detected?

YES >> Proceed to EC-1838, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798499

1.CHECK THROTTLE CONTROL MOTOR OUTPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Disconnect electric throttle control actuator harness connector.
2. Disconnect ECM harness connector.
3. Check the continuity between electric throttle control actuator harness connector and ECM harness connector.

Electric throttle control actuator		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F50	5	F79	107	Not existed
			108	Existed
	6		107	Existed
			108	Not existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace malfunctioning part.

2.CHECK THROTTLE CONTROL MOTOR

Refer to EC-1839, "Component Inspection (Electric Throttle Control Motor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 3.

3.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

Component Inspection (Electric Throttle Control Motor)

INFOID:0000000013798500

1.CHECK THROTTLE CONTROL MOTOR

1. Turn ignition switch OFF.
2. Disconnect electric throttle control actuator harness connector.
3. Check resistance between electric throttle control actuator terminals as per the following.

Terminals	Resistance
5 and 6	Approx. 1 - 15 Ω [at 25°C (77°F)]

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

P2119 ELECTRIC THROTTLE CONTROL ACTUATOR

DTC Description

INFOID:0000000013798501

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition		
P2119	ETC ACTR-B1 (Electric throttle control actuator)	A)	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	Electric throttle control actuator does not function properly due to the return spring malfunction
			Diagnosis delay time	—
		B)	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	Throttle valve opening angle in fail-safe mode is not in specified range
			Diagnosis delay time	—
		C)	Diagnosis condition	—
			Signal (terminal)	—
			Threshold	ECM detects that the throttle valve is stuck open
			Diagnosis delay time	—

POSSIBLE CAUSE

Electric throttle control actuator

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P2119	Electric throttle control actuator	(When electric throttle control actuator does not function properly due to the return spring malfunction:) ECM controls the electric throttle actuator by regulating the throttle opening around the idle position. The engine speed will not rise more than 2,000 rpm.
		(When throttle valve opening angle in fail-safe mode is not in specified range:) ECM controls the electric throttle control actuator because of regulating the throttle opening to 20 degrees or less.
		(When ECM detects the throttle valve is stuck open:) While the vehicle is being driven, it slows down gradually by fuel cut. After the vehicle stops, the engine stalls. The engine can restart in the N or P position, and engine speed will not exceed 1,000 rpm or more.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always turn ignition switch OFF and wait at least 10 seconds before conducting the next test.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION A AND B

1. Turn ignition switch ON and wait at least 1 second.
2. Selector lever position is D and wait at least 3 seconds.

3. Selector lever position is P.
4. Turn ignition switch OFF and wait at least 10 seconds.
5. Turn ignition switch ON and wait at least 1 second.
6. Selector lever position is D and wait at least 3 seconds.
7. Selector lever position is P.
8. Turn ignition switch OFF, wait at least 10 seconds, and then turn ON.
9. Check DTC.

Is DTC detected?

YES >> Go to EC-1841, "Diagnosis Procedure".
NO >> GO TO 3.

3. PERFORM DTC CONFIRMATION PROCEDURE FOR MALFUNCTION C

1. Turn ignition switch ON and wait at least 1 second.
2. Selector lever position is D and wait at least 3 seconds.
3. Selector lever position is N or P.
4. Start engine and let it idle for 3 seconds.
5. Check DTC.

Is DTC detected?

YES >> Proceed to EC-1841, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798502

1. CHECK ELECTRIC THROTTLE CONTROL ACTUATOR VISUALLY

1. Turn ignition switch OFF.
2. Remove the intake air duct.
3. Check if foreign matter is caught between the throttle valve and the housing.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Remove the foreign matter and clean the electric throttle control actuator inside, then perform throttle valve closed position learning. Refer to EC-1429, "Description".

2. REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

P2122, P2123 APP SENSOR

DTC Description

INFOID:0000000013798503

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2122	APP SEN 1/CIRC (Accelerator pedal position sensor 1 circuit low input)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	Accelerator pedal position sensor 1 signal
		Threshold	An excessively low voltage from the APP sensor 1 is sent to ECM
		Diagnosis delay time	—
P2123	APP SEN 1/CIRC (Accelerator pedal position sensor 1 circuit high input)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	Accelerator pedal position sensor 1 signal
		Threshold	An excessively high voltage from the APP sensor 1 is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (APP sensor 1 circuit is open or shorted)
- Accelerator pedal position sensor (APP sensor 1)

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P2122 P2123	Accelerator pedal position sensor	The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees. The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. Therefore, the acceleration will be poor.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P2122 or P2123 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 8 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for 1 second.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1843, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798504

1.CHECK DTC PRIORITY

If DTC P2122 or P2123 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.CHECK ACCELERATOR PEDAL POSITION SENSOR 1 POWER SUPPLY CIRCUIT

1. Disconnect accelerator pedal position (APP) sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between APP sensor harness connector and ground.

APP sensor		Ground	Voltage (V)
Connector	Terminal		
E20	2	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and APP sensor
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

4.CHECK APP SENSOR 1 GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between APP sensor harness connector and ECM harness connector.

APP sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E20	4	E16	151	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and APP sensor
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

6.CHECK APP SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between APP sensor harness connector and ECM harness connector.

APP sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E20	3	E16	150	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7. DETECT MALFUNCTIONING PART

Check the following.
- Loose or poor connection for each connector and harness
- Harness for open or short between ECM and APP sensor

>> Repair open circuit, short to ground or short to power in harness or connectors.

8. CHECK APP SENSOR

Refer to EC-1844, "Component Inspection (Accelerator Pedal Position Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 9.

9. REPLACE ACCELERATOR PEDAL ASSEMBLY

Replace accelerator pedal assembly. Refer to ACC-3, "Removal and Installation".

>> INSPECTION END

Component Inspection (Accelerator Pedal Position Sensor)

INFOID:0000000013798505

1. CHECK ACCELERATOR PEDAL POSITION SENSOR

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Turn ignition switch ON.
4. Check the voltage ECM harness connector terminals under the following conditions.

ECM			Condition		Voltage (V)
Connector	+	–			
	Terminal	Terminal			
E16	150 (APP sensor 1)	151	Accelerator pedal	Fully released	0.5 - 1.0
				Fully depressed	4.2 - 4.8
	143 (APP sensor 2)	144		Fully released	0.25 - 0.5
				Fully depressed	2.0 - 2.5

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2. REPLACE ACCELERATOR PEDAL ASSEMBLY

Replace accelerator pedal assembly. Refer to ACC-3, "Removal and Installation".

>> INSPECTION END

P2127, P2128 APP SENSOR

DTC Description

INFOID:0000000013798506

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2127	APP SEN 2/CIRC (Accelerator pedal position sensor 2 circuit low input)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	APP sensor 2 signal
		Threshold	An excessively low voltage from the APP sensor 2 is sent to ECM
		Diagnosis delay time	—
P2128	APP SEN 2/CIRC (Accelerator pedal position sensor 2 circuit high input)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	APP sensor 2 signal
		Threshold	An excessively high voltage from the APP sensor 2 is sent to ECM
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (Accelerator pedal position sensor 2 circuit is open or shorted)
- Accelerator pedal position sensor (APP sensor 2)
- Sensor power supply 2

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P2127 P2128	Accelerator pedal position sensor	The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees. The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. Therefore, the acceleration will be poor.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 8 V or more at idle.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for 1 second.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1845, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798507

1.CHECK ACCELERATOR PEDAL POSITION SENSOR 2 POWER SUPPLY CIRCUIT-I

1. Disconnect accelerator pedal position (APP) sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between APP sensor harness connector and ground.

APP sensor		Ground	Voltage (V)
Connector	Terminal		
E20	1	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.CHECK SENSOR POWER SUPPLY 2 CIRCUIT

Perform EC-1918, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

3.CHECK APP SENSOR 2 GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between APP sensor harness connector and ECM harness connector.

APP sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E20	5	E16	144	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4.DETECT MALFUNCTIONING PART

Check the following.
- Loose or poor connection for each connector and harness
- Harness for open or short between ECM and APP sensor

>> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK APP SENSOR 2 INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between APP sensor harness connector and ECM harness connector.

APP sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E20	6	E16	143	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and APP sensor
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

7.CHECK APP SENSOR

Refer to EC-1847, "Component Inspection (Accelerator Pedal Position Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 8.

8.REPLACE ACCELERATOR PEDAL ASSEMBLY

Replace accelerator pedal assembly. Refer to ACC-3, "Removal and Installation".

>> INSPECTION END

Component Inspection (Accelerator Pedal Position Sensor)

INFOID:0000000013798508

1.CHECK ACCELERATOR PEDAL POSITION SENSOR

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Turn ignition switch ON.
4. Check the voltage ECM harness connector terminals under the following conditions.

ECM			Condition		Voltage (V)
Connector	+	–			
	Terminal	Terminal			
E16	150 (APP sensor 1)	151	Accelerator pedal	Fully released	0.5 - 1.0
				Fully depressed	4.2 - 4.8
	143 (APP sensor 2)	144		Fully released	0.25 - 0.5
				Fully depressed	2.0 - 2.5

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.REPLACE ACCELERATOR PEDAL ASSEMBLY

Replace accelerator pedal assembly. Refer to ACC-3, "Removal and Installation".

>> INSPECTION END

P2135 TP SENSOR

DTC Description

INFOID:0000000013798509

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2135	TP SENSOR-B1 (Throttle position sensor circuit range/ performance)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	Throttle position sensor signal
		Threshold	Rationally incorrect voltage is sent to ECM compared with the signals from TP sensor 1 and TP sensor 2
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connector (TP sensor 1 or 2 circuit is open or shorted)
- Electric throttle control actuator (TP sensor 1 or 2)

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P2135	Throttle position sensor	The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees. The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. Therefore, the acceleration will be poor.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P2135 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 8 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for 1 second.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1848, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798510

1.CHECK DTC PRIORITY

If DTC P2135 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.CHECK THROTTLE POSITION SENSOR POWER SUPPLY CIRCUIT-I

1. Disconnect electric throttle control actuator harness connector.
2. Turn ignition switch ON.
3. Check the voltage between electric throttle control actuator harness connector and ground.

Electric throttle control actuator		Ground	Voltage (V)
Connector	Terminal		
F50	2	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

3.CHECK THROTTLE POSITION SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between electric throttle control actuator harness connector and ECM harness connector.

Electric throttle control actuator		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F50	4	F79	85	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

4.CHECK THROTTLE POSITION SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between electric throttle control actuator harness connector and ECM harness connector.

Electric throttle control actuator		ECM		Continuity
Connector	Terminal	Connector	Terminal	
F50	1	F79	78	Existed
	3		80	

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

5.CHECK THROTTLE POSITION SENSOR

Refer to EC-1850, "Component Inspection (Throttle Position Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 6.

6.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

Component Inspection (Throttle Position Sensor)

INFOID:0000000013798511

1.CHECK THROTTLE POSITION SENSOR

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Perform EC-1429, "Description".
4. Turn ignition switch ON.
5. Set selector lever position to D.
6. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Condition		Voltage (V)
Connector	+	–			
	Terminal	Terminal			
F79	78 (TP sensor 1 signal)	85 (Sensor ground)	Accelerator pedal	Fully released	More than 0.36
				Fully depressed	Less than 4.75
	80 (TP sensor 2 signal)			Fully released	Less than 4.75
				Fully depressed	More than 0.36

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.REPLACE ELECTRIC THROTTLE CONTROL ACTUATOR

Replace electric throttle control actuator. Refer to EM-35, "Removal and Installation".

>> INSPECTION END

P2138 APP SENSOR

DTC Description

INFOID:0000000013798512

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2138	APP SENSOR (Accelerator pedal position sensor circuit range/performance)	Diagnosis condition	Start the engine and let it idle
		Signal (terminal)	Accelerator pedal position sensor signal
		Threshold	Rationally incorrect voltage is sent to ECM compared with the signals from APP sensor 1 and APP sensor 2
		Diagnosis delay time	—

POSSIBLE CAUSE

- Harness or connectors (APP sensor 1 or 2 circuit is open or shorted)
- Accelerator pedal position sensor (APP sensor 1 or 2)
- Sensor power supply 1 and 2

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P2138	Accelerator pedal position sensor	The ECM controls the electric throttle control actuator in regulating the throttle opening in order for the idle position to be within +10 degrees. The ECM regulates the opening speed of the throttle valve to be slower than the normal condition. Therefore, the acceleration will be poor.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P2138 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 8 V or more at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Start engine and let it idle for 1 second.
2. Check DTC.

Is DTC detected?

YES >> Go to EC-1851, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798513

1.CHECK DTC PRIORITY

If DTC P2138 is displayed with DTC P0643, first perform the trouble diagnosis for DTC P0643.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1747, "DTC Description".
NO >> GO TO 2.

2. CHECK ACCELERATOR PEDAL POSITION SENSOR 1 POWER SUPPLY CIRCUIT

1. Disconnect accelerator pedal position (APP) sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between APP sensor harness connector and ground.

APP sensor		Ground	Voltage (V)
Connector	Terminal		
E20	2	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 4.
NO >> GO TO 3.

3. DETECT MALFUNCTIONING PART

Check the following.
- Loose or poor connection for each connector and harness
- Harness for open or short between ECM and APP sensor

>> Repair open circuit, short to ground or short to power in harness or connectors.

4. CHECK APP SENSOR 2 POWER SUPPLY CIRCUIT-I

1. Turn ignition switch ON.
2. Check the voltage between APP sensor harness connector and ground.

APP sensor		Ground	Voltage (V)
Connector	Terminal		
E20	1	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5.

5. CHECK SENSOR POWER SUPPLY 2 CIRCUIT

Perform EC-1918, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

6. CHECK APP SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between APP sensor harness connector and ECM harness connector.

APP sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E20	4	E16	151	Existed
	5		144	

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and accelerator pedal position sensor
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

8.CHECK APP SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between APP sensor harness connector and ECM harness connector.

APP sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E20	3	E16	150	Existed
	6		143	

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 10.
NO >> GO TO 9.

9.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and accelerator pedal position sensor
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

10.CHECK APP SENSOR

Refer to EC-1853, "Component Inspection (Accelerator Pedal Position Sensor)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 11.

11.REPLACE ACCELERATOR PEDAL ASSEMBLY

Replace accelerator pedal assembly. Refer to ACC-3, "Removal and Installation".

>> INSPECTION END

Component Inspection (Accelerator Pedal Position Sensor)

INFOID:0000000013798514

1.CHECK ACCELERATOR PEDAL POSITION SENSOR

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Turn ignition switch ON.
4. Check the voltage ECM harness connector terminals under the following conditions.

ECM			Condition		Voltage (V)
Connector	+	–			
	Terminal	Terminal			
E16	150 (APP sensor 1)	151	Accelerator pedal	Fully released	0.5 - 1.0
				Fully depressed	4.2 - 4.8
	143 (APP sensor 2)	144		Fully released	0.25 - 0.5
				Fully depressed	2.0 - 2.5

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2. REPLACE ACCELERATOR PEDAL ASSEMBLY

Replace accelerator pedal assembly. Refer to ACC-3, "Removal and Installation".

>> INSPECTION END

P219A, P219B AIR FUEL RATIO

DTC Description

INFOID:0000000013798515

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P219A	AIR FUEL RATIO IMBALANCE B1 (Air-fuel ratio imbalance bank 1)	Diagnosis condition	—
		Signal (terminal)	—
P219B	AIR FUEL RATIO IMBALANCE B2 (Air-fuel ratio imbalance bank 2)	Threshold	ECM detects a lean/rich air fuel ratio state in any cylinder for a specified length of time
		Diagnosis delay time	—

POSSIBLE CAUSE

- Fuel injector
- Exhaust gas leaks
- Incorrect fuel pressure
- Mass air flow sensor
- Intake air leaks
- Lack of fuel
- Incorrect PCV hose connection
- Improper spark plug
- Insufficient compression
- The fuel injector circuit is open or shorted
- Ignition coil
- The ignition signal circuit is open or shorted

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P219A or P219B is displayed with other DTC, first perform the trouble diagnosis for other DTC.
- If DTC P219A or P219B is displayed with P219C, P219D, P219E, P219F, P21A0, P21A1, P21A2 or P21A3, first perform the trouble diagnosis for P219C, P219D, P219E, P219F, P21A0, P21A1, P21A2 or P21A3.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

NOTE:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PRECONDITIONING-2

1. Turn ignition switch ON.
2. Clear the mixture ratio self-learning value. Refer to EC-1434, "Description".

Will CONSULT be used?

YES >> GO TO 4.
NO >> GO TO 7.

4. PERFORM DTC CONFIRMATION PROCEDURE-1

1. Turn ignition switch ON.
2. Select “COOLAN TEMP/S” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
3. Start engine.
4. Make sure that “COOLAN TEMP/S” indicates more than 80°C (176°F).

>> GO TO 5.

5. PERFORM DTC CONFIRMATION PROCEDURE-2

With CONSULT

1. Select “SYSTEM 1 DIAGNOSIS B B1” and “SYSTEM 1 DIAGNOSIS A B1” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
2. Drive vehicle under the following conditions for at least 5 consecutive seconds.

CAUTION:

- **Always drive vehicle at a safe speed.**

ENG SPEED	1,200 – 1,600rpm
COOLAN TEMP/S	More than 80°C (176°F)
B/FUEL SCHDL	8 – 12 msec
Selector lever	D position
SYSTEM 1 DIAGNOSIS B B1	PRSENT

NOTE:

- Drive the vehicle at approximately 88 km/h (55MPH) allows easy diagnosis.
- Keep the accelerator pedal as possible during crusing.

3. Check “SYSTEM 1 DIAGNOSIS A B1” indication.

Is “CMPLT” displayed?

YES >> GO TO 6.
NO >> GO TO 3.

6. PERFORM DTC CONFIRMATION PROCEDURE-3

Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1857, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

7. PERFORM DTC CONFIRMATION PROCEDURE-4

Without CONSULT

1. Start the engine and warm it up to normal operating temperature.
2. Drive vehicle under the following conditions for at least 5 consecutive seconds.

CAUTION:

- **Always drive vehicle at a safe speed.**

Engine speed	1,200 – 1,600 rpm
Calculated load value	34 – 68 %
Selector lever	D position

NOTE:

- Drive the vehicle at approximately 88 km/h (55MPH) allows easy diagnosis.
- Keep the accelerator pedal as possible during crusing.

3. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1857, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".

NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798516

1.CHECK DTC PRIORITY

- If DTC P219A or P219B is displayed with other DTC, first perform the trouble diagnosis for other DTC.
- If DTC P219A or P219B is displayed with P219C, P219D, P219E, P219F, P21A0, P21A1, P21A2 or P21A3, first perform the trouble diagnosis for P219C, P219D, P219E, P219F, P21A0, P21A1, P21A2 or P21A3.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR INTAKE AIR LEAK

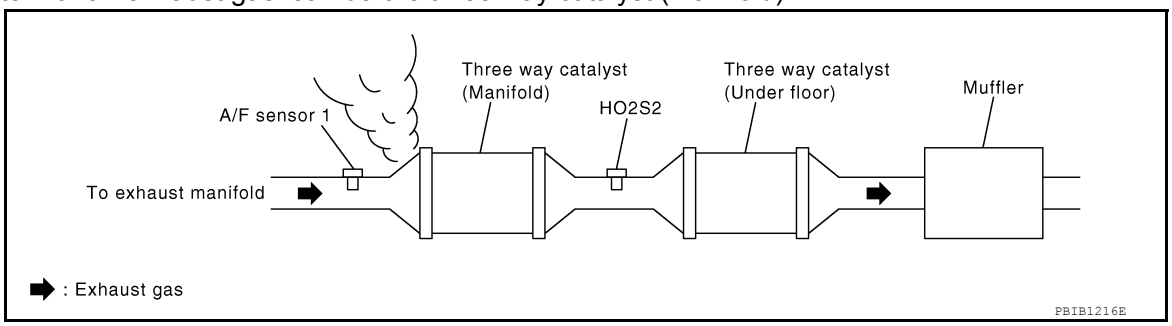
1. Stop engine and check the following for connection.
- Air duct
- Vacuum hoses
- PCV hose
- Intake air passage between air duct to intake manifold
2. Start engine and let it idle.
3. Listen for an intake air leak after the mass air flow sensor.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK EXHAUST GAS LEAK

1. Stop engine and visually check exhaust tube, three way catalyst and muffler for dents connection.
2. Start engine and let it idle.
3. Listen for an exhaust gas leak before three way catalyst (manifold).



Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK FUEL PRESSURE

1. Release fuel pressure to zero. Refer to EC-1435, "Work Procedure".
2. Check fuel pressure. Refer to EC-1435, "Work Procedure".

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 9.

5.CHECK MASS AIR FLOW SENSOR

With CONSULT
Check “MASS AIR FLOW” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
For specification, refer to EC-1936, "Mass Air Flow Sensor".

With GST
Check mass air flow sensor signal in Service $01 using GST.
For specification, refer to EC-1936, "Mass Air Flow Sensor".

Is the inspection result normal?

YES >> GO TO 6.

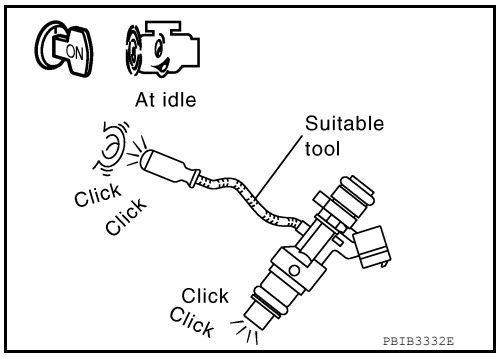
NO >> Check connectors for rusted terminals or loose connections in the mass air flow sensor circuit or grounds. Refer to EC-1534, "Diagnosis Procedure".

6. CHECK FUNCTION OF FUEL INJECTOR-1

With CONSULT
1. Start engine.
2. Perform “POWER BALANCE” in “ACTIVE TEST” mode of “ENGINE” using CONSULT.
3. Check that each circuit produces a momentary engine speed drop.

Without CONSULT
1. Let engine idle.
2. Listen to each fuel injector operating sound.

Clicking noise should be heard.

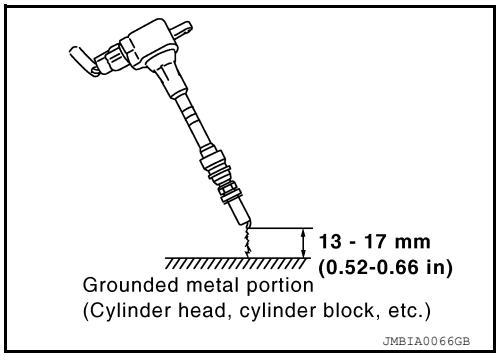


Is the inspection result normal?

YES >> GO TO 7.
NO >> Perform trouble diagnosis for fuel injector, refer to EC-1891, "Component Function Check".

7. CHECK FUNCTION OF IGNITION COIL-1

CAUTION:
Perform the following steps in a well-ventilated area with no combustibles.
1. Turn ignition switch OFF.
2. Remove fuel pump fuse from IPDM E/R to release fuel pressure.
   NOTE:
   CONSULT must not be used to release fuel pressure. It develops again during the following steps, if released by using CONSULT.
3. Start the engine.
4. After an engine stall, crank the engine two or three times to release all the fuel pressure.
5. Turn ignition switch OFF.
6. Disconnect all the harness connectors of ignition coil to prevent electric discharge from occurring in ignition coil.
7. Remove ignition coil assembly and spark plug of cylinder. Refer to EM-34, "Removal and Installation".
8. Crank engine for 5 seconds or more to remove combustion gas in the cylinder.
9. Connect spark plug and harness connector to ignition coil.
10. Allow a 13-17mm (0.52-0.66 in) spacing between spark plug and grounded metal portion as shown in the figure to fix the ignition coil with a rope or an equivalent.
11. Crank the engine for approximately 3 seconds to see if sparking occurs between spark plug and the grounded metal portion.



Spark should be generated.

CAUTION:
- **The discharge voltage becomes 20 kV or higher. Therefore, always stay away from the spark plug and ignition coil at least 50 cm (19.7 in) during the inspection.**
- **Leaving a space of more than 17mm (0.66 in) may damage the ignition coil.**

NOTE:
When the gap is less than 13 mm (0.52 in), a the spark might be generated even if the coil is malfunctioning.

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 10.

8.CHECK COMPRESSION PRESSURE

Check compression pressure. Refer to EM-20, "Inspection".

Is the inspection result normal?

YES >> GO TO 9.
NO >> Check pistons, piston rings, valves, valve seats and cylinder head gaskets.

9.DETECT MALFUNCTIONING PART

Check fuel hoses and fuel tubes for clogging.

Is the inspection result normal?

YES >> Replace fuel filter and fuel pump assembly. Refer to FL-6, "Removal and Installation".
NO >> Repair or replace error-detected parts.

10.CHECK FUNCTION OF IGNITION COIL-2

1. Turn ignition switch OFF.
2. Disconnect spark plug and connect a non-malfunctioning spark plug.
3. Crank engine for approximately 3 seconds, and recheck whether spark is generated between the spark plug and the grounded metal portion.

Spark should be generated.

Is the inspection result normal?

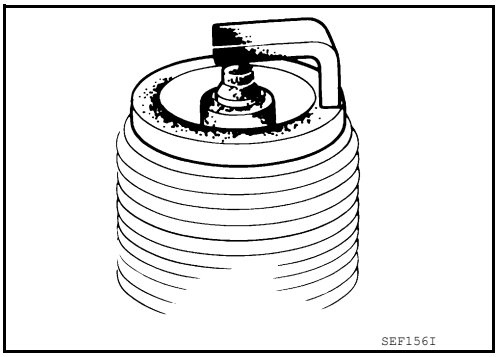
YES >> GO TO 11.
NO >> Check ignition coil, power transistor and their circuits. Refer to EC-1901, "Component Function Check".

11.CHECK SPARK PLUG

Check the initial spark plug for fouling, etc.

Is the inspection result normal?

YES >> 1. Repair or clean spark plug. Refer to EM-34, "Removal and Installation".
2. GO TO 12.
NO >> Replace spark plug(s) with standard type one(s). For spark plug type, refer to EM-146, "Spark Plug".



12.CHECK FUNCTION OF IGNITION COIL-3

1. Reconnect the initial spark plugs.
2. Crank engine for approximately 3 seconds, and recheck whether spark is generated between the spark plug and the grounded portion.

Spark should be generated.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace spark plug(s) with standard type one(s). For spark plug type, refer to EM-146, "Spark Plug".

P219C, P219D, P219E, P219F, P21A0, P21A1, P21A2, P21A3 AIR FUEL RATIO

DTC Description

INFOID:0000000013798517

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P219C	CYLINDER 1 AIR-FUEL RATIO (Cylinder 1 Air-Fuel Ratio Imbalance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The cylinder 1 combustion condition calculated by ECM based on a crankshaft position sensor signal is continuously imbalanced compared with other cylinders (Abnormal air-fuel ratio)
		Diagnosis delay time	—
P219D	CYLINDER 2 AIR-FUEL RATIO (Cylinder 2 Air-Fuel Ratio Imbalance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The cylinder 2 combustion condition calculated by ECM based on a crankshaft position sensor signal is continuously imbalanced compared with other cylinders (Abnormal air-fuel ratio)
		Diagnosis delay time	—
P219E	CYLINDER 3 AIR-FUEL RATIO (Cylinder 3 Air-Fuel Ratio Imbalance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The cylinder 3 combustion condition calculated by ECM based on a crankshaft position sensor signal is continuously imbalanced compared with other cylinders (Abnormal air-fuel ratio)
		Diagnosis delay time	—
P219F	CYLINDER 4 AIR-FUEL RATIO (Cylinder 4 Air-Fuel Ratio Imbalance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The cylinder 4 combustion condition calculated by ECM based on a crankshaft position sensor signal is continuously imbalanced compared with other cylinders (Abnormal air-fuel ratio)
		Diagnosis delay time	—
P21A0	CYLINDER 5 AIR-FUEL RATIO (Cylinder 5 Air-Fuel Ratio Imbalance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The cylinder 5 combustion condition calculated by ECM based on a crankshaft position sensor signal is continuously imbalanced compared with other cylinders (Abnormal air-fuel ratio)
		Diagnosis delay time	—

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P21A1	CYLINDER 6 AIR-FUEL RATIO (Cylinder 6 Air-Fuel Ratio Imbalance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The cylinder 6 combustion condition calculated by ECM based on a crankshaft position sensor signal is continuously imbalanced compared with other cylinders (Abnormal air-fuel ratio)
		Diagnosis delay time	—
P21A2	CYLINDER 7 AIR-FUEL RATIO (Cylinder 7 Air-Fuel Ratio Imbalance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The cylinder 7 combustion condition calculated by ECM based on a crankshaft position sensor signal is continuously imbalanced compared with other cylinders (Abnormal air-fuel ratio)
		Diagnosis delay time	—
P21A3	CYLINDER 8 AIR-FUEL RATIO (Cylinder 8 Air-Fuel Ratio Imbalance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The cylinder 8 combustion condition calculated by ECM based on a crankshaft position sensor signal is continuously imbalanced compared with other cylinders (Abnormal air-fuel ratio)
		Diagnosis delay time	—

POSSIBLE CAUSE

- Fuel injector
- Exhaust gas leaks
- Incorrect fuel pressure
- Mass air flow sensor
- Intake air leaks
- Lack of fuel
- Incorrect PCV hose connection
- Improper spark plug
- Insufficient compression
- The fuel injector circuit is open or shorted
- Ignition coil
- The ignition signal circuit is open or shorted

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P219C, P219D, P219E, P219F, P21A0, P21A1, P21A2 or P21A3 is displayed with other DTC, first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING-1

If DTC Confirmation Procedure has been previously conducted, always perform the following before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.

3. Turn ignition switch OFF and wait at least 10 seconds.

NOTE:
Before performing the following procedure, confirm that battery voltage is 11 V or more at idle.

>> GO TO 3.

3.PRECONDITIONING-2

1. Turn ignition switch ON.
2. Clear the mixture ratio self-learning value. Refer to EC-1434, "Description".

Will CONSULT be used?

YES >> GO TO 4.
NO >> GO TO 7.

4.PERFORM DTC CONFIRMATION PROCEDURE-1

With CONSULT

1. Turn ignition switch ON.
2. On CONSULT screen, select “ENGINE” >> “DATA MONITOR” >> “COOLAN TEMP/S”.
3. Start engine.
4. Check that “COOLAN TEMP/S” indicates more than 80°C (176°F).

>> GO TO 5.

5.PERFORM DTC CONFIRMATION PROCEDURE-2

With CONSULT

1. On CONSULT screen, select the following items in “DATA MONITOR”.
- ENG SPEED
- COOLAN TEMP/S
- B/FUEL SCHDL
- A/F IMBALNC DIAG-CPS STAT
- A/F IMBLNC DIAG-CPS CMPLT

2. Drive vehicle under the following conditions for at least 20 consecutive seconds.

CAUTION:
- **Always drive vehicle at a safe speed.**
- **This procedure must be performed by two or more persons.**

ENG SPEED	1,000 – 1,400 rpm
COOLAN TEMP/S	More than 80°C (176°F)
B/FUEL SCHDL	3 – 6 msec
Selector lever	D position (A/T)
A/F IMBALNC DIAG-CPS STAT	PRSNT

NOTE:
- **Keep the accelerator pedal as possible during cruising.**
- Drive the vehicle at approximately 88 km/h (55MPH) allows easy diagnosis.

3. Check “A/F IMBLNC DIAG-CPS CMPLT” indication.

Is “CMPLT” displayed?

YES >> GO TO 6.
NO >> GO TO 3.

6.PERFORM DTC CONFIRMATION PROCEDURE-3

Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1863, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

7.PERFORM DTC CONFIRMATION PROCEDURE-4

With GST

1. Start the engine and warm it up to normal operating temperature.
2. Drive vehicle under the following conditions for at least 20 consecutive seconds.
   CAUTION:
   - **Always drive vehicle at a safe speed.**

Engine speed	1,000 – 1,400 rpm
Calculated load value	13 – 30%
Selector lever	D position (A/T)

   NOTE:
   - **Keep the accelerator pedal as possible during crusing.**
   - Drive the vehicle at approximately 88 km/h (55MPH) allows easy diagnosis.
3. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1863, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798518

1.CHECK DTC PRIORITY

If DTC P219C, P219D, P219E, P219F, P21A0, P21A1, P21A2 or P21A3 is displayed with other DTC, first perform the trouble diagnosis for other DTC.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK FOR INTAKE AIR LEAK

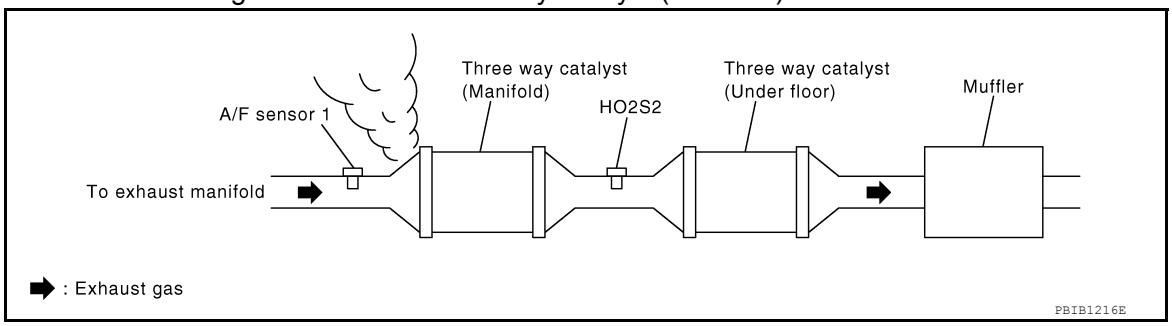
1. Stop engine and check the following for connection.
- Air duct
- Vacuum hoses
- PCV hose
- Intake air passage between air duct to intake manifold
2. Start engine and let it idle.
3. Listen for an intake air leak after the mass air flow sensor.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK EXHAUST GAS LEAK

1. Stop engine and visually check exhaust tube, three way catalyst and muffler for dents connection.
2. Start engine and let it idle.
3. Listen for an exhaust gas leak before three way catalyst (manifold).



Is the inspection result normal?

YES >> GO TO 4.

NO >> Repair or replace error-detected parts.

4. CHECK FUEL PRESSURE

1. Release fuel pressure to zero. Refer to EC-1435, "Work Procedure".
2. Check fuel pressure. Refer to EC-1435, "Work Procedure".

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 9.

5. CHECK MASS AIR FLOW SENSOR

With CONSULT
Check “MASS AIR FLOW” in “DATA MONITOR” mode of “ENGINE” using CONSULT.
For specification, refer to EC-1936, "Mass Air Flow Sensor".

With GST
Check mass air flow sensor signal in Service $01 using GST.
For specification, refer to EC-1936, "Mass Air Flow Sensor".

Is the inspection result normal?

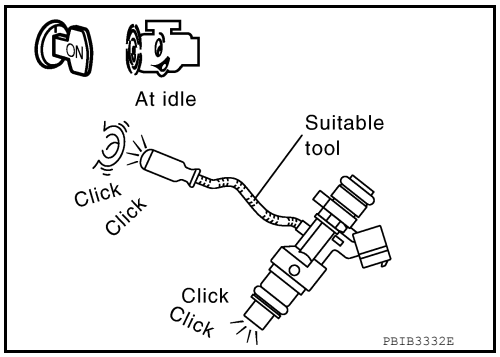
YES >> GO TO 6.
NO >> Check connectors for rusted terminals or loose connections in the mass air flow sensor circuit or grounds. Refer to EC-1534, "Diagnosis Procedure".

6. CHECK FUNCTION OF FUEL INJECTOR-1

With CONSULT
1. Start engine.
2. Perform “POWER BALANCE” in “ACTIVE TEST” mode of “ENGINE” using CONSULT.
3. Check that each circuit produces a momentary engine speed drop.

Without CONSULT
1. Let engine idle.
2. Listen to each fuel injector operating sound.

Clicking noise should be heard.



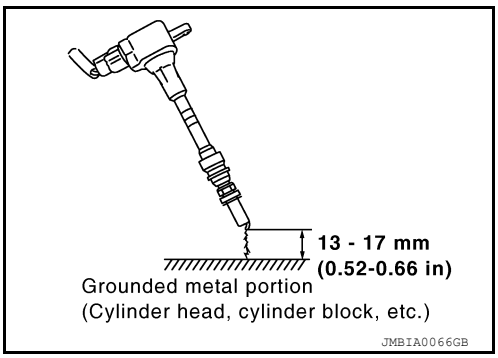
Is the inspection result normal?

YES >> GO TO 7.
NO >> Perform trouble diagnosis for fuel injector, refer to EC-1891, "Component Function Check".

7. CHECK FUNCTION OF IGNITION COIL-1

CAUTION:
Perform the following steps in a well-ventilated area with no combustibles.
1. Turn ignition switch OFF.
2. Remove fuel pump fuse from IPDM E/R to release fuel pressure.
   NOTE:
   CONSULT must not be used to release fuel pressure. It develops again during the following steps, if released by using CONSULT.
3. Start the engine.
4. After an engine stall, crank the engine two or three times to release all the fuel pressure.
5. Turn ignition switch OFF.
6. Disconnect all the harness connectors of ignition coil to prevent electric discharge from occurring in ignition coil.
7. Remove ignition coil assembly and spark plug of cylinder. Refer to EM-34, "Removal and Installation".
8. Crank engine for 5 seconds or more to remove combustion gas in the cylinder.
9. Connect spark plug and harness connector to ignition coil.

10. Allow a 13-17mm (0.52-0.66 in) spacing between spark plug and grounded metal portion as shown in the figure to fix the ignition coil with a rope or an equivalent.
11. Crank the engine for approximately 3 seconds to see if sparking occurs between spark plug and the grounded metal portion.



Spark should be generated.

CAUTION:

- **The discharge voltage becomes 20 kV or higher. Therefore, always stay away from the spark plug and ignition coil at least 50 cm (19.7 in) during the inspection.**
- **Leaving a space of more than 17mm (0.66 in) may damage the ignition coil.**

NOTE:

When the gap is less than 13 mm (0.52 in), a the spark might be generated even if the coil is malfunctioning.

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 10.

8. CHECK COMPRESSION PRESSURE

Check compression pressure. Refer to EM-20, "Inspection".

Is the inspection result normal?

YES >> GO TO 9.
NO >> Check pistons, piston rings, valves, valve seats and cylinder head gaskets.

9. DETECT MALFUNCTIONING PART

Check fuel hoses and fuel tubes for clogging.

Is the inspection result normal?

YES >> Replace fuel filter and fuel pump assembly. Refer to FL-6, "Removal and Installation".
NO >> Repair or replace error-detected parts.

10. CHECK FUNCTION OF IGNITION COIL-2

1. Turn ignition switch OFF.
2. Disconnect spark plug and connect a non-malfunctioning spark plug.
3. Crank engine for approximately 3 seconds, and recheck whether spark is generated between the spark plug and the grounded metal portion.

Spark should be generated.

Is the inspection result normal?

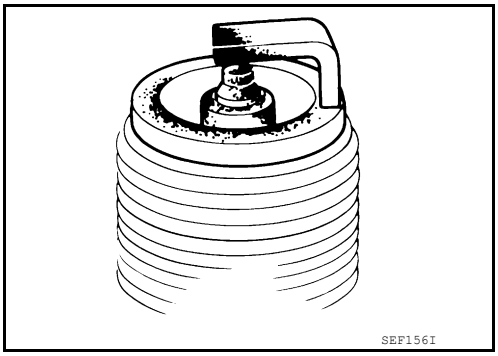
YES >> GO TO 11.
NO >> Check ignition coil, power transistor and their circuits. Refer to EC-1901, "Component Function Check".

11. CHECK SPARK PLUG

Check the initial spark plug for fouling, etc.

Is the inspection result normal?

YES >> 1. Repair or clean spark plug. Refer to EM-34, "Removal and Installation".
2. GO TO 12.
NO >> Replace spark plug(s) with standard type one(s). For spark plug type, refer to EM-146, "Spark Plug".



12. CHECK FUNCTION OF IGNITION COIL-3

1. Reconnect the initial spark plugs.
2. Crank engine for approximately 3 seconds, and recheck whether spark is generated between the spark plug and the grounded portion.

Spark should be generated.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace spark plug(s) with standard type one(s). For spark plug type, refer to EM-146, "Spark Plug".

P2610 ECM INTERNAL TIMER

DTC Description

INFOID:0000000013798520

DTC DETECTION LOGIC

This ECM contains a timer and measures time between an ignition switch OFF and the next ignition switch ON. This enables the judging of the state of engine cooling at an engine start.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P2610	ECM/PCM INTERNAL ENG OFF TIMER (ECM/PCM internal engine off timer performance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	• ECM internal engine off timer is malfunctioning • The time calculated by ECM based on a descent allowance of engine coolant temperatures during ignition switch OFF is extremely shorter than the time counted by the Engine internal OFF timer
		Diagnosis delay time	—

POSSIBLE CAUSE

- ECM
- ECM power supply

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

1.INSPECTION START

It is necessary to erase permanent DTC?

YES >> GO TO 4.
NO >> GO TO 2.

2.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:
Before performing the following procedure, confirm that battery voltage is 12 V or more under ignition switch OFF condition.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-I

1. Turn ignition switch ON and wait at least 190 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1868, "Diagnosis Procedure".
NO >> INSPECTION END

4.PRECONDITIONING

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TESTING CONDITION:

- **Before performing the following procedure, confirm that battery voltage is 12 V or more under ignition switch OFF condition.**
- **Before performing the following procedure, check that fuel level is between 2/8 and 7/8.**

>> GO TO 5.

5.PERFORM DTC CONFIRMATION PROCEDURE-I

1. Turn ignition switch ON and wait at least 190 seconds.
2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1868, "Diagnosis Procedure".
NO >> GO TO 6.

6.PERFORM DTC CONFIRMATION PROCEDURE-II

CAUTION:
To start this self-diagnosis, the conditions listed bellow are required to be satisfied. Perform the following steps to satisfy the conditions.

- **Engine coolant temperature decrease by 55°C (131°F) or more during the time between an ignition switch OFF (after engine warm-up) and the second ignition switch ON.**
- **A fuel temperature at the second ignition switch ON is −5°C (23°F) or more and less than 35°C (95°F).**
- **The temperature difference between engine coolant and fuel is 5°C (41°F) or more.**

NOTE:
This self-diagnosis is not performed if the distance traveled is extremely short.

1. Turn ignition switch ON.
2. Start engine and warm it up to normal operating temperature.
3. Turn ignition switch OFF and soak the vehicle for at least 14 hours.
   CAUTION:
   - **Never turn ON the ignition switch during soaking.**
   - **Never open the fuel filler cap and perform refueling during soaking.**
4. Turn ignition switch ON and wait at least 190 seconds.
5. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1868, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798521

1.CHECK ECM POWER SUPPLY AND GROUND CIRCUIT

Check ECM power supply and ground circuit. Refer to EC-1457, "Diagnosis Procedure".

Is the inspection result normal?

YES >> GO TO 2.
NO >> Repair or replace error-detected parts.

2.CHECK SELF-DIAGNOSTIC RESULT

Check that DTCs related to the fuel system and the cooling system are not detected.

Is the inspection result normal?

YES >> Check the DTC. Refer to EC-1366, "DTC Index".
NO >> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Erase DTC. Refer to EC-1325, "CONSULT Function".
2. Perform DTC Confirmation Procedure again. Refer to EC-1867, "DTC Description".

Is the 1st trip DTC P2610 displayed again?

YES >> Replace ECM. Refer to EC-1933, "Removal and Installation".
NO >> INSPECTION END

P26A3 MULTI-WAY CONTROL VALVE MOTOR

DTC Description

INFOID:0000000013798522

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P26A3	ENGINE COOLANT BYPASS VALVE (Engine coolant bypass valve A range/ performance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	ECM detects the following status continuously : Target valve angle - actual valve angle ≥ ± 5°
		Diagnosis delay time	10 seconds or more

POSSIBLE CAUSE

- Harness or connectors (Multi-way control valve motor circuit is open or shorted)
- Multi-way control valve

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P26A3	Multi-way control valve	• When detecting a malfunction with the valve closed, ECM fully opens the valve. • When detecting a malfunction with the valve opened, ECM maintains valve angle. • When detecting a malfunction in sensor, ECM fully opens the valve. • ECM limits the engine output depending on malfunctions.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

If DTC P26A3 is displayed with DTC P26A5, P26A6, and/or P26A7 first perform the trouble diagnosis for DTC P26A5, P26A6, and/or P26A7.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TEST CONDITION:
Before performing the following procedure, confirm that battery voltage is between more than 10 V and less than 16 V at idle.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 10 seconds.
2. Start the engine and let it idle for 60 seconds.
3. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1870, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798523

1.CHECK DTC PRIORITY

If DTC P26A3 is displayed with DTC P26A5, P26A6, and/or P26A7 first perform the trouble diagnosis for DTC P26A5, P26A6, and/or P26A7.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK MULTI-WAY CONTROL VALVE MOTOR OUTPUT SIGNAL CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect multi-way control valve harness connector and ECM harness connector.
3. Check the continuity between multi-way control valve harness connector and ECM harness connector.

+		–		Continuity
Multi-way control valve		ECM		
Connector	Terminal	Connector	Terminal	
F92	1	F79	58	Existed
	2		57	

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3.CHECK MULTI-WAY CONTROL VALVE MOTOR

Check the multi-way control valve motor. Refer to EC-1870, "Component Inspection (Multi-way Control Valve)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace multi-way control valve. Refer to CO-23, "Removal and Installation".

Component Inspection (Multi-way Control Valve)

INFOID:0000000013798524

1.CHECK MULTI-WAY CONTROL VALVE-1

With CONSULT

1. Turn ignition switch ON and engine stopped.
2. On the CONSULT screen, select “ENGINE” >> “WORK SUPPORT” >> “ENGINE COOLANT BYPASS VALVE”.
3. Check that indication of “ENGINE COOLANT B/V POSI”.

Is “205 deg” or more displayed on CONSULT screen?

YES >> GO TO 2.
NO >> Replace multi-way control valve. Refer to CO-23, "Removal and Installation".

2.CHECK MULTI-WAY CONTROL VALVE-2

With CONSULT

1. Start the engine.
2. Warm engine up to the normal operating temperature.
3. Check the following condition.

COOLANT TEMP/S	10 - 100°C (50 - 212°F)
ENG OIL TEMP	120°C (248°F) or less
A/C switch	OFF

4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start the engine.
6. Check “ENGINE COOLANT B/V POSI” approximately 2 seconds after engine start.

Is “40°” or less displayed on CONSULT screen?

YES >> INSPECTION END
NO >> Replace multi-way control valve. Refer to CO-23, "Removal and Installation".

P26A5 MULTI-WAY CONTROL VALVE POSITION SENSOR

DTC Description

INFOID:0000000013798525

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P26A5	ENGINE COOLANT B/V A POSI SEN (Engine coolant bypass valve A position sensor circuit range/performance)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	ECM detects the following status: • A voltage signal transmitted from the multi-way control valve position sensor is 4.76 V or more/4.3 V or less. Outside the above threshold when the valve is moved to the upper side stopper after ignition OFF • A voltage signal transmitted from the multi-way control valve position sensor is 0.8 V or more/0.34 or less. Outside the threshold when the valve is moved to the lower side stopper after engine start
		Diagnosis delay time	10 seconds or more

POSSIBLE CAUSE

- Harness or connectors (Multi-way control valve position sensor circuit is open or shorted)
- Multi-way control valve position sensor
- Sensor power supply 2

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P26A5	Multi-way control valve	• When detecting a malfunction with the valve closed, ECM fully opens the valve. • When detecting a malfunction with the valve opened, ECM maintains valve angle. • When detecting a malfunction in sensor, ECM fully opens the valve. • ECM limits the engine output depending on malfunctions.

DTC CONFIRMATION PROCEDURE

1.CHECK DTC PRIORITY

- If DTC P26A5 is displayed with DTC P0117 or P0118 first perform the trouble diagnosis for DTC P0117 or P0118.
- If DTC P26A5 is displayed with DTC P26A3 first perform the trouble diagnosis for DTC P26A3.
- If DTC P26A5 is displayed with DTC P26A6, or P26A7 first perform the trouble diagnosis for DTC P26A6, or P26A7.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TEST CONDITION:
Before performing the following procedure, confirm that battery voltage is more than 10 V at ignition switch ON.

>> GO TO 3.

3.PERFORM DTC CONFIRMATION PROCEDURE-1

1. Start the engine and let it idle.
2. Maintain the following conditions for at least 10 consecutive seconds.

Engine outlet coolant temperature (engine coolant temperature sensor 1)	10°C (50°F) or more
Engine oil temperature	135°C (275°F) or less
Engine speed	4,500 rpm or less
Accelerator pedal	Fully released

3. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Proceed to EC-1873, "Diagnosis Procedure".
NO >> GO TO 4.

4.PERFORM DTC CONFIRMATION PROCEDURE-2

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Start the engine and let it idle.
3. Maintain the following conditions for at least 10 consecutive seconds.

Engine outlet coolant temperature (engine coolant temperature sensor 1)	10°C (50°F) or more
Engine oil temperature	135°C (275°F) or less
Engine speed	4,500 rpm or less

4. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1873, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798526

1.CHECK DTC PRIORITY

- If DTC P26A5 is displayed with DTC P0117 or P0118 first perform the trouble diagnosis for DTC P0117 or P0118.
- If DTC P26A5 is displayed with DTC P26A3 first perform the trouble diagnosis for DTC P26A3.
- If DTC P26A5 is displayed with DTC P26A6, or P26A7 first perform the trouble diagnosis for DTC P26A6, or P26A7.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK MULTI-WAY CONTROL VALVE POSITION SENSOR POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect multi-way control valve harness connector.
3. Turn ignition switch ON.
4. Check the voltage between multi-way control valve harness connector and ground.

+		−	Voltage (Approx.)
Multi-way control valve			
Connector	Terminal		
F92	5	Ground	5 V

Is the inspection result normal?

YES >> GO TO 4.

NO >> GO TO 3.

3.CHECK SENSOR POWER SUPPLY 2 CIRCUIT

Perform EC-1918, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

4.CHECK MULTI-WAY CONTROL VALVE POSITION SENSOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between multi-way control valve harness connector and ECM harness connector.

+		–		Continuity
Multi-way control valve		ECM		
Connector	Terminal	Connector	Terminal	
F92	3	F78	43	Existed

4. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK MULTI-WAY CONTROL VALVE POSITION SENSOR INPUT SIGNAL CIRCUIT

1. Check the continuity between multi-way control valve harness connector and ECM harness connector.

+		–		Continuity
Multi-way control valve		ECM		
Connector	Terminal	Connector	Terminal	
F92	4	F79	61	Existed

2. Also check harness for short to ground and to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK MULTI-WAY CONTROL VALVE POSITION SENSOR

Check the multi-way control valve position sensor. Refer to EC-1874, "Component Inspection (Multi-way Control Valve)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace multi-way control valve. Refer to CO-23, "Removal and Installation".

Component Inspection (Multi-way Control Valve)

INFOID:0000000013798527

1.CHECK MULTI-WAY CONTROL VALVE-1

With CONSULT

1. Turn ignition switch ON and engine stopped.
2. On the CONSULT screen, select “ENGINE” >> “WORK SUPPORT” >> “ENGINE COOLANT BYPASS VALVE”.
3. Check that indication of “ENGINE COOLANT B/V POSI”.

Is “205 deg” or more displayed on CONSULT screen?

YES >> GO TO 2.
NO >> Replace multi-way control valve. Refer to CO-23, "Removal and Installation".

2.CHECK MULTI-WAY CONTROL VALVE-2

With CONSULT
1. Start the engine.
2. Warm engine up to the normal operating temperature.
3. Check the following condition.

COOLANT TEMP/S	10 - 100°C (50 - 212°F)
ENG OIL TEMP	120°C (248°F) or less
A/C switch	OFF

4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start the engine.
6. Check “ENGINE COOLANT B/V POSI” approximately 2 seconds after engine start.

Is “40°” or less displayed on CONSULT screen?

YES >> INSPECTION END
NO >> Replace multi-way control valve. Refer to CO-23, "Removal and Installation".

P26A6 P26A7 MULTI-WAY CONTROL VALVE POSITION SENSOR

DTC Description

INFOID:0000000013798528

DTC DETECTION LOGIC

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P26A6	ENGINE COOLANT B/V A POSI SEN (Engine coolant bypass valve A position sensor circuit low)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	ECM detects the following status continuously: A voltage signal transmitted from the multi-way control valve position sensor is 0.34 V or less
		Diagnosis delay time	5 seconds or more
P26A7	ENGINE COOLANT B/V A POSI SEN (Engine coolant bypass valve A position sensor circuit high)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	ECM detects the following status continuously: A voltage signal transmitted from the multi-way control valve position sensor is 4.76 V or more
		Diagnosis delay time	5 seconds or more

POSSIBLE CAUSE

- Harness or connectors (Multi-way control valve position sensor circuit is open or shorted)
- Multi-way control valve position sensor
- Sensor power supply 2

FAIL-SAFE

DTC No.	Detected items	Engine operating condition in fail-safe mode
P26A6 P26A7	Multi-way control valve	• When detecting a malfunction with the valve closed, ECM fully opens the valve. • When detecting a malfunction with the valve opened, ECM maintains valve angle. • When detecting a malfunction in sensor, ECM fully opens the valve. • ECM limits the engine output depending on malfunctions.

DTC CONFIRMATION PROCEDURE

1.PRECONDITIONING

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

TEST CONDITION:

Before performing the following procedure, confirm that battery voltage is more than 11 V at ignition switch ON.

>> GO TO 2.

2.PERFORM DTC CONFIRMATION PROCEDURE

1. Turn ignition switch ON and wait at least 10 seconds.
2. Start the engine and let it idle for 20 seconds.
3. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1877, "Diagnosis Procedure".

NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798529

1.CHECK MULTI-WAY CONTROL VALVE POSITION SENSOR POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect multi-way control valve harness connector.
3. Turn ignition switch ON.
4. Check the voltage between multi-way control valve harness connector and ground.

+		–	Voltage (Approx.)
Multi-way control valve			
Connector	Terminal		
F92	5	Ground	5 V

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.CHECK SENSOR POWER SUPPLY 2 CIRCUIT

Perform EC-1918, "Diagnosis Procedure".

Is inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

3.CHECK MULTI-WAY CONTROL VALVE POSITION SENSOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between multi-way control valve harness connector and ECM harness connector.

+		–		Continuity
Multi-way control valve		ECM		
Connector	Terminal	Connector	Terminal	
F92	3	F78	43	Existed

4. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK MULTI-WAY CONTROL VALVE POSITION SENSOR INPUT SIGNAL CIRCUIT

1. Check the continuity between multi-way control valve harness connector and ECM harness connector.

+		–		Continuity
Multi-way control valve		ECM		
Connector	Terminal	Connector	Terminal	
F92	4	F79	61	Existed

2. Also check harness for short to ground and to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts.

5.CHECK MULTI-WAY CONTROL VALVE POSITION SENSOR

Check the multi-way control valve position sensor. Refer to EC-1874, "Component Inspection (Multi-way Control Valve)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace multi-way control valve. Refer to CO-23, "Removal and Installation".

Component Inspection (Multi-way Control Valve)

INFOID:0000000013798530

1. CHECK MULTI-WAY CONTROL VALVE-1

With CONSULT

1. Turn ignition switch ON and engine stopped.
2. On the CONSULT screen, select “ENGINE” >> “WORK SUPPORT” >> “ENGINE COOLANT BYPASS VALVE”.
3. Check that indication of “ENGINE COOLANT B/V POSI”.

Is “205°” or more displayed on CONSULT screen?

YES >> GO TO 2.
NO >> Replace multi-way control valve. Refer to CO-23, "Removal and Installation".

2. CHECK MULTI-WAY CONTROL VALVE-2

With CONSULT

1. Start the engine.
2. Warm engine up to the normal operating temperature.
3. Check the following condition.

COOLANT TEMP/S	10 - 100°C (50 - 212°F)
ENG OIL TEMP	120°C (248°F) or less
A/C switch	OFF

4. Turn ignition switch OFF and wait at least 10 seconds.
5. Start the engine.
6. Check “ENGINE COOLANT B/V POSI” approximately 2 seconds after engine start.

Is “40 deg” or less displayed on CONSULT screen?

YES >> INSPECTION END
NO >> Replace multi-way control valve. Refer to CO-23, "Removal and Installation".

P26AB MULTI-WAY CONTROL VALVE

DTC Description

INFOID:0000000013798531

DTC DETECTION LOGIC

Engine coolant temperature has not risen enough to open the multi-way control valve even though the engine has run long enough.
This is due to a leak in the seal or the multi-way control valve being stuck open.

DTC	CONSULT screen terms (Trouble diagnosis content)	DTC detection condition	
P26AB	ENGINE COOLANT B/V POSI SEN (Engine coolant bypass valve “A” stuck/ open)	Diagnosis condition	—
		Signal (terminal)	—
		Threshold	The engine coolant temperature does not reach to specified temperature even though the engine has run long enough
		Diagnosis delay time	—

POSSIBLE CAUSE

- Multi-way control valve
- Leakage from multi-way control valve
- Engine coolant temperature sensor 1

FAIL-SAFE

Not applicable

DTC CONFIRMATION PROCEDURE

NOTE:
Never refuel before and during the following procedure.

1.CHECK DTC PRIORITY

If DTC P26AB is displayed with DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308, first perform the trouble diagnosis for DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.PRECONDITIONING-1

If DTC Confirmation Procedure has been previously conducted, always perform the following procedure before conducting the next test.

1. Turn ignition switch OFF and wait at least 10 seconds.
2. Turn ignition switch ON.
3. Turn ignition switch OFF and wait at least 10 seconds.

>> GO TO 3.

3.PRECONDITIONING-2

With CONSULT
1. Turn ignition switch ON.
2. Check the following conditions:

Ambient temperature	−10°C (14°F) or more
A/C switch	OFF
Blower fan switch	OFF

3. Select “DATA MONITOR” mode of “ENGINE” using CONSULT.
4. Check the following conditions:

COOLAN TEMP/S	[(−10°C) – (+52°C) (14 – 126°F)]

Is the condition satisfied?

YES >> GO TO 4.
NO >> 1. Satisfy the condition.
2. GO TO 4.

4. PERFORM DTC CONFIRMATION PROCEDURE-1

With CONSULT
1. Start engine.
2. Drive the vehicle until the following condition is satisfied.

CAUTION:
Always drive vehicle at safe speed.

- **STEP 1**

Drive the vehicle under the conditions instructed below until the difference between “COOLAN TEMP/S” and “FUEL T/TMP SE” becomes at least 23°C (73°F).

COOLAN TEMP/S	68°C (154°F) or less
FUEL T/TMP SE	Less than the value calculated by subtracting 28°C (82°F) from “COOLAN TEMP/S”.*

*: Example

COOLAN TEMP/S	FUEL T/TMP SE
65°C (149°F)	37°C (99°F) or less
60°C (140°F)	32°C (89°F) or less

- **STEP 2**

Drive the vehicle at 60 km/h (37 MPH) or more with the difference between “COOLAN TEMP/S” and “FUEL T/TMP SE” maintained at 28°C (82°F) or more.

NOTE:
Keep the accelerator pedal as steady as possible during cruising.

- **STEP 3**

Drive the vehicle at 60 km/h (37 MPH) or more until “COOLAN TEMP/S” increases by 6°C (43°F).

NOTE:
Keep the accelerator pedal as steady as possible during cruising.

Is the condition satisfied?

YES >> GO TO 5.
NO >> GO TO 2.

5. PERFORM DTC CONFIRMATION PROCEDURE-2

With CONSULT
1. Drive the vehicle until the following condition is satisfied.

COOLAN TEMP/S	68°C (154°F) or more

CAUTION:
Always drive vehicle at safe speed.

2. Check 1st trip DTC.

Is 1st trip DTC detected?

YES >> Go to EC-1880, "Diagnosis Procedure".
NO-1 >> To check malfunction symptom before repair: Refer to GI-43, "Intermittent Incident".
NO-2 >> Confirmation after repair: INSPECTION END

Diagnosis Procedure

INFOID:0000000013798532

1. CHECK DTC PRIORITY

If DTC P26AB is displayed with DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308, first perform the trouble diagnosis for DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

Is applicable DTC detected?

YES >> Perform diagnosis of applicable. Refer to EC-1366, "DTC Index".
NO >> GO TO 2.

2.CHECK ENGINE COOLANT TEMPERATURE SENSOR 1

Check the engine coolant temperature sensor 1. Refer to EC-1881, "Component Inspection".

Is the inspection result normal?

YES >> GO TO 3.
NO >> Replace engine coolant temperature sensor 1. Refer to EM-97, "Exploded View".

3.CHECK MULTI-WAY CONTROL VALVE

Check the multi-way control valve. Refer to EC-1874, "Component Inspection (Multi-way Control Valve)".

Is the inspection result normal?

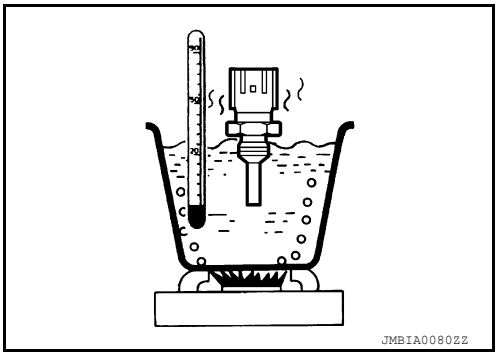
YES >> INSPECTION END
NO >> Replace multi-way control valve. Refer to CO-23, "Removal and Installation".

Component Inspection

INFOID:0000000013798533

1.CHECK ENGINE COOLANT TEMPERATURE SENSOR 1

1. Turn ignition switch OFF.
2. Disconnect engine coolant temperature sensor 1 harness connector.
3. Remove engine coolant temperature sensor 1.
4. Check resistance between engine coolant temperature sensor 1 terminals by heating with hot water as shown in the figure.



Engine coolant temperature sensor 1		Condition		Resistance (kΩ)
+	–			
Terminal				
1	2	Temperature [°C (°F)]	20 (68)	2.35 - 2.73
			50 (122)	0.68 - 1.00
			90 (194)	0.236 - 0.260

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace engine coolant temperature sensor 1. Refer to EM-97, "Exploded View".

ASCD INDICATOR

Component Function Check

INFOID:0000000013798537

1.CHECK ASCD INDICATOR FUNCTION

Check ASCD indicator under the following conditions.

ASCD INDICATOR	CONDITION		SPECIFICATION
CRUISE LAMP	• Ignition switch: ON	• MAIN switch: Pressed at the 1st time → at the 2nd time	ON → OFF

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1882, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798538

1.CHECK DTC

Check that DTC UXXXX is not displayed.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Perform trouble diagnosis for DTC UXXXX.

2.CHECK DTC WITH COMBINATION METER

Refer to MWI-27, "CONSULT Function (METER/M&A)" (TYPE A), MWI-131, "CONSULT Function (METER/M&A)" (TYPE B).

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace malfunctioning part.

3.CHECK INTERMITTENT INCIDENT

Refer to GI-43, "Intermittent Incident".

Is the inspection result normal?

YES >> Replace combination meter. Refer to MWI-108, "Removal and Installation" (TYPE A), MWI-186, "Removal and Installation" (TYPE B).
NO >> Repair or replace malfunctioning part.

BRAKE PEDAL POSITION SWITCH

Component Function Check

INFOID:0000000013798534

1.CHECK BRAKE PEDAL POSITION SWITCH FUNCTION

WITH CONSULT
1. Turn ignition switch ON.
2. Select “BRAKE SW1” in “DATA MONITOR” mode with CONSULT.
3. Check “BRAKE SW1” indication under the following conditions.

Monitor item	Condition		Indication
BRAKE SW1 (Brake pedal position switch)	Brake pedal	Slightly depressed	OFF
		Fully released	ON

WITHOUT CONSULT
1. Turn ignition switch ON.
2. Check the voltage between ECM harness connector terminals as per the following.

ECM			Condition		Voltage (V)
Connector	+	–			
	Terminal	Terminal			
E16	140 (Brake pedal position switch signal)	152	Brake pedal	Slightly depressed	Approx. 0
				Fully released	Battery voltage

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1883, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798535

1.CHECK BRAKE PEDAL POSITION SWITCH POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect brake pedal position switch harness connector.
3. Turn ignition switch ON.
4. Check the voltage between brake pedal position switch harness connector and ground.

Brake pedal position switch		Ground	Voltage
Connector	Terminal		
E170	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.DETECT MALFUNCTIONING PART

Check the following.
- 10 A fuse (No. 30)
- Harness for open or short between brake pedal position switch and fuse
- Loose or poor connection for each connector and harness

>> Repair open circuit or short to ground in harness or connectors.

3.CHECK BRAKE PEDAL POSITION SWITCH INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.

2. Disconnect ECM harness connector.
3. Check the continuity between brake pedal position switch harness connector and ECM harness connector.

Brake pedal position switch		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E170	2	E16	140	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and brake pedal position switch
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

5. CHECK BRAKE PEDAL POSITION SWITCH

Refer to EC-1884, "Component Inspection (Brake Pedal Position Switch)".

Is the inspection result normal?

YES >> GO TO 6.
NO >> Replace brake pedal position switch. Refer to BR-20, "Removal and Installation".

6. CHECK INTERMITTENT INCIDENT

Refer to GI-43, "Intermittent Incident".

>> INSPECTION END

Component Inspection (Brake Pedal Position Switch)

INFOID:0000000013798536

1. CHECK BRAKE PEDAL POSITION SWITCH-I

1. Turn ignition switch OFF.
2. Disconnect brake pedal position switch harness connector.
3. Check the continuity between brake pedal position switch terminals under the following conditions.

Terminals	Condition		Continuity
1 and 2	Brake pedal	Fully released	Existed
		Slightly depressed	Not existed

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2. CHECK BRAKE PEDAL POSITION SWITCH-II

1. Adjust brake pedal position switch installation. Refer to BR-20, "Removal and Installation".
2. Check the continuity between brake pedal position switch terminals under the following conditions.

Terminals	Condition		Continuity
1 and 2	Brake pedal	Fully released	Existed
		Slightly depressed	Not existed

Is the inspection result normal?

YES >> INSPECTION END

NO >> Replace brake pedal position switch. Refer to BR-20, "Removal and Installation".

COOLING FAN

Component Function Check

INFOID:0000000013798542

1.CHECK COOLING FAN FUNCTION

WITH CONSULT
1. Start the engine.
2. Perform “FAN DUTY CONTROL” in “ACTIVE TEST” mode with CONSULT.
3. Check that cooling fan speed varies according to the percentage.

NOTE:
Speed changes gradually as the percentage changes.

WITHOUT CONSULT
1. Start the engine and warm up the engine until engine coolant temperature reaches at least 98°C (209°F).
2. Check that cooling fan speed increase.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Proceed to EC-1886, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798543

1.CHECK DRIVE BELT

1. Turn ignition switch OFF.
2. Check that the drive belt is not broken.

Is inspection result normal?

YES >> GO TO 2.
NO >> Replace drive belt.

2.CHECK FAN CLUTCH ASSEMBLY POWER SUPPLY

1. Disconnect the fan clutch assembly harness connector.
2. Turn ignition switch ON.
3. Check the voltage between the fan clutch assembly harness connector and ground.

+		−	Voltage (Approx.)
Fan clutch assembly			
Connector	Terminal		
F152	1	Ground	Battery voltage

Is inspection result normal?

YES >> GO TO 3.
NO >> Perform trouble diagnosis for power supply circuit.

3.CHECK FAN CLUTCH ASSEMBLY GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Check the continuity between the fan clutch assembly harness connector and ground.

+		−	Continuity
Fan clutch assembly			
Connector	Terminal		
F152	6	Ground	Existed

Is inspection result normal?

YES >> GO TO 4.
NO >> Repair or replace error-detected parts.

4.CHECK FAN CLUTCH ASSEMBLY CONTROL SIGNAL

WITH CONSULT

1. Start the engine.
2. Perform “FAN DUTY CONTROL” in “ACTIVE TEST” mode of “ECM” with CONSULT.
3. Set the Duty value to 100%.
4. Check the voltage between the fan clutch assembly harness connector and ground.

CAUTION:
Wait for 1 minute or more to measure.

+		–	Voltage (Approx.)
Fan clutch assembly			
Connector	Terminal		
F152	3	Ground	 2. 5 V

WITHOUT CONSULT

1. Start the engine and warm up the engine until engine coolant temperature reaches at least 98°C (209°F).
2. Check the voltage between the fan clutch assembly harness connector and ground.

CAUTION:
Wait for 1 minute or more to measure.

+		–	Voltage (Approx.)
Fan clutch assembly			
Connector	Terminal		
F152	3	Ground	 2. 5 V

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 5.

5. CHECK FAN CLUTCH ASSEMBLY CONTROL CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between the fan clutch assembly harness connector and IPDM E/R harness connector.

+		–		Continuity
Fan clutch assembly		IPDM E/R		
Connector	Terminal	Connector	Terminal	
F152	3	E130	72	Existed

4. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair or replace error-detected parts.

6.CHECK CAN COMMUNICATION

Refer to LAN-51, "Trouble Diagnosis Flow Chart".

Is inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Repair or Replace error-detected parts.

7.CHECK COOLING FAN SPEED SENSOR

Refer to EC-1712, "Diagnosis Procedure".

Is inspection result normal?

YES >> Replace the fan clutch assembly. Refer to CO-17, "Removal and Installation".
NO >> Repair or replace error-detected parts.

ELECTRICAL LOAD SIGNAL

Description

INFOID:0000000013798539

The electrical load signal (Rear window defogger switch signal, headlamp switch signal, heater fan switch signal, etc.) is transferred via the CAN communication line.

Component Function Check

INFOID:0000000013798540

1.CHECK REAR WINDOW DEFOGGER SWITCH FUNCTION

1. Turn ignition switch ON.
2. Select “DATA MONITOR” mode with CONSULT.
3. Select “LOAD SIGNAL” and check indication under the following conditions.

Monitor item	Condition		Indication
LOAD SIGNAL	Rear window defogger switch	ON	ON
		OFF	OFF

Is the inspection result normal?

YES >> GO TO 2.
NO >> Go to EC-1889, "Diagnosis Procedure".

2.CHECK LIGHTING SWITCH FUNCTION

Check “LOAD SIGNAL” indication under the following conditions.

Monitor item	Condition		Indication
LOAD SIGNAL	Lighting switch	ON at 2nd position	ON
		OFF	OFF

Is the inspection result normal?

YES >> GO TO 3.
NO >> Go to EC-1889, "Diagnosis Procedure".

3.CHECK HEATER FAN CONTROL SWITCH FUNCTION

Select “HEATER FAN SW” and check indication under the following conditions.

Monitor item	Condition		Indication
HEATER FAN SW	Heater fan control switch	ON	ON
		OFF	OFF

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1889, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798541

1.INSPECTION START

Confirm the malfunctioning circuit (rear window defogger, headlamp or heater fan). Refer to EC-1889, "Component Function Check".

Which circuit is related to the incident?

Rear window defogger>>GO TO 2.
Headlamp>>GO TO 3.
Heater fan>>GO TO 4.

2.CHECK REAR WINDOW DEFOGGER SYSTEM

Refer to DEF-30, "Work Flow".

>> INSPECTION END

3. CHECK HEADLAMP SYSTEM

Refer to EXL-93, "Work Flow".

>> INSPECTION END

4. CHECK HEATER FAN CONTROL SYSTEM

Refer to HAC-55, "Work Flow".

>> INSPECTION END

FUEL INJECTOR

Component Function Check

INFOID:0000000013798544

1.INSPECTION START

Turn ignition switch to START.

Are any cylinders ignited?

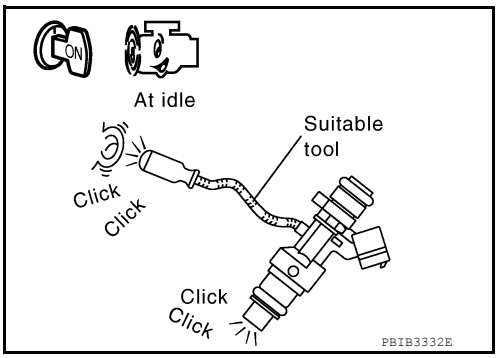
YES >> GO TO 2.
NO >> Proceed to EC-1891, "Diagnosis Procedure".

2.CHECK FUEL INJECTOR FUNCTION

WITH CONSULT
1. Start engine.
2. Perform “POWER BALANCE” in “ACTIVE TEST” mode with CONSULT.
3. Check that each circuit produces a momentary engine speed drop.

WITHOUT CONSULT
1. Start engine.
2. Listen to each fuel injector operating sound.

Clicking sound should be heard.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Proceed to EC-1891, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798545

1.CHECK FUEL INJECTOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect fuel injector harness connector.
3. Turn ignition switch ON.
4. Check the voltage between fuel injector harness connector and ground.

+			–	Voltage
Fuel injector				
Cylinder	Connector	Terminal		
1	F230	1	Ground	Battery voltage
2	F234	1		
3	F231	1		
4	F235	1		
5	F232	1		
6	F236	1		
7	F233	1		
8	F237	1		

Is the inspection result normal?

YES >> GO TO 9.
NO >> GO TO 2.

2.CHECK FUEL INJECTOR POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.

2. Disconnect ECM harness connector.
3. Check the continuity between fuel injector harness connector and ECM harness connector.

Fuel injector			ECM		Continuity
Cylinder	Connector	Terminal	Connector	Terminal	
1	F230	1	F78	47	Existed
2	F234	1		5	
3	F231	1			
4	F235	1		54	
5	F232	1		7	
6	F236	1		47	
7	F233	1		54	
8	F237	1		7	

4. Also check harness for short to ground.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts.

3. CHECK FUEL INJECTOR DRIVER POWER SUPPLY

1. Reconnect ECM harness connector.
2. Turn ignition switch ON.
3. Check the voltage between ECM harness connector and ground.

+		–	Voltage
ECM			
Connector	Terminal		
F78	1	Ground	Battery voltage
	2		
	6		
	46		

Is the inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident"
NO >> GO TO 4.

4. CHECK FUEL INJECTOR DRIVER POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Disconnect fuel injector relay harness connector.
4. Check the continuity between ECM harness connector and fuel injector relay harness connector.

ECM		Fuel injector relay		Continuity
Connector	Terminal	Connector	Terminal	
F78	1	E171	3	Existed
	6		3	

5. Check the continuity between ECM harness connector and high pressure fuel pump and fuel injector relay harness connector.

ECM		High pressure fuel pump and Fuel injector relay		Continuity
Connector	Terminal	Connector	Terminal	
F78	2	E172	6	Existed
	46		6	

6. Also check harness for short to ground.

Is the inspection result normal?

YES >> GO TO 5.
NO >> Repair or replace error-detected parts

5.CHECK FUEL INJECTOR RELAY POWER SUPPLY (CONTACT SIDE)

1. Turn ignition switch ON.
2. Check the voltage between fuel injector relay harness connector and ground.

+		−	Voltage
Fuel injector relay			
Connector	Terminal		
E171	5	Ground	Battery voltage

3. Check the voltage between high pressure fuel pump and fuel injector relay harness connector and ground.

+		−	Voltage
High pressure fuel pump and Fuel injector relay			
Connector	Terminal		
E172	7	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 6.
NO >> Perform the trouble diagnosis for power supply circuit.

6.CHECK FUEL INJECTOR RELAY POWER SUPPLY (EXCITATION COIL SIDE)

1. Reconnect all harness connectors disconnected.
2. Check the voltage between fuel injector relay harness connector and ground.

+		−	Voltage
Fuel injector relay			
Connector	Terminal		
E171	2	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 8.
NO >> GO TO 7.

7.CHECK FUEL INJECTOR RELAY POWER SUPPLY CIRCUIT (EXCITATION COIL SIDE)

1. Turn ignition switch OFF.
2. Disconnect fuel injector relay harness connector.
3. Disconnect IPDM E/R harness connector.
4. Check the continuity between IPDM E/R harness connector and fuel injector harness connector.

IPDM E/R		Fuel injector relay		Continuity
Connector	Terminal	Connector	Terminal	
E121	26	E171	2	Existed

5. Check the continuity between IPDM E/R harness connector and high pressure fuel pump and fuel injector harness connector.

IPDM E/R		High pressure fuel pump and Fuel injector relay		Continuity
Connector	Terminal	Connector	Terminal	
E121	26	E172	2	Existed

6. Also check harness for short to ground.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit.
NO >> Repair or replace error-detected parts.

8. CHECK FUEL INJECTOR RELAY GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect fuel injector relay harness connector.
3. Check the continuity between fuel injector relay harness connector and ground.

Fuel injector relay		–	Continuity
Connector	Terminal		
E171	1	Ground	Existed

4. Check the continuity between high pressure fuel pump and fuel injector relay harness connector and ground.

High pressure fuel pump and Fuel injector relay		–	Continuity
Connector	Terminal		
E172	1	Ground	Existed

5. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair or replace error-detected parts.

9. CHECK FUEL INJECTOR GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between fuel injector harness connector and ECM harness connector.

Fuel injector			ECM		Continuity
Cylinder	Connector	Terminal	Connector	Terminal	
1	F230	2	F78	48	Existed
2	F234	2		9	
3	F231	2		4	
4	F235	2		49	
5	F232	2		8	
6	F236	2		52	
7	F233	2		53	
8	F237	2		3	

4. Also check harness for short to ground and to power.

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

10.CHECK FUEL INJECTOR RELAY

Check the fuel injector relay. Refer to EC-1895, "Component Inspection (Fuel Injector Relay)".

Is the inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident"
NO >> Replace fuel injector relay.

11.CHECK FUEL INJECTOR

Check the fuel injector. Refer to EC-1895, "Component Inspection (Fuel Injector)".

Is the inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident"
NO >> Replace malfunctioning fuel injector. Refer to EM-54, "Exploded View".

Component Inspection (Fuel Injector)

INFOID:0000000013798546

1.CHECK FUEL INJECTOR

1. Turn ignition switch OFF.
2. Disconnect fuel injector harness connector.
3. Check the resistance between fuel injector terminals as per the following.

Injector		Condition		Resistance
+	–			
Terminal				
1	2	Temperature	10 - 60°C (50 - 140°F)	1.44 - 1.73 Ω

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning fuel injector. Refer to EM-54, "Removal and Installation".

Component Inspection (Fuel Injector Relay)

INFOID:0000000013798547

1.CHECK FUEL INJECTOR RELAY

1. Turn ignition switch OFF.
2. Remove fuel injector relay.
3. Check the continuity between fuel injector relay terminals as per the following conditions.

+	–	Conditions	Continuity
Fuel injector relay			
Terminal			
3	5	12 V direct current supply between terminals 1 and 2	Existed
		No current supply	Not existed

4. Check the continuity between high pressure fuel pump and fuel injector relay terminals as per the following conditions.

+	–	Conditions	Continuity
High pressure fuel pump and Fuel injector relay			
Terminal			
6	7	12 V direct current supply between terminals 1 and 2	Existed
		No current supply	Not existed

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace fuel injector relay.

HIGH PRESSURE FUEL PUMP

Component Function Check

INFOID:0000000013798548

1.CHECK HIGH PRESSURE FUEL PUMP FUNCTION

WITH CONSULT
1. Start engine.
2. Check “FUEL PRES SEN V” in “DATA MONITOR” mode with CONSULT.

Monitor Item	Condition	Values/Status
FUEL PRES SEN V	Engine speed: Idle	820 – 1,220 mV
	Engine speed: Revving engine from idle to 4,000 rpm quickly	820 – 3,060 mV

WITHOUT CONSULT
1. Start engine.
2. Check the voltage between ECM harness connector and ground.

ECM				Condition	Voltage
+		–			
Connector	Terminal	Connector	Terminal		
F79	59	E16	152	[Engine is running] • Warm-up condition • Idle speed **NOTE:** The pulse cycle changes depending on rpm at idle	BATTERY VOLTAGE (11 - 14 V)★ 				[Engine is running] • Warm-up condition • Engine speed: 2,000 rpm	BATTERY VOLTAGE (11 - 14 V)★ 
Is the inspection result normal?

YES >> INSPECTION END
NO >> Proceed to EC-1897, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798549

1.CHECK HIGH PRESSURE FUEL PUMP POWER SUPPLY

1. Turn ignition switch ON.
2. Check the voltage between ECM harness connector and ground.

+		–	Voltage
ECM			
Connector	Terminal		
F78	51	Ground	Battery voltage

Is inspection result normal?

YES >> GO TO 8.

NO >> GO TO 2.

2.CHECK HIGH PRESSURE FUEL PUMP POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Disconnect fuel injector relay harness connector.
4. Check the continuity between ECM harness connector and high pressure fuel pump and injector relay harness connector.

+		–		Continuity
ECM		High pressure fuel pump and injector relay		
Connector	Terminal	Connector	Terminal	
F78	51	E172	3	Existed

5. Also check harness for short to ground.

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair or replace error-detected parts

3.CHECK HIGH PRESSURE FUEL PUMP AND INJECTOR RELAY POWER SUPPLY (CONTACT SIDE)

Check the voltage between high pressure fuel pump and injector relay harness connector and ground.

+		–	Voltage
High pressure fuel pump and injector relay			
Connector	Terminal		
E172	5	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 4.
NO >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".

4.CHECK HIGH PRESSURE FUEL PUMP AND INJECTOR RELAY POWER SUPPLY (EXCITATION COIL SIDE)

1. Reconnect all harness connectors disconnected.
2. Turn ignition switch ON.
3. Check the voltage between high pressure fuel pump and injector relay harness connector and ground.

+		–	Voltage
High pressure fuel pump and injector relay			
Connector	Terminal		
E172	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 6.
NO >> GO TO 5

5.CHECK HIGH PRESSURE FUEL PUMP AND INJECTOR RELAY POWER SUPPLY CIRCUIT (EXCITATION COIL SIDE)

1. Turn ignition switch OFF.
2. Disconnect high pressure fuel pump and injector relay harness connector.
3. Disconnect IPDM E/R harness connector.
4. check the continuity between IPDM E/R harness connector and high pressure fuel pump harness connector.

+		–		Continuity
IPDM E/R		High pressure fuel pump and injector relay		
Connector	Terminal	Connector	Terminal	
E121	26	E172	2	Existed

5. Also check harness for short to ground.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure".
NO >> Repair or replace error-detected parts.

6.CHECK HIGH PRESSURE FUEL PUMP AND INJECTOR RELAY GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect high pressure fuel pump and injector relay harness connector.
3. Check the continuity between high pressure fuel pump and injector relay harness connector and ground.

+		–	Continuity
High pressure fuel pump and injector relay			
Connector	Terminal		
E172	1	Ground	Existed

4. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7.CHECK HIGH PRESSURE FUEL PUMP AND INJECTOR RELAY

Check the high pressure fuel pump and injector relay. Refer to EC-1900, "Component Inspection (High Pressure Fuel Pump And Injector Relay)".

Is inspection result normal?

YES >> GO TO 8.
NO >> Replace high pressure fuel pump and injector relay.

8.CHECK HIGH PRESSURE FUEL PUMP SOLENOID CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector and high pressure fuel pump harness connector.
3. Check the continuity between ECM harness connector and high pressure fuel pump harness connector.

+		–		Continuity
ECM		High pressure fuel pump		
Connector	Terminal	Connector	Terminal	
E79	59	F87	1	Existed
	60		2	

4. Also check harness for short to ground and to power.

Is inspection result normal?

YES >> GO TO 9.
NO >> Repair or replace error-detected parts.

9.CHECK HIGH PRESSURE FUEL PUMP SOLENOID

Refer to EC-1900, "Component Inspection (High Pressure Fuel Pump Solenoid)".

Is inspection result normal?

YES >> GO TO 10.
NO >> Replace high pressure fuel pump. Refer to EM-49, "Removal and Installation".

10.CHECK HIGH PRESSURE FUEL PUMP INSTALLATION CONDITION

1. Turn ignition switch OFF.
2. Check that the high pressure fuel pump is installed with no backlash and looseness.

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair or replace error-detected parts.

11.CHECK CAMSHAFT

1. Remove camshaft. Refer to EM-86, "Removal and Installation".
2. Check camshaft. Refer to EM-88, "Inspection".

Is inspection result normal?

YES >> INSPECTION END
NO >> Replace camshaft. Refer to EM-86, "Removal and Installation".

Component Inspection (High Pressure Fuel Pump Solenoid)

INFOID:0000000013798550

1.CHECK HIGH PRESSURE FUEL PUMP SOLENOID

1. Turn ignition switch OFF.
2. Disconnect high pressure fuel pump harness connector.
3. Check the resistance between high pressure fuel pump connector terminals as per the following.

+	–	Condition		Resistance
High pressure fuel pump Terminal				
1	2	Temperature	20 – 30°C (68 – 86°F)	9 – 11 Ω

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace high pressure fuel pump. Refer to EM-49, "Removal and Installation".

Component Inspection (High Pressure Fuel Pump And Injector Relay)

INFOID:0000000013798551

1.CHECK HIGH PRESSURE FUEL PUMP AND INJECTOR RELAY

1. Turn ignition switch OFF.
2. Remove high pressure fuel pump and injector relay.
3. Check the continuity between high pressure fuel pump and injector relay terminals as per the following conditions.

+	–	Conditions	Continuity
High pressure fuel pump and injector relay Terminal			
5	3	12 V direct current supply between terminals 1 and 2	Existed
		No current supply	Not existed

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace high pressure fuel pump and injector relay.

IGNITION SIGNAL

Component Function Check

INFOID:0000000013798555

1.INSPECTION START

Turn ignition switch OFF, and restart engine.

Does the engine start?

YES-1 >> With CONSULT: GO TO 2.
YES-2 >> Without CONSULT: GO TO 3.
NO >> Go to EC-1901, "Diagnosis Procedure".

2.CHECK IGNITION SIGNAL FUNCTION

WITH CONSULT

1. Perform “POWER BALANCE” in “ACTIVE TEST” mode with CONSULT.
2. Check that each circuit produces a momentary engine speed drop.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1901, "Diagnosis Procedure".

3.CHECK IGNITION SIGNAL FUNCTION

WITHOUT CONSULT

1. Let engine idle.
2. Read the voltage signal between ECM harness connector terminals under the following conditions with an oscilloscope.

ECM					Voltage signal
Cylinder	+		–		
	Connector	Terminal	Connector	Terminal	
1	F79	95	E16	152	2		91			
3		92			
4		104			
5		102			
6		94			
7		105			
8		101			

NOTE:

The pulse cycle changes depending on rpm at idle.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1901, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798556

1.CHECK IGNITION COIL POWER SUPPLY CIRCUIT-I

1. Turn ignition switch OFF, wait at least 10 seconds and then turn it ON.
2. Check the voltage between ECM harness connector terminals under the following conditions.

ECM			Voltage
Connector	+	–	
	Terminal	Terminal	
E16	145	152	Battery voltage

Is the inspection result normal?

YES >> GO TO 2.
NO >> Go to EC-1457, "Diagnosis Procedure".

2. CHECK IGNITION COIL POWER SUPPLY CIRCUIT-II

1. Turn ignition switch OFF.
2. Disconnect condenser harness connector.
3. Turn ignition switch ON.
4. Check the voltage between condenser harness connector and ground.

Condenser		Ground	Voltage
Connector	Terminal		
F21	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 3.

3. CHECK IGNITION COIL POWER SUPPLY CIRCUIT-III

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between IPDM E/R harness connector and condenser harness connector.

IPDM E/R		Condenser		Continuity
Connector	Terminal	Connector	Terminal	
E119	17	F21	1	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> Go to EC-1457, "Diagnosis Procedure".
NO >> GO TO 4.

4. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between IPDM E/R and condenser
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

5. CHECK CONDENSER GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Check the continuity between condenser harness connector and ground.

Condenser		Ground	Continuity
Connector	Terminal		
F21	2	Ground	Existed

3. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair open circuit or short to power in harness or connectors.

6. CHECK CONDENSER

Refer to EC-1905, "Component Inspection (Condenser)"

Is the inspection result normal?

YES >> GO TO 7.
NO >> Replace condenser.

7. CHECK IGNITION COIL POWER SUPPLY CIRCUIT-IV

1. Reconnect all harness connectors disconnected.
2. Disconnect ignition coil harness connector.
3. Turn ignition switch ON.
4. Check the voltage between ignition coil harness connector and ground.

Ignition coil			Ground	Voltage
Cylinder	Connector	Terminal		
1	F47	3	Ground	Battery voltage
2	F6	3		
3	F48	3		
4	F7	3		
5	F49	3		
6	F8	3		
7	F51	3		
8	F52	3		

Is the inspection result normal?

YES >> GO TO 9.
NO >> GO TO 8.

8. DETECT MALFUNCTIONING PART

Check the following.
- Harness connector F10 and E22
- Harness for open or short between ignition coil and harness connector F10

>> Repair or replace harness or connectors.

9. CHECK IGNITION COIL GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Check the continuity between ignition coil harness connector and ground.

Ignition coil			Ground	Continuity
Cylinder	Connector	Terminal		
1	F47	2	Ground	Existed
2	F6	2		
3	F48	2		
4	F7	2		
5	F49	2		
6	F8	2		
7	F51	2		
8	F52	2		

3. Also check harness for short to power.

Is the inspection result normal?

YES >> GO TO 10.
NO >> Repair open circuit or short to power in harness or connectors.

10. CHECK IGNITION COIL OUTPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Disconnect ECM harness connector.
2. Check the continuity between ignition coil harness connector and ECM harness connector.

Ignition coil			ECM		Continuity
Cylinder	Connector	Terminal	Connector	Terminal	
1	F47	1	F49	95	Existed
2	F6	1		91	
3	F48	1		92	
4	F7	1		104	
5	F49	1		102	
6	F8	1		94	
7	F51	1		105	
8	F52	1		101	

3. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 11.
NO >> Repair open circuit, short to ground or short to power in harness or connectors.

11.CHECK IGNITION COIL WITH POWER TRANSISTOR

Refer to EC-1904, "Component Inspection (Ignition Coil with Power Transistor)".

Is the inspection result normal?

YES >> GO TO 12.
NO >> Replace malfunctioning ignition coil with power transistor.

12.CHECK INTERMITTENT INCIDENT

Refer to GI-43, "Intermittent Incident".

>> INSPECTION END

Component Inspection (Ignition Coil with Power Transistor)

INFOID:0000000013798557

1.CHECK IGNITION COIL WITH POWER TRANSISTOR-I

1. Turn ignition switch OFF.
2. Disconnect ignition coil harness connector.
3. Check resistance between ignition coil terminals as per the following.

Terminals	Resistance [at 25°C (77°F)]
1 and 2	Except 0 or ∞ Ω
1 and 3	Except 0 Ω
2 and 3	

Is the inspection result normal?

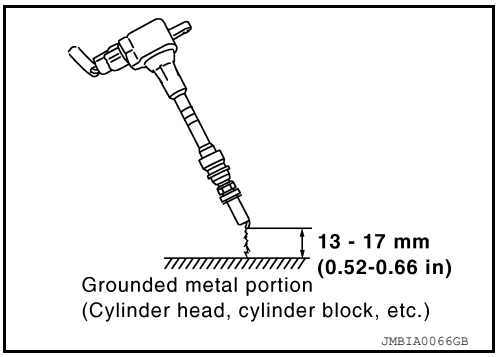
YES >> GO TO 2.
NO >> Replace malfunctioning ignition coil with power transistor.

2.CHECK IGNITION COIL WITH POWER TRANSISTOR-II

CAUTION:
Perform the following procedure in a place with no combustible objects and good ventilation.

1. Turn ignition switch OFF.
2. Reconnect all harness connectors disconnected.
3. Remove fuel pump fuse in IPDM E/R to release fuel pressure.
   NOTE:
   - For the fuse number, refer to EC-1386, "Wiring Diagram".
   - For the fuse arrangement, refer to PG-163, "IPDM E/R Terminal Arrangement".
   - Do not use CONSULT to release fuel pressure, or fuel pressure applies again during the following procedure.

4. Start engine.
5. After engine stalls, crank it 2 or 3 times to release all fuel pressure.
6. Turn ignition switch OFF.
7. Remove all ignition coil harness connectors to avoid the electrical discharge from the ignition coils.
8. Remove ignition coil and spark plug of the cylinder to be checked.
9. Crank engine for 5 seconds or more to remove combustion gas in the cylinder.
10. Connect spark plug and harness connector to ignition coil.
11. Fix ignition coil using a rope etc. with gap of 13 - 17 mm (0.52 - 0.66 in) between the edge of the spark plug and grounded metal portion as shown in the figure.
12. Crank engine for approximately 3 seconds, and check whether spark is generated between the spark plug and the grounded metal portion.



Spark should be generated.

CAUTION:

- **Never place the spark plug and the ignition coil within 50 cm (19.7 in) each other. Be careful not to get an electrical shock while checking, because the electrical discharge voltage becomes 20 kV or more.**
- **It might damage the ignition coil if the gap of more than 17 mm (0.66 in) is made.**

NOTE:

When the gap is less than 13 mm (0.52 in), a spark might be generated even if the coil is malfunctioning.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace malfunctioning ignition coil with power transistor.

Component Inspection (Condenser)

INFOID:0000000013798558

1. CHECK CONDENSER

1. Turn ignition switch OFF.
2. Disconnect condenser harness connector.
3. Check resistance between condenser terminals as per the following.

Terminals	Resistance
1 and 2	Above 1 MΩ [at 25°C (77°F)]

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace condenser.

INFORMATION DISPLAY (ASCD)

Component Function Check

INFOID:0000000013798559

1.CHECK INFORMATION DISPLAY

1. Start engine.
2. Press MAIN switch on ASCD steering switch.
3. Drive the vehicle at more than 40 km/h (25 MPH).
   CAUTION:
   Always drive vehicle at a safe speed.
4. Press SET/COAST switch.
5. Check that the reading of the speedometer shows the same value as the set speed indicated in the information display while driving the vehicle on a flat road.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1906, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798560

1.CHECK DTC

Check that DTC UXXXX or P0500 is not displayed.

Is the inspection result normal?

YES >> GO TO 2.
NO-1 >> Perform trouble diagnosis for DTC UXXXX.
NO-2 >> Perform trouble diagnosis for DTC P0500. Refer to EC-1700, "DTC Description".

2.CHECK DTC WITH “COMBINATION METER”

Refer to MWI-27, "CONSULT Function (METER/M&A)" (TYPE A), MWI-131, "CONSULT Function (METER/M&A)" (TYPE B).

Is the inspection result normal?

YES >> GO TO 3.
NO >> Perform trouble diagnosis for DTC indicated.

3.CHECK INTERMITTENT INCIDENT

Refer to GI-43, "Intermittent Incident".

Is the inspection result normal?

YES >> Replace combination meter.
NO >> Repair or replace.

LOW PRESSURE FUEL PUMP

Component Function Check

INFOID:0000000013798561

1.CHECK FUEL PUMP FUNCTION

1. Turn ignition switch ON.
2. Pinch fuel feed hose with two fingers.

NOTE:
Fuel pressure pulsation should be felt on the fuel feed hose for 1 second after ignition switch is turned ON.

Is the inspection result normal?

YES >> INSPECTION END
NO >> EC-1907, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798562

1.CHECK FUEL PUMP RELAY POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Turn ignition switch ON.
4. Check the voltage between ECM harness connector terminals.

ECM				Voltage
Connector	+	Connector	-	
	Terminal		Terminal	
F79	93	E16	152	Battery voltage

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.CHECK FUEL PUMP RELAY POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between ECM harness connector and IPDM E/R harness connector.

+		–		Continuity
ECM		IPDM E/R		
Connector	Terminal	Connector	Terminal	
F79	93	E122	45	Existed

4. Also check harness for short to ground.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure"
NO >> Repair or replace error-detected parts.

3.CHECK FPCM POWER SUPPLY

1. Turn ignition switch OFF.
2. Disconnect FPCM harness connector.
3. Turn ignition switch ON.
4. Check the voltage between FPCM harness connector and ground.

+		–	Voltage
FPCM			
Connector	Terminal		
C12	1	Ground	Battery voltage

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4. CHECK FPCM POWER SUPPLY CIRCUIT

1. Turn ignition switch OFF.
2. Disconnect IPDM E/R harness connector.
3. Check the continuity between FPCM harness connector and IPDM E/R harness connector.

+		–		Continuity
FPCM		IPDM E/R		
Connector	Terminal	Connector	Terminal	
C12	1	E124	58	Existed

4. Also check harness for short to ground.

Is the inspection result normal?

YES >> Perform the trouble diagnosis for power supply circuit. Refer to EC-1457, "Diagnosis Procedure"
NO >> Repair or replace error-detected parts.

5. CHECK FPCM GROUND CIRCUIT

1. Turn ignition switch OFF.
2. Check the continuity between FPCM harness connector and ground.

+		–	Continuity
FPCM			
Connector	Terminal		
C12	4	Ground	Existed

Is the inspection result normal?

YES >> GO TO 6.
NO >> Repair open circuit or short to power in harness or connectors.

6. CHECK FPCM INPUT AND OUTPUT CIRCUIT

1. Disconnect ECM harness connector.
2. Check the continuity between FPCM harness connector and ECM harness connector.

+		–		Continuity
FPCM		ECM		
Connector	Terminal	Connector	Terminal	
C12	3	E16	130	Existed
	2		136	

3. Also check harness for short to ground and to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> Repair or replace error-detected parts.

7. CHECK FUEL PUMP CONTROL CIRCUIT

1. Disconnect fuel level sensor unit and fuel pump harness connector.
2. Check the continuity between FPCM harness connector and fuel level sensor unit and fuel pump harness connector.

+		–		Continuity
FPCM		Fuel level sensor unit and fuel pump		
Connector	Terminal	Connector	Terminal	
C12	6	C37	1	Existed
	5		2	

3. Also check harness for short to ground and to power.

Is the inspection result normal?

YES >> GO TO 8.
NO >> Repair or replace error-detected parts.

8.CHECK LOW PRESSURE FUEL PUMP

Refer to EC-1909, "Component Inspection (Low Pressure Fuel Pump)".

Is the inspection result normal?

YES >> GO TO 9.
NO >> Replace fuel level sensor unit and fuel pump. Refer to FL-6, "Removal and Installation".

9.CHECK FPCM

Refer to EC-1909, "Component Inspection (FPCM)".

Is the inspection result normal?

YES >> Check intermittent incident. Refer to GI-43, "Intermittent Incident".
NO >> Replace FPCM. Refer to EC-1935, "Removal and Installation".

Component Inspection (Low Pressure Fuel Pump)

INFOID:0000000013798563

1.CHECK FUEL PRESSURE REGULATOR

1. Turn ignition switch OFF.
2. Check low fuel pressure. Refer to EC-1435, "Work Procedure".

Is inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.CHECK LOW PRESSURE FUEL PUMP

1. Turn ignition switch OFF.
2. Disconnect fuel level sensor unit and fuel pump.
3. Check resistance between fuel level sensor unit and fuel pump terminals as follows.

+	–	Condition	Resistance
Fuel level sensor unit and fuel pump			
Terminals			
1	2	Temperature: 25°C (77°F)	0.2 - 5.0 Ω

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace fuel level sensor unit and fuel pump. Refer to FL-6, "Removal and Installation".

Component Inspection (FPCM)

INFOID:0000000013798564

1.CHECK FUEL PUMP CONTROL MODULE (FPCM)

1. Check the voltage between FPCM terminals under the following conditions.

FPCM		Condition	Voltage
+	–		
Terminal	Terminal		
6	5	For 1 second after turning ignition switch ON	Approx. 8.5 V
		More than 1 second after turning ignition switch ON	Approx. 0 V
		Idle speed	Approx. 8.5 V

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace FPCM. Refer to EC-1935, "Removal and Installation".

MALFUNCTION INDICATOR LAMP

Component Function Check

INFOID:0000000013798565

1.CHECK MIL FUNCTION

1. Turn ignition switch ON.
2. Check that MIL illuminates.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1911, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798566

1.CHECK DTC

Check that DTC UXXXX is not displayed.

Is the inspection result normal?

YES >> GO TO 2.
NO >> Perform trouble diagnosis for DTC UXXXX.

2.CHECK DTC WITH COMBINATION METER

Refer to MWI-27, "CONSULT Function (METER/M&A)" (TYPE A), MWI-131, "CONSULT Function (METER/M&A)" (TYPE B).

Is the inspection result normal?

YES >> GO TO 3.
NO >> Perform trouble diagnosis for DTC indicated.

3.CHECK INTERMITTENT INCIDENT

Refer to GI-43, "Intermittent Incident".

Is the inspection result normal?

YES >> Replace combination meter.
NO >> Repair or replace malfunctioning part.

ON BOARD REFUELING VAPOR RECOVERY (ORVR)

Component Function Check

INFOID:0000000013798567

1.CHECK ORVR FUNCTION

Check whether the following symptoms are present.
- Fuel odor from EVAP canister is strong.
- Cannot refuel/Fuel odor from the fuel filler opening is strong while refueling.

Are any symptoms present?

YES >> Proceed to EC-1912, "Diagnosis Procedure".
NO >> INSPECTION END

Diagnosis Procedure

INFOID:0000000013798568

1.INSPECTION START

Check whether the following symptoms are present.
A: Fuel odor from EVAP canister is strong.
B: Cannot refuel/Fuel odor from the fuel filler opening is strong while refueling.

Which symptom is present?

A >> GO TO 2.
B >> GO TO 7.

2.CHECK EVAP CANISTER

1. Remove EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.
2. Weigh the EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.
   The weight should be less than 2.5 kg (5.5 lb).

Is the inspection result normal?

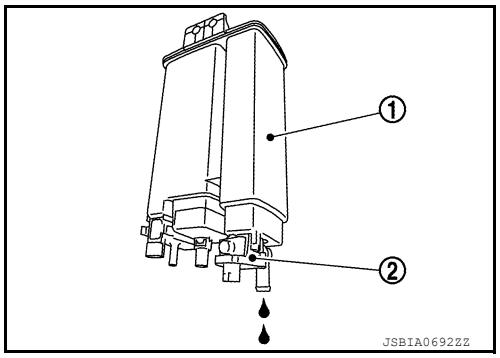
YES >> GO TO 3.
NO >> GO TO 4.

3.CHECK IF EVAP CANISTER IS SATURATED WITH WATER

Check if water will drain from EVAP canister (1).
- EVAP canister vent control valve (2)

Does water drain from the EVAP canister?

YES >> GO TO 4.
NO >> GO TO 6.



4.REPLACE EVAP CANISTER

Replace EVAP canister with a new one.

>> GO TO 5.

5.DETECT MALFUNCTIONING PART

Check the EVAP hose between EVAP canister and vehicle frame for clogging or poor connection.

>> Repair or replace EVAP hose.

6.CHECK REFUELING EVAP VAPOR CUT VALVE

Refer to EC-1914, "Component Inspection (EVAP Vapor Cut Valve)".

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace refueling EVAP vapor cut valve with fuel tank.

7.CHECK EVAP CANISTER

1. Remove EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.
2. Weigh the EVAP canister with EVAP canister vent control valve and EVAP control system pressure sensor attached.
   The weight should be less than 2.5 kg (5.5 lb).

Is the inspection result normal?

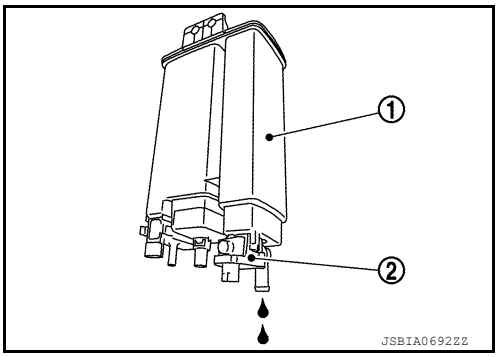
YES >> GO TO 8.
NO >> GO TO 9.

8.CHECK IF EVAP CANISTER IS SATURATED WITH WATER

Check if water will drain from EVAP canister (1).
- EVAP canister vent control valve (2)

Does water drain from the EVAP canister?

YES >> GO TO 9.
NO >> GO TO 11.



9.REPLACE EVAP CANISTER

Replace EVAP canister with a new one.

>> GO TO 10.

10.DETECT MALFUNCTIONING PART

Check the EVAP hose between EVAP canister and vehicle frame for clogging or poor connection.

>> Repair or replace EVAP hose.

11.CHECK VENT HOSES AND VENT TUBES

Check hoses and tubes between EVAP canister and refueling control valve for clogging, kinks, looseness and improper connection.

Is the inspection result normal?

YES >> GO TO 12.
NO >> Repair or replace hoses and tubes.

12.CHECK FILLER NECK TUBE

Check recirculation line for clogging, dents and cracks.

Is the inspection result normal?

YES >> GO TO 13.
NO >> Replace filler neck tube.

13.CHECK REFUELING EVAP VAPOR CUT VALVE

Refer to EC-1914, "Component Inspection (EVAP Vapor Cut Valve)".

Is the inspection result normal?

YES >> GO TO 14.
NO >> Replace refueling EVAP vapor cut valve with fuel tank.

14.CHECK FUEL FILLER TUBE

Check filler neck tube and hose connected to the fuel tank for clogging, dents and cracks.

Is the inspection result normal?

YES >> GO TO 15.
NO >> Replace fuel filler tube.

15. CHECK ONE-WAY FUEL VALVE-I

Check one-way fuel valve for clogging.

Is the inspection result normal?

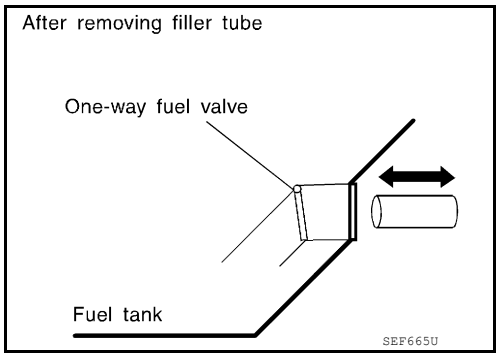
YES >> GO TO 16.
NO >> Repair or replace one-way fuel valve with fuel tank.

16. CHECK ONE-WAY FUEL VALVE-II

1. Check that fuel is drained from the tank.
2. Remove fuel filler tube and hose.
3. Check one-way fuel valve for operation as per the following.
   When a stick is inserted, the valve should open, when removing stick it should close.
   Do not drop any material into the tank.

Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace fuel filler tube or replace one-way fuel valve with fuel tank.



Component Inspection (EVAP Vapor Cut Valve)

INFOID:0000000013798569

1. CHECK REFUELING EVAP VAPOR CUT VALVE

1. Turn ignition switch OFF.
2. Remove fuel tank. Refer to FL-9, "Removal and Installation".
3. Drain fuel from the tank as per the following:

- Remove fuel gauge retainer.
- Drain fuel from the tank using a handy pump into a fuel container.

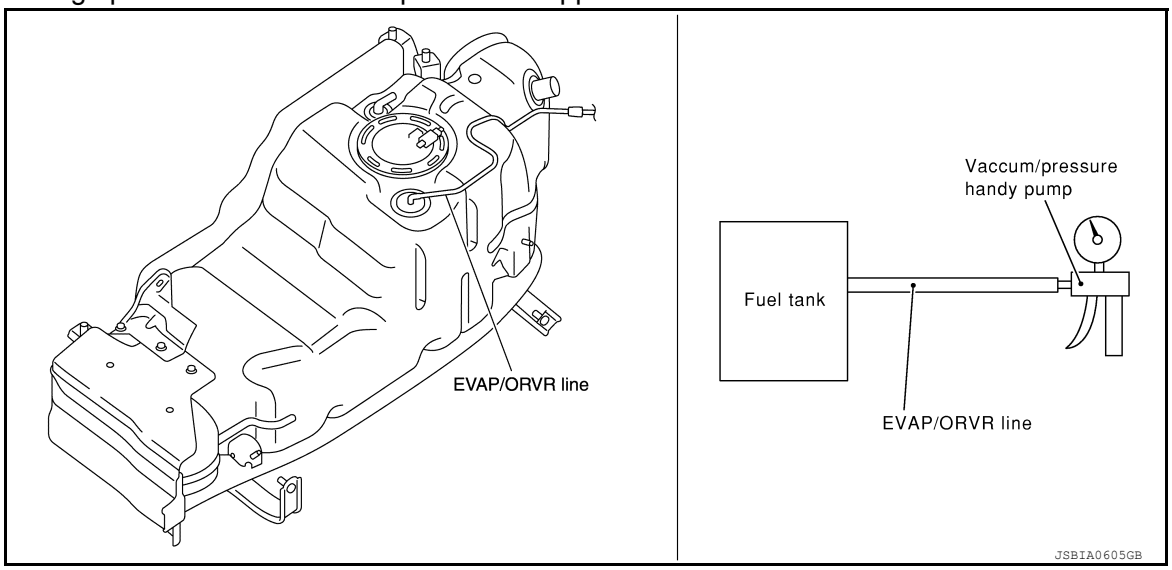
4. Check refueling EVAP vapor cut valve for being stuck to close as per the following.
   Blow air into the refueling EVAP vapor cut valve (from the end of EVAP/ORVR line hose), and check that the air flows freely into the tank.
5. Check refueling EVAP vapor cut valve for being stuck to open as per the following.

- Connect vacuum pump to hose end.
- Remove fuel gauge retainer with fuel gauge unit.

Always replace O-ring with new one.

- Turn fuel tank upside down.

- Apply vacuum pressure to hose end [−13.3 kPa (−0.136 kg/cm^3, −1.93 psi)] with fuel gauge retainer remaining open and check that the pressure is applicable.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace refueling EVAP vapor cut valve with fuel tank.

REFRIGERANT PRESSURE SENSOR

Component Function Check

INFOID:0000000013798570

1.CHECK REFRIGERANT PRESSURE SENSOR FUNCTION

1. Start engine and warm it up to normal operating temperature.
2. Turn A/C switch and blower fan switch ON.
3. Check the voltage between ECM harness connector terminals as per the following.

ECM			Voltage (V)
Connector	+	–	
	Terminal	Terminal	
F78	12 (Refrigerant pressure sensor signal)	13	1.0 - 4.0

Is the inspection result normal?

YES >> INSPECTION END
NO >> Go to EC-1916, "Diagnosis Procedure".

Diagnosis Procedure

INFOID:0000000013798571

1.CHECK REFRIGERANT PRESSURE SENSOR POWER SUPPLY CIRCUIT

1. Disconnect refrigerant pressure sensor harness connector.
2. Turn ignition switch ON.
3. Check the voltage between refrigerant pressure sensor harness connector and ground.

Refrigerant pressure sensor		Ground	Voltage (V)
Connector	Terminal		
E40	3	Ground	Approx. 5

Is the inspection result normal?

YES >> GO TO 3.
NO >> GO TO 2.

2.DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and refrigerant pressure sensor
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

3.CHECK REFRIGERANT PRESSURE SENSOR GROUND CIRCUIT FOR OPEN AND SHORT

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between refrigerant pressure sensor harness connector and ECM harness connector.

Refrigerant pressure sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E40	1	F78	13	Existed

4. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 5.
NO >> GO TO 4.

4. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and refrigerant pressure sensor
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

5. CHECK REFRIGERANT PRESSURE SENSOR INPUT SIGNAL CIRCUIT FOR OPEN AND SHORT

1. Check the continuity between refrigerant pressure sensor harness connector and ECM harness connector.

Refrigerant pressure sensor		ECM		Continuity
Connector	Terminal	Connector	Terminal	
E40	2	F78	12	Existed

2. Also check harness for short to ground and short to power.

Is the inspection result normal?

YES >> GO TO 7.
NO >> GO TO 6.

6. DETECT MALFUNCTIONING PART

Check the following.
- Harness for open or short between ECM and refrigerant pressure sensor
- Loose or poor connection for each connector and harness

>> Repair open circuit, short to ground or short to power in harness or connectors.

7. CHECK INTERMITTENT INCIDENT

Refer to GI-43, "Intermittent Incident".

Is the inspection result normal?

YES >> Replace refrigerant pressure sensor. Refer to HA-31, "Removal and Installation".
NO >> Repair or replace malfunctioning part.

SENSOR POWER SUPPLY 2 CIRCUIT

Description

INFOID:0000000013798580

ECM supplies a voltage of 5 V to some of the sensors systematically divided into 3 groups, respectively. Accordingly, when a short circuit develops in a sensor power source, a malfunction may occur simultaneously in the sensors belonging to the same group as the short-circuited sensor.

Sensor power supply 1

- Accelerator pedal position sensor 1
- Crankshaft position sensor
- Camshaft position sensor (Bank 1)
- Exhaust valve timing control position sensor (Bank 1)
- Throttle position sensor

NOTE:
If sensor power supply 1 circuit is malfunctioning, DTC P0643 is displayed.

Sensor power supply 2

- Accelerator pedal position sensor 2
- Battery current sensor
- Multi-way control valve
- Fan clutch assembly
- Camshaft position sensor (Bank 2)
- Exhaust valve timing control position sensor (Bank 2)

Sensor power supply 3

- EVAP control system pressure sensor
- Fuel rail pressure sensor
- Engine oil pressure sensor
- Refrigerant pressure sensor
- Power steering pressure sensor

Diagnosis Procedure

INFOID:0000000013798581

1.CHECK APP SENSOR 2 POWER SUPPLY CIRCUIT-1

1. Turn ignition switch OFF.
2. Disconnect accelerator pedal position (APP) sensor 2 harness connector.
3. Turn ignition switch ON.
4. Check the voltage between APP sensor 2 harness connector and ground.

+		−	Voltage (Approx.)
APP sensor 2			
Connector	Terminal		
E20	1	Ground	5 V

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.CHECK APP SENSOR 1 POWER SUPPLY CIRCUIT-2

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between APP sensor 2 harness connector and ECM harness connector.

+		−		Continuity
APP sensor 2		ECM		
Connector	Terminal	Connector	Terminal	
E20	1	E16	142	Existed

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair open circuit.

3. CHECK SENSOR POWER SUPPLY 2 CIRCUIT

1. Disconnect following sensors harness connector.
2. Check harness for short to power and short to ground, between the following terminals.

ECM		Sensor		
Connector	Terminal	Name	Connector	Terminal
E16	142	APP sensor 2	E20	1
F78	30	Battery current sensor	E161	1
		Multi-way control valve	F92	5
		Fan clutch assembly	F152	2
F79	73	Camshaft position sensor (Bank 2)	F67	1
		Exhaust valve timing control position sensor (Bank 2)	F72	1

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair short to ground or short to power in harness or connectors.

4. CHECK COMPONENTS

Check the following.
- APP sensor 2 (Refer to EC-1844, "Component Inspection (Accelerator Pedal Position Sensor)".)
- Battery current sensor (Refer to EC-1788, "Component Inspection (Battery Current Sensor)".)
- Multi-way control valve (Refer to EC-1870, "Component Inspection (Multi-way Control Valve)".)
- Fan clutch assembly (Refer to EC-1714, "Component Inspection (Cooling Fan Speed Sensor)".)
- Camshaft position sensor (Bank 2) (Refer to EC-1647, "Component Inspection (Camshaft Position Sensor)".)
- Exhaust valve timing control position sensor (Bank 2) (Refer to EC-1759, "Component Inspection (Exhaust Valve Timing Control Position Sensor)".)

Is the inspection result normal?

YES >> Perform GI-43, "Intermittent Incident".
NO >> Replace malfunctioning component.

SENSOR POWER SUPPLY 3 CIRCUIT

Description

INFOID:0000000013798582

ECM supplies a voltage of 5 V to some of the sensors systematically divided into 3 groups, respectively. Accordingly, when a short circuit develops in a sensor power source, a malfunction may occur simultaneously in the sensors belonging to the same group as the short-circuited sensor.

Sensor power supply 1

- Accelerator pedal position sensor 1
- Crankshaft position sensor
- Camshaft position sensor (Bank 1)
- Exhaust valve timing control position sensor (Bank 1)
- Throttle position sensor

NOTE:
If sensor power supply 1 circuit is malfunctioning, DTC P0643 is displayed.

Sensor power supply 2

- Accelerator pedal position sensor 2
- Battery current sensor
- Multi-way control valve
- Fan clutch assembly
- Camshaft position sensor (Bank 2)
- Exhaust valve timing control position sensor (Bank 2)

Sensor power supply 3

- EVAP control system pressure sensor
- Fuel rail pressure sensor
- Engine oil pressure sensor
- Refrigerant pressure sensor
- Power steering pressure sensor

Diagnosis Procedure

INFOID:0000000013798583

1.CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR POWER SUPPLY CIRCUIT-1

1. Turn ignition switch OFF.
2. Disconnect EVAP control system pressure sensor harness connector.
3. Turn ignition switch ON.
4. Check the voltage between EVAP control system pressure sensor harness connector and ground.

+		−	Voltage (Approx.)
EVAP control system pressure sensor			
Connector	Terminal		
C32	3	Ground	5 V

Is the inspection result normal?

YES >> INSPECTION END
NO >> GO TO 2.

2.CHECK EVAP CONTROL SYSTEM PRESSURE SENSOR POWER SUPPLY CIRCUIT-2

1. Turn ignition switch OFF.
2. Disconnect ECM harness connector.
3. Check the continuity between EVAP control system pressure sensor harness connector and ECM harness connector.

+		–		Continuity
EVAP control system pressure sensor		ECM		
Connector	Terminal	Connector	Terminal	
C32	3	E16	125	Existed

Is the inspection result normal?

YES >> GO TO 3.
NO >> Repair open circuit.

3.CHECK SENSOR POWER SUPPLY 3 CIRCUIT

1. Disconnect following sensors harness connector.
2. Check harness for short to power and short to ground, between the following terminals.

ECM		Sensor		
Connector	Terminal	Name	Connector	Terminal
E16	125	EVAP control system pressure sensor	C32	3
F78	29	Fuel rail pressure sensor	F91	1
		Engine oil pressure sensor	F229	3
		Refrigerant pressure sensor	E40	3
		Power steering pressure sensor	F82	3

Is the inspection result normal?

YES >> GO TO 4.
NO >> Repair short to ground or short to power in harness or connectors.

4.CHECK COMPONENTS

Check the following.
- EVAP control system pressure sensor (Refer to EC-1678, "Component Inspection (EVAP Control System Pressure Sensor)".)
- Fuel rail pressure sensor (Refer to EC-1614, "Component Inspection (Fuel Rail Pressure Sensor)".)
- Engine oil pressure sensor (Refer to EC-1711, "Component Inspection (EOP sensor)".)
- Refrigerant pressure sensor (Refer to EC-1916, "Component Function Check".)
- Power steering pressure sensor (Refer to EC-1729, "Component Inspection (Power Steering Pressure Sensor)".)

Is the inspection result normal?

YES >> Perform GI-43, "Intermittent Incident".
NO >> Replace malfunctioning component.

SYMPTOM DIAGNOSIS

ENGINE CONTROL SYSTEM SYMPTOMS

Symptom Table

INFOID:0000000013798584

SYSTEM — BASIC ENGINE CONTROL SYSTEM

		SYMPTOM													Reference page
		HARD/NO START/RESTART (EXCP. NORMAL OPERATING CONDITION

Description

INFOID:0000000013798585

FUEL CUT CONTROL (AT NO LOAD AND HIGH ENGINE SPEED)

If the engine speed is above 1,800 rpm under no load (for example, the selector lever position is neutral and engine speed is over 1,800 rpm) fuel will be cut off after some time. The exact time when the fuel is cut off varies based on engine speed.

Fuel cut will be operated until the engine speed reaches 1,500 rpm, then fuel cut will be cancelled.

NOTE:

This function is different from deceleration control listed under direct injection gasoline System, EC-1291, "DIRECT INJECTION GASOLINE SYSTEM : System Description".

PERIODIC MAINTENANCE

IDLE SPEED

Inspection

INFOID:0000000013798586

1.CHECK IDLE SPEED

WITH CONSULT
Check idle speed in “DATA MONITOR” mode with CONSULT.
WITH GST
Check idle speed with Service $01 of GST.

>> INSPECTION END

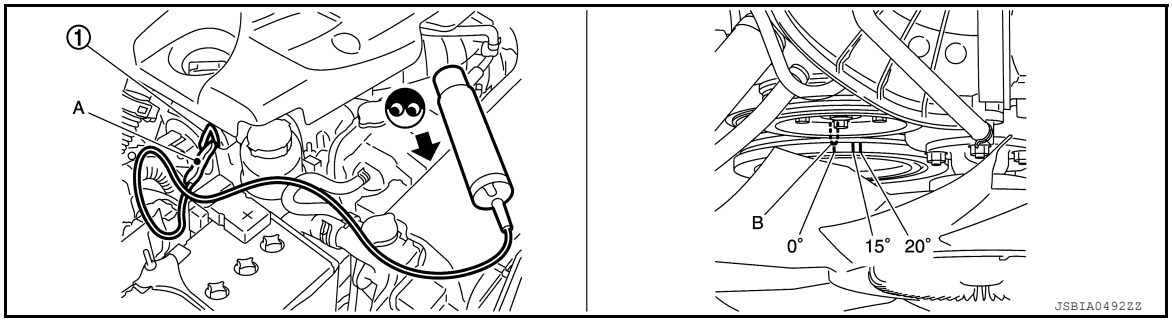
IGNITION TIMING

Inspection

INFOID:0000000013798587

1.CHECK IGNITION TIMING

1. Attach timing light to loop wire as shown.



1. Loop wire
A. Timing light
B. Timing indicator

2. Check ignition timing.

>> INSPECTION END

EVAP LEAK CHECK

Inspection

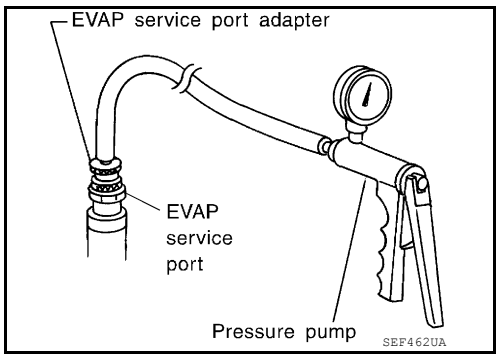
INFOID:0000000013798588

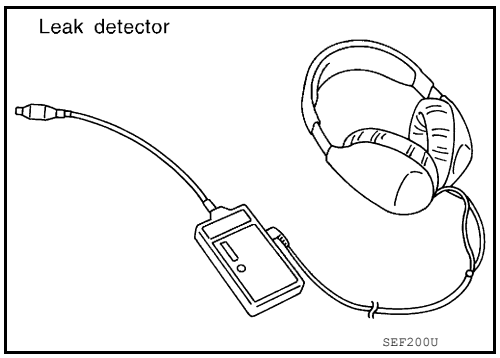
CAUTION:
- **Do not use compressed air or a high pressure pump.**
- **Do not exceed 4.12 kPa (0.042 kg/cm^2, 0.6 psi) of pressure in EVAP system.**

NOTE:
- Do not start engine.
- Improper installation of EVAP service port adapter (commercial service tool) to the EVAP service port may cause a leak.

WITH CONSULT

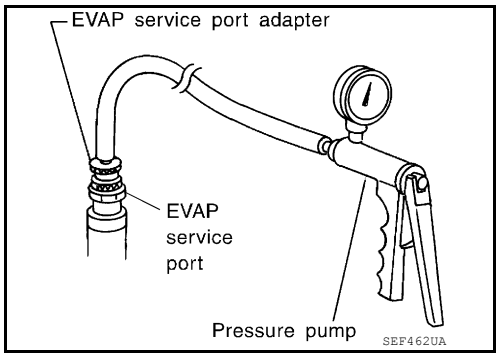
1. To locate the EVAP leak, install EVAP service port adapter (commercial service tool) and pressure pump to EVAP service port.
2. Turn ignition switch ON.
3. Select the “EVAP SYSTEM CLOSE” of “WORK SUPPORT” mode with CONSULT.
4. Touch “START”. A bar graph (Pressure indicating display) will appear on the screen.
5. Apply positive pressure to the EVAP system until the pressure indicator reaches the middle of the bar graph.
6. Remove EVAP service port adapter (commercial service tool) and hose with pressure pump.
7. Locate the leak using a leak detector (commercial service tool). Refer to EC-1301, "EVAPORATIVE EMISSION SYSTEM : System Diagram".



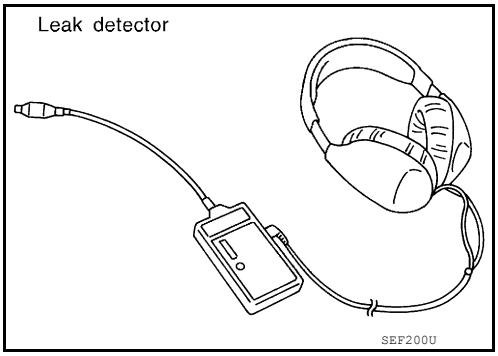


WITHOUT CONSULT

1. To locate the EVAP leak, install EVAP service port adapter (commercial service tool) and pressure pump to EVAP service port.
2. Apply battery voltage between the terminals of EVAP canister vent control valve to make a closed EVAP system.
3. To locate the leak, deliver positive pressure to the EVAP system until pressure gauge points reach 1.38 to 2.76 kPa (0.014 to 0.028 kg/cm^2, 0.2 to 0.4 psi).
4. Remove EVAP service port adapter (commercial service tool) and hose with pressure pump.



5. Locate the leak using a leak detector (commercial service tool). Refer to EC-1301, "EVAPORATIVE EMISSION SYSTEM : System Diagram".



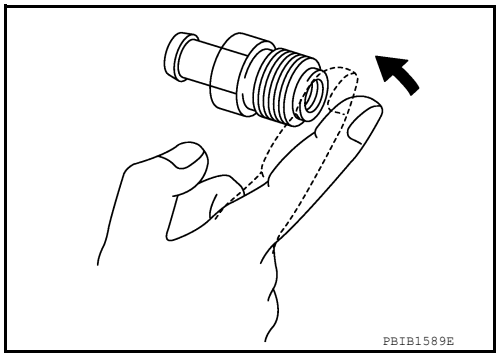
POSITIVE CRANKCASE VENTILATION

Inspection

INFOID:0000000013798589

1. CHECK PCV VALVE

With engine running at idle, remove PCV valve from rocker cover. A properly working valve makes a hissing noise as air passes through it. A strong vacuum should be felt immediately when a finger is placed over valve inlet.



Is the inspection result normal?

YES >> INSPECTION END
NO >> Replace PCV valve. Refer to EM-38, "Exploded View".

REMOVAL AND INSTALLATION

ECM

Removal and Installation

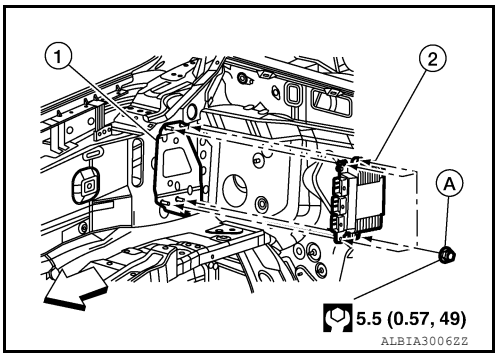
INFOID:0000000013798590

REMOVAL

CAUTION:

Perform ADDITIONAL SERVICE WHEN REPLACING ECM. Refer to EC-1424, "Description".

1. Disconnect the battery. Refer to PG-174, "Battery Disconnect".
2. Remove the cowl top extension. Refer to EXT-27, "Removal and Installation - Cowl Top Extension".
3. Remove the fender protector. Refer to EXT-32, "Removal and Installation - Front Fender Protector".
4. Position the relay box and IDPM/ER aside.
5. Disconnect harness connector from the ECM.
6. Remove the ECM bracket nuts (A).
7. Separate the ECM (2) from ECM bracket (1).
8. Remove the ECM (2).



INSTALLATION

Install in the reverse order of removal.

VVEL CONTROL MODULE

Removal and Installation

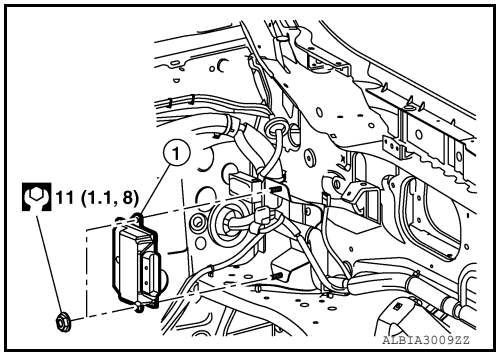
INFOID:0000000013798591

REMOVAL

CAUTION:

Additional service must be preformed when replacing VVEL control module. Refer to EC-1426, "Description"

1. Remove the cowl top extension. refer to EXT-27, "Removal and Installation - Cowl Top Extension"
2. Disconnect the harness connector from the VVEL control module.
3. Remove the VVEL control module (1).



INSTALLATION

Install in the reverse order of removal.

- Additional service is required after VVEL module replacement. Refer to EC-1426, "Description".

FUEL PUMP CONTROL MODULE (FPCM)

Removal and Installation

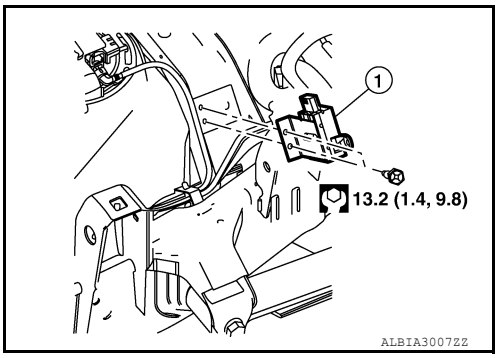
INFOID:0000000013798592

REMOVAL

CAUTION:

Additional service must be performed when replacing fuel pump control module. Refer to EC-1294, "FUEL PRESSURE CONTROL : System Description"

1. Remove the (LH) rear wheel. Refer to WT-69, "Removal and Installation".
2. Remove the mudguard. Refer to EXT-36, "Removal and Installation".
3. Remove the fender protector. Refer to EXT-32, "Removal and Installation - Front Fender Protector".
4. Disconnect the harness connector from the fuel pump control module (FPCM).
5. Remove the mounting bolts and the fuel pump control module (FPCM) and bracket assembly (1).



INSTALLATION

Install in the reverse order of removal.

SERVICE DATA AND SPECIFICATIONS (SDS)

SERVICE DATA AND SPECIFICATIONS (SDS)

Idle Speed

INFOID:0000000013798593

Condition	Specification
No load* (in P or N position)	600 ± 50 rpm

*: Under the following conditions

- A/C switch: OFF
- Electric load: OFF (Lights, heater fan & rear window defogger)
- Steering wheel: Kept in straight-ahead position

Ignition Timing

INFOID:0000000013798594

Condition	Specification
No load* (in P or N position)	12 ± 2°BTDC

*: Under the following conditions

- A/C switch: OFF
- Electric load: OFF (Lights, heater fan & rear window defogger)
- Steering wheel: Kept in straight-ahead position

Calculated Load Value

INFOID:0000000013798595

Condition	Specification (Using CONSULT or GST)
At idle	5 – 35%
At 2,500 rpm	5 – 35%

Mass Air Flow Sensor

INFOID:0000000013798596

Supply voltage	Battery voltage (11 – 14 V)
Output voltage at idle	0.7 – 1.2 V*
Mass air flow (Using CONSULT or GST)	1.0 – 5.0 g/s at idle* 7.0 – 20.0 g/s at 2,500 rpm*

*: Engine is warmed up to normal operating temperature and running under no load.

1. P2128-SE1378: Accelerator Pedal or Lever Position Sensor 2 Circuit - Voltage Above Normal or Shorted to High Source

Secondary Accelerator Pedal Position Out-of-Range High

Monitor Operation:	
DTC	P2128-SE1378
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.8 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P2127-SE1379

Malfunction Thresholds (all active):
Secondary Accelerator Pedal Position Sensor Value > 4.399 V (100 %)

2. P2127-SE1379: Accelerator Pedal or Lever Position Sensor 2 Circuit - Voltage Below Normal or Shorted to Low Source

Secondary Accelerator Pedal Position Out-of-Range Low

Monitor Operation:	
DTC	P2127-SE1379
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.8 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P06D4-SE1893
P06D3-SE1894

Pause Conditions (any active):
P06D4-SE1893
P06D3-SE1894

Malfunction Thresholds (all active):
Secondary Accelerator Pedal Position Sensor Value < 0.147 V (0 %)

3. P0533-SE1806: Refrigerant High Pressure Switch Circuit - Voltage Above Normal or Shorted to High Source

Detect an in-range High Error with the Air Conditioner (AC) Pressure Sensor.

Monitor Operation:	
DTC	P0533-SE1806
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
AC Pressure Sensor Value > 4.924V(3,140kPa(absolute))

4. P0532-SE1807: Refrigerant High Pressure Switch Circuit - Voltage Below Normal or Shorted to Low Source

Detect an in-range Low Error with the Air Conditioner (AC) Pressure Sensor.

Monitor Operation:	
DTC	P0532-SE1807
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
AC Pressure Sensor Value < 0.05V(0kPa(absolute))

5. P221A-SE10826: Aftertreatment Intake and Outlet Oxygen Concentration Mismatch - Condition Exists

The system has detected aftertreatment outlet NOx sensor O2 reading within range but reading inappropriately high.

Monitor Operation:	
DTC	P221A-SE10826
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P1C56-SE7613
P229F-SE5978
P229F-SE5976
P1191-SE4190, P1191-SE4746, P1192-SE484, P1193-SE486
P2201-SE5366
P2201-SE5365

Malfunction Thresholds (all active):
The average cumulative sum of error ((SCR In O2 - SCR out O2) / SCR In O2) over a 60 sec period is ever > 70 , which is equivalent to [Average of Error - Tolerance] > 0.233 % Where diagnostic tolerance is defined as: 0 %

7. P2280-SE5447: Engine Air Filter Differential Pressure - Data Valid But Above Normal Operating Range - Moderately Severe Level

This monitor determines when the air filter has become too restrictive by calculating the air pressure change in the air filter box. When the filtered air pressure drops faster than a calibratable threshold a counter is updated for that drive cycle. Once the counter equals the calibrated limit for a period of time, the error is set.

Monitor Operation:	
DTC	P2280-SE5447
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.5 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0102-SE3207, P0103-SE3206
Engine Speed ≥ 500 RPM
Key Switch ON time > 2 sec

Pause Conditions (any active):
Turbo charger surge margin < 0 %

Malfunction Thresholds (all active):
When the Filtered Ambient Air Pressure rate of change is less than RefTable2

8. P2509-SE215: Power Supply Lost With Ignition On - Data Erratic, Intermittent, or Incorrect

Powerdown block checksum does not match selected block checksum for either powerdown block.

Monitor Operation:	
DTC	P2509-SE215
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0 sec
MIL Activation Criteria	OBD No MIL

Malfunction Thresholds (all active):
At powerup, neither powerdown block checksums match the selected block checksum.

9. P0591-SE11096: Cruise Control System Command State - Mechanical System Not Responding or Out of Adjustment

The analog cruise switch input gets stuck for longer than calibrated time.

Monitor Operation:	
DTC	P0591-SE11096
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
When the Cruise switch input is sending an active signal continuously longer than 120 seconds

10. P0581-SE1898: Cruise Control (Resistive) Signal Circuit - Voltage Above Normal or Shorted to High Source

The cruise control switch 1 output value is above the operational limit.

Monitor Operation:	
DTC	P0581-SE1898
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	20 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Cruise Control Switch value > 4.888 V

11. P0579-SE6019: Cruise Control Enable Switch - Data Erratic, Intermittent, or Incorrect

The analog cruise switch input voltage is not within one of the expected values.

Monitor Operation:	
DTC	P0579-SE6019
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
When the cruise control switch value is not in boundary defined by
(Switch Value > 0.005 V AND
Switch Value < 0.196 V) OR
(Switch Value > 0.43 V AND
Switch Value < 0.645 V) OR
(Switch Value > 1.007 V AND
Switch Value < 1.413 V) OR
(Switch Value > 1.808 V AND
Switch Value < 2.346 V) OR
(Switch Value > 3.011 V AND
Switch Value < 3.514 V)

12. P0513-SE2329: Antitheft Password Valid Indicator - Data Erratic, Intermittent, or Incorrect

Invalid Key is used to start the vehicle.

Monitor Operation:	
DTC	P0513-SE2329
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Driver used wrong Key

13. P0563-SE297: Battery 1 Voltage - Data Valid But Above Normal Operating Range - Moderately Severe Level

Battery 1 Voltage - Data Valid But Above Normal Operating Range - Moderately Severe Level

Monitor Operation:	
DTC	P0563-SE297
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	30 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Engine Is Running

Pause Conditions (any active):
Engine Is Not Running

Malfunction Thresholds (all active):
Battery Voltage > 17.766 V

14. P0562-SE296: Battery 1 Voltage - Data Valid But Below Normal Operating Range - Moderately Severe Level

Battery 1 Voltage - Data Valid But Below Normal Operating Range - Moderately Severe Level

Monitor Operation:	
DTC	P0562-SE296
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	30 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Engine Is Running

Pause Conditions (any active):
Engine Is Not Running

Malfunction Thresholds (all active):
Battery Voltage < 8.128 V

15. P051B-SE2086: Crankcase Pressure - Data Erratic, Intermittent, or Incorrect

Crankcase Pressure is either In range High or In Range Low

Monitor Operation:	
DTC	P051B-SE2086
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.02 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P051C-SE1424, P051D-SE1422
Engine RPM ≤ 0 RPM
[Coolant Temperature is > 71.109 deg C for 300 seconds]
Crankcase Pressure delta ≤ 0.02 kPa(gauge)

Abort Conditions (any active):
P051C-SE1424, P051D-SE1422

Pause Conditions (any active):
Engine Speed > 0 RPM
[Coolant Temperature has not been > 71.109 deg C for 300 seconds]
Crankcase Pressure delta > 0.02 kPa(gauge)

Malfunction Thresholds (all active):
Crankcase Pressure > 0.5 kPa(gauge)
OR
Crankcase Pressure < - 0.5 kPa(gauge)

16. P007B-SE4129: Engine Charge Air Cooler Outlet Temperature - Data Erratic, Intermittent, or Incorrect

Charge Air Cooler Outlet Temperature reading is In Range Low

Monitor Operation:	
DTC	P007B-SE4129
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Pause Conditions (any active):
P007B-SE3870
P007C-SE2873, P007D-SE2872
P0501-SE130, P0501-SE4361
P0049-SE3641, P0102-SE3207, P0103-SE3206, P0111-SE4067, P0111-SE4070, P0501-SE130, P0501-SE4361, P1191-SE4190, P1191-SE4746, P1192-SE484, P1193-SE486, P2580-SE3642
Remote Throttle is active
Ambient Air Temperature ≤ -6.67 °C
Fresh Air Flow ≤ 8 kg/min
Vehicle speed < 37.282 mph
The time, after vehicle speed is >= 37.282 (mph), is less than a calibrated Diagnostic Delay RefTable3. The Low Vehicle Speed time input to the table is determined by logging the time below a calibrated vehicle speed, 18.641 (mph) while the engine is running.
|Compressor Inlet Temperature - Ambient Air Temperature| > 12 °C
Compressor Inlet Temperature ≥ 50 °C
Compressor Outlet Temperature - Compressor Inlet Temperature < 40 °C
Engine is not in run state OR has been in run state for < 120 sec

Malfunction Thresholds (all active):
Cumulative sum of error (Estimated Value - Measured Value) in 90 seconds is ever > 54,000 Deg C, which is equivalent to [Average of Error - Tolerance] >= 24 Deg C. Where Tolerance is defined as: 0 Deg C.

17. P007B-SE3870: Engine Charge Air Cooler Outlet Temperature - Data Erratic, Intermittent, or Incorrect

Charge Air Cooler Outlet Temperature sensor reading is erratic, intermittent or incorrect.

Monitor Operation:	
DTC	P007B-SE3870
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine off time ≥ 480 min
The temperature drop detected on Coolant Temperature Sensor ≤ 1 °C for a time period of 30 seconds after the engine is started up.

Abort Conditions (any active):
P007C-SE2873, P007D-SE2872
U3017-SE4759
U3017-SE4760

Malfunction Thresholds (all active):
| Charge Air Cooler Outlet Temperature sensor - the most accurate sensor from the remaining temperature sensors | > (13 + the tolerance of the most accurate sensor from the remaining temperature sensors) °C
| Charge Air Cooler Outlet Temperature sensor - the second most accurate sensor from the remaining temperature sensors | > (13 + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
| the most accurate sensor from the remaining temperature sensors - the second most accurate sensor from the remaining temperature sensors | < (the tolerance of the most accurate sensor from the remaining temperature sensors + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
The tolerance of the remaining temperature sensors are:
Compressor Inlet Temperature sensor tolerance = 40 °C
Charge Temperature sensor tolerance = 25 °C
Coolant Temperature sensor tolerance = 20 °C
ECM Internal Temperature sensor tolerance = 35 °C
EGR Orifice Temperature sensor tolerance = 25 °C

18. P007D-SE2872: Engine Charge Air Cooler Outlet Temperature - Voltage Above Normal or Shorted to High Source

Charge Air Cooler Outlet Temperature sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P007D-SE2872
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Charge Air Cooler Outlet Temperature sensor value > 4.737V (< -40 degC)

19. P007C-SE2873: Engine Charge Air Cooler Outlet Temperature - Voltage Below Normal or Shorted to Low Source

Charge Air Cooler Outlet Temperature sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P007C-SE2873
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Charge Air Cooler Outlet Temperature sensor voltage < 0.057V (> 130 degC)

20. P026A-SE3562: Engine Charge Air Cooler Efficiency - Data Valid But Below Normal Operating Range - Moderately Severe Level

Charge Air Cooler failed to provide enough cooling

Monitor Operation:	
DTC	P026A-SE3562
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine has been in Run state for >= 360 s

Pause Conditions (any active):
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0107-SE490, P0108-SE489, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0472-SE494, P0473-SE493

P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0107-SE490, P0108-SE489, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0472-SE494, P0473-SE493
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0107-SE490, P0108-SE489, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0472-SE494, P0473-SE493
Fresh Air Flow < 3.5 kg/min
Ambient Air Temperature < -6.67 °C
Compressor Outlet Temperature - Compressor Inlet Temperature < 28 °C
The time, after vehicle speed is >= 24.855 (mph), is less than a calibrated Diagnostic Delay RefTable4. The Low Vehicle Speed time input to the table is determined by logging the time below a calibrated vehicle speed, 24.233 (mph) while the engine is running
Total Fueling < 10 mg/stroke
Total Fueling > 1,000 mg/stroke
Absolute value of (Compressor Inlet Temperature - Ambient Air Temperature) > 12 °C

Malfunction Thresholds (all active):
Cumulative sum of error (Charge Air Cooler [CAC] Outlet Temperature - RefTable5) in a 50 second period is ever > 600 Deg C, which is equivalent to [Average of Error - Tolerance] >= 12 Deg C, where Tolerance is defined as: 0 Deg C

21. P0340-SE4499: Engine Camshaft Speed/Position Sensor - Data Erratic, Intermittent, or Incorrect

This diagnostic sets an error when there is a valid crankshaft signal without a corresponding camshaft signal.

Monitor Operation:	
DTC	P0340-SE4499
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	8 rev
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0335-SE4372, P0335-SE6886
P0016-SE5202
P0652-SE225, P0653-SE243
Crankshaft tonewheel gap is detected.

Abort Conditions (any active):
P0335-SE4372, P0335-SE6886
P0016-SE5202
P0652-SE225, P0653-SE243
Crankshaft tonewheel gap is NOT detected.

Malfunction Thresholds (all active):
No camshaft signal is present

22. P0016-SE5202: Engine Speed/Position Camshaft and Crankshaft Misalignment - Mechanical System Not Responding or Out of Adjustment

The camshaft timing is incorrect relative to crankshaft timing.

Monitor Operation:	
DTC	P0016-SE5202
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	8 rev
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0335-SE4372, P0335-SE6886, P0340-SE3392, P0340-SE4499

Abort Conditions (any active):
P0335-SE4372, P0335-SE6886, P0340-SE3392, P0340-SE4499

Malfunction Thresholds (all active):
Camshaft tonewheel tooth angle offset from radial > 5.56 deg
OR Camshaft tonewheel tooth angle offset from radial < -10.11 deg

23. P0340-SE3392: Engine Camshaft Speed/Position Sensor - Data Erratic, Intermittent, or Incorrect

Incorrect or displaced camshaft signal pulses are detected when the camshaft signal pulse count in the ECU reaches a calibrated threshold.

Monitor Operation:	
DTC	P0340-SE3392
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	6 rev
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0335-SE4372, P0335-SE6886
P0016-SE5202
P0652-SE225, P0653-SE243
This indicates that a crankshaft signal is present.

Abort Conditions (any active):
P0335-SE4372, P0335-SE6886
P0016-SE5202
P0652-SE225, P0653-SE243
Crankshaft tonewheel gap is NOT detected.

Malfunction Thresholds (all active):
The number of camshaft pulse counts != 9
OR the camshaft pulses are not syncronized with the crankshaft pulses.

24. U0002-SE3232: J1939 Network #1 - Data Erratic, Intermittent, or Incorrect

Set error when CAN module ceases communications.

Monitor Operation:	
DTC	U0002-SE3232
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 msec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Bus Off interupt triggered by CAN hardware.

25. U1000-SE5599: Forward Collision Warning - Abnormal Update Rate

The Engine Control Module did not receive Airbag Control Unit Status message on the datalink.

Monitor Operation:	
DTC	U1000-SE5599
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	510 msec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT [Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Message not received from Airbag Control Unit.

26. U0101-SE8016: Transmission ECU to ECM Communication - Abnormal Update Rate

The Engine Control Module did not receive message from Automatic Transmission Electronic Control Unit on the datalink.

Monitor Operation:	
DTC	U0101-SE8016
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	510 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Message not received from Automatic Transmission Electronic Control Unit.

27. U0101-SE4922: Transmission ECU to ECM Communication - Abnormal Update Rate

The Engine Control Module did not receive message from Automatic Transmission Electronic Control Unit on the datalink.

Monitor Operation:	
DTC	U0101-SE4922
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	60 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Message not received from Automatic Transmission Electronic Control Unit.

28. U0101-SE4918: Transmission ECU to ECM Communication - Abnormal Update Rate

The Engine Control Module did not receive message from Automatic Transmission Electronic Control Unit on the datalink.

Monitor Operation:	
DTC	U0101-SE4918
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	60 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Message not received from Automatic Transmission Electronic Control Unit.

29. U0402-SE4919: Transmission ECU to ECM Communication - Received Network Data in Error

Determine if Torque Control RN1 message data from the Automatic Transmission Electronic Control Unit has been updated.

Monitor Operation:	
DTC	U0402-SE4919
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Heartbeat counter value from Automatic Transmission Electronic Control Unit to is not incrementing.

30. U0101-SE4920: Transmission ECU to ECM Communication - Abnormal Update Rate

The Engine Control Module did not receive message from Automatic Transmission Electronic Control Unit on the datalink.

Monitor Operation:	
DTC	U0101-SE4920
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	60 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Message not received from Automatic Transmission Electronic Control Unit.

31. U0402-SE4921: Transmission ECU to ECM Communication - Received Network Data in Error

Determine if Torque Control RN2 message data from the Automatic Transmission Electronic Control Unit has been updated.

Monitor Operation:	
DTC	U0402-SE4921
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Heartbeat counter value from Automatic Transmission Electronic Control Unit to is not incrementing.

32. U1000-SE11622: Body Control Module - Abnormal Update Rate

The Engine Control Module did not receive message from Body Control Module on the datalink.

Monitor Operation:	
DTC	U1000-SE11622
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	510 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Message not received from Body Control Module.

33. U1000-SE4929: Body Control Module - Abnormal Update Rate

The Engine Control Module did not receive message from Body Control Module on the datalink.

Monitor Operation:	
DTC	U1000-SE4929
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	510 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Message not received from Body Control Module.

34. U1000-SE4928: Lost Communication with ABS Control Module - Condition Exists

The Engine Control Module did not receive message from Brake Controller on the datalink.

Monitor Operation:	
DTC	U1000-SE4928
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	210 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Message not received from Brake Controller.

35. U0415-SE5061: Invalid Data Received From Anti-Lock Brake System (ABS) Control Module - Condition Exists

Determine if Stability Control RN1 message torque data from the Brake Controller is within torque limits

Monitor Operation:	
DTC	U0415-SE5061
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Torque control values from the Brake Controller exceed maximum torque values.

36. U1000-SE4924: Lost Communication with ABS Control Module - Condition Exists

The Engine Control Module did not receive message from Brake Controller on the datalink.

Monitor Operation:	
DTC	U1000-SE4924
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	110 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Message not received from Brake Controller.

37. U0415-SE4925: Invalid Data Received From Anti-Lock Brake System (ABS) Control Module - Condition Exists

Determine if Stability Control RN1 message data from the Brake Controller has been updated.

Monitor Operation:	
DTC	U0415-SE4925
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Heartbeat counter value from Brake Controller is not incrementing.

38. U1000-SE11575: Cab HVAC System Controller - Abnormal Update Rate

The Engine Control Module did not receive message from Body Control Module on the datalink.

Monitor Operation:	
DTC	U1000-SE11575
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	510 msec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Message not received from Body Control Module.

39. U1000-SE4926: Instrument Cluster Control Module - Abnormal Update Rate

The Engine Control Module did not receive message from Instrument Cluster Electronic Control Panel on the datalink.

Monitor Operation:	
DTC	U1000-SE4926
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	110 msec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Message not received from Instrument Cluster Electronic Control Unit.

40. U0426-SE10862: Immobilizer ID Invalid - Condition Exists

Determine when there are communication errors between ECM and immobilizer

Monitor Operation:	
DTC	U0426-SE10862
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	250 msec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
ECM can't receive feedback message from immobilizer within expected period of time. Or ECM receives feedback from immobilizer, but the message content is indicating there is communication error between the antenna interfacing with immobilizer controller.

41. U0426-SE10863: Immobilizer Lock Mode Error - Condition Exists

Determine when engine is locked because of 5 consecutive ignition on requests have failed.

Monitor Operation:	
DTC	U0426-SE10863
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
If the ECM finds out the verification process at the end of the ignition on communication fails on 5 consecutive occasions or if the ECM finds out the ignition on communication fails to complete on 5 successive occasions

42. U0426-SE10860: Immobilizer Key Code Error - Condition Exists

Determine when the key code pragrammed in the transponder interfacing with immobilizer controller is not right

Monitor Operation:	
DTC	U0426-SE10860
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
ECM receives message from immobilizer which indicates that the key programmed in tranponder interfacing with this immobilizer carries wrong key code

43. U0426-SE10861: Immobilizer No Key Error - Condition Exists

Determine when there is no key code programmed in the transponder interfacing with immobilizer controller.

Monitor Operation:	
DTC	U0426-SE10861
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
ECM receives message from immobilizer which indicates that there is no key code programmed in the transponder which is interfacing with the immobilizer

44. P1A78-SE9985: Engine Fuel Shutoff 1 Control - Special Instructions

Airbag Control Unit is sending Airbag Crash Order value of 0x54AB to ECM to stop vehicle fueling.

Monitor Operation:	
DTC	P1A78-SE9985
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 msec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Nissan Airbag Crash indicator = 0x54AB

45. P0700-SE8015: Transmission Requested Malfunction Indicator Lamp - Condition Exists

Automatic Transmission Electronic Control Unit is sending request to ECM to turn on OBD Malfunction Indicator Lamp.

Monitor Operation:	
DTC	P0700-SE8015
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fault Inhibit Time has elapsed (See RefCond0003.)

Abort Conditions (any active):
NOT[Fault Inhibit Time has elapsed (See RefCond0003.)]

Malfunction Thresholds (all active):
Nissan OBD MIL Requested

46. P22CC-SE7828: Engine Turbocharger Compressor Bypass Actuator Control Command Circuit - Voltage Above Normal or Shorted to High Source

This monitor detects if the Compressor Bypass Valve Discrete Output actuator device command line is shorted high

Monitor Operation:	
DTC	P22CC-SE7828
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.02 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The diagnostic will continue to detect and reset the fault for 5 times within the current drive cycle.

Malfunction Thresholds (all active):
The low level output line is commanded to have a PWM waveform, but has a voltage of ≥ 16.25 V.
OR
The low level output line is commanded to have a voltage of ≤ 0 V, but has a voltage of ≥ 16.25 V.

47. P22CB-SE7829: Engine Turbocharger Compressor Bypass Actuator Control Command Circuit - Voltage Below Normal or Shorted to Low Source

This monitor detects if the Compressor Bypass Valve Discrete Output actuator device command line is shorted low.

Monitor Operation:	
DTC	P22CB-SE7829
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.02 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
The low level output line is commanded to have a PWM waveform, but has a voltage of ≤ 1.5 V.
OR
The low level output line is commanded to have a voltage of ≥ 13.2 V, but has a voltage of ≤ 1.5 V.

48. P22CE-SE8242: Engine Turbocharger Compressor Bypass Actuator 1 Position - Data Valid But Below Normal Operating Range - Moderately Severe Level

Detects when the air flow fails to pass through the Compressor Bypass loop when the Compressor Bypass Valve commanded position is "bypass" or "open", i.e. the flow should be passing exclusively through the bypass loop.

Monitor Operation:	
DTC	P22CE-SE8242
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.51 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0107-SE490, P0108-SE489, P0237-SE2976, P0238-SE2977
P0049-SE3641, P2580-SE3642
The Compressor Bypass Valve is commanded open.
Engine Speed > 1,800 RPM
Engine Speed < 4,200 RPM
Turbo Speed < 190 KRPM
(Ambient air temperature >= -6.7 Deg C OR Charge air cooler outlet temperature >= 12 Deg C)
All of the above enable conditions must be met for >= 500 msec

Malfunction Thresholds (all active):
Within a time window of 0.51 sec, the Minimum Pressure Ratio across the High Pressure Compressor falls below or is equal to 0.85 (ratio).
OR
Within a time window of 0.51 sec, the Maximum Pressure Ratio across the High Pressure Compressor rises above or is equal to 1.3 (ratio).

49. P22CD-SE8243: Engine Turbocharger Compressor Bypass Actuator 1 Position - Data Valid But Above Normal Operating Range - Moderately Severe Level

Detects when the air flow fails to pass through the Compressor when the Compressor Bypass Valve commanded position is "default" or "closed", i.e. the flow should be passing exclusively through the Compressor.

Monitor Operation:	
DTC	P22CD-SE8243
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.01 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0107-SE490, P0108-SE489, P0237-SE2976, P0238-SE2977
P0049-SE3641, P2580-SE3642
The Compressor Bypass Valve is commanded closed.
Engine Speed > 1,000 RPM
Engine Speed < 1,800 RPM
Turbo Speed > 100 KRPM
All of the above enable conditions must be met for >= 500 msec

Malfunction Thresholds (all active):
Within a time window of 10.01 sec, the Maximum Pressure Ratio across the High Pressure Compressor never rises above nor is equal to 1.1 (ratio).

50. P051B-SE3665: Crankcase Pressure - Data Erratic, Intermittent, or Incorrect

Crankcase Pressure (CCP) sensor is stuck in range.

Monitor Operation:	
DTC	P051B-SE3665
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	50 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P051B-SE2086
P051C-SE1424, P051D-SE1422
Engine RPM > 0 RPM
The engine has operated both under High Power and Low Power conditions.
High Power Condition:[Engine Torque (Nm) >= 250 Nm and Engine Speed (RPM) >= 1,600 RPM and Boost Pressure (kPa (Gauge)) >=50 kPa (Gauge) for 5 sec] This condition should occur at least 5 times.
Low Power Condition:[Engine Torque (Nm) <= 180 Nm and Engine Speed (RPM) <= 1,200 RPM and Boost Pressure (kPa (Gauge)) <=20 kPa (Gauge) for atleast 5 (sec)] This condition should occur at least 5 times.
Coolant Temperature is > 71.109 deg C for 300 seconds.

Abort Conditions (any active):
P051C-SE1424, P051D-SE1422
P051B-SE2086
Engine RPM = 0 RPM

Pause Conditions (any active):
Coolant Temperature is < 71.109 deg C .

Malfunction Thresholds (all active):
Difference between observed minimum and maximum Crankcase Pressure values is less than 0.1 kPa(gauge) at least 5 (counts) number of times.

51. P2457-SE3565: Engine Exhaust Gas Recirculation Cooler Efficiency - Data Valid But Below Normal Operating Range - Moderately Severe Level

EGR cooler failed to provide enough cooling

Monitor Operation:	
DTC	P2457-SE3565
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	2 trips

Pause Conditions (any active):
P0106-SE3651, P0106-SE3652, P0107-SE490, P0108-SE489, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0472-SE494, P0473-SE493
P0106-SE3651, P0106-SE3652, P0107-SE490, P0108-SE489, P0112-SE488, P0113-SE487, P0471-SE3922, P0471-SE3924, P0472-SE494, P0473-SE493
P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878
P0116-SE3669, P0117-SE76, P0118-SE75
P0405-SE3203, P0406-SE3202, P046C-SE3869, P0489-SE2798, P0490-SE2797, P0490-SE3582
EGR flow < 0.6 kg/min
Exhaust temperature minus coolant temperature < 100 °C
Aftertreatment operation mode is in a mode other than NORMAL

Malfunction Thresholds (all active):
Cumulative sum of error (EGR Orifice Temperature - RefTable6) in a 60 second period is ever > 400 Deg C, which is equivalent to [Average of Error - Tolerance] >= 6.667 Deg C, where Tolerance is defined as: 0 Deg C

52. P0106-SE3651: Engine Charge Air Cooler Outlet Pressure - Data Erratic, Intermittent, or Incorrect

Charge Pressure Sensor reading is In Range High.

Monitor Operation:	
DTC	P0106-SE3651
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	1 trip

Abort Conditions (any active):
EGR Off Engine Protection is active and Number of OBD Operating Cycle Increases
Key Switch Detect Increase

Pause Conditions (any active):
P0107-SE490, P0108-SE489
P0106-SE4439
P0049-SE3641, P007B-SE3870, P007B-SE4129, P007C-SE2873, P007D-SE2872, P0102-SE3207, P0103-SE3206, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P1191-SE4190, P1191-SE4746, P1192-SE484, P1193-SE486, P2580-SE3642
Engine is not in Run State.
EGR Off Engine Protection is active

Malfunction Thresholds (all active):
Cumulative sum of error (Measured Value - Estimated Value) in 45 seconds is ever > 270,000 kPa, which is equivalent to [Average of Error - Tolerance] >= 60 kPa.
Where Tolerance is defined as: RefTable8 kPa.

53. P0106-SE3652: Engine Charge Air Cooler Outlet Pressure - Data Erratic, Intermittent, or Incorrect

Charge Pressure Sensor reading is In Range Low.

Monitor Operation:	
DTC	P0106-SE3652
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	1 trip

Abort Conditions (any active):
EGR Off Engine Protection is active and Number of OBD Operating Cycle Increases
Key Switch Detect Increase

Pause Conditions (any active):
P0106-SE4439
P0107-SE490, P0108-SE489
P0049-SE3641, P007B-SE3870, P007B-SE4129, P007C-SE2873, P007D-SE2872, P0102-SE3207, P0103-SE3206, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P1191-SE4190, P1191-SE4746, P1192-SE484, P1193-SE486, P2580-SE3642
Engine is not in Run State.
EGR Off Engine Protection is active

Malfunction Thresholds (all active):
Cumulative sum of error (Estimated Value - Measured Value) in 45 seconds is ever > 270,000 kPa, which is equivalent to [Average of Error - Tolerance] >= 60 kPa.
Where Tolerance is defined as: RefTable8 kPa.

54. P0106-SE4439: Engine Charge Air Cooler Outlet Pressure - Data Erratic, Intermittent, or Incorrect

Charge Pressure Sensor reading is erratic, intermittent or incorrect at keyoff.

Monitor Operation:	
DTC	P0106-SE4439
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine is in stopped state
The time since Key Switch is turned OFF ≥ 30 sec

Abort Conditions (any active):
P0107-SE490, P0108-SE489
Coolant Temperature ≤ 70 °C

Malfunction Thresholds (all active):
Charge Pressure Sensor reading < 18 kPa(absolute)
OR
Charge Pressure Sensor reading > 144.31 kPa(absolute)
OR
|Charge Pressure - the most accurate pressure sensor from the remaining pressure sensor| > (11.84 + the tolerance of the most accurate pressure sensor from the remaining pressure sensors) kPa(absolute)
|Charge Pressure - the second most accurate pressure sensor from the remaining pressure sensor| > (11.84 + the tolerance of the second most accurate pressure sensor from the remaining pressure sensors) kPa(absolute)
| the most accurate sensor from the remaining pressure sensors - the second most accurate sensor from the remaining pressure sensors | < (the tolerance of the most accurate sensor from the remaining pressure sensors + the tolerance of the second most accurate sensor from the remaining pressure sensors) kPa(absolute)
The tolerance of the remaining pressure sensors are:
Exhaust Pressure sensor tolerance = 39.59 kPa(absolute)
Compressor Inlet Pressure sensor tolerance = 3.19 kPa(absolute)

55. P0108-SE489: Engine Charge Air Cooler Outlet Pressure - Voltage Above Normal or Shorted to High Source

Charge Pressure sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0108-SE489
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Charge Pressure sensor value > 4.8V (350 kPa(absolute))

56. P0107-SE490: Engine Charge Air Cooler Outlet Pressure - Voltage Below Normal or Shorted to Low Source

Charge Pressure sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0107-SE490
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Charge Pressure sensor value < 0.2V (44.81 kPa(absolute))

57. P0111-SE4067: Intake Manifold 1 Temperature - Data Erratic, Intermittent, or Incorrect

Charge Temperature reading is In Range High.

Monitor Operation:	
DTC	P0111-SE4067
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	2 trips

Pause Conditions (any active):
P0112-SE488, P0113-SE487
P0111-SE3793
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493

Remote Throttle is active
EGR Off Engine Protection from aftertreatment component is active.
EGR Off Engine Protection from air handling component is active.
Engine is not in Run state OR has been in Run state for < 120 s

Malfunction Thresholds (all active):
Cumulative sum of error (Estimated Value - Measured Value) in 60 seconds is ever > 216,000 Deg C, which is equivalent to [Average of Error - Tolerance] >= 36 Deg C. Where
Tolerance is defined as: 0 Deg C

59. P0111-SE3793: Intake Manifold 1 Temperature - Data Erratic, Intermittent, or Incorrect

Charge Temperature sensor reading is erratic, intermittent or incorrect.

Monitor Operation:	
DTC	P0111-SE3793
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine off time ≥ 480 min
The temperature drop detected on Coolant Temperature Sensor ≤ 1 °C for a time period of 30 seconds after the engine is started up.

Abort Conditions (any active):
P0112-SE488, P0113-SE487
U3017-SE4759
U3017-SE4760

Malfunction Thresholds (all active):
| Charge Temperature sensor - the most accurate sensor from the remaining temperature sensors | > (25 + the tolerance of the most accurate sensor from the remaining temperature sensors) °C
| Charge Temperature sensor - the second most accurate sensor from the remaining temperature sensors | > (25 + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
| the most accurate sensor from the remaining temperature sensors - the second most accurate sensor from the remaining temperature sensors | < (the tolerance of the most accurate sensor from the remaining temperature sensors + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
The tolerance of the remaining temperature sensors are:
Compressor Inlet Temperature sensor tolerance = 40 °C
Charge Air Cooler Outlet Temperature sensor tolerance = 13 °C
Coolant Temperature sensor tolerance = 20 °C
ECM Internal Temperature sensor tolerance = 35 °C
EGR Orifice Temperature sensor tolerance = 25 °C

60. P0113-SE487: Intake Manifold 1 Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

Charge Temperature sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0113-SE487
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Charge Temperature sensor value > 4.738V (< -40 degC)

61. P0112-SE488: Intake Manifold 1 Temperature Sensor Circuit - Voltage Below Normal or Shorted to Low Source

Charge Temperature sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0112-SE488
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Charge Temperature sensor value < 0.067V (> 250 degC)

62. P0606-SE6842: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

There is a short circuit in the injector current charging and discharging switch for injector bank number 1.

Monitor Operation:	
DTC	P0606-SE6842
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P0262-SE4673, P02EE-SE6854, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
During Initialization with no injection; Actuator Charge-up Voltage [uChrgUp] > 210 V
OR
Main injection is active AND all of the following:
Actuator charging time [tiChrg] for the cylinder being fired < 5 µsecs
Actuator Discharge time [tiDisch] for the cylinder being fired ≥ 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for the cylinder being fired > Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A
Actuator charging time [tiChrg] for all cylinders in injector bank number 1 < 5 µsecs
Actuator Discharge time [tiDisch] for all cylinders in injector bank number 1 ≥ 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for all cylinders in injector bank number 1 > Injector charge voltage set-point+80 V

63. P0606-SE6843: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

There is a short circuit in the injector current charging and discharging switch for injector bank number 2.

Monitor Operation:	
DTC	P0606-SE6843
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P0262-SE4673, P02EE-SE6854, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. Malfunction Thresholds (all active):
During Initialization with no injection; Actuator Charge-up Voltage [uChrgUp] > 210 V
OR
Main injection is active AND all of the following:
Actuator charging time [tiChrg] for the cylinder being fired < 5 µsecs
Actuator Discharge time [tiDisch] for the cylinder being fired ≥ 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for the cylinder being fired > Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
Actuator charging time [tiChrg] for all cylinders in injector bank number 2 < 5 µsecs
Actuator Discharge time [tiDisch] for all cylinders in injector bank number 2 ≥ 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for all cylinders in injector bank number 2 > Injector charge voltage set-point+80 V
Injector buffer current during voltage discharging ≤ 9.6 A

64. P0088-SE10028: Injector Metering Rail 1 Pressure - Data Valid But Above Normal Operating Range - Moderately Severe Level

The measured fuel rail pressure is above the setpoint by more than a calibratable amount, regardless of the control mode.

Monitor Operation:	
DTC	P0088-SE10028
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec OR 10 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Pressure control is by Pressure Control Valve [PCV] OR Volume Control Valve [VCV] OR by combined pressure control mode [CPC]

Malfunction Thresholds (all active):
Commanded Fuel Rail Pressure - Actual Fuel Rail Pressure < RefTable9 bar
High Pressure Pump Delivery Volume Set Point ≤ -0 m3/sec
OR
Commanded Fuel Rail Pressure - Actual Fuel Rail Pressure < -200 bar
Pressure Control Valve [PCV] setpoint value < 10 bar

65. P0087-SE10027: Injector Metering Rail 1 Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

The measured fuel rail pressure falls below the setpoint by more than a calibratable amount, regardless of the control mode.

Monitor Operation:	
DTC	P0087-SE10027
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec OR 10 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Pressure Control Valve [PCV] OR Fuel Inlet Metering Valve [VCV] OR by comined pressure control mode [CPC]
Fuel Level > 14.898 %

Malfunction Thresholds (all active):
Commanded Fuel Rail Pressure - Actual Fuel Rail Pressure > RefTable10 bar
High Pressure Pump Delivery Volume Set Point ≥ 0 m3/sec
OR
Commanded Fuel Rail Pressure - Actual Fuel Rail Pressure > RefTable10 bar

66. P012B-SE8698: Turbocharger 1 Compressor Intake Pressure - Data Erratic, Intermittent, or Incorrect

Compressor Inlet Pressure reading is In Range High

Monitor Operation:	
DTC	P012B-SE8698
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	2 trips

Pause Conditions (any active):
P012B-SE8802
P012C-SE8366, P012D-SE8365
Engine is not in Run State.

Malfunction Thresholds (all active):
Cumulative sum of error (Measured Value - Estimated Value) in 30 seconds is ever > 15 kPa, which is equivalent to [Average of Error - Tolerance] >= 0.1 kPa. Where Tolerance is defined as: 28.74 kPa.

67. P012B-SE8699: Turbocharger 1 Compressor Intake Pressure - Data Erratic, Intermittent, or Incorrect

Compressor Inlet Pressure reading is In Range Low

Monitor Operation:	
DTC	P012B-SE8699
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	2 trips

Pause Conditions (any active):
P012B-SE8802
P012C-SE8366, P012D-SE8365
Engine is not in Run State.

Malfunction Thresholds (all active):
Cumulative sum of error (Estimated Value - Measured Value) in 30 seconds is ever > 15 kPa, which is equivalent to [Average of Error - Tolerance] >= 0.1 kPa. Where Tolerance is defined as: 28.74 kPa.

68. P012B-SE8802: Turbocharger 1 Compressor Intake Pressure - Data Erratic, Intermittent, or Incorrect

Compressor Inlet Pressure Sensor reading is erratic, intermittent or incorrect at keyoff.

Monitor Operation:	
DTC	P012B-SE8802
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine is in stopped state
The time since Key Switch is turned OFF ≥ 30 sec

Abort Conditions (any active):
P012C-SE8366, P012D-SE8365
Coolant Temperature ≤ 70 °C

Malfunction Thresholds (all active):
Compressor Inlet Pressure Sensor reading < 18 kPa(absolute)
OR
Compressor Inlet Pressure Sensor reading > 144.31 kPa(absolute)
OR
(|Compressor Inlet Pressure - the most accurate pressure sensor from the remaining pressure sensor| > 3.19 + the tolerance of the most accurate pressure sensor from the remaining pressure sensors kPa(absolute)
|Compressor Inlet Pressure - the second most accurate pressure sensor from the remaining pressure sensor| > 3.19 + the tolerance of the second most accurate pressure sensor from the remaining pressure sensors kPa(absolute)
| the most accurate sensor from the remaining pressure sensors - the second most accurate sensor from the remaining pressure sensors | < the tolerance of the most accurate sensor from the remaining pressure sensors + the tolerance of the second most accurate sensor from the remaining pressure sensors) kPa(absolute)
The tolerance of the remaining pressure sensors are:
Exhaust Pressure sensor tolerance = 39.59 kPa(absolute)
Charge Pressure sensor tolerance = 11.84 kPa(absolute)

69. P012D-SE8365: Turbocharger 1 Compressor Intake Pressure Circuit - Voltage Above Normal or Shorted to High Source

Compressor Inlet Pressure sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P012D-SE8365
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Compressor Inlet Pressure sensor value > 4.8 V (110.32 kPa (absolute))

70. P012C-SE8366: Turbocharger 1 Compressor Intake Pressure Circuit - Voltage Below Normal or Shorted to Low Source

Compressor Inlet Pressure sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P012C-SE8366
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Compressor Inlet Pressure sensor value < 0.2 V (44.82 kPa (absolute))

71. P0238-SE2977: Interstage Air Pressure 1 Circuit - Voltage Above Normal or Shorted to High Source

Compressor Interstage Pressure sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0238-SE2977
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	8 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Compressor Interstage Pressure sensor value > 4.8V (620.53 (kPa (absolute)))

72. P0237-SE2976: Interstage Air Pressure 1 Circuit - Voltage Below Normal or Shorted to Low Source

Compressor Interstage Pressure sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0237-SE2976
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	8 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Compressor Interstage Pressure sensor value < 0.2V (44.81 (kPa (absolute)))

73. P1191-SE4190: Turbocharger 1 Compressor Intake Temperature - Data Erratic, Intermittent, or Incorrect

Compressor Inlet Temperature reading is In Range High

Monitor Operation:	
DTC	P1191-SE4190
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine has been in Run state for >= 120 s

Pause Conditions (any active):
P1191-SE4746
P1192-SE484, P1193-SE486

Malfunction Thresholds (all active):
Cumulative sum of error (Measured Value - Estimated Value) in 150 seconds is ever > 1,500 Deg C, which is equivalent to [Average of Error - Tolerance] >= 2 Deg C. Where Tolerance is defined as: 68.5 Deg C.

74. P1191-SE4746: Turbocharger 1 Compressor Intake Temperature - Data Erratic, Intermittent, or Incorrect

Compressor Inlet Temperature sensor reading is erratic, intermittent or incorrect.

Monitor Operation:	
DTC	P1191-SE4746
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine off time ≥ 480 min
The temperature drop detected on Coolant Temperature Sensor ≤ 1 °C for a time period of 30 seconds after the engine is started up.

Abort Conditions (any active):
P1192-SE484, P1193-SE486
U3017-SE4759
U3017-SE4760

Malfunction Thresholds (all active):
| Compressor Inlet Temperature sensor - the most accurate sensor from the remaining temperature sensors | > (40 + the tolerance of the most accurate sensor from the remaining temperature sensors) °C
| Compressor Inlet Temperature sensor - the second most accurate sensor from the remaining temperature sensors | > (40 + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
| the most accurate sensor from the remaining temperature sensors - the second most accurate sensor from the remaining temperature sensors | < (the tolerance of the most accurate sensor from the remaining temperature sensors + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
The tolerance of the remaining temperature sensors are:
Charge Temperature sensor tolerance = 25 °C
Charge Air Cooler Outlet Temperature sensor tolerance = 13 °C
Coolant Temperature sensor tolerance = 20 °C
ECM Internal Temperature sensor tolerance = 35 °C
EGR Orifice Temperature sensor tolerance = 25 °C

75. P1193-SE486: Turbocharger 1 Compressor Intake Temperature Circuit - Voltage Above Normal or Shorted to High Source

Compressor Inlet Temperature sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P1193-SE486
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Compressor Inlet Temperature sensor value > 4.737V (< -40 degC)

76. P1192-SE484: Turbocharger 1 Compressor Intake Temperature Circuit - Voltage Below Normal or Shorted to Low Source

Compressor Inlet Temperature sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P1192-SE484
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Compressor Inlet Temperature sensor value < 0.096V (> 119.885 degC)

77. P2559-SE572: Coolant Level Sensor 1 Circuit - Voltage Above Normal or Shorted to High Source

Coolant Level Sensor Circuit has its voltage above normal, or shorted to a high source

Monitor Operation:	
DTC	P2559-SE572
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Coolant Level Sensor Value > 4.629 V

78. P2558-SE283: Coolant Level Sensor 1 Circuit - Voltage Below Normal or Shorted to Low Source

Coolant Level Sensor Circuit has its voltage below normal, or is shorted to a low source.

Monitor Operation:	
DTC	P2558-SE283
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Coolant Level Sensor Value < 0.371 V

79. P2560-SE1909: Coolant Level - Data Valid But Below Normal Operating Range - Least Severe Level

Data from the 'Coolant Level sensor' is valid but below normal operating range; level being the 'Least Severe'.

Monitor Operation:	
DTC	P2560-SE1909
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	90 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
P2558-SE283, P2559-SE572

Malfunction Thresholds (all active):
Coolant Level Sensor Voltage ≥ 2.953 V
Coolant Level Sensor Voltage < 3.75 V

80. P0118-SE75: Engine Coolant Temperature 1 Sensor Circuit - Voltage Above Normal or Shorted to High Source

Coolant Temperature sensor circuit has its voltage above normal, or shorted to a high source

Monitor Operation:	
DTC	P0118-SE75
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.96 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):	
Coolant Temperature Sensor Value > 4.966 V	(<-40 Deg C)

81. P0117-SE76: Engine Coolant Temperature 1 Sensor Circuit - Voltage Below Normal or Shorted to Low Source

Coolant Temperature Circuit has its voltage below normal, or is shorted to a low source.

Monitor Operation:	
DTC	P0117-SE76
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.96 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):	
Coolant Temperature Sensor Value < 0.108 V	(>150 Deg C)

82. P0116-SE3669: Engine Coolant Temperature - Data Erratic, Intermittent, or Incorrect

Coolant Temperature Stuck In Range Error

Monitor Operation:	
DTC	P0116-SE3669
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine Is Running

Pause Conditions (any active):
P0117-SE76
P0118-SE75
P0116-SE3805

Malfunction Thresholds (all active):
(Maximum Coolant Temperature – Minimum Coolant Temperature) < 0.5 DegC for 300 counts. Where: Counts increment according to High Counts and Low Counts: 'High Counts' increment when: Net Engine Torque > 300 Nm OR (Coolant Temperature Sensor < 71.094 degC AND Net Engine Torque > 300 Nm) 'Low counts' increment when: Net Engine Torque < 170 Nm OR (Coolant Temperature Sensor < 71.094 degC AND Net Engine Torque < 170 Nm)

83. P0116-SE3805: Engine Coolant Temperature - Data Erratic, Intermittent, or Incorrect

Coolant Temperature sensor reading is erratic, intermittent or incorrect.

Monitor Operation:	
DTC	P0116-SE3805
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine off time ≥ 480 min
The temperature drop detected on Coolant Temperature Sensor ≤ 1 °C for a time period of 30 seconds after the engine is started up.

Abort Conditions (any active):
P0117-SE76, P0118-SE75
U3017-SE4759
U3017-SE4760

Malfunction Thresholds (all active):
| Coolant Temperature sensor - the most accurate sensor from the remaining temperature sensors | > (20 + the tolerance of the most accurate sensor from the remaining temperature sensors) °C
| Coolant Temperature sensor - the second most accurate sensor from the remaining temperature sensors | > (20 + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
| the most accurate sensor from the remaining temperature sensors - the second most accurate sensor from the remaining temperature sensors | < (the tolerance of the most accurate sensor from the remaining temperature sensors + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
The tolerance of the remaining temperature sensors are:
Compressor Inlet Temperature sensor tolerance = 40 °C
Charge Temperature sensor tolerance = 25 °C
Charge Air Cooler Outlet Temperature sensor tolerance = 13 °C
ECM Internal Temperature sensor tolerance = 35 °C
EGR Orifice Temperature sensor tolerance = 25 °C

84. P0128-SE3190: Engine Cooling System Monitor - Data Valid But Below Normal Operating Range - Moderately Severe Level

Engine not warming up

Monitor Operation:	
DTC	P0128-SE3190
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Variable based on Operating Conditions, but not more than RefTable11 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine RPM > 300 RPM
Coolant Temperature at engine startup < 51.594 °C
Time Elapsed Since Engine Start ≥ 10 sec

Abort Conditions (any active):
P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P0116-SE3669, P0116-SE3805, P0117-SE76, P0118-SE75
Engine RPM < 300 RPM
Elapsed Time that this monitor has been running ≥ RefTable11 sec
Coolant Temperature ≤ -6.695 °C

Pause Conditions (any active):
Percentage of time at engine idle > 50 %

Malfunction Thresholds (all active):
Predicted Coolant Temperature ≥ 71.094 °C
Coolant Temperature < 71.094 °C

85. P0128-SE8351: Engine Cooling System Monitor - Data Valid But Below Normal Operating Range - Moderately Severe Level

Coolant Temperture drops after engine has warmed up

Monitor Operation:	
DTC	P0128-SE8351
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	20 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0128-SE3190
Maximum Coolant Temperature this trip ≥ 71.094 °C
Engine Is Running

Abort Conditions (any active):
P0117-SE76
P0118-SE75
P0116-SE3805
P0116-SE3669
Ambient Air Temperature ≤ -6.695 °C

Malfunction Thresholds (all active):
Coolant Temperature < 71.094 °C
Net Engine Torque > 200 Nm
Coolant Temperature <= previous Coolant Temperature

86. P0087-SE6787: Injector Metering Rail 1 Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

Fuel Rail Pressure falls below a calibratable minimum threshold [based on engine speed] while running in the Combined Pressure Control Mode.

Monitor Operation:	
DTC	P0087-SE6787
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.3 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fuel Rail Pressure control is by both Volume Control Valve [VCV] AND Pressure Control Valve [PCV] in closed loop [Coupled Pressure Control, in closed loop]

Malfunction Thresholds (all active):
Fuel Rail Pressure < RefTable12 bar

87. P053E-SE2020: Crankcase Pressure - Data Valid But Above Normal Operating Range - Most Severe Level

Crankcase Pressure - High (critical severity)

Monitor Operation:	
DTC	P053E-SE2020
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
P051C-SE1424, P051D-SE1422
P051B-SE2086, P051B-SE3665
Engine RPM ≥ 400 RPM
(coolant temperature > 71.109 degC for 300 sec AND P0118-SE75 is inactive AND P0117-SE76 is inactive) OR (engine RPM > 0 RPM for 1,200 sec).

Abort Conditions (any active):
P051C-SE1424, P051D-SE1422
P051B-SE2086, P051B-SE3665
Engine RPM < 400 RPM

Pause Conditions (any active):
Any Active Air Temperature System Errors (See RefCond0005.) AND (coolant temperature ≤ 71.109 degC OR P0118-SE75 is active OR P0117-SE76 is active) AND (engine RPM > 0 RPM for less than 1,200 sec)

Malfunction Thresholds (all active):
Crankcase Pressure ≥ RefTable13 kPa(gauge)

88. P051D-SE1422: Crankcase Pressure Circuit - Voltage Above Normal or Shorted to High Source

Crankcase Pressure Out Of Range High

Monitor Operation:	
DTC	P051D-SE1422
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	8 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Crankcase Pressure Sensor Value > 4.746 V (6.89 kPa (gauge))

89. P051C-SE1424: Crankcase Pressure Circuit - Voltage Below Normal or Shorted to Low Source

Crankcase Pressure Out Of Range Low

Monitor Operation:	
DTC	P051C-SE1424
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	8 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Crankcase Pressure Sensor Value < 0.254 V (-2.49 kPa (gauge))

90. P0335-SE4372: Engine Crankshaft Speed/Position - Data Erratic, Intermittent, or Incorrect

Crankshaft tonewheel pulses are monitored for “disturbances” due to missing pulses or pulses in wrong locations. The error is set if an incorrect signal is received for a calibratable number of engine revolutions.

Monitor Operation:	
DTC	P0335-SE4372
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 rev
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0335-SE6886, P0501-SE130, P0501-SE4361, P0698-SE816, P0699-SE814
Crankshaft signal profile with tonewheel gap effect is detected.
0.621 mph > Vehicle Speed > 15.534 mph OR Engine Speed > 400 rpm
Engine Speed ≥ 550 RPM

Abort Conditions (any active):
P0335-SE6886, P0501-SE130, P0501-SE4361, P0698-SE816, P0699-SE814
Crankshaft signal profile with tonewheel gap effect is NOT detected.
Vehicle Speed ≤ 15.534 mph AND Engine Speed ≤ 400 rpm
Vehicle Speed ≥ 0.621 mph AND Engine Speed ≤ 400 rpm
Engine Speed < 550 RPM

Malfunction Thresholds (all active):
Crankshaft tone wheel pulses are intermittently missing.

91. P0335-SE6886: Engine Crankshaft Speed/Position - Data Erratic, Intermittent, or Incorrect

This diagnostic sets an error when there is a valid camshaft signal without a corresponding crankshaft signal.

Monitor Operation:	
DTC	P0335-SE6886
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3 rev
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0501-SE130, P0501-SE4361
P0698-SE816, P0699-SE814
Engine Speed ≥ 550 RPM
To prevent false errors due to tow start, vehicle speed is outside a calibratable range as follows: 0.621 mph > Vehicle Speed > 15.534 mph for an Engine Speed ≤400 RPM

Abort Conditions (any active):
P0501-SE130, P0501-SE4361
P0698-SE816, P0699-SE814
Engine Speed < 550 RPM
Vehicle Speed ≤ 15.534 mph
Vehicle Speed ≥ 0.621 mph

Malfunction Thresholds (all active):
No Crankshaft signal is present.

92. P0301-SE7393: Engine Misfire Cylinder 1 - Condition Exists

A cylinder misfire event is recorded when the angular acceleration of the crankshaft is less than a minimum threshold within a calibratable number of engine revolutions. Cylinder number 1 misfire error is set when excessive misfires are detected.

Monitor Operation:	
DTC	P0301-SE7393
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	484 rev
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Only 1 cylinder is detected misfiring and flagged by software.
450 rpm ≤ Engine Speed ≤ 1,500 rpm
(Low Idle Speed Governor Set Point -450 rpm) ≤ Engine Speed ≤ (Low Idle Speed Governor Set Point + 450 rpm)
4 mg/stroke ≤ Injection Quantity ≤ 29 mg/stroke
Engine Coolant Temperature ≥ 30 °C
Vehicle Speed ≤ 1.864 mph
The engine is running.
Time since engine attained Normal Running Mode ≥ 5 sec

Malfunction Thresholds (all active):
At least 120 misfires on Cylinder number 1 were detected during 440 crankshaft revs
The Angular Acceleration of the crankshaft after cylinder number 1 injection is below a minimum threshold that is dynamically calculated from current injection quantity and engine speed.

93. P02EE-SE6854: Injector Solenoid Driver Cylinder 1 - Voltage Above Normal or Shorted to High Source

Injector number 1 low side or negative terminal is short-circuited to battery.

Monitor Operation:	
DTC	P02EE-SE6854
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P0262-SE4673, P0606-SE6842, P0606-SE6844, P2146-SE6840
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 1 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis > 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

94. P0261-SE6892: Injector Solenoid Driver Cylinder 1 - Voltage Below Normal or Shorted to Low Source

Injector number 1 driver high side is short-circuited to the injector driver low side of another injector on the same bank with a high resistance.
OR
Injector number 1 driver low side is short-circuited to the injector driver low side of another injector on the same bank.

Monitor Operation:	
DTC	P0261-SE6892
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 1 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Charge-up voltage [uChrgUp] for cylinder number 1 < Injector charge voltage set-point*0.7 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
OR
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 1 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Discharge voltage [uUp] < Injector charge voltage set-point*0.55 V

Actuator Charge-up voltage [uChrgUp] for cylinder number 1 ≤ Injector charge voltage set-point+80 V
Actuator Charge-up voltage [uChrgUp] for cylinder number 1 < Injector charge voltage set-point*0.7 V
Actuator Charge-up voltage [uChrgUp] for cylinder number 1 < Injector charge voltage set-point*0.55 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
Injector buffer current during voltage discharging ≤ 9.6 A

95. P0302-SE7394: Engine Misfire Cylinder 2 - Condition Exists

A cylinder misfire event is recorded when the angular acceleration of the crankshaft is less than a minimum threshold within a calibratable number of engine revolutions. Cylinder number 2 misfire error is set when excessive misfires are detected.

Monitor Operation:	
DTC	P0302-SE7394
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	484 rev
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Only 1cylinder is detected misfiring and flagged by software.
450 rpm ≤ Engine Speed ≤ 1,500 rpm
(Low Idle Speed Governor Set Point -450 rpm) ≤ Engine Speed ≤ (Low Idle Speed Governor Set Point + 450 rpm)
4 mg/stroke ≤ Injection Quantity ≤ 29 mg/stroke
Engine Coolant Temperature ≥ 30 °C
Vehicle Speed ≤ 1.864 mph
The engine is running.
Time since engine attained Normal Running Mode ≥ 5 sec

Malfunction Thresholds (all active):
At least 120 misfires on Cylinder number 2 were detected during 440 crankshaft revs
The Angular Acceleration of the crankshaft after cylinder number 2 injection is below a minimum threshold that is dynamically calculated from current injection quantity and engine speed.

96. P02EF-SE6855: Injector Solenoid Driver Cylinder 2 - Voltage Above Normal or Shorted to High Source

Injector number 2 low side or negative terminal is short-circuited to battery.

Monitor Operation:	
DTC	P02EF-SE6855
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P0262-SE4673, P0606-SE6842, P0606-SE6844, P2146-SE6840
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 2 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis > 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

97. P0264-SE6893: Injector Solenoid Driver Cylinder 2 - Voltage Below Normal or Shorted to Low Source

Injector number 2 driver high side is short-circuited to the injector driver low side of another injector on the same bank with a high resistance.
OR
Injector number 2 driver low side is short-circuited to the injector driver low side of another injector on the same bank.

Monitor Operation:	
DTC	P0264-SE6893
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 2 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Charge-up voltage [uChrgUp] for cylinder number 2 < Injector charge voltage set-point*0.7 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
OR
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 2 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Discharge voltage [uUp] < Injector charge voltage set-point*0.55 V

Actuator Charge-up voltage [uChrgUp] for cylinder number 2 ≤ Injector charge voltage set-point+80 V
Actuator Charge-up voltage [uChrgUp] for cylinder number 2 < Injector charge voltage set-point*0.7 V
Actuator Charge-up voltage [uChrgUp] for cylinder number 2 < Injector charge voltage set-point*0.55 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
Injector buffer current during voltage discharging ≤ 9.6 A

98. P0303-SE7399: Engine Misfire Cylinder 3 - Condition Exists

A cylinder misfire event is recorded when the angular acceleration of the crankshaft is less than a minimum threshold within a calibratable number of engine revolutions. Cylinder number 3 misfire error is set when excessive misfires are detected.

Monitor Operation:	
DTC	P0303-SE7399
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	484 rev
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Only 1 cylinder is detected misfiring and flagged by software.
450 rpm ≤ Engine Speed ≤ 1,500 rpm
(Low Idle Speed Governor Set Point -450 rpm) ≤ Engine Speed ≤ (Low Idle Speed Governor Set Point + 450 rpm)
4 mg/stroke ≤ Injection Quantity ≤ 29 mg/stroke
Engine Coolant Temperature ≥ 30 °C
Vehicle Speed ≤ 1.864 mph
The engine is running.
Time since engine attained Normal Running Mode ≥ 5 sec

Malfunction Thresholds (all active):
At least 120 misfires on Cylinder number 3 were detected during 440 crankshaft revs
The Angular Acceleration of the crankshaft after cylinder number 3 injection is below a minimum threshold that is dynamically calculated from current injection quantity and engine speed.

99. P02F0-SE6861: Injector Solenoid Driver Cylinder 3 - Voltage Above Normal or Shorted to High Source

Injector number 3 low side or negative terminal is short-circuited to battery.

Monitor Operation:	
DTC	P02F0-SE6861
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P0262-SE4673, P0606-SE6842, P0606-SE6844, P2146-SE6840
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 3 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis > 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

100. P0267-SE6899: Injector Solenoid Driver Cylinder 3 - Voltage Below Normal or Shorted to Low Source

Injector number 3 driver high side is short-circuited to the injector driver low side of another injector on the same bank with a high resistance.
OR
Injector number 3 driver low side is short-circuited to the injector driver low side of another injector on the same bank.

Monitor Operation:	
DTC	P0267-SE6899
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 3 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Charge-up voltage [uChrgUp] for cylinder number 3 < Injector charge voltage set-point*0.7 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
OR
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 3 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Discharge voltage [uUp] < Injector charge voltage set-point*0.55 V

Actuator Charge-up voltage [uChrgUp] for cylinder number 3 ≤ Injector charge voltage set-point+80 V
Actuator Charge-up voltage [uChrgUp] for cylinder number 3 < Injector charge voltage set-point*0.7 V
Actuator Charge-up voltage [uChrgUp] for cylinder number 3 < Injector charge voltage set-point*0.55 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

101. P0304-SE7396: Engine Misfire Cylinder 4 - Condition Exists

A cylinder misfire event is recorded when the angular acceleration of the crankshaft is less than a minimum threshold within a calibratable number of engine revolutions. Cylinder number 4 misfire error is set when excessive misfires are detected.

Monitor Operation:	
DTC	P0304-SE7396
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	484 rev
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Only 1 cylinder is detected misfiring and flagged by software.
450 rpm ≤ Engine Speed ≤ 1,500 rpm
(Low Idle Speed Governor Set Point -450 rpm) ≤ Engine Speed ≤ (Low Idle Speed Governor Set Point + 450 rpm)
4 mg/stroke ≤ Injection Quantity ≤ 29 mg/stroke

The engine is running.
Time since engine attained Normal Running Mode ≥ 5 sec

Malfunction Thresholds (all active):
At least 120 misfires on Cylinder number 8 were detected during 440 crankshaft revs
The Angular Acceleration of the crankshaft after cylinder number 8 injection is below a minimum threshold that is dynamically calculated from current injection quantity and engine speed.

114. P02F5-SE6857: Injector Solenoid Driver Cylinder 8 - Voltage Above Normal or Shorted to High Source

Injector number 8 low side or negative terminal is short-circuited to battery.

Monitor Operation:	
DTC	P02F5-SE6857
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P0262-SE4673, P0606-SE6842, P0606-SE6844, P2146-SE6840
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 8 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis > 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

115. P0282-SE6895: Injector Solenoid Driver Cylinder 8 - Voltage Below Normal or Shorted to Low Source

Injector number 8 driver high side is short-circuited to the injector driver low side of another injector on the same bank with a high resistance.
OR
Injector number 8 driver low side is short-circuited to the injector driver low side of another injector on the same bank.

Monitor Operation:	
DTC	P0282-SE6895
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 8 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Charge-up voltage [uChrgUp] for cylinder number 8 < Injector charge voltage set-point*0.7 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
OR
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 8 ≥ 5 µsecs

Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Discharge voltage [uUp] < Injector charge voltage set-point*0.55 V
Actuator Charge-up voltage [uChrgUp] for cylinder number 8 ≤ Injector charge voltage set-point+80 V
Actuator Charge-up voltage [uChrgUp] for cylinder number 8 < Injector charge voltage set-point*0.7 V
Actuator Charge-up voltage [uChrgUp] for cylinder number 8 < Injector charge voltage set-point*0.55 V
Actuator Charge-up voltage [uChrgUp] for cylinder number 8 ≥ Injector charge voltage set-point*0.55 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

116. P0606-SE6881: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

The DCDC Converter controls and monitors the charging of the Buffer Capacitors of the Charge Switches in the injector driver circuit. This system error is set If the DCDC Converter fails to be started.

Monitor Operation:	
DTC	P0606-SE6881
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediately
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0606-SE6842
The injector driver ASIC successfully initialized.

Malfunction Thresholds (all active):
A SPI command from the microcontroller to the injector driver ASIC to START the DCDC converter of injector bank number 1 was unsuccessful.
OR
The Buffer Capacitor voltage of the Charging Switch for injector bank number 1 has not reached 250 V after a calibratable time of 1,100 msec

117. P0606-SE6862: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

The DCDC Converter controls and monitors the charging of the Buffer Capacitors of the Charge Switches in the injector driver circuit. This system error is set if the DCDC Converter cannot be turned off.

Monitor Operation:	
DTC	P0606-SE6862
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0606-SE6842
The DCDC Converter for injector bank number 1 was successfully started.

Malfunction Thresholds (all active):
A SPI command from the microcontroller to the injector driver ASIC to STOP the DCDC converter of injector bank number 1 was unsuccessful.

118. P0606-SE6882: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

The DCDC Converter controls and monitors the charging of the Buffer Capacitors of the Charge Switches in the injector driver circuit. This system error is set If the DCDC Converter fails to be started.

Monitor Operation:	
DTC	P0606-SE6882
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediately
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0606-SE6843
The injector driver ASIC successfully initialized.

Malfunction Thresholds (all active):
A SPI command from the microcontroller to the injector driver ASIC to START the DCDC converter of injector bank number 2 was unsuccessful.
OR
The Buffer Capacitor voltage of the Charging Switch for injector bank number 2 has not reached 250 V after a calibratable time of 1,100 msec

119. P0606-SE6863: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

The DCDC Converter controls and monitors the charging of the Buffer Capacitors of the Charge Switches in the injector driver circuit. This system error is set if the DCDC Converter cannot be turned off.

Monitor Operation:	
DTC	P0606-SE6863
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0606-SE6843
The DCDC Converter for injector bank number 2 was successfully started.

Malfunction Thresholds (all active):
A SPI command from the microcontroller to the injector driver ASIC to STOP the DCDC converter of injector bank number 2 was unsuccessful.

120. P218F-SE8289: Aftertreatment 1 Diesel Exhaust Fluid Actual Dosing Quantity - Data Valid But Below Normal Operating Range - Moderately Severe Level

To determine degraded doser performance based on accumulated nominal error between commanded and estimated DEF flow.

Monitor Operation:	
DTC	P218F-SE8289
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Reset for Urea Delivery Monitor Diagnostic Cumulative Sum (CUSUM) calculation. (See RefCond0008.)

Malfunction Thresholds (all active):

Cumulative sum of error (((Commanded DEF flow - Estimated DEF flow)/Commanded DEF flow) - Tolerance) over a 120 second period is ever ≥ 300 unitless, which is equivalent to [Average of Error - Tolerance] >= 0.5 unitless. Where: Tolerance is defined as 0 unitless.

121. P0611-SE7410: Injector Power Supply - Bad Intelligent Device or Component

Plausibility diagnosis of Engine speed offset between Engine Speed calculated at 10 ms interval and Engine Speed calculated at 40 ms interval.

Monitor Operation:	
DTC	P0611-SE7410
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.32 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine speed > 1,200 RPM

Malfunction Thresholds (all active):
|Engine speed calculated at 10 ms interval - Engine speed calculated at 40 ms interval| > 400 RPM

122. P0611-SE7416: Injector Power Supply - Bad Intelligent Device or Component

Diagnosis of the Post Fuel Injection 2 shut-off.

Monitor Operation:	
DTC	P0611-SE7416
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine speed > 1,200 RPM
Post Fuel Injection 2 quantity > 5 mg

Malfunction Thresholds (all active):
Post Fuel Injection 2 quantity > 25 mg OR Start of Energizing angle for Post Fuel Injection 2 quantity is greater than Permissible Start of Energizing angle OR RefTable14 > Post Fuel Injection 2 Efficiency factor OR RefTable15 < Post Fuel Injection 2 Efficiency factor

123. P0611-SE7417: Injector Power Supply - Bad Intelligent Device or Component

Diagnosis of Post Fuel Injection 3 efficiency plausibility.

Monitor Operation:	
DTC	P0611-SE7417
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine speed > 1,200 RPM
Post Fuel Injection 3 quantity > 5 mg

Malfunction Thresholds (all active):
-0.102 (unitless) > Post Fuel Injection 3 efficiency factor OR 1.102 (unitless) < Post Fuel Injection 3 efficiency factor

124. P062B-SE7419: Fuel System Shutdown Failure - Condition Exists

Plausibility diagnosis of the fuel injection correction components of Pilot, Main and Post fuel injections

Monitor Operation:	
DTC	P062B-SE7419
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine speed > 1,200 RPM

Malfunction Thresholds (all active):
|Actual fuel injection correction component for Main Fuel Injection 1 - Requested fuel injection correction component for Main Fuel Injection 1| >= 9.5 mg OR |Actual fuel injection correction component for Pilot Fuel Injection 1 - Requested fuel injection correction component for Pilot Fuel Injection 1| >= 9.5 mg OR |Actual fuel injection correction component for Post Fuel Injection 2 - Requested fuel injection correction component for Post Fuel Injection 2| >= 9.5 mg OR |Actual fuel injection correction component for Post Fuel Injection 3 - Requested fuel injection correction component for Post Fuel Injection 3| >= 9.5 mg

125. P062B-SE7481: Fuel System Shutdown Failure - Condition Exists

Monitoring of the vehicle brake pedal switch signal status plausibility.

Monitor Operation:	
DTC	P062B-SE7481
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Brake Status indication = Complement of Brake Status indication

126. P062B-SE7414: Fuel System Shutdown Failure - Condition Exists

Diagnosis of the energizing time correction values plausibility for Zero Fuel quantity Calibration (ZFC) or Zero Fuel quantity Calibration at Low Idle (ZFL) as applicable

Monitor Operation:	
DTC	P062B-SE7414
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine speed > 1,200 RPM

Malfunction Thresholds (all active):
RefTable16 > Energizing time correction value for ZFC/ZFL for Pilot Injection 1 OR RefTable17 < Energizing time correction value for ZFC/ZFL for Pilot Injection 1 OR RefTable16 > Energizing time correction value for ZFC/ZFL for Pilot Injection 2 OR RefTable17 < Energizing time correction value for ZFC/ZFL for Pilot Injection 2 OR RefTable16 > Energizing time correction value for ZFC/ZFL for Pilot Injection 3 OR RefTable17 < Energizing time correction value for ZFC/ZFL for Pilot Injection 3 ZFC - Zero Fuel quantity Calibration ZFL - Zero Fuel quantity Calibration at Low Idle

127. P0611-SE7482: Injector Power Supply - Bad Intelligent Device or Component

Diagnosis of plausibility of current energizing time with maximum permitted energizing time.

Monitor Operation:	
DTC	P0611-SE7482
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.3 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Commanded injection quantity is zero for minimum 100 ms

Malfunction Thresholds (all active):
Averaged energizing time per cylinder > RefTable18

128. P0611-SE7411: Injector Power Supply - Bad Intelligent Device or Component

Plausibility diagnosis of Energizing time for Pilot, Main and Post Fuel Injection quantity.

Monitor Operation:	
DTC	P0611-SE7411
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine speed > 1,200 RPM

Malfunction Thresholds (all active):
Measured energizing time (µs) - Requested energizing time (µs) > 70 µs

129. P0611-SE7412: Injector Power Supply - Bad Intelligent Device or Component

Plausibility diagnosis of Start of Energizing angle for Pilot, Main and Post Fuel Injection quantity.

Monitor Operation:	
DTC	P0611-SE7412
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine speed > 1,200 RPM
Fuel Injection energizing time (µs) is non-zero.

Malfunction Thresholds (all active):
-23.01 ° > Start of energizing angle for Pilot Fuel Injection 3 OR 123.76 ° < Start of energizing angle for Pilot Fuel Injection 3 OR -23.01 ° > Start of energizing angle for Main Fuel Injection 1 OR 33 ° < Start of energizing angle for Main Fuel Injection 1 OR -92.99 ° > Start of energizing angle for Post Fuel Injection 3 OR 13.01 ° < Start of energizing angle for Post Fuel Injection 3 OR -92.99 ° > Start of energizing angle for Post Fuel Injection 2 OR -2 ° < Start of energizing angle for Post Fuel Injection 2 OR -360 ° > Start of energizing angle for Post Fuel Injection 1 OR -36.98 ° < Start of energizing angle for Post Fuel Injection 1 OR -360 ° > Start of energizing angle for Post Fuel Injection 0 OR -36.98 ° < Start of energizing angle for Post Fuel Injection 0 (The unit of Start of energizing angle is Crankshaft angle in degrees (°CrS))

130. P0611-SE7413: Injector Power Supply - Bad Intelligent Device or Component

Diagnosis of Fuel Injection quantity RAM data values update.

Monitor Operation:	
DTC	P0611-SE7413
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine speed > 1,200 RPM

Malfunction Thresholds (all active):
Fuel injection quantity values are not updated in to RAM buffer.

131. P0611-SE7420: Injector Power Supply - Bad Intelligent Device or Component

Diagnosis of fuel rail pressure plausibility.

Monitor Operation:	
DTC	P0611-SE7420
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.12 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine speed > 1,200 RPM

Malfunction Thresholds (all active):
7,200 kPa (absolute) > Fuel Rail Pressure OR 203,200 kPa (absolute) < Fuel Rail Pressure

132. P0611-SE7418: Injector Power Supply - Bad Intelligent Device or Component

Diagnosis of calculated actual torque-relevant fuel injection quantity plausibility.

Monitor Operation:	
DTC	P0611-SE7418
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.52 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Calculated actual torque-relevant fuel injection quantity > Permissible torque-relevant fuel injection quantity

133. P200E-SE3070: Aftertreatment 1 Diesel Particulate Filter Intake Temperature - Data Valid But Above Normal Operating Range - Moderately Severe Level

Aftertreatment DOC delta gas temperature is continuously above a high threshold for a calibrated period of time while active regeneration of the DPF is not occurring.

Monitor Operation:	
DTC	P200E-SE3070
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	55 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P2031-SE2844, P2032-SE6732, P2033-SE6731, P2033-SE6736

DOC Inlet Temperature sensor reading is suspected and not yet confirmed as faulty. (See RefCond0013.)
DOC Outlet Temperature sensor reading is suspected and not yet confirmed as faulty. (See RefCond0014.)
DPF Outlet Temperature sensor reading is suspected and not yet confirmed as faulty. (See RefCond0015.)

Malfunction Thresholds (all active):
(Average temperature drop across DOC > 85 degC) OR (average temperature drop across DOC < -85 degC)
-85 degC < average temperature drop across DPF < 85 degC

135. P2080-SE3068: Aftertreatment 1 Diesel Oxidation Catalyst Intake Temperature - Data Valid But Above Normal Operating Range - Moderately Severe Level

Aftertreatment DOC inlet gas temperature is above a high threshold for a calibrated period of time while active regeneration of the DPF is not occurring.

Monitor Operation:	
DTC	P2080-SE3068
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	65 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0544-SE2858, P0545-SE6730, P0546-SE6729, P0546-SE6735, P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168
Elapsed time since last active regeneration > 540 sec
Rate of active/intrusive injection of hydrocarbons in exhaust < 0.2 g/sec

Abort Conditions (any active):
P0544-SE2858, P0545-SE6730, P0546-SE6729, P0546-SE6735, P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168
Rate of active/intrusive injection of hydrocarbons in exhaust ≥ 0.2 g/sec

Malfunction Thresholds (all active):
DOC inlet temperature > 745 °C

136. P0420-SE4719: Aftertreatment 1 Diesel Oxidation Catalyst Conversion Efficiency - Data Valid But Below Normal Operating Range - Moderately Severe Level

Decrease in the NMHC conversion capability of the DOC that would cause tailpipe out NMHC emissions to exceed the applicable OBD threshold.

Monitor Operation:	
DTC	P0420-SE4719
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	375 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Conditions that enable the calculation of conversion efficiency of an oxidation catalyst. (See RefCond0016.)

Abort Conditions (any active):
System errors that could abort the calculation of conversion efficiency of an oxidation catalyst. (See RefCond0017.)

Pause Conditions (any active):
Conditions that pause the calculation of conversion efficiency of an oxidation catalyst. (See RefCond0018.)

Malfunction Thresholds (all active):
Filtered value of Hydrocarbon dosing efficiency < 58 %, where Hydrocarbon dosing efficiency is defined as DOC Heat / DOC Dosing Heat

137. P2031-SE2844: Aftertreatment 1 Diesel Particulate Filter Intake Temperature - Data Erratic, Intermittent, or Incorrect

Aftertreatment DPF intake gas temperature is in-range but not rational.

Monitor Operation:	
DTC	P2031-SE2844
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	500 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0545-SE6730, P0546-SE6729, P0546-SE6735, P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168

Elapsed time since last active regeneration < 120 sec

Pause Conditions (any active):
Engine is not running
Exhaust flow < 25 g/sec
(DOC Intake Temperature or DPF Intake Temperature or DPF Outlet Temperature) < 215 degC OR (DOC Intake Temperature or DPF Intake Temperature or DPF Outlet Temperature) > 600 degC
OEM datalink requested Engine intrusive diagnostics is active
DOC Inlet Temperature sensor reading is suspected and not yet confirmed as faulty. (See RefCond0013.)
DOC Outlet Temperature sensor reading is suspected and not yet confirmed as faulty. (See RefCond0014.)
DPF Outlet Temperature sensor reading is suspected and not yet confirmed as faulty. (See RefCond0015.)

Malfunction Thresholds (all active):
(Average temperature drop across DOC > 85 degC) OR (average temperature drop across DOC < -85 degC)
(Average temperature drop across DPF > 85 degC) OR (average temperature drop across DPF < -85 degC)

138. P200E-SE3069: Aftertreatment 1 Diesel Particulate Filter Intake Temperature - Data Valid But Above Normal Operating Range - Moderately Severe Level

Aftertreatment DPF inlet gas temperature is continuously above a high threshold for a calibrated period of time while active regeneration of the DPF is not occurring.

Monitor Operation:	
DTC	P200E-SE3069
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	100 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P2031-SE2844, P2032-SE6732, P2033-SE6731, P2033-SE6736
Elapsed time since last active regeneration > 540 sec
Rate of active/intrusive injection of hydrocarbons in exhaust < 0.2 g/sec

Abort Conditions (any active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P2031-SE2844, P2032-SE6732, P2033-SE6731, P2033-SE6736
Rate of active/intrusive injection of hydrocarbons in exhaust ≥ 0.2 g/sec

Malfunction Thresholds (all active):
DPF inlet temperature > 735 °C

139. P1484-SE1759: Aftertreatment 1 Diesel Particulate Filter Intake Temperature - Data Valid But Above Normal Operating Range - Least Severe Level

Persistent temperature overshoots of the aftertreatment DPF inlet gas temperature during active regeneration of the DPF

Monitor Operation:	
DTC	P1484-SE1759
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 unique occurrences of temperature overshoots persisting for a minimum of 5 seconds each .
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P2031-SE2844, P2032-SE6732, P2033-SE6731, P2033-SE6736
DPF Regeneration is Active

Malfunction Thresholds (all active):
Case A: DPF inlet temperature > 800 °C
OR
Case B: DPF inlet temperature - DOC inlet temperature > 540 °C

141. P24A0-SE7455: Aftertreatment Diesel Particulate Filter 1 Conditions Not Met for Active Regeneration - Condition Exists

The engine control module is unable to begin closed loop control of active regeneration of DPF due to low DOC temperature.

Monitor Operation:	
DTC	P24A0-SE7455
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	115 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine Speed > 400 RPM for 450 seconds
Ambient Air Pressure ≥ 75 kPa(absolute)
Ambient Air Temperature ≥ -6.7 °C
Active regeneration of DPF has been requested more than 450 sec

Abort Conditions (any active):
P0545-SE6730, P0546-SE6729, P0546-SE6735, P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P2032-SE6732, P2033-SE6731, P2033-SE6736
P1191-SE4190, P1191-SE4746, P1192-SE484, P1193-SE486
Engine Speed ≤ 1,125 RPM for 60 seconds.
Engine Fueling ≤ 15 mg/stroke for 60 seconds.

Pause Conditions (any active):
Engine Speed ≤ 1,125 RPM
Engine Fueling ≤ 15 mg/stroke
The above two Pause Conditions turns from true to false for less than 3 seconds.

Malfunction Thresholds (all active):
DOC Bed Temperature < 250 °C

142. P245F-SE2851: Aftertreatment 1 Diesel Particulate Filter Differential Pressure - Abnormal Rate of Change

Aftertreatment DPF differential pressure sensor signal stuck in-range.

Monitor Operation:	
DTC	P245F-SE2851
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediately.
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493
P2460-SE2857, P2461-SE2849
Range of exhaust volumetric flow since last decision > 0.14 m3/sec
DPF differential pressure sensor signal not saturated at high exhaust flow: (DPF differential pressure <= 35 kPa) OR (Exhaust flow <= 2 m3/sec)
Engine is Running.

Abort Conditions (any active):
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493
P2460-SE2857, P2461-SE2849
Range of exhaust volumetric flow since last decision ≤ 0.14 m3/sec
DPF differential pressure sensor signal saturated at high exhaust flow: (DPF differential pressure > 35 kPa) AND (Exhaust flow > 2 m3/sec)
Engine is Not Running.

Malfunction Thresholds (all active):
Range of DPF differential pressure < 0.1 kPa

143. P2462-SE7316: Aftertreatment Diesel Particulate Filter Differential Pressure - Data Erratic, Intermittent, or Incorrect

Aftertreatment DPF differential pressure sensor key-off check indicates signal in-range but not rational.

Monitor Operation:	
DTC	P2462-SE7316
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P242C-SE6734, P242D-SE6733, P242D-SE6737
P2460-SE2857, P2461-SE2849
Key Switch is OFF AND Engine Speed is 0 rpm for 54 seconds
Before Key Switch turns Off, DPF Outlet Temperature is >= 200 deg C AND Engine is Running AND the above two conditions are true for 100 seconds.

Abort Conditions (any active):
P2460-SE2857, P2461-SE2849
Key Switch is ON OR Engine Speed is not 0 rpm

Malfunction Thresholds (all active):
Absolute value of averaged DPF delta pressure measured by the delta P sensor > 1.5 kPa(gauge)

144. P2461-SE2849: Aftertreatment Diesel Particulate Filter Differential Pressure Sensor Circuit - Voltage Above Normal or Shorted to High Source

Aftertreatment DPF Delta Pressure sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P2461-SE2849
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	8 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Aftertreatment DPF Delta Pressure sensor value > 4.75 V (36.733 kPa)

145. P2460-SE2857: Aftertreatment Diesel Particulate Filter Differential Pressure Sensor Circuit - Voltage Below Normal or Shorted to Low Source

Aftertreatment DPF Delta Pressure sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P2460-SE2857
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	8 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Aftertreatment DPF Delta Pressure sensor value < 0.25 V (-3.983 kPa)

146. P200C-SE3072: Aftertreatment 1 Diesel Particulate Filter Outlet Temperature - Data Valid But Above Normal Operating Range - Moderately Severe Level

Aftertreatment DPF delta gas temperature is continuously above a high threshold for a calibrated period of time while active regeneration of the DPF is not occurring.

Monitor Operation:	
DTC	P200C-SE3072
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	140 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P2031-SE2844, P2032-SE6732, P2033-SE6731, P2033-SE6736

Elapsed time since last active regeneration > 700 sec
Rate of active/intrusive injection of hydrocarbons in exhaust < 0.2 g/sec

Abort Conditions (any active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P2031-SE2844, P2032-SE6732, P2033-SE6731, P2033-SE6736
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P242B-SE2852, P242C-SE6734, P242D-SE6733, P242D-SE6737
Rate of active/intrusive injection of hydrocarbons in exhaust ≥ 0.2 g/sec

Malfunction Thresholds (all active):
DPF outlet temperature - DPF inlet temperature > 400 °C

147. P24A2-SE3036: Aftertreatment Diesel Particulate Filter Incomplete Regeneration - Condition Exists

System has detected incomplete regeneration of aftertreatment DPF. This diagnostic feature is essentially a rationality check between the model-based and sensor-based soot load estimate. The OBD system shall detect an incomplete regeneration when the model has predicted that regeneration has completed but more direct indicators (such as pressure signature) indicates the regeneration has not been completed properly. This could be caused by soot failed to be removed under conditions where it is expected to be removed. Or it can be caused by high ash loading that is holding DPF back pressure high even with insignificant amount of soot in the filter

Monitor Operation:	
DTC	P24A2-SE3036
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):

Rate of active/intrusive injection of HC's in exhaust < 0.2 g/sec

Abort Conditions (any active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P242B-SE2852, P242C-SE6734, P242D-SE6733, P242D-SE6737
Rate of active/intrusive injection of HC's in exhaust ≥ 0.2 g/sec

Malfunction Thresholds (all active):
DPF Outlet Temperature > 735 °C

156. P244D-SE1754: Aftertreatment 1 Diesel Particulate Filter Outlet Temperature - Data Valid But Above Normal Operating Range - Least Severe Level

Persistent temperature overshoots of the Aftertreatment DPF outlet gas temperature during active regeneration of the DPF.

Monitor Operation:	
DTC	P244D-SE1754
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 unique occurrences of temperature overshoots persisting for a minimum of 10 seconds each.
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P242B-SE2852, P242C-SE6734, P242D-SE6733, P242D-SE6737
DPF Regeneration is Active

Abort Conditions (any active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P242B-SE2852, P242C-SE6734, P242D-SE6733, P242D-SE6737

Malfunction Thresholds (all active):
DPF outlet temperature > 650 °C

157. P200C-SE3592: Aftertreatment 1 Diesel Particulate Filter Outlet Temperature - Data Valid But Above Normal Operating Range - Most Severe Level

Aftertreatment DPF outlet gas temperature continuously above a severe, high threshold for a calibrated period of time.

Monitor Operation:	
DTC	P200C-SE3592
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	35 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P242B-SE2852, P242C-SE6734, P242D-SE6733, P242D-SE6737

Abort Conditions (any active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P242B-SE2852, P242C-SE6734, P242D-SE6733, P242D-SE6737

Malfunction Thresholds (all active):
DPF outlet temperature > 810 °C

158. P2463-SE1887: Aftertreatment Diesel Particulate Filter Differential Pressure - Data Valid But Above Normal Operating Range - Moderately Severe Level

Aftertreatment DPF Soot Load Estimate has increased above the Moderate Severe Level

Monitor Operation:	
DTC	P2463-SE1887
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Soot Load Estimate > 13 g/L

159. P1451-SE2096: Aftertreatment Diesel Particulate Filter Differential Pressure - Data Valid But Above Normal Operating Range - Least Severe Level

Aftertreatment DPF Soot Load Estimate has increased above the Least Severe Level

Monitor Operation:	
DTC	P1451-SE2096
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Soot Load Estimate > 11 g/L

160. P242F-SE2097: Aftertreatment Diesel Particulate Filter Differential Pressure - Data Valid But Above Normal Operating Range - Most Severe Level

Aftertreatment DPF Soot Load Estimate has increased above the Most Severe Level

Monitor Operation:	
DTC	P242F-SE2097
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Soot Load Estimate > 14.9 g/L

161. P2459-SE3590: Aftertreatment Diesel Particulate Filter Regeneration too Frequent - Condition Exists

Aftertreatment DPF system active regeneration occurring more frequently than intended.

Monitor Operation:	
DTC	P2459-SE3590
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

P2509-SE294
%O2 reading of Exhaust Air (See RefCond0022.)
Engine speed > 50 RPM
Active regeneration of DPF not disabled due to Active errors within the SCR system that will disable active/intrusive injection of HC's into the exhaust in order to protect the SCR system (See RefCond0025.)
the system detects that the DPF is no longer new, or "green". New DPF temporarily exhibits high backpressure during their first hours of use which can lead to a false high estimation of soot load. (See RefCond0021.)

Not [%O2 reading of Exhaust Air (See RefCond0022.)]
Active errors within the SCR system that will disable active/intrusive injection of HC's into the exhaust in order to protect the SCR system (See RefCond0025.)
the system considers that the DPF is new, or "green". New DPF temporarily exhibits high backpressure during their first hours of use which can lead to a false high estimation of soot load. (See RefCond0023.)
NOT [%O2 reading of Exhaust Air (See RefCond0022.)].

Pause Conditions (any active):
Engine speed < 50 RPM

Malfunction Thresholds (all active):
Time since the last active regeneration of the DPF completed till new active regeneration is requested < RefTable22 hr
Number of failed decisions out of 3 updates made >=3 counts.

162. P2121-SE1380: Accelerator Pedal or Lever Position Sensor 1 - Data Erratic, Intermittent, or Incorrect

Dual Potentiometer Accelerator Rationality Check

Monitor Operation:	
DTC	P2121-SE1380
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
(Primary Accelerator Pedal Position > (Secondary Accelerator Pedal Position + 10.551%)) OR (Primary Accelerator Pedal Position < (Secondary Accelerator Pedal Position - 10.551%))

163. P245D-SE2766: EGR Cooler Bypass Actuator Circuit - Voltage Above Normal or Shorted to High Source

The ECM has detected that EGR Bypass Valve (EBV) driver is short to high source.

Monitor Operation:	
DTC	P245D-SE2766
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The diagnostic will continue to detect the condition for 5 times.

Malfunction Thresholds (all active):
The current rises above the low-side shutdown threshold of 12.6 A during PWM On-state.

164. P245C-SE2767: EGR Cooler Bypass Actuator Circuit - Voltage Below Normal or Shorted to Low Source

The ECM has detected that EGR Bypass Valve (EBV) driver is short to low source.

Monitor Operation:	
DTC	P245C-SE2767
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The diagnostic will continue to detect the condition for 5 times.

Malfunction Thresholds (all active):
The current rises above the high-side shutdown threshold of 12.6 A when a high-side switch is turned on.

165. P245D-SE3563: EGR Cooler Bypass Actuator Circuit - Voltage Above Normal or Shorted to High Source

The ECM has detected that EGR Bypass Valve (EBV) driver has an open circuit.

Monitor Operation:	
DTC	P245D-SE3563
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.15 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The EGR Bypass valve motor is being driven by a zero PWM signal while the ECM is being powered up.
The diagnostic will continue to detect the condition for 5 times.

Malfunction Thresholds (all active):
The current through the low side transistor is lower than the referenced current (1.5 mA to 1 mA) during PWM Off-state.

166. P2493-SE4118: EGR Cooler Bypass Actuator Position - Data Erratic, Intermittent, or Incorrect

The EGR Bypass Valve position feedback value is In Range, High.

Monitor Operation:	
DTC	P2493-SE4118
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The total number of in range failures must be < 1. The total number of in range failures include the following:
The accumulated number of P2493-SE4119 Failures this OBD operation cycle.
The accumulated number of P2493-SE4118 Failures this OBD operation cycle.

Abort Conditions (any active):
A new OBD operation cycle is detected

Pause Conditions (any active):
EGR Bypass valve actuator is not in any of the following states: feedback control state, holding zero position state, or holding full position state.
EBV auto zero or span check is in progress
P245C-SE2767, P245D-SE2766, P245D-SE3563
EGR Bypass valve is cycling its position to break free from being stuck. (See RefCond0026.)

Malfunction Thresholds (all active):
Cumulative sum of error (Measured EBV Position Value - Commanded EBV Position Value) over a 30 second period is ever > 30,000%, which is equivalent to (Average of In Range High Error - Tolerance) > 20%, where Tolerance is defined as 0%.

167. P2493-SE4119: EGR Cooler Bypass Actuator Position - Data Erratic, Intermittent, or Incorrect

The EGR Bypass Valve position feedback value is In Range, Low.

Monitor Operation:	
DTC	P2493-SE4119
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The total number of in range failures must be < 1. The total number of in range failures include the following:
The accumulated number of P2493-SE4119 Failures this OBD operation cycle.
The accumulated number of P2493-SE4118 Failures this OBD operation cycle.

Abort Conditions (any active):
A new OBD operation cycle is detected

Pause Conditions (any active):
EGR Bypass valve actuator is not in any of the following states: feedback control state, holding zero position state, or holding full position state.
EBV auto zero or span check is in progress
P245C-SE2767, P245D-SE2766, P245D-SE3563
EGR Bypass valve is cycling its position to break free from being stuck. (See RefCond0026.)

Malfunction Thresholds (all active):
Cumulative sum of error (Commanded EBV Position Value - Measured EBV Position Value) over a 30 second period is ever > 30,000%, which is equivalent to (Average of In Range Low Error - Tolerance) > 20%, where Tolerance is defined as 0%.

168. P2495-SE3185: EGR Cooler Bypass Actuator Position Circuit - Voltage Above Normal or Shorted to High Source

EGR Bypass Valve Position greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P2495-SE3185
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.508 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Measured EGR Bypass Valve Position > 4.801 V (105.329 %)

169. P2494-SE3184: EGR Cooler Bypass Actuator Position Circuit - Voltage Below Normal or Shorted to Low Source

EGR Bypass valve position less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P2494-SE3184
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.508 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Measured EGR Bypass Valve Position < 0.2 V (-8.544%)

170. P0667-SE3806: Engine ECU Temperature - Data Erratic, Intermittent, or Incorrect

ECM Internal Temperature sensor reading is erratic, intermittent or incorrect.

Monitor Operation:	
DTC	P0667-SE3806
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine off time ≥ 480 min
The temperature drop detected on Coolant Temperature Sensor ≤ 1 °C for a time period of 30 seconds after the engine is started up.

Abort Conditions (any active):
U3017-SE4759
U3017-SE4760

Malfunction Thresholds (all active):
| ECM Internal Temperature sensor - the most accurate sensor from the remaining temperature sensors | > (35 + the tolerance of the most accurate sensor from the remaining temperature sensors) °C
| ECM Internal Temperature sensor - the second most accurate sensor from the remaining temperature sensors | > (35 + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
| the most accurate sensor from the remaining temperature sensors - the second most accurate sensor from the remaining temperature sensors | < (the tolerance of the most accurate sensor from the remaining temperature sensors + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
The tolerance of the remaining temperature sensors are:
Compressor Inlet Temperature sensor tolerance = 40 °C
Charge Temperature sensor tolerance = 25 °C
Charge Air Cooler Outlet Temperature sensor tolerance = 13 °C
Coolant Temperature sensor tolerance = 20 °C
EGR Orifice Temperature sensor tolerance = 25 °C

171. P0667-SE10056: Engine ECU Temperature - Data Erratic, Intermittent, or Incorrect

The temperature delta between the ECM Internal Digital Sensor and the ECM Internal Analog Sensor exceeds a calibratable maximum threshold for a calibratable duration, OR the difference in temperature between both sensors is below a calibratable lower threshold for a calibratable duration.

Monitor Operation:	
DTC	P0667-SE10056
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0606-SE4500, P0606-SE4501
P0606-SE7489
P0667-SE3806
Engine Speed ≤ 3,000 RPM
Number of Injection Pulses per Camshaft Revolution ≤ 5 counts
Key off Time ≥ 600 sec

Abort Conditions (any active):
P0606-SE4500, P0606-SE4501
P0606-SE7489
P0667-SE3806
Engine Speed > 3,000 RPM
Number of Injection Pulses per Camshaft Revolution > 5 counts

Malfunction Thresholds (all active):
ECM Digital Sensor Temperature minus ECM Analog Sensor Temperature > 50 degC
OR
ECM Digital Sensor Temperature minus ECM Analog Sensor Temperature < -20 degC

172. P0605-SE216: Engine Control Module Calibration Memory (ROM) Corruption - Root Cause Not Known

Engine control module non-volatile (Flash) memory failure.

Monitor Operation:	
DTC	P0605-SE216
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Fail to save the data to the non-volatile memory.

173. P0606-SE4500: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

Internal ECM Analog Temperature sensor reading greater than specified threshold for a calibrated amount of time.

Monitor Operation:	
DTC	P0606-SE4500
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
ECM Internal Temperature sensor value > 3.666 V (149.96 °C)

174. P0606-SE4501: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

Internal ECM Analog Temperature sensor reading lower than specified threshold for a calibrated amount of time.

Monitor Operation:	
DTC	P0606-SE4501
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
ECM Internal Temperature sensor value < 0.491 V (-50.04 °C)

175. P0606-SE7489: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

The diagnostic function sets the error if either or both bits D0 and D1 is 0 in the bit coded value received from the Electronic Control Module's Internal Digital Temperature Sensor at continuous temperature conversion mode or the bit coded value received from the sensor during shutdown mode is not equal to the manufacturer's ID.

Monitor Operation:	
DTC	P0606-SE7489
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	7 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Either or both of bits D0 & D1 in the bit coded value received from the ECM internal digital temperature sensor is 0.
OR
The bit coded value received from the ECM internal digital temperature sensor during shutdown mode is not equal to the manuacturer's ID.

176. P0490-SE2797: EGR Valve Control Circuit - Voltage Above Normal or Shorted to High Source

The ECM monitors whether the H-Bridge circuit that drives an EGR actuator motor is shorted to a high voltage source.

Monitor Operation:	
DTC	P0490-SE2797
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Current through low-side switches of EGR H-Bridge circuit > 12.6 A

177. P0489-SE2798: EGR Valve Control Circuit - Voltage Below Normal or Shorted to Low Source

The ECM monitors whether the H-Bridge circuit that drives an EGR actuator motor is shorted to a low voltage source.

Monitor Operation:	
DTC	P0489-SE2798
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Current through high-side switches of EGR H-Bridge circuit > 12.6 A

178. P0490-SE3582: EGR Valve Control Circuit - Voltage Above Normal or Shorted to High Source

The ECM monitors whether the H-Bridge circuit that drives an EGR actuator motor has an open-load condition.

Monitor Operation:	
DTC	P0490-SE3582
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Current through low-side switches of EGR H-Bridge circuit < 1.5 mA while being driven by a zero PWM signal at ECM power up

179. P046C-SE3869: EGR Valve Position - Data Erratic, Intermittent, or Incorrect

The EGR valve position feedback is failed in range, but not clearly "in range high" or "in range low."

Monitor Operation:	
DTC	P046C-SE3869
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	≤ 60 sec
MIL Activation Criteria	2 trips

Pause Conditions (any active):
P0490-SE2797
P0490-SE3582
P0489-SE2798
EGR actuator is in PWM-Off state.
Engine speed < 1,500 RPM.
Torque fueling < 4 mg/stroke.

Malfunction Thresholds (all active):
Average of (|Measured Value - Commanded Value| + |Commanded Value - Measured Value|) over a 60 second period is ever > 1.583 %. Where Diagnostic Tolerance is defined as 0 %.

180. P0406-SE3202: EGR Valve Position Circuit - Voltage Above Normal or Shorted to High Source

EGR valve position sensor reading is greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0406-SE3202
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.5 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Measured EGR H-Bridge valve position > 4.801 V (112.822 %)

181. P0405-SE3203: EGR Valve Position Circuit - Voltage Below Normal or Shorted to Low Source

EGR valve position sensor reading is less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0405-SE3203
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.5 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Measured EGR H-Bridge valve position < 0.2 V (-20.609 %)

182. P040B-SE3876: Exhaust Gas Recirculation Temperature - Data Erratic, Intermittent, or Incorrect

EGR Orifice Temperature reading is In Range High

Monitor Operation:	
DTC	P040B-SE3876
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine has been in Run state for >= 120 s

Pause Conditions (any active):
P040C-SE495, P040D-SE496
P040B-SE3872
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493
P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P0116-SE3669, P0116-SE3805, P0117-SE76, P0118-SE75, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493
P0405-SE3203, P0406-SE3202, P046C-SE3869, P0489-SE2798, P0490-SE2797, P0490-SE3582
EGR Cooler Bypass Valve Position > 0 %
Coolant Temperature < 60 °C
EGR Orifice Temperature < 250 DegC AND EGR Flow < 1.5 kg/min

Malfunction Thresholds (all active):
Cumulative sum of error (Measured Value - Estimated Value) in 60 seconds is ever > 6,000 Deg C, which is equivalent to [Average of Error - Tolerance] >= 1 Deg C. where, Tolerance is defined as: 207.5 Deg C.

183. P040B-SE3877: Exhaust Gas Recirculation Temperature - Data Erratic, Intermittent, or Incorrect

EGR Orifice Temperature reading is In Range Low

Monitor Operation:	
DTC	P040B-SE3877
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine has been in Run state for >= 120 s

Pause Conditions (any active):
P040B-SE3872

Condition enters when |Engine speed - Filtered engine speed| < 80 RPM and condition exits when |Engine speed - Filtered engine speed| > 100 RPM
EGR Cooler Bypass Valve Position > 0 %
EGR Flow < 1.5 kg/min
Coolant Temperature < 60 °C
EGR Orifice Temperature < 250 DegC AND EGR Flow < 1.5 kg/min

Malfunction Thresholds (all active):
(Maximum sensor value - Minimum sensor value) at the end of 60 seconds is < 0.3 °C

185. P040B-SE3872: Exhaust Gas Recirculation Temperature - Data Erratic, Intermittent, or Incorrect

EGR Orifice Temperature sensor reading is erratic, intermittent or incorrect.

Monitor Operation:	
DTC	P040B-SE3872
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine off time ≥ 480 min
The temperature drop detected on Coolant Temperature Sensor ≤ 1 °C for a time period of 30 seconds after the engine is started up.

Abort Conditions (any active):
P040C-SE495, P040D-SE496
U3017-SE4759
U3017-SE4760

Malfunction Thresholds (all active):
| EGR Orifice Temperature sensor - the most accurate sensor from the remaining temperature sensors | > (25 + the tolerance of the most accurate sensor from the remaining temperature sensors) °C
| EGR Orifice Temperature sensor - the second most accurate sensor from the remaining temperature sensors | > (25 + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
| the most accurate sensor from the remaining temperature sensors - the second most accurate sensor from the remaining temperature sensors | < (the tolerance of the most accurate sensor from the remaining temperature sensors + the tolerance of the second most accurate sensor from the remaining temperature sensors) °C
The tolerance of the remaining temperature sensors are:
Compressor Inlet Temperature sensor tolerance = 40 °C
Charge Temperature sensor tolerance = 25 °C
Charge Air Cooler Outlet Temperature sensor tolerance = 13 °C
Coolant Temperature sensor tolerance = 20 °C
ECM Internal Temperature sensor tolerance = 35 °C

186. P040D-SE496: Exhaust Gas Recirculation Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

EGR Orifice Temperature Sensor reading is greater than specified operating range for calibrated amount of time.

Monitor Operation:	
DTC	P040D-SE496
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	8 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
EGR Orifice Temperature sensor value > 4.738V (< -40 degC)

187. P040C-SE495: Exhaust Gas Recirculation Temperature Sensor Circuit - Voltage Below Normal or Shorted to Low Source

EGR Orifice Temperature Sensor reading is less than specified operating range for calibrated amount of time.

Monitor Operation:	
DTC	P040C-SE495
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	8 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
EGR Orifice Temperature sensor value < 0.067V (> 500degC)

188. P2457-SE869: Exhaust Gas Recirculation Temperature - Data Valid But Above Normal Operating Range - Moderately Severe Level

EGR Orifice Temperature above allowed engine operating range.

Monitor Operation:	
DTC	P2457-SE869
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	Non-OBD

Pause Conditions (any active):

The EGR H-bridge valve position is not known to be good. (See RefCond0029.)
Fresh Air Flow Command < 0.5 kg/min
Fresh Air Flow Command > 7.75 kg/min
VGT Actuator Effective Flow Area < 0.85 cm2
VGT Actuator Effective Flow Area > 10 cm2
EGR Off Engine Protection is active
Filtered (tau = 0.011 sec) Charge Temperature ≤ 15 °C
Filtered (tau = 0.011 sec) EGR Orifice Temperature ≤ 15 °C
EGR Delta P sensor autozero check is not complete
Engine Speed < 800 RPM
Engine Speed > 1,940 RPM
Total Fueling < 5 mg/stroke

Total Fueling > 50 mg/stroke
EGR Actuator Effective Flow Area is greater than 0 cm2 and EBV Actuator Effective Flow Area is greater than 0 cm2

Malfunction Thresholds (all active):
Cumulative sum of error (Estimated Flow - Measured Flow) over 600 second period is ever > 3,600 kg/min, which is equivalent to [Average of Error - Tolerance] >= 0.6 kg/min, where Tolerance is defined as: 0 kg/min

192. P0546-SE6729: Aftertreatment 1 Diesel Oxidation Catalyst Intake Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detetected a sensor short to battery or open circuit condition that causes too high of an input voltage condition in the intake DOC thermocouple sensor circuit.

Monitor Operation:	
DTC	P0546-SE6729
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
Aftertreatment intake DOC gas temperature sensor input voltage ≥ 5 V (240 DegC)
OR intake DOC gas temperature thermocouple impedance ≥ 10 Ohms

193. P0545-SE6730: Aftertreatment 1 Diesel Oxidation Catalyst Intake Temperature Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The Smart Exhaust Gas Temperature Module has detetected a sensor short to ground that causes too low of an input voltage condition in the intake DOC thermocouple sensor circuit.

Monitor Operation:	
DTC	P0545-SE6730
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
Aftertreatment intake DOC gas temperature sensor input voltage ≤ 1 V (-40 DegC)

194. P2033-SE6731: Aftertreatment 1 Diesel Particulate Filter Intake Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detetected a sensor short to battery or open circuit condition that causes too high of an input voltage condition in the outlet DOC thermocouple sensor circuit.

Monitor Operation:	
DTC	P2033-SE6731
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
Aftertreatment outlet DOC gas temperature sensor input voltage ≥ 5 V (240 DegC)
OR outlet DOC gas temperature thermocouple impedance ≥ 10 Ohms

195. P2032-SE6732: Aftertreatment 1 Diesel Particulate Filter Intake Temperature Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The Smart Exhaust Gas Temperature Module has detetected a sensor short to ground that causes too low of an input voltage condition in the outlet DOC thermocouple sensor circuit.

Monitor Operation:	
DTC	P2032-SE6732
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
Aftertreatment outlet DOC gas temperature sensor input voltage ≤ 1 V (-40 DegC)

196. P242D-SE6733: Aftertreatment 1 Diesel Particulate Filter Outlet Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detetected a sensor short to battery or open circuit condition that causes too high of an input voltage condition in the outlet DPF thermocouple sensor circuit.

Monitor Operation:	
DTC	P242D-SE6733
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
Aftertreatment outlet DPF gas temperature sensor input voltage ≥ 5 V (240 DegC)
OR outlet DPF gas temperature thermocouple impedance ≥ 10 Ohms

197. P242C-SE6734: Aftertreatment 1 Diesel Particulate Filter Outlet Temperature Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The Smart Exhaust Gas Temperature Module has detetected a sensor short to ground that causes too low of an input voltage condition in the outlet DPF thermocouple sensor circuit.

Monitor Operation:	
DTC	P242C-SE6734
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
Aftertreatment outlet DPF gas temperature sensor input voltage ≤ 1 V (-40 DegC)

198. P1613-SE6722: Aftertreatment Diesel Particulate Filter Temperature Sensor Module - Bad Intelligent Device or Component

The Smart Exhaust Gas Temperature Module has detetected an open circuit condition in the reference cold junction thermistor internal to the triple sensor module.

Monitor Operation:	
DTC	P1613-SE6722
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
EGTS Module Cold Junction Temperature < -55 °C

199. P1613-SE6724: Aftertreatment Diesel Particulate Filter Temperature Sensor Module - Bad Intelligent Device or Component

The Smart Exhaust Gas Temperature Module has detetected an implausible temperature error condition in the reference cold junction thermistor internal to the triple sensor module.

Monitor Operation:	
DTC	P1613-SE6724
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
|EGTS Module Cold Junction Temperature - EGTS ECU Temperature| > 20 °C

200. P1613-SE6721: Aftertreatment Diesel Particulate Filter Temperature Sensor Module - Bad Intelligent Device or Component

The Smart Exhaust Gas Temperature Module has detetected a short circuit condition in the reference cold junction thermistor internal to the triple sensor module.

Monitor Operation:	
DTC	P1613-SE6721
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
EGTS Module Cold Junction Temperature > 180 °C

201. P1613-SE6726: Aftertreatment Diesel Particulate Filter Temperature Sensor Module - Bad Intelligent Device or Component

The Smart Exhaust Gas Temperature Module has detetected an ASIC memory corruption error condition in the internal triple sensor module circuitry.

Monitor Operation:	
DTC	P1613-SE6726
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
Mismatched or invalid CRC of the Smart Exhaust Gas Temperature Module ASIC's internal memory at power up.

202. P1614-SE6727: Aftertreatment Diesel Particulate Filter Temperature Sensor Module - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detetected a too high of a voltage condition to the triple sensor control module.

Monitor Operation:	
DTC	P1614-SE6727
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
EGT module supply voltage > 16 V

203. P1615-SE6728: Aftertreatment Diesel Particulate Filter Temperature Sensor Module - Voltage Below Normal or Shorted to Low Source

The Smart Exhaust Gas Temperature Module has detetected a too low of a voltage condition to the triple sensor control module.

Monitor Operation:	
DTC	P1615-SE6728
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off
Engine is in cranking state.
Elapsed time since engine has exited the cranking state >= 2 seconds.

Malfunction Thresholds (all active):
EGT module supply voltage < 6 V

204. P1616-SE7167: Aftertreatment Diesel Particulate Filter Temperature Sensor Module - Data Valid But Above Normal Operating Range - Moderately Severe Level

The Smart Exhaust Gas Temperature Module has detetected an ECU temperature too high condition in the internal triple sensor module circuitry.

Monitor Operation:	
DTC	P1616-SE7167
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
Smart Exhaust Gas Temperature Module internal circuit board temperature > 150 °C

205. P1613-SE6725: Aftertreatment Diesel Particulate Filter Temperature Sensor Module - Bad Intelligent Device or Component

The Smart Exhaust Gas Temperature Module has detetected mismatched data in the two copies of microcontroller EEPROM in the triple sensor module circuitry.

Monitor Operation:	
DTC	P1613-SE6725
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
The Smart Exhaust Gas Temperature Module's parameter storage within nonvolatile memory does not match the corresponding parameters volatile storage at power up

206. P1623-SE7168: Aftertreatment Diesel Particulate Filter Temperature Sensor Module - Root Cause Not Known

The Smart Exhaust Gas Temperature Module has detetected an intermittent power supply voltage drop that results in a reset internal to the module.

Monitor Operation:	
DTC	P1623-SE7168
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Time delay after key-on ≥ 5 sec
Key switch is turned on

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
The number of EGT module power reset events within a 300 second window is ≥ 5 counts

207. P0546-SE6735: Aftertreatment 1 Diesel Oxidation Catalyst Intake Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detected an ASIC communication error with the intake DOC thermocouple.

Monitor Operation:	
DTC	P0546-SE6735
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
Within the Smart Exhaust Gas Temperature Module an ASIC communication error is causing no data transfer between intake DOC thermocouple and the internal ASIC.

208. P2033-SE6736: Aftertreatment 1 Diesel Particulate Filter Intake Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detected an ASIC communication error with the outlet DOC thermocouple.

Monitor Operation:	
DTC	P2033-SE6736
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
Within the Smart Exhaust Gas Temperature Module an ASIC communication error is causing no data transfer between outlet DOC thermocouple and the internal ASIC.

209. P242D-SE6737: Aftertreatment 1 Diesel Particulate Filter Outlet Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detected an ASIC communication error with the outlet DPF thermocouple.

Monitor Operation:	
DTC	P242D-SE6737
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1611-SE6686, U1611-SE6687
Key switch is turned off

Malfunction Thresholds (all active):
Within the Smart Exhaust Gas Temperature Module an ASIC communication error is causing no data transfer between outlet DPF thermocouple and the internal ASIC.

210. P1624-SE6753: Aftertreatment Selective Catalytic Reduction Temperature Sensor Module - Bad Intelligent Device or Component

The Smart Exhaust Gas Temperature Module has detetected an open circuit condition in the reference cold junction thermistor internal to the dual sensor module.

Monitor Operation:	
DTC	P1624-SE6753
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	1 trip

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
EGTS Module Cold Junction Temperature < -55 °C

211. P1624-SE6755: Aftertreatment Selective Catalytic Reduction Temperature Sensor Module - Bad Intelligent Device or Component

The Smart Exhaust Gas Temperature Module has detetected an implausible temperature error condition in the reference cold junction thermistor internal to the dual sensor module.

Monitor Operation:	
DTC	P1624-SE6755
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	1 trip

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
|EGTS Module Cold Junction Temperature - EGTS ECU Temperature| > 20 °C

212. P1624-SE6752: Aftertreatment Selective Catalytic Reduction Temperature Sensor Module - Bad Intelligent Device or Component

The Smart Exhaust Gas Temperature Module has detetected a short circuit condition in the reference cold junction thermistor internal to the dual sensor module.

Monitor Operation:	
DTC	P1624-SE6752
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	1 trip

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
EGTS Module Cold Junction Temperature < 180 °C

213. P1624-SE6757: Aftertreatment Selective Catalytic Reduction Temperature Sensor Module - Bad Intelligent Device or Component

The Smart Exhaust Gas Temperature Module has detetected an ASIC memory corruption error condition in the internal dual sensor module circuitry.

Monitor Operation:	
DTC	P1624-SE6757
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	1 trip

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
Mismatched or invalid CRC of the Smart Exhaust Gas Temperature Module ASIC's internal memory at power up.

214. P1625-SE6758: Aftertreatment Selective Catalytic Reduction Temperature Sensor Module - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detetected a too high of a voltage condition to the dual sensor control module.

Monitor Operation:	
DTC	P1625-SE6758
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
EGT module supply voltage > 16 V

215. P1626-SE6759: Aftertreatment Selective Catalytic Reduction Temperature Sensor Module - Voltage Below Normal or Shorted to Low Source

The Smart Exhaust Gas Temperature Module has detetected a too low of a voltage condition to the dual sensor control module.

Monitor Operation:	
DTC	P1626-SE6759
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off
Engine is in cranking state.
Elapsed time since engine has exited cranking state >= 2 seconds

Malfunction Thresholds (all active):
EGT module supply voltage < 6 V

216. P1627-SE7179: Aftertreatment Selective Catalytic Reduction Temperature Sensor Module - Data Valid But Above Normal Operating Range - Moderately Severe Level

The Smart Exhaust Gas Temperature Module has detetected an ECU temperature too high condition in the internal dual sensor module circuitry.

Monitor Operation:	
DTC	P1627-SE7179
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
Smart Exhaust Gas Temperature Module internal circuit board temperature > 150 °C

217. P1624-SE6756: Aftertreatment Selective Catalytic Reduction Temperature Sensor Module - Bad Intelligent Device or Component

The Smart Exhaust Gas Temperature Module has detetected mismatched data in the two copies of microcontroller EEPROM in the dual sensor module circuitry.

Monitor Operation:	
DTC	P1624-SE6756
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4.2 sec
MIL Activation Criteria	1 trip

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
The Smart Exhaust Gas Temperature Module's parameter storage within nonvolatile memory does not match the corresponding parameters volatile storage at power up.

218. P2482-SE6762: Aftertreatment 1 SCR Outlet Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detetected a sensor short to battery or open circuit condition that causes too high of an input voltage condition in the outlet SCR thermocouple sensor circuit.

Monitor Operation:	
DTC	P2482-SE6762
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	1 trip

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
Aftertreatment outlet SCR gas temperature sensor input voltage ≥ 5 V (240 DegC)
OR outlet SCR gas temperature thermocouple impedance ≥ 10 Ohms

219. P2481-SE6763: Aftertreatment 1 SCR Outlet Temperature Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The Smart Exhaust Gas Temperature Module has detetected a sensor short to ground condition that causes too low of an input voltage condition in the outlet SCR thermocouple sensor circuit.

Monitor Operation:	
DTC	P2481-SE6763
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
Aftertreatment outlet SCR gas temperature sensor input voltage ≤ 1 V (-40 DegC)

220. P1628-SE7180: Aftertreatment Selective Catalytic Reduction Temperature Sensor Module - Root Cause Not Known

The Smart Exhaust Gas Temperature Module has detetected an intermittent power supply voltage drop that results in a reset internal to the module.

Monitor Operation:	
DTC	P1628-SE7180
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Time delay after key-on ≥ 5 sec
Key switch is turned on

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
The number of EGT module power reset events within a 300 s window ≥ 5 counts

221. P2471-SE6760: Aftertreatment 1 SCR Intermediate Gas Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detetected a sensor short to battery or open circuit condition that causes too high of an input voltage condition in the intake/mid-bed SCR thermocouple sensor circuit.

Monitor Operation:	
DTC	P2471-SE6760
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	1 trip

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
Aftertreatment intake/mid-bed SCR gas temperature sensor input voltage ≥ 5 V (240 DegC)
OR intake/mid-bed SCR gas temperature thermocouple impedance ≥ 10 Ohms

222. P2470-SE6761: Aftertreatment 1 SCR Intermediate Gas Temperature Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The Smart Exhaust Gas Temperature Module has detetected a sensor short to ground condition that causes too low of an input voltage condition in the intake/mid-bed SCR thermocouple sensor circuit.

Monitor Operation:	
DTC	P2470-SE6761
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
Aftertreatment intake/mid-bed SCR gas temperature sensor input voltage ≤ 1 V (-40 DegC)

223. P2471-SE6764: Aftertreatment 1 SCR Intermediate Gas Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detected an ASIC communication error with the intake/mid-bed SCR thermocouple.

Monitor Operation:	
DTC	P2471-SE6764
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	1 trip

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
Within the Smart Exhaust Gas Temperature Module an ASIC communication error is causing no data transfer between intake/mid-bed SCR thermocouple and the internal ASIC.

224. P2482-SE6765: Aftertreatment 1 SCR Outlet Temperature Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Smart Exhaust Gas Temperature Module has detected an ASIC communication error with the outlet SCR thermocouple.

Monitor Operation:	
DTC	P2482-SE6765
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3.8 sec
MIL Activation Criteria	1 trip

Abort Conditions (any active):
U1612-SE6683, U1612-SE6685
Key switch is turned off

Malfunction Thresholds (all active):
Within the Smart Exhaust Gas Temperature Module an ASIC communication error is causing no data transfer between outlet SCR thermocouple and the internal ASIC.

225. P2560-SE657: Coolant Level - Data Valid But Below Normal Operating Range - Moderately Severe Level

Data read from the Coolant Level sensor is valid but is below normal operating range.

Monitor Operation:	
DTC	P2560-SE657
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	90 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
P2558-SE283, P2559-SE572

Malfunction Thresholds (all active):
Coolant Level Sensor Value ≥ 3.75 V

226. P0219-SE124: Engine Crankshaft Speed/Position - Data Valid But Above Normal Operating Range - Most Severe Level

Engine Speed too high

Monitor Operation:	
DTC	P0219-SE124
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.06 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Engine Speed > 4,650 RPM

227. P2202-SE5151: Aftertreatment 1 Intake NOx Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The NOx sensor circuitry has detected a failure affecting the engine outlet NOx sensor heater circuit. This monitor is used to provide fault isolation for particular circuit continuity failure modes. However, if the physical failure prevents reaching the enable conditions for this monitor, coverage is still provided via other diagnostics. For example, P2209-SE5245 doesn't require the sensor temperature to reach any threshold, and thus will provide coverage for heater performance failure modes.

Monitor Operation:	
DTC	P2202-SE5151
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 seconds after sensor identifies any of the listed malfunction criteria.
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U029D-SE2487

Pause Conditions (any active):
Exhaust gas temperature is above a threshold representing the point at which there is no longer a concern of condensation on the NOx sensor element. (See RefCond0031.) for less than 160 seconds
Exhaust gas temperature is below a threshold or above a threshold for insufficient time representing that dew point is not reached. (See RefCond0032.)

Malfunction Thresholds (all active):
[Open H-] The resistance between the sensors heater connection to Ground and a 3rd heater electrode > 1,000,000 ohms for 10 seconds.
or
[Open H+] The resistance between the sensors heater supply and a 3rd heater electrode > 1,000,000 ohms for 10 seconds.
or
[H-/Tmp] The voltage between the 3rd electrode within the sensors internal heater and ground < 0.5 V for 10 seconds.
or
[M2/Tmp] The resistance between the sensors measuring electrode in the 2nd pumping chamber and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.
or
[P-/Tmp] The resistance between the sensors pumping electrode in the 1st pumping chamber and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.
or

[M1/Tmp] The resistance between the sensors pumping electrode in the 2nd pumping chamber and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.
or
[Ref/Tmp] (The resistance between the sensors air reference electrode and the sensors 3rd electrode within its internal heater is < 0.5 ohms AND the voltage between reference line and ground < 1 V) for 40 seconds.
or
[H+/H-] The resistance between the sensors internal heater supply voltage line and sensor ground is < 0.5 ohms for 10 seconds.
or
[Vbatt/P-] The resistance between supply voltage and the sensors pumping electrode in the 1st pumping chamber is < 0.5 ohms for 10 seconds.
or
[Vbatt/P+] The resistance between supply voltage and the sensors top electrode (directly exposed to exhaust gas) is < 0.5 ohms for 10 seconds.
or
[Vbatt/M1] The resistance between supply voltage and the sensors pumping electrode in the 2nd pumping chamber is < 0.5 ohms for 10 seconds.
or
[H+/Tmp] (The voltage between the 3rd electrode within the internal heater and ground < 2.19 V AND the sensors internal heater resistance < 20.97 Ohms) for 40 seconds.
or
[Vbatt/M2] The resistance between supply voltage and the sensors measuring electrode in 2nd chamber is < 0.5 ohms for 10 seconds.
or
[P+/Tmp] The resistance between the sensors top electrode (directly exposed to exhaust gas) and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.
or
[Vbatt/Ref] The resistance between supply voltage and the sensors air reference electrode is < 0.5 ohms for 10 seconds.
or
[Vbatt/H+] The resistance between supply voltage and the sensors heater supply is < 0.5 ohms for 10 seconds.
or
[Open Tmp] The resistance between the sensors 3rd electrode within its internal heater is > 1,000,000 ohms for 10 seconds.
or
[M1/M2] (5 mV < the voltage between the measuring electrode in the 2nd chamber with respect to the air reference electrode < 500 mV AND the voltage between the pumping electrode in the 2nd chamber and the air reference electrode = the voltage between the measuring electrode in the 2nd chamber with respect to the air reference electrode) for 40 seconds.
or
[Vbatt/Tmp] The voltage at the 3rd electrode within the sensors internal heater > 8 V for 10 seconds.
or
[Open M2] The resistance between the sensors measuring electrode in the 2nd chamber and ground > 0 ohms for 10 seconds.

230. P220A-SE5829: Aftertreatment 1 Intake NOx Sensor Power Supply - Data Erratic, Intermittent, or Incorrect

The engine out NOx sensor circuitry has detected an intermittent power supply voltage drop that results in a reset internal to the sensor.

Monitor Operation:	
DTC	P220A-SE5829
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Pause Conditions (any active):
Exhaust gas temperature is below a threshold or above a threshold for insufficient time representing that dew point is not reached. (See RefCond0032.)
Exhaust gas temperature is above a threshold representing the point at which there is no longer a concern of condensation on the NOx sensor element. (See RefCond0031.) for less than 1 seconds

Malfunction Thresholds (all active):
The number of filtered sensor reset events (sensor supply power < 6 V) is greater than 10 counts, within a diagnostic time window (300 sec) Sensor reset events are "filtered" by ignoring consecutive reset events occuring within (20 sec).

231. P220A-SE5152: Aftertreatment 1 Intake NOx Sensor Power Supply - Data Erratic, Intermittent, or Incorrect

The engine out NOx sensor circuitry has detected that its battery supply voltage is outside the desired range.

Monitor Operation:	
DTC	P220A-SE5152
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 seconds after sensor identifies any of the listed malfunction criteria.
MIL Activation Criteria	2 trips

Abort Conditions (any active):
U029D-SE2487

Pause Conditions (any active):
Exhaust gas temperature is above a threshold representing the point at which there is no longer a concern of condensation on the NOx sensor element. (See RefCond0031.) for less than 160 seconds
Exhaust gas temperature is below a threshold or above a threshold for insufficient time representing that dew point is not reached. (See RefCond0032.)

Malfunction Thresholds (all active):
NOx sensor supply voltage > 16.5 V for 10 seconds.
or NOx sensor supply voltage < 10.8 V for 10 seconds.

232. P2202-SE5153: Aftertreatment 1 Intake NOx Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The NOx sensor circuitry has detected a failure within the engine out NOx sensor's internal circuitry that causes the sensed NOx value to be suspect. This monitor is used to provide fault isolation for particular circuit continuity failure modes. However, if the physical failure prevents reaching the enable conditions for this monitor, coverage is still provided via other diagnostics. For example, P2209-SE5245 doesn't require the sensor temperature to reach any threshold, and thus will provide coverage for heater performance failure modes.

Monitor Operation:	
DTC	P2202-SE5153
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 seconds after sensor identifies any of the listed malfunction criteria.

[Vbatt/H+] The resistance between supply voltage and the sensors heater supply is < 0.5 ohms for 10 seconds.
or
[M1/M2] (5 mV < the voltage between the measuring electrode in the 2nd chamber with respect to the air reference electrode < 500 mV AND the voltage between the pumping electrode in the 2nd chamber and the air reference electrode = the voltage between the measuring electrode in the 2nd chamber with respect to the air reference electrode) for 40 seconds.

234. P0471-SE3924: Exhaust Gas Pressure 1 - Data Erratic, Intermittent, or Incorrect

Exhaust Pressure Sensor reading is In Range High

Monitor Operation:	
DTC	P0471-SE3924
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Abort Conditions (any active):

Pause Conditions (any active):
P0471-SE4442
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493
P0472-SE494, P0473-SE493
Engine is not in Run State.
VGT Position < 35 %
Fueling < 12 mg/stroke
EGR Off Engine Protection is active

Malfunction Thresholds (all active):
Cumulative sum of error (Measured Value - Estimated Value) in 90 seconds is ever > 1,800,000 KPa, which is equivalent to [Average of Error - Tolerance] >= 100 KPa. Where Tolerance is defined as: 0 KPa.

235. P0471-SE3922: Exhaust Gas Pressure 1 - Data Erratic, Intermittent, or Incorrect

Exhaust Pressure Sensor reading is In Range Low

Monitor Operation:	
DTC	P0471-SE3922
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Abort Conditions (any active):

Pause Conditions (any active):

P0472-SE494, P0473-SE493
Engine is not in Run State.
VGT Position < 35 %
Fueling < 12 mg/stroke
EGR Off Engine Protection is active

Malfunction Thresholds (all active):
Cumulative sum of error (Estimated Value - Measured Value) in 90 seconds is ever > 1,800,000 KPa, which is equivalent to [Average of Error - Tolerance] >= 100 KPa. Where Tolerance is defined as: 0 KPa.

236. P0471-SE4442: Exhaust Gas Pressure 1 - Data Erratic, Intermittent, or Incorrect

Exhaust Pressure Sensor reading is erratic, intermittent or incorrect at keyoff.

Monitor Operation:	
DTC	P0471-SE4442
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine is in stopped state
The time since Key Switch is turned OFF ≥ 30 sec

Abort Conditions (any active):
P0472-SE494, P0473-SE493
Coolant Temperature ≤ 70 °C

Malfunction Thresholds (all active):
Exhaust Pressure Sensor reading < 18 kPa(absolute)
OR
Exhaust Pressure Sensor reading > 144.31 kPa(absolute)
OR
|Exhaust Pressure - the most accurate pressure sensor from the remaining pressure sensor| > (39.59 + the tolerance of the most accurate pressure sensor from the remaining pressure sensors) kPa(absolute)
|Exhaust Pressure - the second most accurate pressure sensor from the remaining pressure sensor| > (39.59 + the tolerance of the second most accurate pressure sensor from the remaining pressure sensors) kPa(absolute)
| the most accurate sensor from the remaining pressure sensors - the second most accurate sensor from the remaining pressure sensors | < (the tolerance of the most accurate sensor from the remaining pressure sensors + the tolerance of the second most accurate sensor from the remaining pressure sensors) kPa(absolute)
The tolerance of the remaining pressure sensors are:
Charge Pressure sensor tolerance = 11.84 kPa(absolute)
Compressor Inlet Pressure sensor tolerance = 3.19 kPa(absolute)

237. P0473-SE493: Exhaust Gas Pressure Sensor 1 Circuit - Voltage Above Normal or Shorted to High Source

Exhaust Pressure sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0473-SE493
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.5 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Exhaust Pressure sensor value > 4.8V (620.53 kPa(absolute))

238. P0472-SE494: Exhaust Gas Pressure Sensor 1 Circuit - Voltage Below Normal or Shorted to Low Source

Exhaust Pressure sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0472-SE494
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.5 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Exhaust Pressure sensor value < 0.2V (44.82 kPa(absolute))

239. P0A0F-SE10214: Engine Failed Automatic Start - Condition Exists

Engine Camshaft to Crankshaft synchronization is not achieved within a calibratable window.

Monitor Operation:	
DTC	P0A0F-SE10214
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	7 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine Cranking Time > 0.25 sec
Engine Speed ≥ 70 RPM
Measured Fuel Rail Pressure > 120 bar
Measured Fuel Rail Pressure > RefTable24 bar

Malfunction Thresholds (all active):
Engine Synchronization Time > 5 sec

240. P00C6-SE10215: Engine Injector Metering Rail 1 Cranking Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

Rail pressure is too low to start the engine, as the fuel rail pressure is less than the specified minimum injection pressure threshold during cranking.

Monitor Operation:	
DTC	P00C6-SE10215
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	40 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0192-SE1403, P0193-SE1402, P0335-SE4372, P0335-SE6886, P0340-SE3392, P0340-SE4499
Engine Speed ≥ 70 RPM
Battery Voltage during starting ≥ 8 V
Ambient Air Temperature ≥ -7 °C
Ambient Air Pressure ≥ 70 kPa(absolute)
Fuel Level > 14.898 %

Malfunction Thresholds (all active):
Measured Fuel Rail Pressure ≤ 120 bar

241. P0691-SE1003: Fan Control Circuit - Voltage Below Normal or Shorted to Low Source

Fan Clutch driver voltage has its voltage below normal, or shorted to a low source

Monitor Operation:	
DTC	P0691-SE1003
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	400 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
The resistance between the Fan Clutch Driver and ground < 0.2 Ohms

242. P0692-SE1004: Fan Control Circuit - Voltage Above Normal or Shorted to High Source

Fan Clutch driver voltage is above voltage limit.

Monitor Operation:	
DTC	P0692-SE1004
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	400 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
The resistance between the Fan Clutch Driver and ground > 500,000 Ohms

243. P026B-SE7471: Engine Fuel Injection Quantity Error for Multiple Cylinders - Condition Exists

The Fuel quantity Balancing Control has failed to enter closed loop mode.

Monitor Operation:	
DTC	P026B-SE7471
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1,150 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0201-SE3357, P0202-SE3358, P0203-SE3359, P0204-SE3360, P0205-SE3361, P0206-SE3362, P0207-SE3363, P0208-SE3364, P0261-SE6892, P0262-SE4673, P0264-SE6893, P0265-SE4674, P0267-SE6899, P0268-SE4680, P0270-SE6896, P0271-SE4677, P0273-SE6897, P0274-SE4678, P0276-SE6898, P0277-SE4679, P0279-SE6894, P0280-SE4675, P0282-SE6895, P0283-SE4676, P02EE-SE6854, P02EF-SE6855, P02F0-SE6861, P02F1-SE6858, P02F2-SE6859, P02F3-SE6860, P02F4-SE6856, P02F5-SE6857, P0335-SE4372, P0335-SE6886, P0606-SE6842, P0606-SE6843, P0606-SE6862, P0606-SE6863, P0606-SE6881, P0606-SE6882, P2146-SE6840, P2149-SE6841
2 mg/stroke ≤ Fuel Injection Quantity ≤ RefTable25
The engine is not in Particulate Filter regeneration mode.
Engine is in running state for at least 30 seconds.
This monitor is not disabled by any gear dependent deactivation.
Air to fuel ratio divided by the Stoichiometric Air to fuel ratio > RefTable26+0 (ratio)

Abort Conditions (any active):
P0201-SE3357, P0202-SE3358, P0203-SE3359, P0204-SE3360, P0205-SE3361, P0206-SE3362, P0207-SE3363, P0208-SE3364, P0261-SE6892, P0262-SE4673, P0264-SE6893, P0265-SE4674, P0267-SE6899, P0268-SE4680, P0270-SE6896, P0271-SE4677, P0273-SE6897, P0274-SE4678, P0276-SE6898, P0277-SE4679, P0279-SE6894, P0280-SE4675, P0282-SE6895, P0283-SE4676, P02EE-SE6854, P02EF-SE6855, P02F0-SE6861, P02F1-SE6858, P02F2-SE6859, P02F3-SE6860, P02F4-SE6856, P02F5-SE6857, P0335-SE4372, P0335-SE6886, P0606-SE6842, P0606-SE6843, P0606-SE6862, P0606-SE6863, P0606-SE6881, P0606-SE6882, P2146-SE6840, P2149-SE6841
Fuel Injection Quantity < 2 mg/strok OR Fuel Injection Quantity > RefTable25
The engine is in Particulate Filter regeneration mode.
This monitor is disabled by any gear dependent deactivation.
Air to fuel ratio divided by the Stoichiometric Air to fuel ratio ≤ RefTable26+0 (ratio)

Malfunction Thresholds (all active):
Fuel quantity Balancing Control is not in closed loop mode

244. P0263-SE7472: Engine Cylinder 1 Fuel Injection Quantity - Data Erratic, Intermittent, or Incorrect

The Fuel Balance Control correction quantity for cylinder number 1 is within a calibratable offset of its limit.

Monitor Operation:	
DTC	P0263-SE7472
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Fuel quantity Balancing Control is in a closed-loop operating mode.
The engine is not in Particulate Filter regeneration mode.
No cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity ≥ 3 mg/stroke
Engine Coolant Temperature > 30 °C
Ambient Air Pressure ≥ 75 kPa(absolute)

Abort Conditions (any active):
Fuel quantity Balancing Control is not in a closed-loop operating mode.
The engine is in Particulate Filter regeneration mode.
One or more cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity < 3 mg/stroke
Engine Coolant Temperature ≤ 30 °C
Ambient Air Pressure < 75 kPa(absolute)

Malfunction Thresholds (all active):
Cylinder number 1 Fuel Balance Control Correction Quantity > RefTable27

245. P0266-SE7473: Engine Cylinder 2 Fuel Injection Quantity - Data Erratic, Intermittent, or Incorrect

The Fuel Balance Control correction quantity for cylinder number 2 is within a calibratable offset of its limit.

Monitor Operation:	
DTC	P0266-SE7473
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Fuel quantity Balancing Control is in a closed-loop operating mode.
The engine is not in Particulate Filter regeneration mode.
No cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity ≥ 3 mg/stroke
Engine Coolant Temperature > 30 °C
Ambient Air Pressure ≥ 75 kPa(absolute)

Abort Conditions (any active):
Fuel quantity Balancing Control is not in a closed-loop operating mode.
The engine is in Particulate Filter regeneration mode.
One or more cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity < 3 mg/stroke
Engine Coolant Temperature ≤ 30 °C
Ambient Air Pressure < 75 kPa(absolute)

Malfunction Thresholds (all active):
Cylinder number 2 Fuel Balance Control Correction Quantity > RefTable27

246. P0269-SE7480: Engine Cylinder 3 Fuel Injection Quantity - Data Erratic, Intermittent, or Incorrect

The Fuel Balance Control correction quantity for cylinder number 3 is within a calibratable offset of its limit.

Monitor Operation:	
DTC	P0269-SE7480
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Fuel quantity Balancing Control is in a closed-loop operating mode.
The engine is not in Particulate Filter regeneration mode.
No cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity ≥ 3 mg/stroke
Engine Coolant Temperature > 30 °C
Ambient Air Pressure ≥ 75 kPa(absolute)

Abort Conditions (any active):
Fuel quantity Balancing Control is not in a closed-loop operating mode.
The engine is in Particulate Filter regeneration mode.
One or more cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity < 3 mg/stroke
Engine Coolant Temperature ≤ 30 °C
Ambient Air Pressure < 75 kPa(absolute)

Malfunction Thresholds (all active):
Cylinder number 3 Fuel Balance Control Correction Quantity > RefTable27

247. P0272-SE7477: Engine Cylinder 4 Fuel Injection Quantity - Data Erratic, Intermittent, or Incorrect

The Fuel Balance Control correction quantity for cylinder number 4 is within a calibratable offset of its limit.

Monitor Operation:	
DTC	P0272-SE7477
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Fuel quantity Balancing Control is in a closed-loop operating mode.
The engine is not in Particulate Filter regeneration mode.
No cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity ≥ 3 mg/stroke
Engine Coolant Temperature > 30 °C
Ambient Air Pressure ≥ 75 kPa(absolute)

Abort Conditions (any active):
Fuel quantity Balancing Control is not in a closed-loop operating mode.
The engine is in Particulate Filter regeneration mode.
One or more cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity < 3 mg/stroke
Engine Coolant Temperature ≤ 30 °C
Ambient Air Pressure < 75 kPa(absolute)

Malfunction Thresholds (all active):
Cylinder number 4 Fuel Balance Control Correction Quantity > RefTable27

248. P0275-SE7478: Engine Cylinder 5 Fuel Injection Quantity - Data Erratic, Intermittent, or Incorrect

The Fuel Balance Control correction quantity for cylinder number 5 is within a calibratable offset of its limit.

Monitor Operation:	
DTC	P0275-SE7478
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Fuel quantity Balancing Control is in a closed-loop operating mode.
The engine is not in Particulate Filter regeneration mode.
No cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity ≥ 3 mg/stroke
Engine Coolant Temperature > 30 °C
Ambient Air Pressure ≥ 75 kPa(absolute)

Abort Conditions (any active):
Fuel quantity Balancing Control is not in a closed-loop operating mode.
The engine is in Particulate Filter regeneration mode.
One or more cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity < 3 mg/stroke
Engine Coolant Temperature ≤ 30 °C
Ambient Air Pressure < 75 kPa(absolute)

Malfunction Thresholds (all active):
Cylinder number 5 Fuel Balance Control Correction Quantity > RefTable27

249. P0278-SE7479: Engine Cylinder 6 Fuel Injection Quantity - Data Erratic, Intermittent, or Incorrect

The Fuel Balance Control correction quantity for cylinder number 6 is within a calibratable offset of its limit.

Monitor Operation:	
DTC	P0278-SE7479
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Fuel quantity Balancing Control is in a closed-loop operating mode.
The engine is not in Particulate Filter regeneration mode.
No cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity ≥ 3 mg/stroke
Engine Coolant Temperature > 30 °C
Ambient Air Pressure ≥ 75 kPa(absolute)

Abort Conditions (any active):
Fuel quantity Balancing Control is not in a closed-loop operating mode.
The engine is in Particulate Filter regeneration mode.
One or more cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity < 3 mg/stroke
Engine Coolant Temperature ≤ 30 °C
Ambient Air Pressure < 75 kPa(absolute)

Malfunction Thresholds (all active):
Cylinder number 6 Fuel Balance Control Correction Quantity > RefTable27

250. P0281-SE7475: Engine Cylinder 7 Fuel Injection Quantity - Data Erratic, Intermittent, or Incorrect

The Fuel Balance Control correction quantity for cylinder number 7 is within a calibratable offset of its limit.

Monitor Operation:	
DTC	P0281-SE7475
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Fuel quantity Balancing Control is in a closed-loop operating mode.
The engine is not in Particulate Filter regeneration mode.
No cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity ≥ 3 mg/stroke
Engine Coolant Temperature > 30 °C
Ambient Air Pressure ≥ 75 kPa(absolute)

Abort Conditions (any active):
Fuel quantity Balancing Control is not in a closed-loop operating mode.
The engine is in Particulate Filter regeneration mode.
One or more cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity < 3 mg/stroke
Engine Coolant Temperature ≤ 30 °C
Ambient Air Pressure < 75 kPa(absolute)

Malfunction Thresholds (all active):
Cylinder number 7 Fuel Balance Control Correction Quantity > RefTable27

251. P0284-SE7476: Engine Cylinder 8 Fuel Injection Quantity - Data Erratic, Intermittent, or Incorrect

The Fuel Balance Control correction quantity for cylinder number 8 is within a calibratable offset of its limit.

Monitor Operation:	
DTC	P0284-SE7476
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Fuel quantity Balancing Control is in a closed-loop operating mode.
The engine is not in Particulate Filter regeneration mode.
No cylinders have been switched off due to limp-home or engine shut-off.
Fuel Injection Quantity ≥ 3 mg/stroke
Engine Coolant Temperature > 30 °C
Ambient Air Pressure ≥ 75 kPa(absolute)

Abort Conditions (any active):
Fuel quantity Balancing Control is not in a closed-loop operating mode.
The engine is in Particulate Filter regeneration mode.
One or more cylinders have been switched off due to limp-home or engine shut-off
Fuel Injection Quantity < 3 mg/stroke
Engine Coolant Temperature ≤ 30 °C
Ambient Air Pressure < 75 kPa(absolute)

Malfunction Thresholds (all active):
Cylinder number 8 Fuel Balance Control Correction Quantity > RefTable27

252. U11C1-SE7156: Aftertreatment Diesel Exhaust Fluid Controller - Received Network Data in Error

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) has detected its Internal Dataset is Invalid.

Monitor Operation:	
DTC	U11C1-SE7156
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0 sec
MIL Activation Criteria	1 trip

Abort Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V during startup sequence.

Malfunction Thresholds (all active):
The Flange Controller (FCU) has detected that the Internal Dataset Checksum does not match the expected value

253. U040F-SE7150: Aftertreatment Diesel Exhaust Fluid Controller - Root Cause Not Known

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) has detected a requested operation state out of sequence, which is an Implausible State Request from the ECM.

Monitor Operation:	
DTC	U040F-SE7150
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) has detected an Engine Control Module (ECM) SAE Aftertreatment 1 SCR Dosing System Requests 1 (PGN 61476) message that is out of sequence.

254. U040F-SE7149: Aftertreatment Diesel Exhaust Fluid Controller - Root Cause Not Known

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) has detected missing control messages from the ECM.

Monitor Operation:	
DTC	U040F-SE7149
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Control Unit (FCU) has not received the SAE Aftertreatment 1 SCR Dosing System Requests 1 (PGN 61476) message from the Engine Control Module (ECM)
OR
The FCU has not received the SAE Aftertreatment 1 SCR Dosing System Requests 2 (PGN 64832) message from the Engine Control Module (ECM)
OR
The FCU has not received the SAE Ambient Conditions (PGN 65269) message from the Engine Control Module (ECM)
OR
The FCU has not received the Diagnostic Override (PGN 65353) message from the Engine Control Module (ECM)

255. P21C4-SE7891: Aftertreatment Diesel Exhaust Fluid Line Heater Relay - Voltage Above Normal or Shorted to High Source

Flange Control Unit (FCU) Heater power supply is open or shorted to high voltage source.

Monitor Operation:	
DTC	P21C4-SE7891
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Keyswitch has been Off for 10 seconds
The Flange Control Unit continues to communicate with the Engine Control Unit for 10 seconds after key off
This diagnostic has not previously completed during this key cycle

Abort Conditions (any active):
Keyswitch is ON

Malfunction Thresholds (all active):
the Flange Control Unit (FCU) Heater voltage is below operational range condition (See RefCond0033.) has not occurred

256. P20B8-SE7100: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit 1 Heater Circuit - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Heater Input Power Source voltage to the Flange Controller Unit (FCU) is in excess of an allowable value.

Monitor Operation:	
DTC	P20B8-SE7100
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	32 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The Keyswitch is ON.
The Engine is not in a Cranking mode.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Heater Input Power Source voltage to the Flange Controller Unit (FCU) ≥ 16 V

257. P20B7-SE7217: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit 1 Heater Circuit - Voltage Below Normal or Shorted to Low Source

The Engine Control Module (ECM) has detected the Heater Input Power Source Voltage to the Flange Controller Unit (FCU) is below an allowable value.

Monitor Operation:	
DTC	P20B7-SE7217
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	62 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The Keyswitch is ON.
The Engine is not in a Cranking mode.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Heater Input Power Source Voltage to the Flange Controller Unit (FCU) < 8.99 V

258. P20BC-SE7145: Aftertreatment 1 Diesel Exhaust Fluid Line Heater 1 Circuit - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Line Heater current is above an allowable limit.

Monitor Operation:	
DTC	P20BC-SE7145
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	16 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The FCU Diesel Exhaust Fluid Line Heater is active.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Line Heater current ≥ 4 A

259. P20B9-SE7144: Aftertreatment 1 Diesel Exhaust Fluid Line Heater 1 Circuit - Current Below Normal or Open Circuit

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Line Heater current is below an allowable limit.

Monitor Operation:	
DTC	P20B9-SE7144
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	16 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The FCU Diesel Exhaust Fluid Line Heater is active.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Line Heater current < 1 A
The DEF line heater current > 0 A

260. P20B9-SE7143: Aftertreatment 1 Diesel Exhaust Fluid Line Heater 1 Circuit - Current Below Normal or Open Circuit

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Line Heater has an open circuit.

Monitor Operation:	
DTC	P20B9-SE7143
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	12 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Diesel Exhaust Fluid (DEF) Line Heater is active and the Flange Control Unit (FCU) detects that the Line Heater current < 1 A
The DEF Line Heater becomes inactive and the FCU detects that the switching Line Heater High Side driver voltage > 70 % of the heater supply.
The DEF Line Heater is inactive and the FCU detects that the switching Line Heater Low Side driver voltage < 30% of the heater supply.

261. P20BC-SE7139: Aftertreatment 1 Diesel Exhaust Fluid Line Heater 1 Circuit - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Line Heater has a short circuit between the positive and negative heater circuit.

Monitor Operation:	
DTC	P20BC-SE7139
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.9 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The FCU Diesel Exhaust Fluid Line Heater is active.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
(The Diesel Exhaust Fluid (DEF) Line Heating is active and the Flange Control Unit (FCU) detects the Line Heater Low Side Driver current > 55.2 A
OR
The DEF Line Heating is active and the Flange Control Unit (FCU) detects the Line Heater High Side Driver current > 12A)
AND
The DEF Line Heater becomes inactive and the Line Heater High Side Driver voltage < 70% of the switching heater supply voltage
AND
The DEF Line Heater becomes inactive and the Line Heater Low Side Driver voltage < 70% of the switching heater supply voltage
AND
The DEF Line Heating becomes inactive and the FCU detects the Line Heater High and Low Side Driver voltage > 30 % of the Switching Heater Supply voltage.

262. P20BC-SE7140: Aftertreatment 1 Diesel Exhaust Fluid Line Heater 1 Circuit - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Line Heater has a short circuit to the battery.

Monitor Operation:	
DTC	P20BC-SE7140
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	12 sec
MIL Activation Criteria	2 trips

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
(The Diesel Exhaust Fluid (DEF) Line Heater is active and the Line Heater High Side Driver current > 12 A
OR
The DEF Line Heater is active and the Line Heater Low Side Driver current > 55.2 A
OR
The DEF Line Heater is active and the Line Heater Current is < 5A)
AND
(The DEF Line Heater becomes inactive and the Line Heater High Side Driver voltage > 70% of the switching heater supply voltage
OR
The DEF Line Heater becomes inactive and the Line Heater Low Side Driver voltage ≥ 70% of the switching heater supply voltage)

263. P20BB-SE7142: Aftertreatment 1 Diesel Exhaust Fluid Line Heater 1 Circuit - Voltage Below Normal or Shorted to Low Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Line Heater has a short circuit to ground.

Monitor Operation:	
DTC	P20BB-SE7142
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	12 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Diesel Exhaust Fluid (DEF) Line Heating is active and the Flange Control Unit (FCU) detects the Line Heater current > 15 A
The DEF Line Heating becomes inactive and the FCU detects the Line Heater Low or High Side Driver voltage < 30 % of the Switching Heater Supply voltage.

264. P208D-SE7598: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Brushless Direct Current (BLDC) Motor Driver temperature is above an allowable limit.

Monitor Operation:	
DTC	P208D-SE7598
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Motor is On
OR
The FCU Diesel Exhaust Fluid Tank Heater is active, as disclosed in AECD 13-3.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Brushless Direct Current (BLDC) Motor Driver temperature ≥ 130 °C
The FCU DEF Tank Heater Driver temperature - FCU Pump BLDC Motor Driver temperature ≤ 30 °C

265. P204A-SE7129: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit - Mechanical System Not Responding or Out of Adjustment

The Engine Control Module (ECM) has detected that the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump is stuck.

Monitor Operation:	
DTC	P204A-SE7129
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Motor is commanded On.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Control Unit (FCU) has requested the Diesel Exhaust Fluid (DEF) Pump to rotate and has detected the pump motor will not rotate

266. P208A-SE7127: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit - Current Below Normal or Open Circuit

The Engine Control Module (ECM) has detected that any of the 3 Brushless Direct Current (DC) Motor phases, within the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) pump, has an open circuit condition.

Monitor Operation:	
DTC	P208A-SE7127
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	11 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
(The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Brushless Direct Current (BLDC) Motor is turning forward or reverse
AND
Any of the DEF Pump BLDC Motor Driver phase current is ≤ 0.5 A
AND
The DEF Pump BLDC Motor is turning ≤ 500RPM)
OR
(The DEF Pump is in heating mode
AND
The DEF Pump BLDC Motor current is ≤ 1.5A)
OR
(The DEF Pump BLDC Motor is not active
AND
Any of the DEF Pump BLDC Motor Driver phase voltage is ≤ 7V)

267. P208D-SE7599: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Brushless Direct Current (BLDC) Motor Driver current is above an allowable limit.

Monitor Operation:	
DTC	P208D-SE7599
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	13 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Motor is commanded On.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
(The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Brushless DC (BLDC) Motor is turning forward or reverse
AND
The DEF Pump BLDC Motor Driver current ≥ 3A)
OR
(The DEF Pump BLDC Motor is in heating mode
AND
The Pump BLDC Motor Driver current ≥ 10.6A)

268. P204A-SE7128: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit - Mechanical System Not Responding or Out of Adjustment

The Engine Control Module (ECM) has detected that there is a short circuit between any 2 of the 3 Brushless Direct Current (BLDC) Motor Phases, within the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump.

Monitor Operation:	
DTC	P204A-SE7128
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	11 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
(The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Brushless Direct Current (BLDC) Motor is active turning forward or reverse
AND
One of the DEF Pump 3 BLDC Motor Driver Phase current is ≥ 13.6 A
AND
The DEF Pump BLDC Motor becomes inactive and voltage is applied to the suspected DEF Pump BLDC Motor phase high and low side driver
AND
The suspect DEF Pump BLDC Motor Driver current ≤ 13.6A)
OR
(The DEF pump is in heating mode
AND
One of the DEF pump 3 brushless DC driver phase is ≥ 13.6 A
AND
The pump heating is stopped and voltage is applied to the suspected DEF Pump BLDC Motor phase high and low side driver
AND
The suspect DEF Pump BLDC Motor Driver phase current is ≤ 13.6A)
OR
(The DEF pump brushless motor is not turning
AND
Any of the DEF pump 3 brushless DC driver phase is ≤ 7A)

269. P208D-SE7125: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected that any of the 3 Brushless Direct Current (BLDC) Motor Phases, within the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump, has a voltage in excess of an allowable value.

Monitor Operation:	
DTC	P208D-SE7125
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	11 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
(The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Brushless Direct Current (BLDC) Motor is turning forward or reverse
AND
Any of the DEF Pump BLDC Motor Driver Phase current is ≥ 13.6 A
AND
The DEF Pump BLDC Motor becomes inactive and voltage is applied to the suspected DEF Pump BLDC Motor phase high and low side driver
AND
The suspect DEF Pump BLDC Motor Driver current ≥ 13.6A)
OR
(The DEF Pump is in heating mode
AND
Any of the DEF Pump BLDC Motor Driver Phase current is ≥ 13.6A)
OR
(Any DEF Pump BLDC Motor phase is inactive
AND
Any of the DEF Pump BLDC Motor Driver Phase voltage is ≥ 6V)
OR
(The DEF pump brushless motor is off
AND
Any of the DEF Pump BLDC Motor Driver Phase voltage is ≥ 6V)

270. P208C-SE7126: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit - Voltage Below Normal or Shorted to Low Source

The Engine Control Module (ECM) has detected that any of the 3 Brushless Direct Current (BLDC) Motor Phases, within the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump, has a voltage below an allowable value.

Monitor Operation:	
DTC	P208C-SE7126
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	11 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
(The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump is in heating mode
AND
Any of the DEF Pump Brushless Direct Current (BLDC) Motor High Side Driver Phase current is ≥ 13.6A)
OR
(The DEF Pump BLDC Motor is turning forward or reverse
AND
Any of the DEF Pump BLDC Motor High Side Driver Phase current is ≥ 13.6A)
OR
(Any DEF Pump BLDC Motor phase is inactive
AND
Any of the DEF Pump BLDC Motor Driver Phase voltage is < 1V)
OR
(The DEF Pump BLDC motor is not turning
AND
Any of the DEF Pump BLDC Motor Driver Phase voltage is ≤ 1V)

271. P204A-SE7130: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit - Mechanical System Not Responding or Out of Adjustment

The Engine Control Module (ECM) has detected that the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump cannot maintain the target pressure.

Monitor Operation:	
DTC	P204A-SE7130
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	25 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P20E9-SE7966
P20E8-SE7969
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Motor is commanded On.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
P20E8-SE7969, P20E9-SE7966
AND
(The Flange Control Unit (FCU) has detected the Diesel Exhaust Fluid (DEF) Pressure ≥ 550kPa(gauge))
OR
(The FCU has detected the Diesel Exhaust Fluid (DEF) Pressure ≤ 450 kPa(gauge))

272. P208D-SE7604: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected that the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump is turning the wrong direction.

Monitor Operation:	
DTC	P208D-SE7604
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.4 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) pump is commanded in the reverse direction.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pressure ≥ 30 kPa(gauge)

273. P21CA-SE7106: Aftertreatment Diesel Exhaust Fluid Controller - Data Erratic, Intermittent, or Incorrect

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Internal Sensor Power Supply Ground is in excess of an allowable value.

Monitor Operation:	
DTC	P21CA-SE7106
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.3 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The ground of the Flange Controller Unit (FCU) Internal Sensor Power Supply voltage ≥ 0.2 V

274. P21CA-SE7102: Aftertreatment Diesel Exhaust Fluid Controller - Data Erratic, Intermittent, or Incorrect

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Internal Sensor Power Supply Unit (PSU) voltage is in excess of an allowable value.

Monitor Operation:	
DTC	P21CA-SE7102
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.3 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Internal Sensor Power Supply voltage ≥ 5.16 V

275. P21CA-SE7104: Aftertreatment Diesel Exhaust Fluid Controller - Data Erratic, Intermittent, or Incorrect

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Internal Sensor Power Supply Unit (PSU) voltage is below an allowable value.

Monitor Operation:	
DTC	P21CA-SE7104
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.3 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Internal Sensor Power Supply voltage < 4.83 V

276. P203B-SE7113: Aftertreatment 1 Diesel Exhaust Fluid Tank Level Sensor - Data Erratic, Intermittent, or Incorrect

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) detection of an electrical fault with temperature compensation error with the Diesel Exhaust Fluid (DEF) Tank Level Sensor.

Monitor Operation:	
DTC	P203B-SE7113
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.3 sec
MIL Activation Criteria	2 trips

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Level Sensor voltage > 4.37 V
The FCU DEF Tank Level Sensor voltage ≤ 4.63 V

277. P202C-SE7137: Aftertreatment 1 Diesel Exhaust Fluid Tank Heater - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Heater current is above an allowable limit.

Monitor Operation:	
DTC	P202C-SE7137
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	16 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The FCU Diesel Exhaust Fluid Tank Heater is active, as disclosed in AECD 13-3.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Heater current ≥ 12.9 A

278. P202B-SE7136: Aftertreatment 1 Diesel Exhaust Fluid Tank Heater - Voltage Below Normal or Shorted to Low Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Heater current is below an allowable limit.

Monitor Operation:	
DTC	P202B-SE7136
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	16 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The FCU Diesel Exhaust Fluid Tank Heater is active, as disclosed in AECD 13-3.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Heater current < 5.3 A
The DEF Tank Heater current > 0 A

279. P202B-SE7135: Aftertreatment 1 Diesel Exhaust Fluid Tank Heater - Voltage Below Normal or Shorted to Low Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Heater has an open circuit.

Monitor Operation:	
DTC	P202B-SE7135
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	12 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Diesel Exhaust Fluid (DEF) Tank Heater is active and the Flange Control Unit (FCU) detects that the Tank Heater current < 5 A
The DEF Tank Heater becomes inactive and the FCU detects that the Tank Heater High Side Driver voltage > 70 % of the heater supply voltage.
The DEF Tank Heater is inactive and the FCU detects that the Tank Heater Low Side Driver voltage < 30% of the heater supply voltage.

280. P202C-SE7131: Aftertreatment 1 Diesel Exhaust Fluid Tank Heater - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Heater has a short circuit between the positive and negative heater circuit.

Monitor Operation:	
DTC	P202C-SE7131
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.9 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The FCU Diesel Exhaust Fluid Tank Heater is active, as disclosed in AECD 13-3.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
(The Diesel Exhaust Fluid (DEF) tank heating is active and the Flange Control Unit (FCU) detects the tank heater low side driver current > 55.2 A
OR
The DEF tank heating is active and the FCU detects the tank heater high side driver current > 15A)
AND
The DEF Tank Heater becomes inactive and the Tank Heater High Side Driver voltage < 70% of the switching heater supply voltage
AND
The DEF Tank Heater becomes inactive and the Tank Heater Low Side Driver voltage < 70% of the switching heater supply voltage
AND
The DEF Tank Heating becomes inactive and the FCU detects the Tank Heater High and Low Side Driver voltage > 30 % of the switching heater supply voltage

281. P202C-SE7132: Aftertreatment 1 Diesel Exhaust Fluid Tank Heater - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Heater has a short circuit to the battery.

Monitor Operation:	
DTC	P202C-SE7132
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	12 sec
MIL Activation Criteria	2 trips

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
(The Diesel Exhaust Fluid (DEF) Tank Heater is active and the Tank Heater High Side Driver current > 15 A
OR
The Diesel Exhaust Fluid (DEF) Tank Heater is active and the Tank Heater Low Side Driver current > 55.2 A
OR
The DEF Tank Heater is active and the Tank Heater Current is < 5A)
AND
(The DEF Tank Heater becomes inactive and the Tank Heater High Side Driver voltage > 70% of the switching heater supply voltage
OR
The DEF Tank Heater becomes inactive and the Tank Heater Low Side Driver voltage ≥ 70% of the switching heater supply voltage)

282. P202B-SE7134: Aftertreatment 1 Diesel Exhaust Fluid Tank Heater - Voltage Below Normal or Shorted to Low Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Heater has a short circuit to ground.

Monitor Operation:	
DTC	P202B-SE7134
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	12 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Diesel Exhaust Fluid (DEF) Tank Heating is active and the Flange Control Unit (FCU) detects the Tank Heater current > 15 A
The DEF Tank Heating becomes inactive and the FCU detects the Tank Heater High and Low Side Driver voltage < 30 % of the switching heater supply voltage.

283. P202C-SE7138: Aftertreatment 1 Diesel Exhaust Fluid Tank Heater - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Heater Driver temperature is above an allowable limit.

Monitor Operation:	
DTC	P202C-SE7138
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The FCU Diesel Exhaust Fluid Tank Heater is active, as disclosed in AECD 13-3.
OR
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Motor is On

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Heater Driver temperature ≥ 130 °C
The FCU DEF Tank Heater Driver temperature - FCU Pump Motor Driver temperature ≤ 30 °C

284. P203B-SE7112: Aftertreatment 1 Diesel Exhaust Fluid Tank Level Sensor - Data Erratic, Intermittent, or Incorrect

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) detection of an internal critical error with the Diesel Exhaust Fluid (DEF) Tank Level Sensor.

Monitor Operation:	
DTC	P203B-SE7112
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.3 sec
MIL Activation Criteria	2 trips

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Level Sensor voltage ≤ 4.87 V
The FCU DEF Tank Level Sensor voltage > 4.62 V

285. P203D-SE7107: Aftertreatment 1 Diesel Exhaust Fluid Tank Level Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Level Sensor voltage is in excess of an allowable value.

Monitor Operation:	
DTC	P203D-SE7107
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.3 sec
MIL Activation Criteria	2 trips

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Level Sensor voltage ≥ 4.87V (100% DEF tank level)

286. P203C-SE7110: Aftertreatment 1 Diesel Exhaust Fluid Tank Level Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Level Sensor voltage is below an allowable value.

Monitor Operation:	
DTC	P203C-SE7110
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.3 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) tank level sensor voltage < 0.32V (0% DEF tank level)

287. P20E9-SE7120: Aftertreatment 1 Diesel Exhaust Fluid Pressure - Data Valid But Above Normal Operating Range - Moderately Severe Level

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pressure Sensor measures an in-range high pressure.

Monitor Operation:	
DTC	P20E9-SE7120
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.3 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The FCU Internal Pump Rotor stall test has passed.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump has intentionally stopped.
The DEF Pressure Sensor value ≥ 50 kPa(gauge)

288. P20E8-SE7121: Aftertreatment 1 Diesel Exhaust Fluid Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pressure Sensor measures an in-range low pressure.

Monitor Operation:	
DTC	P20E8-SE7121
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The FCU Internal Pump Rotor stall test has passed.

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump has intentionally stopped.
The DEF Pressure Sensor value ≤ -47.5 kPa(gauge)

289. P204D-SE7115: Aftertreatment 1 Diesel Exhaust Fluid Pressure Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pressure sensor voltage is in excess of an allowable value.

Monitor Operation:	
DTC	P204D-SE7115
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.3 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pressure Sensor voltage ≥ 4.62V (900kPa(gauge))

290. P204C-SE7118: Aftertreatment 1 Diesel Exhaust Fluid Pressure Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pressure Sensor voltage is below an allowable value.

Monitor Operation:	
DTC	P204C-SE7118
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.2 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pressure Sensor voltage < 0.45V (-50kPa(gauge))

291. P205D-SE7122: Aftertreatment 1 Diesel Exhaust Fluid Tank Temperature Sensor - Voltage Above Normal or Shorted to High Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Temperature Sensor voltage is in excess of an allowable value.

Monitor Operation:	
DTC	P205D-SE7122
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Temperature Sensor voltage ≥ 4.4V (-40°C)

292. P205C-SE7124: Aftertreatment 1 Diesel Exhaust Fluid Tank Temperature Sensor - Voltage Below Normal or Shorted to Low Source

The Engine Control Module (ECM) has detected the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Temperature Sensor voltage is below an allowable value.

Monitor Operation:	
DTC	P205C-SE7124
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10.3 sec
MIL Activation Criteria	2 trips

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Tank Temperature Sensor voltage < 0.17V (80°C)

293. P21CC-SE7074: Battery 2 Voltage - Data Valid But Above Normal Operating Range - Moderately Severe Level

The Engine Control Module (ECM) has detected the Input Power Source voltage to the Flange Controller Unit (FCU) is in excess of an allowable value.

Monitor Operation:	
DTC	P21CC-SE7074
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	32 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine has been running for > 270 sec this drive cycle.

Malfunction Thresholds (all active):
The Input Power Source voltage to the Flange Controller Unit (FCU) ≥ 16 V

294. P21CB-SE7098: Battery 2 Voltage - Data Valid But Below Normal Operating Range - Moderately Severe Level

The Engine Control Module (ECM) has detected the Input Power Source voltage to the Flange Controller Unit (FCU) is below an allowable value.

Monitor Operation:	
DTC	P21CB-SE7098
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	32 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine has been running for > 270 sec this drive cycle.

Malfunction Thresholds (all active):
The Input Power Supply voltage to the Flange Controller Unit (FCU) < 8.99 V

295. P20E9-SE7966: Aftertreatment 1 Diesel Exhaust Fluid Pressure - Data Valid But Above Normal Operating Range - Moderately Severe Level

The Engine Control Module (ECM) has detected that the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Pressure Control is too high.

Monitor Operation:	
DTC	P20E9-SE7966
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	12 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Motor is On
AND
The DEF Pump Pressure >= 450 kPa (gauge) AND DEF Pump Pressure <= 550 kPa (gauge)

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Control Unit (FCU) has detected the Diesel Exhaust Fluid (DEF) Pressure ≥ 550 kPa(gauge)

296. P20E8-SE7969: Aftertreatment 1 Diesel Exhaust Fluid Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

The Engine Control Module (ECM) has detected that the Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Pressure Control is too low.

Monitor Operation:	
DTC	P20E8-SE7969
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	20 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The Flange Controller Unit (FCU) Diesel Exhaust Fluid (DEF) Pump Motor is On.
AND
The DEF Pump Pressure >= 450 kPa (gauge) AND DEF Pump Pressure <= 550 kPa (gauge)

Pause Conditions (any active):
The Flange Controller Unit (FCU) Battery input voltage < 6.5 V

Malfunction Thresholds (all active):
The Flange Control Unit (FCU) has detected the Diesel Exhaust Fluid (DEF) Pressure ≤ 450 kPa(gauge)

297. P0168-SE2351: Engine Fuel Temperature - Data Valid But Above Normal Operating Range - Moderately Severe Level

Fuel temperature value greater than a calibrated threshold for a calibrated amount of time.

Monitor Operation:	
DTC	P0168-SE2351
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Engine speed > 570 RPM

Malfunction Thresholds (all active):
Fuel Temperature > 80 °C

298. P0461-SE3948: Fuel Level (Main Tank) - Data Erratic, Intermittent, or Incorrect

The fuel level has been under the calibrated low threshold for a longer distance than possible.

Monitor Operation:	
DTC	P0461-SE3948
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
P0501-SE130, P0501-SE4361, U0402-SE4921, U1000-SE4924, U1000-SE4928

Abort Conditions (any active):
P0462-SE3947, P0463-SE3946, U0002-SE3232, U1000-SE4926, U1000-SE4929

Pause Conditions (any active):
P0501-SE130, P0501-SE4361, U0402-SE4921, U1000-SE4924, U1000-SE4928

Malfunction Thresholds (all active):
Vehicle has traveled for at least 192.625 miles while Fuel level < 14.898 %

299. P0463-SE3946: Fuel Level (Main Tank) Sensor Circuit - Voltage Above Normal or Shorted to High Source

The analog or the datalink fuel level sensor output signal voltage was higher than expected.

Monitor Operation:	
DTC	P0463-SE3946
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	70 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
U0002-SE3232, U1000-SE4926, U1000-SE4929

Abort Conditions (any active):
U0002-SE3232, U1000-SE4926, U1000-SE4929

Malfunction Thresholds (all active):
Fuel level sensor voltage > 4.302 V

300. P0462-SE3947: Fuel Level (Main Tank) Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The fuel level sensor output signal voltage was lower than expected

Monitor Operation:	
DTC	P0462-SE3947
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	70 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
U0002-SE3232, U1000-SE4926, U1000-SE4929

Abort Conditions (any active):
U0002-SE3232, U1000-SE4926, U1000-SE4929

Malfunction Thresholds (all active):
Fuel level sensor voltage < 0.122 V

301. P2540-SE10364: Fuel Delivery Pressure - Data Erratic, Intermittent, or Incorrect

The Fuel Pump Inlet Pressure is greater than or equal to a calibrated threshold for a calibrated amount of time at the expiration of a calibrated delay time.

Monitor Operation:	
DTC	P2540-SE10364
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	60 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
The Fuel Lift Pump is OFF

Abort Conditions (any active):
P2541-SE6554, P2542-SE6553

Malfunction Thresholds (all active):
Fuel Pump Inlet Pressure >= 7 bar for 1 secs at the expiration of a sensor rationality check delay time of 60 secs

302. P2540-SE10365: Fuel Delivery Pressure - Data Erratic, Intermittent, or Incorrect

The Fuel Pump Inlet Pressure is less than a calibrated threshold for a calibrated amount of time at the expiration of a calibrated delay time.

Monitor Operation:	
DTC	P2540-SE10365
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	60 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
The Fuel Lift Pump is OFF for the entire Sensor Rationality Check delay time of 60 secs

Abort Conditions (any active):
P2541-SE6554, P2542-SE6553

Malfunction Thresholds (all active):
Fuel Pump Inlet Pressure < 0.5 bar for 1 secs at the expiration of a sensor rationality check delay time of 60 secs

303. P008A-SE6552: Engine Fuel Delivery Pressure - Data Valid But Below Normal Operating Range - Least Severe Level

The integrated severity value of the Actual Fuel Pump Inlet Pressure minus the Fuel Pressure threshold reaches a severity threshold.

Monitor Operation:	
DTC	P008A-SE6552
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Fuel Level ≥ 14.898 %
AND
The Fuel Lift Pump has been running for at least a minimum calibratable time interpolated from RefTable29

Abort Conditions (any active):
P2541-SE6554, P2542-SE6553

Malfunction Thresholds (all active):
A severity value of Fuel Pump Inlet Pressure minus 4.5 bar is interpolated from RefTable31. The accumulated severity reaches 500 secs.

304. P2542-SE6553: Fuel Delivery Pressure Sensor Circuit - Voltage Above Normal or Shorted to High Source

Fuel Supply Pressure sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P2542-SE6553
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Fuel Supply Pressure Sensor value > 4.835 V (24.13 bar Absolute)

305. P2541-SE6554: Fuel Delivery Pressure Sensor Circuit - Voltage Below Normal or Shorted to Low Source

Fuel Supply Pressure sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P2541-SE6554
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	3 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Fuel Supply Pressure Sensor value < 0.155 V (0 bar Absolute)

306. P008A-SE8269: Engine Fuel Delivery Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

The integrated severity value of the Actual Fuel Pump Inlet Pressure minus the Fuel Pressure threshold has reached a severity threshold for a calibratable number of consecutive key cycles, severe torque derate will be performed.

Monitor Operation:	
DTC	P008A-SE8269
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
A severity value of Fuel Pump Inlet Pressure minus 4.5 bar is interpolated from RefTable31. The accumulated severity reaches 500 seconds on 5 consecutive key cycles.

307. P0193-SE1402: Injector Metering Rail 1 Pressure Sensor Circuit - Voltage Above Normal or Shorted to High Source

Fuel Rail Pressure sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0193-SE1402
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1.4 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0652-SE225, P0653-SE243

Malfunction Thresholds (all active):
Fuel Rail Pressure Sensor Value > 4,810 mV (2,200 bar absolute

308. P0192-SE1403: Injector Metering Rail 1 Pressure Sensor Circuit - Voltage Below Normal or Shorted to Low Source

Fuel Rail Pressure sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0192-SE1403
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1.4 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0652-SE225, P0653-SE243

Malfunction Thresholds (all active):
Fuel Rail Pressure Sensor Value < 189 mV (0 bar absolute

309. P0191-SE4713: Injector Metering Rail 1 Pressure - Data Erratic, Intermittent, or Incorrect

Fuel Rail Pressure sensor reading greater than specified operating range for a calibrated amount of time at Key-on OR at Key-off.

Monitor Operation:	
DTC	P0191-SE4713
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.03 sec at Key-on 0.1 sec at Key-off.
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0016-SE5202, P009C-SE4715, P0117-SE76, P0118-SE75, P0192-SE1403, P0193-SE1402, P0335-SE4372, P0335-SE6886, P0340-SE3392, P0340-SE4499, P0606-SE7489, P0652-SE225, P0653-SE243
Engine shut-off timer at key on ≥ 3 sec
The engine has not yet moved at key on.
Engine Coolant temperature at Key On ≥ -7 °C
Engine speed reaches zero at key off.
Fuel temperature at key off > -7 °C
At key off, the engine has already run in the current driving cycle.
The Pressure Control Valve [PCV] is open at key off. This implies that the current flowing through the PCV ≤ 0.5 A
Delay Time for offset monitoring of rail pressure sensor at key off = RefTable32 , based on current rail pressure

Malfunction Thresholds (all active):
Rail Pressure Sensor value at Key-on > 0.609 V (59.965 bar(absolute))
OR
The delay time after all enable conditions are satisfied is greater than a calculated threshold at key off. This threshold is calculated from the delay time map for rail pressure sensor offset monitoring based on fuel rail pressure.
AND
Rail Pressure Sensor value at Key-off > 0.609 V (59.965 bar(absolute))

310. P0191-SE6941: Injector Metering Rail 1 Pressure - Data Erratic, Intermittent, or Incorrect

Fuel Rail Pressure sensor reading less than specified operating range for a calibrated amount of time at Key-on OR at Key-off.

Monitor Operation:	
DTC	P0191-SE6941
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.03 sec at Key-on OR 0.1 sec at Key-off
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0016-SE5202, P009C-SE4715, P0117-SE76, P0118-SE75, P0192-SE1403, P0193-SE1402, P0335-SE4372, P0335-SE6886, P0340-SE3392, P0340-SE4499, P0606-SE7489, P0652-SE225, P0653-SE243
Engine shut-off timer at key on ≥ 3 sec
Engine Coolant temperature at Key On ≥ -7 °C
The engine has not yet moved at key on.
Engine speed reaches zero at key off.
Fuel temperature at key off > -7 °C
At key off, the engine has already run in the current driving cycle.
The Pressure Control Valve [PCV] is open at key off. This implies that the current flowing through the PCV ≤ 0.5 A
Delay Time for offset monitoring of rail pressure sensor at key off = RefTable32 , based on current rail pressure

Malfunction Thresholds (all active):
Rail Pressure Sensor value at Key-on < 0.424 V (0 bar absolute
OR
The delay time after all enable conditions are satisfied is greater than a calculated threshold at key off. This threshold is calculated from the delay time map for rail pressure sensor offset monitoring based on fuel rail pressure.
AND
Rail Pressure Sensor value at Key-off < 0.424 V (0 bar absolute

311. P0181-SE10097: Engine Fuel Temperature - Data Erratic, Intermittent, or Incorrect

The difference between Fuel Temperature and Ambient Air Temperature sensor readings is greater than a calibrated threshold for a calibrated amount of time.

Monitor Operation:	
DTC	P0181-SE10097
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	30 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Vehicle Speed > 3.107 mph for 300 sec
If Fuel Level Sensor is present and not malfunctioning, Fuel Level >= 14.898 %.
Ambient Air Temperature ≥ -6.7 °C

Abort Conditions (any active):
P0182-SE1024, P0183-SE1023
P0501-SE130, P0501-SE4361
P1191-SE4190, P1192-SE484, P1193-SE486
P0102-SE3207, P0103-SE3206
Vehicle Speed ≤ 3.107 mph
If Fuel Level Sensor is present and not malfunctioning, Fuel Level < 14.898 %.
Ambient Air Temperature < -6.7 °C

Malfunction Thresholds (all active):
Fuel Temperature - Ambient Air Temperature > 45 °C

312. P0184-SE10098: Engine Fuel Temperature - Data Valid But Below Normal Operating Range - Moderately Severe Level

The difference between Fuel Temperature and Ambient Air Temperature sensor readings falls below a calibrated threshold for a calibrated amount of time

Monitor Operation:	
DTC	P0184-SE10098
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	30 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Vehicle Speed > 3.107 mph for 300 sec
If Fuel Level Sensor is present and not malfunctioning, Fuel Level >= 14.898 %.
Ambient Air Temperature ≥ -6.7 °C

Abort Conditions (any active):
P0182-SE1024, P0183-SE1023
P0501-SE130, P0501-SE4361
P1191-SE4190, P1192-SE484, P1193-SE486
P0102-SE3207, P0103-SE3206
Vehicle Speed ≤ 3.107 mph
If Fuel Level Sensor is present and not malfunctioning, Fuel Level < 14.898 %.
Ambient Air Temperature < -6.7 °C

Malfunction Thresholds (all active):
Fuel Temperature - Ambient Air Temperature < -38 °C

313. P0183-SE1023: Engine Fuel Temperature Sensor 1 Circuit - Voltage Above Normal or Shorted to High Source

Fuel Temperature sensor reading is greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0183-SE1023
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Fuel Temperature Sensor value > 4.979 V (< -40 degC)

314. P0182-SE1024: Engine Fuel Temperature Sensor 1 Circuit - Voltage Below Normal or Shorted to Low Source

Fuel Temperature sensor reading is lower than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0182-SE1024
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Fuel Temperature Sensor value < 0.089 V (> 150 degC)

315. P066A-SE4074: Glow Plug Heater Circuit #1 - Voltage Below Normal or Shorted to Low Source

Glow Plug 1 Circuit Voltage is Out of Range Low or Shorted to Ground Resulting in Too High of a Current.

Monitor Operation:	
DTC	P066A-SE4074
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.1 OR 0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current ≥ 41 A
OR
Current ≥ 90 A

316. P066B-SE9446: Glow Plug Heater Circuit #1 - Voltage Above Normal or Shorted to High Source

Glow Plug 1 Circuit Voltage is Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error has been detected.

Monitor Operation:	
DTC	P066B-SE9446
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
(Voltage > 0.6
* Vbatt
AND
MOSFET is Commanded Off)
OR
(Voltage < 0.6
* Vbatt
AND
MOSFET is Commanded On)

317. P0671-SE9437: Glow Plug Heater Circuit #1 - Current Below Normal or Open Circuit

Glow Plug 1 Circuit Current is Out of Range Low resulting from an Open Circuit

Monitor Operation:	
DTC	P0671-SE9437
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.6 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current < 1.374 A

318. P06E5-SE9455: Glow Plug Control Module - Root Cause Not Known

Glow Plug 1 circuit diagnostics have not made a decision

Monitor Operation:	
DTC	P06E5-SE9455
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostics on glow plug 1 circuit to detect the following: 1) Voltage Out of Range Low or Shorted to Ground Resulting in Too High of a Current 2) Voltage Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error 3) Current Out of Range Low resulting from an Open Circuit has not completed.

319. P06B9-SE9472: Engine Glow Plug 1 - Data Erratic, Intermittent, or Incorrect

Glow Plug 1 circuit current is too low, but not low enough to be detected as an open circuit. Therefore the resistance of the glow plug has increased and is now outside of the acceptable range of resistance for a glow plug.

Monitor Operation:	
DTC	P06B9-SE9472
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation
Engine Speed < 850 RPM
Net Engine Torque < 80 Nm
Circuit Potential Change < 2.116 V/sec
Coolant Temperature > 5 °C

Malfunction Thresholds (all active):
Current > 1.374 A
&
Current < RefTable33 A

320. P066C-SE4075: Glow Plug Heater Circuit #2 - Voltage Below Normal or Shorted to Low Source

Glow Plug 2 Circuit Voltage is Out of Range Low or Shorted to Ground Resulting in Too High of a Current.

Monitor Operation:	
DTC	P066C-SE4075
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.1 OR 0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current ≥ 41 A
OR
Current ≥ 90 A

321. P066D-SE9447: Glow Plug Heater Circuit #2 - Voltage Above Normal or Shorted to High Source

Glow Plug 2 Circuit Voltage is Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error has been detected.

Monitor Operation:	
DTC	P066D-SE9447
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
(Voltage > 0.6
* Vbatt
AND
MOSFET is Commanded Off)
OR
(Voltage < 0.6
* Vbatt
AND
MOSFET is Commanded On)

322. P0672-SE9439: Glow Plug Heater Circuit #2 - Current Below Normal or Open Circuit

Glow Plug 2 Circuit Current is Out of Range Low resulting from an Open Circuit

Monitor Operation:	
DTC	P0672-SE9439
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.6 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current < 1.374 A

323. P06E5-SE9456: Glow Plug Control Module - Root Cause Not Known

Glow Plug 2 circuit diagnostics have not made a decision

Monitor Operation:	
DTC	P06E5-SE9456
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostics on glow plug 2 circuit to detect the following: 1) Voltage Out of Range Low or Shorted to Ground Resulting in Too High of a Current 2) Voltage Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error 3) Current Out of Range Low resulting from an Open Circuit has not completed.

324. P06BA-SE9473: Engine Glow Plug 2 - Data Erratic, Intermittent, or Incorrect

Glow Plug 2 circuit current is too low, but not low enough to be detected as an open circuit. Therefore the resistance of the glow plug has increased and is now outside of the acceptable range of resistance for a glow plug.

Monitor Operation:	
DTC	P06BA-SE9473
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation
Engine Speed < 850 RPM
Net Engine Torque < 80 Nm
Circuit Potential Change < 2.116 V/sec
Coolant Temperature > 5 °C

Malfunction Thresholds (all active):
Current > 1.374 A
&
Current < RefTable33 A

325. P066E-SE4076: Glow Plug Heater Circuit #3 - Voltage Below Normal or Shorted to Low Source

Glow Plug 3 Circuit Voltage is Out of Range Low or Shorted to Ground Resulting in Too High of a Current.

Monitor Operation:	
DTC	P066E-SE4076
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.1 OR 0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current ≥ 41 A
OR
Current ≥ 90 A

326. P066F-SE9449: Glow Plug Heater Circuit #3 - Voltage Above Normal or Shorted to High Source

Glow Plug 3 Circuit Voltage is Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error has been detected.

Monitor Operation:	
DTC	P066F-SE9449
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
(Voltage > 0.6
* Vbatt
AND
MOSFET is Commanded Off)
OR
(Voltage < 0.6
* Vbatt
AND
MOSFET is Commanded On)

327. P0673-SE9440: Glow Plug Heater Circuit #3 - Current Below Normal or Open Circuit

Glow Plug 3 Circuit Current is Out of Range Low resulting from an Open Circuit

Monitor Operation:	
DTC	P0673-SE9440
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.6 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current < 1.374 A

328. P06E5-SE9457: Glow Plug Control Module - Root Cause Not Known

Glow Plug 3 circuit diagnostics have not made a decision

Monitor Operation:	
DTC	P06E5-SE9457
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostics on glow plug 3 circuit to detect the following: 1) Voltage Out of Range Low or Shorted to Ground Resulting in Too High of a Current 2) Voltage Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error 3) Current Out of Range Low resulting from an Open Circuit has not completed.

329. P06BB-SE9474: Engine Glow Plug 3 - Data Erratic, Intermittent, or Incorrect

Glow Plug 3 circuit current is too low, but not low enough to be detected as an open circuit. Therefore the resistance of the glow plug has increased and is now outside of the acceptable range of resistance for a glow plug.

Monitor Operation:	
DTC	P06BB-SE9474
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation
Engine Speed < 850 RPM
Net Engine Torque < 80 Nm
Circuit Potential Change < 2.116 V/sec
Coolant Temperature > 5 °C

Malfunction Thresholds (all active):
Current > 1.374 A
&
Current < RefTable33 A

330. P067A-SE4077: Glow Plug Heater Circuit #4 - Voltage Below Normal or Shorted to Low Source

Glow Plug 4 Circuit Voltage is Out of Range Low or Shorted to Ground Resulting in Too High of a Current.

Monitor Operation:	
DTC	P067A-SE4077
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.1 OR 0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current ≥ 41 A
OR
Current ≥ 90 A

331. P067B-SE9450: Glow Plug Heater Circuit #4 - Voltage Above Normal or Shorted to High Source

Glow Plug 4 Circuit Voltage is Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error has been detected.

Monitor Operation:	
DTC	P067B-SE9450
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
(Voltage > 0.6
* Vbatt
AND
MOSFET is Commanded Off)
OR
(Voltage < 0.6
* Vbatt
AND
MOSFET is Commanded On)

332. P0674-SE9441: Glow Plug Heater Circuit #4 - Current Below Normal or Open Circuit

Glow Plug 4 Circuit Current is Out of Range Low resulting from an Open Circuit

Monitor Operation:	
DTC	P0674-SE9441
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.6 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current < 1.374 A

333. P06E5-SE9458: Glow Plug Control Module - Root Cause Not Known

Glow Plug 4 circuit diagnostics have not made a decision

Monitor Operation:	
DTC	P06E5-SE9458
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostics on glow plug 4 circuit to detect the following: 1) Voltage Out of Range Low or Shorted to Ground Resulting in Too High of a Current 2) Voltage Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error 3) Current Out of Range Low resulting from an Open Circuit has not completed.

334. P06BC-SE9476: Engine Glow Plug 4 - Data Erratic, Intermittent, or Incorrect

Glow Plug 4 circuit current is too low, but not low enough to be detected as an open circuit. Therefore the resistance of the glow plug has increased and is now outside of the acceptable range of resistance for a glow plug.

Monitor Operation:	
DTC	P06BC-SE9476
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation
Engine Speed < 850 RPM
Net Engine Torque < 80 Nm
Circuit Potential Change < 2.116 V/sec
Coolant Temperature > 5 °C

Malfunction Thresholds (all active):
Current > 1.374 A
&
Current < RefTable33 A

335. P067C-SE4078: Glow Plug Heater Circuit #5 - Voltage Below Normal or Shorted to Low Source

Glow Plug 5 Circuit Voltage is Out of Range Low or Shorted to Ground Resulting in Too High of a Current.

Monitor Operation:	
DTC	P067C-SE4078
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.1 OR 0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current ≥ 41 A
OR
Current ≥ 90 A

336. P067D-SE9451: Glow Plug Heater Circuit #5 - Voltage Above Normal or Shorted to High Source

Glow Plug 5 Circuit Voltage is Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error has been detected.

Monitor Operation:	
DTC	P067D-SE9451
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
(Voltage > 0.6
* Vbatt
AND
MOSFET is Commanded Off)
OR
(Voltage < 0.6
* Vbatt
AND
MOSFET is Commanded On)

337. P0675-SE9442: Glow Plug Heater Circuit #5 - Current Below Normal or Open Circuit

Glow Plug 5 Circuit Current is Out of Range Low resulting from an Open Circuit

Monitor Operation:	
DTC	P0675-SE9442
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.6 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current < 1.374 A

338. P06E5-SE9459: Glow Plug Control Module - Root Cause Not Known

Glow Plug 5 circuit diagnostics have not made a decision

Monitor Operation:	
DTC	P06E5-SE9459
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostics on glow plug 5 circuit to detect the following: 1) Voltage Out of Range Low or Shorted to Ground Resulting in Too High of a Current 2) Voltage Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error 3) Current Out of Range Low resulting from an Open Circuit has not completed.

339. P06BD-SE9477: Engine Glow Plug 5 - Data Erratic, Intermittent, or Incorrect

Glow Plug 5 circuit current is too low, but not low enough to be detected as an open circuit. Therefore the resistance of the glow plug has increased and is now outside of the acceptable range of resistance for a glow plug.

Monitor Operation:	
DTC	P06BD-SE9477
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation
Engine Speed < 850 RPM
Net Engine Torque < 80 Nm
Circuit Potential Change < 2.116 V/sec
Coolant Temperature > 5 °C

Malfunction Thresholds (all active):
Current > 1.374 A
&
Current < RefTable33 A

340. P067E-SE4079: Glow Plug Heater Circuit #6 - Voltage Below Normal or Shorted to Low Source

Glow Plug 6 Circuit Voltage is Out of Range Low or Shorted to Ground Resulting in Too High of a Current.

Monitor Operation:	
DTC	P067E-SE4079
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.1 OR 0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current ≥ 41 A
OR
Current ≥ 90 A

341. P067F-SE9452: Glow Plug Heater Circuit #6 - Voltage Above Normal or Shorted to High Source

Glow Plug 6 Circuit Voltage is Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error has been detected.

Monitor Operation:	
DTC	P067F-SE9452
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
(Voltage > 0.6
* Vbatt
AND
MOSFET is Commanded Off)
OR
(Voltage < 0.6
* Vbatt
AND
MOSFET is Commanded On)

342. P0676-SE9443: Glow Plug Heater Circuit #6 - Current Below Normal or Open Circuit

Glow Plug 6 Circuit Current is Out of Range Low resulting from an Open Circuit

Monitor Operation:	
DTC	P0676-SE9443
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.6 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current < 1.374 A

343. P06E5-SE9460: Glow Plug Control Module - Root Cause Not Known

Glow Plug 6 circuit diagnostics have not made a decision

Monitor Operation:	
DTC	P06E5-SE9460
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostics on glow plug 6 circuit to detect the following: 1) Voltage Out of Range Low or Shorted to Ground Resulting in Too High of a Current 2) Voltage Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error 3) Current Out of Range Low resulting from an Open Circuit has not completed.

344. P06BE-SE9478: Engine Glow Plug 6 - Data Erratic, Intermittent, or Incorrect

Glow Plug 6 circuit current is too low, but not low enough to be detected as an open circuit. Therefore the resistance of the glow plug has increased and is now outside of the acceptable range of resistance for a glow plug.

Monitor Operation:	
DTC	P06BE-SE9478
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation
Engine Speed < 850 RPM
Net Engine Torque < 80 Nm
Circuit Potential Change < 2.116 V/sec
Coolant Temperature > 5 °C

Malfunction Thresholds (all active):
Current > 1.374 A
&
Current < RefTable33 A

345. P068C-SE4080: Glow Plug Heater Circuit #7 - Voltage Below Normal or Shorted to Low Source

Glow Plug 7 Circuit Voltage is Out of Range Low or Shorted to Ground Resulting in Too High of a Current.

Monitor Operation:	
DTC	P068C-SE4080
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.1 OR 0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current ≥ 41 A
OR
Current ≥ 90 A

346. P068D-SE9453: Glow Plug Heater Circuit #7 - Voltage Above Normal or Shorted to High Source

Glow Plug 7 Circuit Voltage is Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error has been detected.

Monitor Operation:	
DTC	P068D-SE9453
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
(Voltage > 0.6
* Vbatt
AND
MOSFET is Commanded Off)
OR
(Voltage < 0.6
* Vbatt
AND
MOSFET is Commanded On)

347. P0677-SE9444: Glow Plug Heater Circuit #7 - Current Below Normal or Open Circuit

Glow Plug 7 Circuit Current is Out of Range Low resulting from an Open Circuit

Monitor Operation:	
DTC	P0677-SE9444
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.6 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current < 1.374 A

348. P06E5-SE9461: Glow Plug Control Module - Root Cause Not Known

Glow Plug 7 circuit diagnostics have not made a decision

Monitor Operation:	
DTC	P06E5-SE9461
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostics on glow plug 7 circuit to detect the following: 1) Voltage Out of Range Low or Shorted to Ground Resulting in Too High of a Current 2) Voltage Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error 3) Current Out of Range Low resulting from an Open Circuit has not completed.

349. P06BF-SE9479: Engine Glow Plug 7 - Data Erratic, Intermittent, or Incorrect

Glow Plug 7 circuit current is too low, but not low enough to be detected as an open circuit. Therefore the resistance of the glow plug has increased and is now outside of the acceptable range of resistance for a glow plug.

Monitor Operation:	
DTC	P06BF-SE9479
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation
Engine Speed < 850 RPM
Net Engine Torque < 80 Nm
Circuit Potential Change < 2.116 V/sec
Coolant Temperature > 5 °C

Malfunction Thresholds (all active):
Current > 1.374 A
&
Current < RefTable33 A

350. P068E-SE4081: Glow Plug Heater Circuit #8 - Voltage Below Normal or Shorted to Low Source

Glow Plug 8 Circuit Voltage is Out of Range Low or Shorted to Ground Resulting in Too High of a Current.

Monitor Operation:	
DTC	P068E-SE4081
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.1 OR 0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current ≥ 41 A
OR
Current ≥ 90 A

351. P068F-SE9454: Glow Plug Heater Circuit #8 - Voltage Above Normal or Shorted to High Source

Glow Plug 8 Circuit Voltage is Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error has been detected.

Monitor Operation:	
DTC	P068F-SE9454
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
(Voltage > 0.6
* Vbatt
AND
MOSFET is Commanded Off)
OR
(Voltage < 0.6
* Vbatt
AND
MOSFET is Commanded On)

352. P0678-SE9445: Glow Plug Heater Circuit #8 - Current Below Normal or Open Circuit

Glow Plug 8 Circuit Current is Out of Range Low resulting from an Open Circuit

Monitor Operation:	
DTC	P0678-SE9445
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.6 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation

Malfunction Thresholds (all active):
Current < 1.374 A

353. P06E5-SE9462: Glow Plug Control Module - Root Cause Not Known

Glow Plug 8 circuit diagnostics have not made a decision

Monitor Operation:	
DTC	P06E5-SE9462
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostics on glow plug 8 circuit to detect the following: 1) Voltage Out of Range Low or Shorted to Ground Resulting in Too High of a Current 2) Voltage Out of Range High, Shorted to Battery, or an internal GPCM MOSFET error 3) Current Out of Range Low resulting from an Open Circuit has not completed.

354. P06C0-SE9480: Engine Glow Plug 8 - Data Erratic, Intermittent, or Incorrect

Glow Plug 8 circuit current is too low, but not low enough to be detected as an open circuit. Therefore the resistance of the glow plug has increased and is now outside of the acceptable range of resistance for a glow plug.

Monitor Operation:	
DTC	P06C0-SE9480
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.2
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Glow Plugs must be in Operation
Engine Speed < 850 RPM
Net Engine Torque < 80 Nm
Circuit Potential Change < 2.116 V/sec
Coolant Temperature > 5 °C

Malfunction Thresholds (all active):
Current > 1.374 A
&
Current < RefTable33 A

355. P064C-SE9492: Glow Plug Control Module - Bad Intelligent Device or Component

Glow Plug Control Module Stuck in After-Run Mode

Monitor Operation:	
DTC	P064C-SE9492
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module has not updated the status signal to indicate "No after-run delay requested."

356. P06E5-SE10508: Glow Plug Control Module - Root Cause Not Known

Glow Plug Control Module EEPROM diagnostic has not made a decision

Monitor Operation:	
DTC	P06E5-SE10508
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostic to detect a read/write error in the EEPROM has not made a decision.

357. P064C-SE9491: Glow Plug Control Module - Bad Intelligent Device or Component

Glow Plug Control Module EEPROM Read/Write Error

Monitor Operation:	
DTC	P064C-SE9491
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
A read/write error has been detected in the Glow Plug Control Module's EEPROM.

358. P064C-SE9488: Glow Plug Control Module - Bad Intelligent Device or Component

Glow Plug Control Module has an internal communication or charge-pump error

Monitor Operation:	
DTC	P064C-SE9488
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
Internal communication between the Glow Plug Control Module's microcontroller and ASIC has disturbed. OR A charge-pump error has been detected inside the Glow Plug Control Module's ASIC.

359. P06E5-SE9490: Glow Plug Control Module - Root Cause Not Known

Glow Plug Control Module internal communication and charge-pump diagnostic has not made a decision

Monitor Operation:	
DTC	P06E5-SE9490
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostic to detect an internal communication disturbance between microcontroller and ASIC and charge-pump errors in the ASIC has not made a decision.

360. P263E-SE9481: Glow Plug Control Module Internal Temperature - Data Valid But Above Normal Operating Range - Moderately Severe Level

Glow Plug Control Module Internal Temperature is Too High

Monitor Operation:	
DTC	P263E-SE9481
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
Glow Plug Control Module ASIC Temperature > 150 °C for 2 seconds
OR
Glow Plug Control Module PCB Temperature > 125 °C for 2.525 seconds

361. P06E5-SE9483: Glow Plug Control Module - Root Cause Not Known

Glow Plug Control Module overtemperature diagnostic has not made a decision

Monitor Operation:	
DTC	P06E5-SE9483
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostic to detect overtemperature on the PCB and ASIC has not made a decision.

362. P0384-SE9486: Glow Plug Control Module - Voltage Above Normal or Shorted to High Source

Glow Plug Control Module Supply Voltage is Out Of Range High

Monitor Operation:	
DTC	P0384-SE9486
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.175 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
Glow Plug Control Module Supply Voltage ≥ 16 V

363. P06E5-SE9487: Glow Plug Control Module - Root Cause Not Known

Glow Plug Control Module overvoltage diagnostic has not made a decision

Monitor Operation:	
DTC	P06E5-SE9487
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostic to detect a high voltage on its supply voltage input has not made a decision.

364. P0383-SE9484: Glow Plug Control Module - Voltage Below Normal or Shorted to Low Source

Glow Plug Control Module Supply Voltage is Out Of Range Low

Monitor Operation:	
DTC	P0383-SE9484
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2.175 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
Glow Plug Control Module Supply Voltage < 6 V

365. P06E5-SE9485: Glow Plug Control Module - Root Cause Not Known

Glow Plug Control Module undervoltage diagnostic has not made a decision

Monitor Operation:	
DTC	P06E5-SE9485
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
U0106-SE3031

Malfunction Thresholds (all active):
The Glow Plug Control Module's diagnostic to detect a low voltage on its supply voltage input has not made a decision.

366. P0217-SE2141: Engine Coolant Temperature - Condition Exists

High Coolant temperature.

Monitor Operation:	
DTC	P0217-SE2141
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Abort Conditions (any active):

Pause Conditions (any active):
Engine is not Running

Malfunction Thresholds (all active):
Coolant Temperature >= 118 Deg C

367. P1612-SE2330: Proprietary Datalink Error (OEM/Vehicle Datalink) - Abnormal Update Rate

Communication is lost between ECM and Immobilizer.

Monitor Operation:	
DTC	P1612-SE2330
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
No message is received from Immobilizer on datalink.

368. P054F-SE3782: Engine Idle Fuel Quantity - Data Valid But Above Normal Operating Range - Moderately Severe Level

Idle Fuel higher than the nominal fueling at idle.

Monitor Operation:	
DTC	P054F-SE3782
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine State is Run and not Stop/Crank/Brake/Shutdown
Idle Reference Speed ≤ 2,000 RPM
Vehicle Speed ≤ 0 mph
Fueling is controlled by a governor requesting a lower bound on Engine Speed
Current Idle Reference Speed (Target) is the same as previous Idle Reference (verifies reference speed is not changing).
RefTable34 seconds have passed since Key On.

Abort Conditions (any active):
P2121-SE1380, P2122-SE64, P2123-SE63, P2127-SE1379, P2128-SE1378
P0116-SE3669, P0116-SE3805, P0117-SE76, P0118-SE75
P0501-SE130, P0501-SE4361

Pause Conditions (any active):
Engine State is not Run
Idle Reference Speed > 2,000 RPM
Vehicle Speed > 0 mph
Fueling is controlled by a governor that does not request a lower bound on Engine Speed
Current Idle Reference Speed (Target Speed) is not the same as previous Idle Reference

Malfunction Thresholds (all active):
Idle Fuel > RefTable35 mg/stroke

369. P054E-SE3783: Engine Idle Fuel Quantity - Data Valid But Below Normal Operating Range - Moderately Severe Level

Idle Fuel lower than the nominal fueling at idle.

Monitor Operation:	
DTC	P054E-SE3783
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	15 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine State is Run and not Stop/Crank/Brake/Shutdown
Idle Reference Speed ≤ 2,000 RPM
Vehicle Speed ≤ 0 mph
Fueling is controlled by a governor requesting a lower bound on Engine Speed
Current Idle Reference Speed (Target) is the same as previous Idle Reference (verifies reference speed is not changing).

Abort Conditions (any active):
P2121-SE1380, P2122-SE64, P2123-SE63, P2127-SE1379, P2128-SE1378
P0116-SE3669, P0116-SE3805, P0117-SE76, P0118-SE75
P0501-SE130, P0501-SE4361

Pause Conditions (any active):
Engine State is not Run
Idle Reference Speed > 2,000 RPM
Vehicle Speed > 0 mph
Fueling is controlled by a governor that does not request a lower bound on Engine Speed
Current Idle Reference Speed (Target Speed) is not the same as previous Idle Reference

Malfunction Thresholds (all active):
Idle Fuel < 2 mg/stroke

370. P0507-SE3775: Engine Speed At Idle - Data Valid But Above Normal Operating Range - Moderately Severe Level

Engine Speed at Idle lies outside the acceptable boundary of nominal Idle speed and tends to run above nominal Idle speed.

Monitor Operation:	
DTC	P0507-SE3775
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine State is Run and not Stop/Crank/Brake/Shutdown
Idle Reference Speed ≤ 2,000 RPM
Vehicle Speed ≤ 0 mph
Fueling is controlled by a governor requesting a lower bound on Engine Speed
Current Idle Reference Speed (Target) is the same as previous Idle Reference (verifies reference speed is not changing).

Abort Conditions (any active):
P2121-SE1380, P2122-SE64, P2123-SE63, P2127-SE1379, P2128-SE1378
P0116-SE3669, P0116-SE3805, P0117-SE76, P0118-SE75
P0501-SE130, P0501-SE4361

Pause Conditions (any active):
Engine State is not Run
Idle Reference Speed > 2,000 RPM
Vehicle Speed > 0 mph
Fueling is controlled by a governor that does not request a lower bound on Engine Speed
Current Idle Reference Speed (Target Speed) is not the same as previous Idle Reference

Malfunction Thresholds (all active):
Engine Speed - Idle Reference Speed > 50 RPM, when the amount of time that engine speed is outside the idle reference speed band, by more than 50 RPM, is equal to 15 seconds.

371. P0506-SE3781: Engine Speed At Idle - Data Valid But Below Normal Operating Range - Moderately Severe Level

Engine Speed at Idle lies outside the acceptable boundary of nominal Idle speed and tends to run below nominal Idle speed.

Monitor Operation:	
DTC	P0506-SE3781
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine State is Run and not Stop/Crank/Brake/Shutdown
Idle Reference Speed ≤ 2,000 RPM
Vehicle Speed ≤ 0 mph
Fueling is controlled by a governor requesting a lower bound on Engine Speed
Current Idle Reference Speed (Target) is the same as previous Idle Reference (verifies reference speed is not changing).

Abort Conditions (any active):
P2121-SE1380, P2122-SE64, P2123-SE63, P2127-SE1379, P2128-SE1378
P0116-SE3669, P0116-SE3805, P0117-SE76, P0118-SE75
P0501-SE130, P0501-SE4361

Pause Conditions (any active):
Engine State is not Run
Idle Reference Speed > 2,000 RPM
Vehicle Speed > 0 mph
Fueling is controlled by a governor that does not request a lower bound on Engine Speed
Current Idle Reference Speed (Target Speed) is not the same as previous Idle Reference

Malfunction Thresholds (all active):
Idle Reference Speed - Engine Speed > 50 RPM, when the amount of time that engine speed is outside the idle reference speed band, by more than 50 RPM, is equal to 15 seconds.

372. P0127-SE649: Intake Manifold 1 Temperature - Data Valid But Above Normal Operating Range - Most Severe Level

intake Manifold Temperature above allowed engine operating range.

Monitor Operation:	
DTC	P0127-SE649
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Engine Speed ≥ 570 RPM
Intake Manifold Temperature Start Timer ≥ 10 sec

Pause Conditions (any active):
P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487
Engine Speed < 570 RPM

Malfunction Thresholds (all active):
Intake Manifold Temperature ≥ 132 °C

373. P0127-SE648: Intake Manifold 1 Temperature - Data Valid But Above Normal Operating Range - Least Severe Level

intake Manifold Temperature above normal engine operating range

Monitor Operation:	
DTC	P0127-SE648
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Engine Speed ≥ 570 RPM
Intake Manifold Temperature Start Timer ≥ 10 sec

Pause Conditions (any active):
P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487
Engine Speed < 570 RPM

Malfunction Thresholds (all active):
Intake Manifold Temperature ≥ 121 °C

374. P2BAC-SE5737: Engine Protection Torque Derate - Condition Exists

Active alternate Moderate Driver Inducement

Monitor Operation:	
DTC	P2BAC-SE5737
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Variable (see AECD document)
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
One or more conditions exist requiring Moderate Driver Inducement (see AECD Document section 7-1 and Appendix VI)

375. P2BAC-SE5408: Engine Protection Torque Derate - Condition Exists

Active Moderate Driver Inducement

Monitor Operation:	
DTC	P2BAC-SE5408
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Variable (see AECD document)
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
One or more conditions exist requiring Moderate Driver Inducement (see AECD Document section 7-1 and Appendix VI)

376. P020A-SE6791: Injector Solenoid Driver Cylinder 1 - Mechanical System Not Responding or Out of Adjustment

The corrected injector Energizing Time (ET) for at least one rail pressure point on injector number 1 exceeds a calibratable maximum threshold.

Monitor Operation:	
DTC	P020A-SE6791
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	52 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0087-SE3236, P0087-SE3237, P0087-SE6787, P0088-SE3238, P0088-SE3239, P0088-SE6780, P0088-SE6783, P0088-SE6785, P009C-SE4715, P009D-SE3257, P009D-SE4714, P009E-SE4482, P009E-SE4485, P0191-SE4713, P0191-SE6941, P0192-SE1403, P0193-SE1402, P0252-SE3262, P0253-SE4717, P0254-SE3261, P0254-SE4716, P0257-SE3258, P0335-SE4372, P0335-SE6886, P0652-SE225, P0653-SE243, P0698-SE816, P0699-SE814
P0201-SE3357, P0202-SE3358, P0203-SE3359, P0204-SE3360, P0205-SE3361, P0206-SE3362, P0207-SE3363, P0208-SE3364, P0261-SE6892, P0262-SE4673, P0264-SE6893, P0265-SE4674, P0267-SE6899, P0268-SE4680, P0270-SE6896, P0271-SE4677, P0273-SE6897, P0274-SE4678, P0276-SE6898, P0277-SE4679, P0279-SE6894, P0280-SE4675, P0282-SE6895, P0283-SE4676, P02EE-SE6854, P02EF-SE6855, P02F0-SE6861, P02F1-SE6858, P02F2-SE6859, P02F3-SE6860, P02F4-SE6856, P02F5-SE6857, P0606-SE6842, P0606-SE6843, P0606-SE6862, P0606-SE6863, P0606-SE6881, P0606-SE6882, P2146-SE6840, P2149-SE6841
Intake Air temperature > -10 °C
15 °C ≤ Fuel temperature ≤ 90 °C
Engine Coolant temperature > 70 °C
Battery voltage > 10 V
The combustion chamber is warm: The commanded injection quantity > 5 mg/stroke for 10 sec
Boost pressure > 85 kPa(absolute)
Accelerator Pedal position ≤ 0 %
The OBD Arbitrator allows this diagnostic to run
Time since start of Motoring ≥ 0 msecs
The Vehicle is in an enabled gear and the Engine speed is within a calibratable range. (See RefCond0034.)
The clutch is engaged.
Vehicle speed > RefTable36
Rail pressure has stabilized: |Rail pressure set point - Rail Pressure| < RefTable37 for 0.2 sec

Abort Conditions (any active):

P0087-SE3236, P0087-SE3237, P0087-SE6787, P0088-SE3238, P0088-SE3239, P0088-SE6780, P0088-SE6783, P0088-SE6785, P009C-SE4715, P009D-SE3257, P009D-SE4714, P009E-SE4482, P009E-SE4485, P0191-SE4713, P0191-SE6941, P0192-SE1403, P0193-SE1402, P0252-SE3262, P0253-SE4717, P0254-SE3261, P0254-SE4716, P0257-SE3258, P0335-SE4372, P0335-SE6886, P0652-SE225, P0653-SE243, P0698-SE816, P0699-SE814

Intake Air temperature ≤ -10 °C
Fuel temperature < 15 °C OR Fuel temperature > 90 °C
Engine Coolant temperature ≤ 70 °C
Battery voltage ≤ 10 V
The combustion chamber has cooled: The duration of Motoring ≥ RefTable38
Boost pressure ≤ 85 kPa(absolute)
Accelerator Pedal position > 0 %
The Vehicle is not in an enabled gear OR (the Vehicle is in an enabled gear AND the Engine speed is outside of a calibratable range). (See RefCond0035.)
A gear change occurs in the Motoring event
The clutch is disengaged.
Vehicle speed ≤ RefTable36

Malfunction Thresholds (all active):
Corrected Energizing Time of injector number 1 > 690 µsec for the Rail pressure set point of 250 bar
OR
Corrected Energizing Time of injector number 1 > 370 µsec for the Rail pressure set point of 600 bar
OR
Corrected Energizing Time of injector number 1 > 270 µsec for the Rail pressure set point of 1,200 bar

377. P020A-SE6799: Injector Solenoid Driver Cylinder 1 - Mechanical System Not Responding or Out of Adjustment

The corrected injector Energizing Time (ET) for at least one rail pressure point on injector number 1 falls below a calibratable minimum threshold.

Monitor Operation:	
DTC	P020A-SE6799
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	52 sec
MIL Activation Criteria	1 trip

Corrected Energizing Time of injector number 1 < 100 µsec for the Rail pressure set point of 1,200 bar

378. P268C-SE6865: Injector Solenoid Driver Cylinder 1 - Out of Calibration

Injector Trim Codes consists of Injector Quantity Adjustment [IQA] and Injector Voltage Adjustment [IVA] values. The Trim Codes are programmed into the EEPROM of the Engine management Electronic Control Unit [ECU]. Monitoring is done to ensure the integrity of this data. Monitoring for this error is for both IQA and IVA and it is performed either at key-on or when triggered by a service tool or at cyclic update.

Monitor Operation:	
DTC	P268C-SE6865
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Incorrect checksum of injector adjustment code for Injector number 1.
OR
Injector number 1 manufacturing trim adjustment for Pilot Injection operation is outside of the range -1 mm3 to 1 mm3
OR
Injector number 1 manufacturing trim adjustment for High Load operation is outside of the range -4 mm3 to 4 mm3
OR
Injector number 1 manufacturing trim adjustment for Low Idle operation is outside of the range -1.1 mm3 to 1.1 mm3
OR
Injector number 1 manufacturing trim adjustment for Partial Load operation is outside of the range -2.1 mm3 to 2.1 mm3
OR
Injector Adjustment values for injector number 1 unreadable due to faulty EEPROM access.

379. P0201-SE3357: Injector Solenoid Driver Cylinder 1 Circuit - Current Below Normal or Open Circuit

No load due to open circuit as a result of defective cable connector or broken connection to actuator within injector number 1.

Monitor Operation:	
DTC	P0201-SE3357
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0261-SE6892, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 1 < 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Discharge time [tiDisch] for cylinder number 1 ≥ 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 1 ≤ Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
OR
All of the following:
Actuator charging time [tiChrg] for cylinder number 1 ≥ 5 µsecs
Actuator Discharge time [tiDisch] for cylinder number 1 < 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 1 > Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A

Injector buffer current during voltage discharging ≤ 9.6 A

380. P0262-SE4673: Injector Solenoid Driver Cylinder 1 Circuit - Current Above Normal or Grounded Circuit

Injector number 1 driver high side is short-circuited to the injector driver low side of another injector on the same bank.

Monitor Operation:	
DTC	P0262-SE4673
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] >100 µsecs
Actuator charging time [tiChrg] for cylinder number 1 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

381. P020B-SE6792: Injector Solenoid Driver Cylinder 2 - Mechanical System Not Responding or Out of Adjustment

The corrected injector Energizing Time (ET) for at least one rail pressure point on injector number 2 exceeds a calibratable maximum threshold.

Monitor Operation:	
DTC	P020B-SE6792
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	52 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0087-SE3236, P0087-SE3237, P0087-SE6787, P0088-SE3238, P0088-SE3239, P0088-SE6780, P0088-SE6783, P0088-SE6785, P009C-SE4715, P009D-SE3257, P009D-SE4714, P009E-SE4482, P009E-SE4485, P0191-SE4713, P0191-SE6941, P0192-SE1403, P0193-SE1402, P0252-SE3262, P0253-SE4717, P0254-SE3261, P0254-SE4716, P0257-SE3258, P0335-SE4372, P0335-SE6886, P0652-SE225, P0653-SE243, P0698-SE816, P0699-SE814
P0201-SE3357, P0202-SE3358, P0203-SE3359, P0204-SE3360, P0205-SE3361, P0206-SE3362, P0207-SE3363, P0208-SE3364, P0261-SE6892, P0262-SE4673, P0264-SE6893, P0265-SE4674, P0267-SE6899, P0268-SE4680, P0270-SE6896, P0271-SE4677, P0273-SE6897, P0274-SE4678, P0276-SE6898, P0277-SE4679, P0279-SE6894, P0280-SE4675, P0282-SE6895, P0283-SE4676, P02EE-SE6854, P02EF-SE6855, P02F0-SE6861, P02F1-SE6858, P02F2-SE6859, P02F3-SE6860, P02F4-SE6856, P02F5-SE6857, P0606-SE6842, P0606-SE6843, P0606-SE6862, P0606-SE6863, P0606-SE6881, P0606-SE6882, P2146-SE6840, P2149-SE6841
Intake Air temperature > -10 °C
15 °C ≤ Fuel temperature ≤ 90 °C
Engine Coolant temperature > 70 °C
Battery voltage > 10 V
The combustion chamber is warm: The commanded injection quantity > 5 mg/stroke for 10 sec
Boost pressure > 85 kPa(absolute)
Accelerator Pedal position ≤ 0 %
The OBD Arbitrator allows this diagnostic to run
Time since start of Motoring ≥ 0 msecs
The Vehicle is in an enabled gear and the Engine speed is within a calibratable range. (See RefCond0034.)
The clutch is engaged.
Vehicle speed > RefTable36
Rail pressure has stabilized: |Rail pressure set point - Rail Pressure| < RefTable37 for 0.2 sec

Abort Conditions (any active):

P0087-SE3236, P0087-SE3237, P0087-SE6787, P0088-SE3238, P0088-SE3239, P0088-SE6780, P0088-SE6783, P0088-SE6785, P009C-SE4715, P009D-SE3257, P009D-SE4714, P009E-SE4482, P009E-SE4485, P0191-SE4713, P0191-SE6941, P0192-SE1403, P0193-SE1402, P0252-SE3262, P0253-SE4717, P0254-SE3261, P0254-SE4716, P0257-SE3258, P0335-SE4372, P0335-SE6886, P0652-SE225, P0653-SE243, P0698-SE816, P0699-SE814
P0201-SE3357, P0202-SE3358, P0203-SE3359, P0204-SE3360, P0205-SE3361, P0206-SE3362, P0207-SE3363, P0208-SE3364, P0261-SE6892, P0262-SE4673, P0264-SE6893, P0265-SE4674, P0267-SE6899, P0268-SE4680, P0270-SE6896, P0271-SE4677, P0273-SE6897, P0274-SE4678, P0276-SE6898, P0277-SE4679, P0279-SE6894, P0280-SE4675, P0282-SE6895, P0283-SE4676, P02EE-SE6854, P02EF-SE6855, P02F0-SE6861, P02F1-SE6858, P02F2-SE6859, P02F3-SE6860, P02F4-SE6856, P02F5-SE6857, P0606-SE6842, P0606-SE6843, P0606-SE6862, P0606-SE6863, P0606-SE6881, P0606-SE6882, P2146-SE6840, P2149-SE6841
Intake Air temperature ≤ -10 °C
Fuel temperature < 15 °C OR Fuel temperature > 90 °C
Engine Coolant temperature ≤ 70 °C
Battery voltage ≤ 10 V
The combustion chamber has cooled: The duration of Motoring ≥ RefTable38
Boost pressure ≤ 85 kPa(absolute)
Accelerator Pedal position > 0 %
The Vehicle is not in an enabled gear OR (the Vehicle is in an enabled gear AND the Engine speed is outside of a calibratable range). (See RefCond0035.)
A gear change occurs in the Motoring event
The clutch is disengaged.
Vehicle speed ≤ RefTable36

Malfunction Thresholds (all active):
Corrected Energizing Time of injector number 2 > 690 µsec for the Rail pressure set point of 250 bar
OR
Corrected Energizing Time of injector number 2 > 370 µsec for the Rail pressure set point of 600 bar
OR
Corrected Energizing Time of injector number 2 > 270 µsec for the Rail pressure set point of 1,200 bar

382. P020B-SE6800: Injector Solenoid Driver Cylinder 2 - Mechanical System Not Responding or Out of Adjustment

The corrected injector Energizing Time (ET) for at least one rail pressure point on injector number 2 falls below a calibratable minimum threshold.

Monitor Operation:	
DTC	P020B-SE6800
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	52 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):

Intake Air temperature ≤ -10 °C
Fuel temperature < 15 °C OR Fuel temperature > 90 °C
Engine Coolant temperature ≤ 70 °C
Battery voltage ≤ 10 V
The combustion chamber has cooled: The duration of Motoring ≥ RefTable38
Boost pressure ≤ 85 kPa(absolute)
Accelerator Pedal position > 0 %
The Vehicle is not in an enabled gear OR (the Vehicle is in an enabled gear AND the Engine speed is outside of a calibratable range). (See RefCond0035.)
A gear change occurs in the Motoring event
The clutch is disengaged.
Vehicle speed ≤ RefTable36

Malfunction Thresholds (all active):
Corrected Energizing Time of injector number 2 < 100 µsec for the Rail pressure set point of 250 bar
OR
Corrected Energizing Time of injector number 2 < 90 µsec for the Rail pressure set point of 600 bar
OR
Corrected Energizing Time of injector number 2 < 100 µsec for the Rail pressure set point of 1,200 bar

383. P268D-SE6866: Injector Solenoid Driver Cylinder 2 - Out of Calibration

Injector Trim Codes consists of Injector Quantity Adjustment [IQA] and Injector Voltage Adjustment [IVA] values. The Trim Codes are programmed into the EEPROM of the Engine management Electronic Control Unit [ECU]. Monitoring is done to ensure the integrity of this data. Monitoring for this error is for both IQA and IVA and it is performed either at key-on or when triggered by a service tool or at cyclic update.

Monitor Operation:	
DTC	P268D-SE6866
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Incorrect checksum of injector adjustment code for Injector number 2.
OR
Injector number 2 manufacturing trim adjustment for Pilot Injection operation is outside of the range -1 mm3 to 1 mm3
OR
Injector number 2 manufacturing trim adjustment for High Load operation is outside of the range -4 mm3 to 4 mm3
OR
Injector number 2 manufacturing trim adjustment for Low Idle operation is outside of the range -1.1 mm3 to 1.1 mm3
OR
Injector number 2 manufacturing trim adjustment for Partial Load operation is outside of the range -2.1 mm3 to 2.1 mm3
OR
Injector Adjustment values for injector number 2 unreadable due to faulty EEPROM access.

384. P0202-SE3358: Injector Solenoid Driver Cylinder 2 Circuit - Current Below Normal or Open Circuit

No load due to open circuit as a result of defective cable connector or broken connection to actuator within injector number 2.

Monitor Operation:	
DTC	P0202-SE3358
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0261-SE6892, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 2 < 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Discharge time [tiDisch] for cylinder number 2 ≥ 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 2 ≤ Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
OR
All of the following:
Actuator charging time [tiChrg] for cylinder number 2 ≥ 5 µsecs
Actuator Discharge time [tiDisch] for cylinder number 2 < 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 2 > Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A

Injector buffer current during voltage discharging ≤ 9.6 A

385. P0265-SE4674: Injector Solenoid Driver Cylinder 2 Circuit - Current Above Normal or Grounded Circuit

Injector number 2 driver high side is short-circuited to the injector driver low side of another injector on the same bank.

Monitor Operation:	
DTC	P0265-SE4674
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] >100 µsecs
Actuator charging time [tiChrg] for cylinder number 2 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

386. P020C-SE6798: Injector Solenoid Driver Cylinder 3 - Mechanical System Not Responding or Out of Adjustment

The corrected injector Energizing Time (ET) for at least one rail pressure point on injector number 3 exceeds a calibratable maximum threshold.

Monitor Operation:	
DTC	P020C-SE6798
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	52 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0087-SE3236, P0087-SE3237, P0087-SE6787, P0088-SE3238, P0088-SE3239, P0088-SE6780, P0088-SE6783, P0088-SE6785, P009C-SE4715, P009D-SE3257, P009D-SE4714, P009E-SE4482, P009E-SE4485, P0191-SE4713, P0191-SE6941, P0192-SE1403, P0193-SE1402, P0252-SE3262, P0253-SE4717, P0254-SE3261, P0254-SE4716, P0257-SE3258, P0335-SE4372, P0335-SE6886, P0652-SE225, P0653-SE243, P0698-SE816, P0699-SE814

OR
Corrected Energizing Time of injector number 3 > 270 µsec for the Rail pressure set point of 1,200 bar

387. P020C-SE6806: Injector Solenoid Driver Cylinder 3 - Mechanical System Not Responding or Out of Adjustment

The corrected injector Energizing Time (ET) for at least one rail pressure point on injector number 3 falls below a calibratable minimum threshold.

Monitor Operation:	
DTC	P020C-SE6806
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	52 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0087-SE3236, P0087-SE3237, P0087-SE6787, P0088-SE3238, P0088-SE3239, P0088-SE6780, P0088-SE6783, P0088-SE6785, P009C-SE4715, P009D-SE3257, P009D-SE4714, P009E-SE4482, P009E-SE4485, P0191-SE4713, P0191-SE6941, P0192-SE1403, P0193-SE1402, P0252-SE3262, P0253-SE4717, P0254-SE3261, P0254-SE4716, P0257-SE3258, P0335-SE4372, P0335-SE6886, P0652-SE225, P0653-SE243, P0698-SE816, P0699-SE814
P0201-SE3357, P0202-SE3358, P0203-SE3359, P0204-SE3360, P0205-SE3361, P0206-SE3362, P0207-SE3363, P0208-SE3364, P0261-SE6892, P0262-SE4673, P0264-SE6893, P0265-SE4674, P0267-SE6899, P0268-SE4680, P0270-SE6896, P0271-SE4677, P0273-SE6897, P0274-SE4678, P0276-SE6898, P0277-SE4679, P0279-SE6894, P0280-SE4675, P0282-SE6895, P0283-SE4676, P02EE-SE6854, P02EF-SE6855, P02F0-SE6861, P02F1-SE6858, P02F2-SE6859, P02F3-SE6860, P02F4-SE6856, P02F5-SE6857, P0606-SE6842, P0606-SE6843, P0606-SE6862, P0606-SE6863, P0606-SE6881, P0606-SE6882, P2146-SE6840, P2149-SE6841
Intake Air temperature > -10 °C
15 °C ≤ Fuel temperature ≤ 90 °C
Engine Coolant temperature > 70 °C
Battery voltage > 10 V
The combustion chamber is warm: The commanded injection quantity > 5 mg/stroke for 10 sec
Boost pressure > 85 kPa(absolute)
Accelerator Pedal position ≤ 0 %
The OBD Arbitrator allows this diagnostic to run
Time since start of Motoring ≥ 0 msecs
The Vehicle is in an enabled gear and the Engine speed is within a calibratable range. (See RefCond0034.)
The clutch is engaged.
Vehicle speed > RefTable36
Rail pressure has stabilized: |Rail pressure set point - Rail Pressure| < RefTable37 for 0.2 sec

Abort Conditions (any active):

P0087-SE3236, P0087-SE3237, P0087-SE6787, P0088-SE3238, P0088-SE3239, P0088-SE6780, P0088-SE6783, P0088-SE6785, P009C-SE4715, P009D-SE3257, P009D-SE4714, P009E-SE4482, P009E-SE4485, P0191-SE4713, P0191-SE6941, P0192-SE1403, P0193-SE1402, P0252-SE3262, P0253-SE4717, P0254-SE3261, P0254-SE4716, P0257-SE3258, P0335-SE4372, P0335-SE6886, P0652-SE225, P0653-SE243, P0698-SE816, P0699-SE814
P0201-SE3357, P0202-SE3358, P0203-SE3359, P0204-SE3360, P0205-SE3361, P0206-SE3362, P0207-SE3363, P0208-SE3364, P0261-SE6892, P0262-SE4673, P0264-SE6893, P0265-SE4674, P0267-SE6899, P0268-SE4680, P0270-SE6896, P0271-SE4677, P0273-SE6897, P0274-SE4678, P0276-SE6898, P0277-SE4679, P0279-SE6894, P0280-SE4675, P0282-SE6895, P0283-SE4676, P02EE-SE6854, P02EF-SE6855, P02F0-SE6861, P02F1-SE6858, P02F2-SE6859, P02F3-SE6860, P02F4-SE6856, P02F5-SE6857, P0606-SE6842, P0606-SE6843, P0606-SE6862, P0606-SE6863, P0606-SE6881, P0606-SE6882, P2146-SE6840, P2149-SE6841
Intake Air temperature ≤ -10 °C
Fuel temperature < 15 °C OR Fuel temperature > 90 °C
Engine Coolant temperature ≤ 70 °C
Battery voltage ≤ 10 V
The combustion chamber has cooled: The duration of Motoring ≥ RefTable38
Boost pressure ≤ 85 kPa(absolute)
Accelerator Pedal position > 0 %
The Vehicle is not in an enabled gear OR (the Vehicle is in an enabled gear AND the Engine speed is outside of a calibratable range). (See RefCond0035.)
A gear change occurs in the Motoring event
The clutch is disengaged.
Vehicle speed ≤ RefTable36

Malfunction Thresholds (all active):
Corrected Energizing Time of injector number 3 < 100 µsec for the Rail pressure set point of 250 bar
OR
Corrected Energizing Time of injector number 3 < 90 µsec for the Rail pressure set point of 600 bar
OR
Corrected Energizing Time of injector number 3 < 100 µsec for the Rail pressure set point of 1,200 bar

388. P268E-SE6872: Injector Solenoid Driver Cylinder 3 - Out of Calibration

Injector Trim Codes consists of Injector Quantity Adjustment [IQA] and Injector Voltage Adjustment [IVA] values. The Trim Codes are programmed into the EEPROM of the Engine management Electronic Control Unit [ECU]. Monitoring is done to ensure the integrity of this data. Monitoring for this error is for both IQA and IVA and it is performed either at key-on or when triggered by a service tool or at cyclic update.

Monitor Operation:	
DTC	P268E-SE6872
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Incorrect checksum of injector adjustment code for Injector number 3.
OR
Injector number 3 manufacturing trim adjustment for Pilot Injection operation is outside of the range -1 mm3 to 1 mm3
OR
Injector number 3 manufacturing trim adjustment for High Load operation is outside of the range -4 mm3 to 4 mm3
OR
Injector number 3 manufacturing trim adjustment for Low Idle operation is outside of the range -1.1 mm3 to 1.1 mm3
OR
Injector number 3 manufacturing trim adjustment for Partial Load operation is outside of the range -2.1 mm3 to 2.1 mm3
OR
Injector Adjustment values for injector number 3 unreadable due to faulty EEPROM access.

389. P0203-SE3359: Injector Solenoid Driver Cylinder 3 Circuit - Current Below Normal or Open Circuit

No load due to open circuit as a result of defective cable connector or broken connection to actuator within injector number 3.

Monitor Operation:	
DTC	P0203-SE3359
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0261-SE6892, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 3 < 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Discharge time [tiDisch] for cylinder number 3 ≥ 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 3 ≤ Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
OR
All of the following:
Actuator charging time [tiChrg] for cylinder number 3 ≥ 5 µsecs
Actuator Discharge time [tiDisch] for cylinder number 3 < 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 3 > Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A

Injector buffer current during voltage discharging ≤ 9.6 A

390. P0268-SE4680: Injector Solenoid Driver Cylinder 3 Circuit - Current Above Normal or Grounded Circuit

Injector number 3 driver high side is short-circuited to the injector driver low side of another injector on the same bank.

Monitor Operation:	
DTC	P0268-SE4680
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] >100 µsecs
Actuator charging time [tiChrg] for cylinder number 3 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

391. P020D-SE6795: Injector Solenoid Driver Cylinder 4 - Mechanical System Not Responding or Out of Adjustment

The corrected injector Energizing Time (ET) for at least one rail pressure point on injector number 4 exceeds a calibratable maximum threshold.

Monitor Operation:	
DTC	P020D-SE6795
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	52 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0087-SE3236, P0087-SE3237, P0087-SE6787, P0088-SE3238, P0088-SE3239, P0088-SE6780, P0088-SE6783, P0088-SE6785, P009C-SE4715, P009D-SE3257, P009D-SE4714, P009E-SE4482, P009E-SE4485, P0191-SE4713, P0191-SE6941, P0192-SE1403, P0193-SE1402, P0252-SE3262, P0253-SE4717, P0254-SE3261, P0254-SE4716, P0257-SE3258, P0335-SE4372, P0335-SE6886, P0652-SE225, P0653-SE243, P0698-SE816, P0699-SE814

OR
Injector number 4 manufacturing trim adjustment for High Load operation is outside of the range -4 mm3 to 4 mm3
OR
Injector number 4 manufacturing trim adjustment for Low Idle operation is outside of the range -1.1 mm3 to 1.1 mm3
OR
Injector number 4 manufacturing trim adjustment for Partial Load operation is outside of the range -2.1 mm3 to 2.1 mm3
OR
Injector Adjustment values for injector number 4 unreadable due to faulty EEPROM access.

394. P0204-SE3360: Injector Solenoid Driver Cylinder 4 Circuit - Current Below Normal or Open Circuit

No load due to open circuit as a result of defective cable connector or broken connection to actuator within injector number 4.

Monitor Operation:	
DTC	P0204-SE3360
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0261-SE6892, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 4 < 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Discharge time [tiDisch] for cylinder number 4 ≥ 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 4 ≤ Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
OR
All of the following:
Actuator charging time [tiChrg] for cylinder number 4 ≥ 5 µsecs
Actuator Discharge time [tiDisch] for cylinder number 4 < 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 4 > Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A

Injector buffer current during voltage discharging ≤ 9.6 A

395. P0271-SE4677: Injector Solenoid Driver Cylinder 4 Circuit - Current Above Normal or Grounded Circuit

Injector number 4 driver high side is short-circuited to the injector driver low side of another injector on the same bank.

Monitor Operation:	
DTC	P0271-SE4677
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None

398. P2690-SE6870: Injector Solenoid Driver Cylinder 5 - Out of Calibration

Injector Trim Codes consists of Injector Quantity Adjustment [IQA] and Injector Voltage Adjustment [IVA] values. The Trim Codes are programmed into the EEPROM of the Engine management Electronic Control Unit [ECU]. Monitoring is done to ensure the integrity of this data. Monitoring for this error is for both IQA and IVA and it is performed either at key-on or when triggered by a service tool or at cyclic update.

Monitor Operation:	
DTC	P2690-SE6870
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Incorrect checksum of injector adjustment code for Injector number 5.
OR
Injector number 5 manufacturing trim adjustment for Pilot Injection operation is outside of the range -1 mm3 to 1 mm3
OR
Injector number 5 manufacturing trim adjustment for High Load operation is outside of the range -4 mm3 to 4 mm3
OR
Injector number 5 manufacturing trim adjustment for Low Idle operation is outside of the range -1.1 mm3 to 1.1 mm3
OR
Injector number 5 manufacturing trim adjustment for Partial Load operation is outside of the range -2.1 mm3 to 2.1 mm3
OR
Injector Adjustment values for injector number 5 unreadable due to faulty EEPROM access.

399. P0205-SE3361: Injector Solenoid Driver Cylinder 5 Circuit - Current Below Normal or Open Circuit

No load due to open circuit as a result of defective cable connector or broken connection to actuator within injector number 5.

Monitor Operation:	
DTC	P0205-SE3361
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):

Intake Air temperature ≤ -10 °C
Fuel temperature < 15 °C OR Fuel temperature > 90 °C
Engine Coolant temperature ≤ 70 °C
Battery voltage ≤ 10 V
The combustion chamber has cooled: The duration of Motoring ≥ RefTable38
Boost pressure ≤ 85 kPa(absolute)
Accelerator Pedal position > 0 %
The Vehicle is not in an enabled gear OR (the Vehicle is in an enabled gear AND the Engine speed is outside of a calibratable range). (See RefCond0035.)
A gear change occurs in the Motoring event
The clutch is disengaged.
Vehicle speed ≤ RefTable36

Malfunction Thresholds (all active):
Corrected Energizing Time of injector number 6 > 690 µsec for the Rail pressure set point of 250 bar
OR
Corrected Energizing Time of injector number 6 > 370 µsec for the Rail pressure set point of 600 bar
OR
Corrected Energizing Time of injector number 6 > 270 µsec for the Rail pressure set point of 1,200 bar

402. P020F-SE6805: Injector Solenoid Driver Cylinder 6 - Mechanical System Not Responding or Out of Adjustment

The corrected injector Energizing Time (ET) for at least one rail pressure point on injector number 6 falls below a calibratable minimum threshold.

Monitor Operation:	
DTC	P020F-SE6805
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	52 sec
MIL Activation Criteria	1 trip

Boost pressure ≤ 85 kPa(absolute)
Accelerator Pedal position > 0 %
The Vehicle is not in an enabled gear OR (the Vehicle is in an enabled gear AND the Engine speed is outside of a calibratable range). (See RefCond0035.)
A gear change occurs in the Motoring event
The clutch is disengaged.
Vehicle speed ≤ RefTable36

Malfunction Thresholds (all active):
Corrected Energizing Time of injector number 6 < 100 µsec for the Rail pressure set point of 250 bar
OR
Corrected Energizing Time of injector number 6 < 90 µsec for the Rail pressure set point of 600 bar
OR
Corrected Energizing Time of injector number 6 < 100 µsec for the Rail pressure set point of 1,200 bar

403. P2691-SE6871: Injector Solenoid Driver Cylinder 6 - Out of Calibration

Injector Trim Codes consists of Injector Quantity Adjustment [IQA] and Injector Voltage Adjustment [IVA] values. The Trim Codes are programmed into the EEPROM of the Engine management Electronic Control Unit [ECU]. Monitoring is done to ensure the integrity of this data. Monitoring for this error is for both IQA and IVA and it is performed either at key-on or when triggered by a service tool or at cyclic update.

Monitor Operation:	
DTC	P2691-SE6871
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Incorrect checksum of injector adjustment code for Injector number 6.
OR
Injector number 6 manufacturing trim adjustment for Pilot Injection operation is outside of the range -1 mm3 to 1 mm3
OR
Injector number 6 manufacturing trim adjustment for High Load operation is outside of the range -4 mm3 to 4 mm3
OR
Injector number 6 manufacturing trim adjustment for Low Idle operation is outside of the range -1.1 mm3 to 1.1 mm3
OR
Injector number 6 manufacturing trim adjustment for Partial Load operation is outside of the range -2.1 mm3 to 2.1 mm3
OR
Injector Adjustment values for injector number 6 unreadable due to faulty EEPROM access.

404. P0206-SE3362: Injector Solenoid Driver Cylinder 6 Circuit - Current Below Normal or Open Circuit

No load due to open circuit as a result of defective cable connector or broken connection to actuator within injector number 6.

Monitor Operation:	
DTC	P0206-SE3362
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0261-SE6892, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 6 < 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Discharge time [tiDisch] for cylinder number 6 ≥ 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 6 ≤ Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
OR
All of the following:
Actuator charging time [tiChrg] for cylinder number 6 ≥ 5 µsecs
Actuator Discharge time [tiDisch] for cylinder number 6 < 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 6 > Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A

Injector buffer current during voltage discharging ≤ 9.6 A

405. P0277-SE4679: Injector Solenoid Driver Cylinder 6 Circuit - Current Above Normal or Grounded Circuit

Injector number 6 driver high side is short-circuited to the injector driver low side of another injector on the same bank.

Monitor Operation:	
DTC	P0277-SE4679
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] >100 µsecs
Actuator charging time [tiChrg] for cylinder number 6 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

406. P021A-SE6793: Injector Solenoid Driver Cylinder 7 - Mechanical System Not Responding or Out of Adjustment

The corrected injector Energizing Time (ET) for at least one rail pressure point on injector number 7 exceeds a calibratable maximum threshold.

Monitor Operation:	
DTC	P021A-SE6793
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	52 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):

Intake Air temperature ≤ -10 °C
Fuel temperature < 15 °C OR Fuel temperature > 90 °C
Engine Coolant temperature ≤ 70 °C
Battery voltage ≤ 10 V
The combustion chamber has cooled: The duration of Motoring ≥ RefTable38
Boost pressure ≤ 85 kPa(absolute)
Accelerator Pedal position > 0 %
The Vehicle is not in an enabled gear OR (the Vehicle is in an enabled gear AND the Engine speed is outside of a calibratable range). (See RefCond0035.)
A gear change occurs in the Motoring event
The clutch is disengaged.
Vehicle speed ≤ RefTable36

Malfunction Thresholds (all active):
Corrected Energizing Time of injector number 7 < 100 µsec for the Rail pressure set point of 250 bar
OR
Corrected Energizing Time of injector number 7 < 90 µsec for the Rail pressure set point of 600 bar
OR
Corrected Energizing Time of injector number 7 < 100 µsec for the Rail pressure set point of 1,200 bar

408. P2692-SE6867: Injector Solenoid Driver Cylinder 7 - Out of Calibration

Injector Trim Codes consists of Injector Quantity Adjustment [IQA] and Injector Voltage Adjustment [IVA] values. The Trim Codes are programmed into the EEPROM of the Engine management Electronic Control Unit [ECU]. Monitoring is done to ensure the integrity of this data. Monitoring for this error is for both IQA and IVA and it is performed either at key-on or when triggered by a service tool or at cyclic update.

Monitor Operation:	
DTC	P2692-SE6867
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Incorrect checksum of injector adjustment code for Injector number 7.
OR
Injector number 7 manufacturing trim adjustment for Pilot Injection operation is outside of the range -1 mm3 to 1 mm3
OR
Injector number 7 manufacturing trim adjustment for High Load operation is outside of the range -4 mm3 to 4 mm3
OR
Injector number 7 manufacturing trim adjustment for Low Idle operation is outside of the range -1.1 mm3 to 1.1 mm3
OR
Injector number 7 manufacturing trim adjustment for Partial Load operation is outside of the range -2.1 mm3 to 2.1 mm3
OR
Injector Adjustment values for injector number 7 unreadable due to faulty EEPROM access.

409. P0207-SE3363: Injector Solenoid Driver Cylinder 7 Circuit - Current Below Normal or Open Circuit

No load due to open circuit as a result of defective cable connector or broken connection to actuator within injector number 7.

Monitor Operation:	
DTC	P0207-SE3363
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0261-SE6892, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
Main injection is active with voltage and time measurements perfomed in the µ-controller within the ECM.
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for cylinder number 7 < 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Discharge time [tiDisch] for cylinder number 7 ≥ 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 7 ≤ Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
OR
All of the following:
Actuator charging time [tiChrg] for cylinder number 7 ≥ 5 µsecs
Actuator Discharge time [tiDisch] for cylinder number 7 < 35.2 µsecs
Actuator Charge-up voltage [uChrgUp] for cylinder number 7 > Injector charge voltage set-point+80 V
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
The maximum injector current [ipiezo] ≤ 32 A

Injector buffer current during voltage discharging ≤ 9.6 A

410. P0280-SE4675: Injector Solenoid Driver Cylinder 7 Circuit - Current Above Normal or Grounded Circuit

Injector number 7 driver high side is short-circuited to the injector driver low side of another injector on the same bank.

Monitor Operation:	
DTC	P0280-SE4675
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P02EE-SE6854, P0606-SE6842, P0606-SE6844, P2146-SE6840
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] >100 µsecs
Actuator charging time [tiChrg] for cylinder number 7 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

411. P021B-SE6794: Injector Solenoid Driver Cylinder 8 - Mechanical System Not Responding or Out of Adjustment

The corrected injector Energizing Time (ET) for at least one rail pressure point on injector number 8 exceeds a calibratable maximum threshold.

Monitor Operation:	
DTC	P021B-SE6794
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	52 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):

The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] >100 µsecs
Actuator charging time [tiChrg] for cylinder number 8 ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Actuator Discharge time [tiDisch] for cylinder number 8 ≥ 35.2 µsecs
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

416. P0606-SE6844: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

Communication error in the integrated circuit [IC] chip for injector bank number 1.

Monitor Operation:	
DTC	P0606-SE6844
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P2146-SE6840
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis ≤ 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

417. P2146-SE6840: Engine Injector Group 1 Circuit - Current Above Normal or Grounded Circuit

Injector driver high side is short-circuted to ground within injector bank number 1, or Injector driver low side is short-circuited to ground within injector bank number 1, or Injector driver low side is short-circuited to battery within bank number 1.
OR
Injector driver high side is short-circuted to battery within bank number 1.

Monitor Operation:	
DTC	P2146-SE6840
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P0606-SE6844
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. OR Safety related software functions execute in the expected sequence. OR Safety related parameters match their complementary data values.

Malfunction Thresholds (all active):
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for the cylinder being fired ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis > 9.8 A
The maximum injector current [ipiezo] ≤ 32 A
Injector buffer current during voltage discharging ≤ 9.6 A
OR
Actuator charging time [tiChrg] ≤100 µsecs
Actuator charging time [tiChrg] for the cylinder being fired ≥ 5 µsecs
Differential current in the injector shunt [idiff_piezo] for current measurement and difference analysis ≤ 9.8 A
Differential current in the injector Buffer shunt [idiff_buffer] for current measurement and difference analysis > 9.8 A
Injector buffer current during voltage discharging ≤ 9.6 A

418. P0606-SE6845: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

Communication error in the integrated circuit [IC] chip for injector bank number 2.

Monitor Operation:	
DTC	P0606-SE6845
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0201-SE3357, P0261-SE6892, P0262-SE4673, P02EE-SE6854, P0606-SE6842, P2146-SE6840
The injector circuitry watchdog status signal is correctly formatted and present AND The injector circuitry watchdog status indicates that the injector circuitry µ-controller has not stopped working. The 500 ms detection threshold required for the watchdog to trigger injection deactivation is not attained due to the following: Read and write RAM errors are not present. Injector buffer current during voltage discharging ≤ 9.6 A

420. P0611-SE7392: Injector Power Supply - Bad Intelligent Device or Component

Diagnosis of Engine speed during injection cut-off request.

Monitor Operation:	
DTC	P0611-SE7392
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Injection cut-off request is active

Malfunction Thresholds (all active):
Engine speed in Standard Mode > 1,500 RPM
Engine speed in Comfort Mode > 1,500 RPM

421. U1612-SE6683: Aftertreatment Selective Catalytic Reduction Temperature Sensor Module - Abnormal Update Rate

Determine when the J1939 proprietary EGTS-dual cold junction message is not received on the Datalink

Monitor Operation:	
DTC	U1612-SE6683
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2,510 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
Whenever any enable conditions is not met.

Malfunction Thresholds (all active):
J1939 proprietary EGTS-dual cold junction Message not received

422. U1612-SE6685: Aftertreatment Selective Catalytic Reduction Temperature Sensor Module - Abnormal Update Rate

Determine when the J1939 proprietary EGTS Triple message is not received on the Datalink

Monitor Operation:	
DTC	U1612-SE6685
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2,510 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
Whenever any enable conditions is not met.

Malfunction Thresholds (all active):
J1939 proprietary EGTS Triple Message not received

423. U1611-SE6686: Aftertreatment Diesel Particulate Filter Temperature Sensor Module - Abnormal Update Rate

Determine when the J1939 proprietary EGTS-triple cold junction message is not received on the Datalink

Monitor Operation:	
DTC	U1611-SE6686
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2,510 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
Whenever any enable conditions is not met.

Malfunction Thresholds (all active):
J1939 proprietary EGTS-triple cold junction Message not received

424. U1611-SE6687: Aftertreatment Diesel Particulate Filter Temperature Sensor Module - Abnormal Update Rate

Determine when the J1939 proprietary EGTS Triple message is not received on the Datalink

Monitor Operation:	
DTC	U1611-SE6687
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2,510 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
Whenever any enable conditions is not met.

Malfunction Thresholds (all active):
J1939 proprietary EGTS Triple Message not received

425. U029D-SE2487: Aftertreatment 1 Intake NOx Sensor - Abnormal Update Rate

Determine when the AT1IG1 message is not received on the Datalink

Monitor Operation:	
DTC	U029D-SE2487
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2,010 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
Whenever any enable conditions is not met.

Malfunction Thresholds (all active):
Message not received

426. U029E-SE2488: Aftertreatment 1 Outlet NOx Sensor - Abnormal Update Rate

Determine when the AT1OG1 message is not received on the Datalink

Monitor Operation:	
DTC	U029E-SE2488
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2,010 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
Whenever any enable conditions is not met.

Malfunction Thresholds (all active):
Message not received

427. U0106-SE3031: Glow Plug Control Module - Abnormal Update Rate

The Engine Control Module did not receive Status message from Glow Plug Control Module on the datalink.

Monitor Operation:	
DTC	U0106-SE3031
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	510 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
NOTDatalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Malfunction Thresholds (all active):
Message not received from Glow Plug Control Module.

428. U0307-SE3030: Glow Plug Control Module - Out of Calibration

Determine if Software ID from Glow Plug Control Module matches the expected Software ID.

Monitor Operation:	
DTC	U0307-SE3030
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 msec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
NOTDatalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Malfunction Thresholds (all active):
Software ID from Glow Plug Control Module does not match Software ID stored in calibration parameter.

429. U0407-SE10384: Glow Plug Control Module - Data Erratic, Intermittent, or Incorrect

Determine if Status and Status 2 message data from Glow Plug Control Module is within limits.

Monitor Operation:	
DTC	U0407-SE10384
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 msec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
NOTDatalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Malfunction Thresholds (all active):
Status and Status 2 message data from Glow Plug Control Module is not within limits

430. U010C-SE8277: Engine Turbocharger Turbine Bypass Actuator - Abnormal Update Rate

Determine when the TBV (Turbo Bypass Valve) Status signal is not received over the datalink.

Monitor Operation:	
DTC	U010C-SE8277
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1,010 msec.
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
NOT [Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)].

Malfunction Thresholds (all active):
TBV Status ID Message not received

431. P20FF-SE2327: Aftertreatment Diesel Exhaust Fluid Controller - Bad Intelligent Device or Component

Determine if the correct Software ID has been received from the SCR smart device.

Monitor Operation:	
DTC	P20FF-SE2327
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 mSec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Software ID message has been received.

Abort Conditions (any active):
Whenever any enable condition is not met.

Malfunction Thresholds (all active):
Incorrect Software ID received

432. U010E-SE2290: Aftertreatment Diesel Exhaust Fluid Controller - Abnormal Update Rate

The ECM monitors SCR communications over the datalink and sets an error when they are not received.

Monitor Operation:	
DTC	U010E-SE2290
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	30.010 sec to detect missing software ID message. 0.260 sec to detect missing status message.
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
Whenever any enable condition is not met.

Malfunction Thresholds (all active):
Message not received

433. U02A2-SE6447: Aftertreatment Diesel Exhaust Fluid Quality - Abnormal Update Rate

Determine when the J1939 DEF quality message is not received on the Datalink

Monitor Operation:	
DTC	U02A2-SE6447
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5,010 msec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Datalinks-related faults are inhibited for a calibratable amount of time following a key-on event, a low battery voltage event, an engine cranking event, and a stop/suspend broadcast event. This is to allow reasonable time for datalink devices to power up and begin periodic broadcasts before the ECM performs time-out diagnostics. (See RefCond0036.)

Abort Conditions (any active):
Whenever any enable conditions is not met.

Malfunction Thresholds (all active):
Message not received

434. P0629-SE3950: Electric Lift Pump for Engine Fuel Supply Circuit - Voltage Above Normal or Shorted to High Source

When the lift pump is "OFF", an open circuit or short circuit of the lift pump relay driver output to ground is detected if the measured voltage across the gates of the MOSFET of the driver ASIC is below a fixed threshold defined by the hardware.

Monitor Operation:	
DTC	P0629-SE3950
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
The Key-switch is ON.
The Lift Pump is turned OFF.

Pause Conditions (any active):
The Lift Pump is turned ON.

Malfunction Thresholds (all active):
Fuel Lift Pump driver voltage < 5 V

435. P0628-SE3951: Electric Lift Pump for Engine Fuel Supply Circuit - Voltage Below Normal or Shorted to Low Source

When the lift pump is "ON", a short circuit of the lift pump relay driver output to battery is detected if the measured current flowing through the gates of the MOSFET of the driver ASIC exceeds a fixed threshold defined by the hardware.

Monitor Operation:	
DTC	P0628-SE3951
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	4 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
The Key-switch is ON.
The Lift Pump is turned ON.

Pause Conditions (any active):
The Lift Pump is turned OFF.

Malfunction Thresholds (all active):
Fuel Lift Pump driver current > 4A

436. P0101-SE10395: Engine Intake Air Mass Flow - Data Erratic, Intermittent, or Incorrect

Mass Air Flow Correction is lower than calibrated limit for a calibrated amount of time

Monitor Operation:	
DTC	P0101-SE10395
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
P0102-SE3207, P0103-SE3206

Malfunction Thresholds (all active):
Mass Air Flow Adjustment Minimum Factor ≤ 0.8

437. P0101-SE10396: Engine Intake Air Mass Flow - Data Erratic, Intermittent, or Incorrect

Mass Air Flow Correction is higher than calibrated limit for a calibrated amount of time

Monitor Operation:	
DTC	P0101-SE10396
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
P0102-SE3207, P0103-SE3206

Malfunction Thresholds (all active):
Mass Air Flow Adjustment Maximum Factor ≥ 1.2

438. P0103-SE3206: Engine Intake Air Mass Flow Sensor Circuit - Voltage Above Normal or Shorted to High Source

Mass Air Flow sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0103-SE3206
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Mass Air Flow sensor value > 15,100 Hz (< 0 kg/min)

439. P0102-SE3207: Engine Intake Air Mass Flow Circuit - Voltage Below Normal or Shorted to Low Source

Mass Air Flow sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0102-SE3207
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Mass Air Flow sensor value < 1,000 Hz (> 29.72 kg/min)

440. P0299-SE7294: Engine Charge Air Cooler Outlet Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

Charge Flow lower than normal

Monitor Operation:	
DTC	P0299-SE7294
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine is in run state.
Ambient Air Temperature > -6.67 °C
Compressor Inlet Density > 0.5 kg/m3
Time which all Enable Conditions have been true ≥ 2 sec

Pause Conditions (any active):
P0405-SE3203, P0406-SE3202, P046C-SE3869, P0489-SE2798, P0490-SE2797, P0490-SE3582

P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493
P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493
The EGR H-bridge valve position is not known to be good. (See RefCond0029.)
Charge Flow Command < 2 kg/min
Charge Flow Command > 9 kg/min
EGR Valve Effective Flow Area < 0.25 cm2
EGR Valve Effective Flow Area > 2 cm2
EGR Off Engine Protection is active
Filtered (tau = 0.011 sec) Charge Temperature ≤ 15 °C
Filtered (tau = 0.011 sec) EGR Orifice Temperature ≤ 15 °C
EGR Delta P sensor autozero check is not complete
Engine Speed < 800 RPM
Engine Speed > 1,800 RPM

Total Fueling < 5 mg/stroke
Total Fueling > 75 mg/stroke
EGR Actuator Effective Flow Area is greater than 0 cm2 and EBV Actuator Effective Flow Area is greater than 0 cm2

Malfunction Thresholds (all active):
Cumulative sum of error (Estimated Flow - Measured Flow) over 200 second period is ever > 1,720 kg/min, which is equivalent to [Average of Error - Tolerance] >= 0.86 kg/min, where Tolerance is defined as: 0 kg/min

441. P0087-SE6789: Injector Metering Rail 1 Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

Fuel Rail Pressure falls below a calibratable minimum threshold [based on engine speed] while running in the Volume Control Mode.

Monitor Operation:	
DTC	P0087-SE6789
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.3 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fuel Rail Pressure control is only by Volume Control Valve in closed loop.
Service procedure for high pressure test should not be running.
Fuel Level > 14.898 %

Malfunction Thresholds (all active):
Fuel Rail Pressure < RefTable39 bar

442. P0300-SE7400: Engine Misfire for Multiple Cylinders - Condition Exists

A cylinder misfire event is recorded when the angular acceleration of the crankshaft is less than a minimum threshold within a calibratable number of engine revolutions. The Multiple Cylinder misfire error is set when excessive misfires were detected on at least two cylinders.

Monitor Operation:	
DTC	P0300-SE7400
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	484 rev
MIL Activation Criteria	2 trips

Entry Conditions (all active):
450 rpm ≤ Engine Speed ≤ 1,500 rpm
(Low Idle Speed Governor Set Point -450 rpm) ≤ Engine Speed ≤ (Low Idle Speed Governor Set Point + 450 rpm)
4 mg/stroke ≤ Injection Quantity ≤ 29 mg/stroke
Engine Coolant Temperature ≥ 30 °C
Vehicle Speed ≤ 1.864 mph
The engine is running.
Time since engine attained Normal Running Mode ≥ 5 sec

Malfunction Thresholds (all active):
At least 120 misfires on each of at least two cylinders were detected during 440 crankshaft revs
The Angular Acceleration of the crankshaft after the injection of each of at least two cylinders is below a minimum threshold that is dynamically calculated from current injection quantity and engine speed.

443. P2BAD-SE5369: Aftertreatment 1 Intake NOx Sensor - Root Cause Not Known

Engine Out NOx sensor reading is stuck in range

Monitor Operation:	
DTC	P2BAD-SE5369
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	40 seconds
MIL Activation Criteria	2 trips

Entry Conditions (all active):
| Estimated Engine Out NOx Concentration - filtered (tau = 13.133 sec) estimated Engine Out NOx Concentration | > 200 ppm.

Pause Conditions (any active):
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493

Engine is in Protection state
Compressor Inlet Density ≤ 0.85 kg/m3
Compressor Inlet Density ≥ 1.5 kg/m3
Ambient Air Temperature ≤ -6.7 °C
Engine Speed ≥ 2,800 RPM
Engine Speed ≤ 900 RPM
Net Engine Torque > RefTable40
Net Engine Torque < RefTable41
Engine doesn't run in Alpha 1 control mode
EGR Fraction ≤ 0.01 (ratio)
EGR Fraction ≥ 0.8 (ratio)
Fueling change rate > 50 mg/stroke/sec
Duration for which the pause conditions are FALSE < 10 sec
Aftertreatment Inlet NOx sensor reading is not valid due to the internal control loops within the sensor being unstable, or active faults detected by the sensor, or the sensor's battery supply voltage

is outside the desired range or dewpoint temperature has not been met or dewpoint temperature has been meet for less than a light off time. (See RefCond0037.)

Malfunction Thresholds (all active):

Cumulative sum of the ratio of (Measured Value - Estimated Value) to a Threshold in 300 seconds is ever >= 3,000 ppm ratio, which is equivalent to [Average of ratio - Tolerance] >= 2 ppm ratio. Where, Tolerance is defined as: 0 ppm, Threshold is defined as: max (1ppm, 1 scalar * Estimated Value).

445. P2201-SE5365: Aftertreatment 1 Intake NOx Sensor - Data Not Rational - Drifted High

Engine out NOx sensor reading is in range high during motoring condition

Monitor Operation:	
DTC	P2201-SE5365
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Pause Conditions (any active):
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493, P0544-SE2858, P0545-SE6730, P0546-SE6729, P0546-SE6735, P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P2031-SE2844, P2032-SE6732, P2033-SE6731, P2033-SE6736, P2453-SE2983, P2454-SE2883, P2455-SE2882, P2456-SE3284, P245F-SE2851, P2460-SE2857, P2461-SE2849

%O2 reading of Exhaust Air (See RefCond0022.)
The rate of change of estimated engine out O2 ≥ 7 %/s
The rate of change of estimated exhaust pressure ≥ 5 kPa(absolute)/s

Malfunction Thresholds (all active):
NOx sensor reading is not valid due to internal control loops within the sensor being unstable.. (See RefCond0038.)

448. P2201-SE5384: Aftertreatment 1 Intake NOx - Out of Calibration

The rated NOx sensor voltage is compared to the system supply voltage. Checking for appropriate part for the appropriate system

Monitor Operation:	
DTC	P2201-SE5384
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Pause Conditions (any active):
NOx sensor voltage parameter is not avaliable

Malfunction Thresholds (all active):
Rated NOx Sensor voltage does not match nominal system voltage

449. P229E-SE5990: Aftertreatment 1 Outlet NOx Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The NOx sensor circuitry has detected a failure affecting the aftertreatment outlet NOx sensor heater circuit.

Monitor Operation:	
DTC	P229E-SE5990
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 seconds
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Processing of fail messages from the sensor enabled 160 seconds after Exhaust gas temperature is above a threshold representing the point at which there is no longer a concern of condensation on the NOx sensor element. (See RefCond0039.)

Abort Conditions (any active):
U029E-SE2488

Pause Conditions (any active):
Exhaust gas temperature is below a threshold representing that dew point is not reached (See RefCond0040.)

Malfunction Thresholds (all active):
[Open H-] The resistance between the sensors heater connection to Ground and a 3rd heater electrode > 1,000,000 ohms for 10 seconds.
or
[Open H+] The resistance between the sensors heater supply and a 3rd heater electrode > 1,000,000 ohms for 10 seconds.
or
[H-/Tmp] The voltage between the 3rd electrode within the sensors internal heater and ground < 0.5 V for 10 seconds.
or
[M2/Tmp] The resistance between the sensors measuring electrode in the 2nd pumping chamber and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.
or
[P-/Tmp] The resistance between the sensors pumping electrode in the 1st pumping chamber and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.
or

[M1/Tmp] The resistance between the sensors pumping electrode in the 2nd pumping chamber and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.
or
[Ref/Tmp] (The resistance between the sensors air reference electrode and the sensors 3rd electrode within its internal heater is < 0.5 ohms AND the voltage between reference line and ground < 1 V) for 40 seconds.
or
[H+/H-] The resistance between the sensors internal heater supply voltage line and sensor ground is < 0.5 ohms for 10 seconds.
or
[Vbatt/P-] The resistance between supply voltage and the sensors pumping electrode in the 1st pumping chamber is < 0.5 ohms for 10 seconds.
or
[Vbatt/P+] The resistance between supply voltage and the sensors top electrode (directly exposed to exhaust gas) is < 0.5 ohms for 10 seconds.
or
[Vbatt/M1] The resistance between supply voltage and the sensors pumping electrode in the 2nd pumping chamber is < 0.5 ohms for 10 seconds.
or
[H+/Tmp] The voltage between the 3rd electrode within the internal heater and ground < 2.19 V AND the sensors internal heater resistance < 20.97 Ohms for 40 seconds.
or
[Vbatt/M2] The resistance between supply voltage and the sensors measuring electrode in 2nd chamber is < 0.5 ohms for 10 seconds.
or
[P+/Tmp] The resistance between the sensors top electrode (directly exposed to exhaust gas) and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.
or
[Vbatt/Ref] The resistance between supply voltage and the sensors air reference electrode is < 0.5 ohms for 10 seconds.
or
[Vbatt/H+] The resistance between supply voltage and the sensors heater supply is < 0.5 ohms for 10 seconds.
or
[Open Tmp] The resistance between the sensors 3rd electrode within its internal heater is > 1,000,000 ohms for 10 seconds.
or
[M1/M2] 5 mV < the voltage between the measuring electrode in the 2nd chamber with respect to the air reference electrode < 500 mV AND the voltage between the pumping electrode in the 2nd chamber and the air reference electrode = the voltage between the measuring electrode in the 2nd chamber with respect to the air reference electrode for 40 seconds.
or
[Vbatt/Tmp] The voltage at the 3rd electrode within the sensors internal heater > 8 V for 10 seconds.
or
[Open M2] The resistance between the sensors measuring electrode in the 2nd chamber and ground > 0 ohms for 10 seconds.

450. P22A7-SE5051: Aftertreatment 1 Outlet NOx Sensor Heater - Abnormal Rate of Change

Aftertreatment outlet NOx sensor heater malfunction.

Monitor Operation:	
DTC	P22A7-SE5051
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):

Engine total fueling ≤ 0.01 mg/stroke
NOx sensor reading is valid since the internal control loops within the sensor have stabilized. (See RefCond0041.)
Engine is operating in base mode.
Exhaust Flow ≥ 10 g/sec
Commanded DEF injection rate < 0.01 ml/sec
The OBD arbitrator allows the Tail Pipe NOx Sensor gain diagnostics to run.
None of the Abort Conditions are satisfied
The OBD Arbitrator allows the diagnostic to run.

NOT [When NH3 slip is detected, corrective action is taken. Commanded ANR is decreased by temporarily stepping down the target SCR conversion efficiency. (See RefCond0043.)]
All the other enable conditions has to be true for 6 seconds.

Sensors OK	None
Typical Monitoring Duration	10 seconds
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Processing of fail messages from the sensor enabled 160 seconds after dewpoint reached. Dewpoint is defined as: Exhaust gas temperature is above a threshold representing the point at which there is no longer a concern of condensation on the NOx sensor element. (See RefCond0039.)

Abort Conditions (any active):
U029E-SE2488

Pause Conditions (any active):
Exhaust gas temperature is below a threshold representing that dew point is not reached (See RefCond0040.)

Malfunction Thresholds (all active):
NOx sensor supply voltage > 16.5 V for 10 seconds.
OR
NOx sensor supply voltage < 10.8 V for 10 seconds.

456. P220B-SE6021: Aftertreatment 1 Outlet NOx Sensor Power Supply - Data Erratic, Intermittent, or Incorrect

The system out NOx sensor circuitry has detected an intermittent power supply voltage drop that results in a reset internal to the system out NOx sensor.

Monitor Operation:	
DTC	P220B-SE6021
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Exhaust gas temperature is above a threshold representing the point at which there is no longer a concern of condensation on the NOx sensor element. (See RefCond0039.) for less than 5 seconds

Abort Conditions (any active):
Exhaust gas temperature is below a threshold representing that dew point is not reached (See RefCond0040.)

Malfunction Thresholds (all active):
The number of filtered sensor reset events (sensor supply power < 6 V) is greater than 12 counts, within a diagnostic time window (300 sec). Sensor reset events are "filtered" by ignoring consecutive reset events occuring within (20 sec).

457. P229E-SE5987: Aftertreatment 1 Outlet NOx Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The NOx sensor circuitry has detected a failure within the aftertreatment outlet NOx sensor's internal circuitry that causes the sensed NOx value to be suspect.

Monitor Operation:	
DTC	P229E-SE5987
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 seconds
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Processing of fail messages from the sensor enabled 160 seconds after dewpoint reached. Dewpoint is defined as: Exhaust gas temperature is above a threshold representing the point at which there is no longer a concern of condensation on the NOx sensor element. (See RefCond0039.)

Abort Conditions (any active):
U029E-SE2488

Pause Conditions (any active):
Exhaust gas temperature is below a threshold representing that dew point is not reached (See RefCond0040.)

Malfunction Thresholds (all active):
[Open P+] The resistance between the electrode on the top of the sensor (directly exposed to exhaust gas) and ground > 1,000,000 ohms for 10 seconds.
or
[Open Ref] The resistance between the sensors air reference electrode and ground > 1,000,000 ohms for 10 seconds.
or
[Open M1] The resistance between the sensors pumping electrode in the 2nd chamber and ground > 1,000,000 ohms for 10 seconds.
or
[Open P-] The resistance between the sensors pumping electrode in 1st pumping chamber and ground > 1,000,000 ohms for 10 seconds.
or
[Ref/M2] (The resistance between the sensors air reference electrode and the sensors measuring electrode in the 2nd chamber is < 0.5 ohms AND the voltage between the pumping electrode in the 2nd chamber and reference is within 20mV of a 420mV setpoint AND the voltage between the measuring electrode in the 2nd chamber and the reference < 15mV) for 40 seconds.

or
[P-/M2] (The binary voltage between the electrode on the top of the sensor (exposed to the exhaust gas) and the air reference electrode > 900 mV AND the voltage across the electrode in the 1st chamber and reference = the voltage across the measuring electrode in the 2nd chamber and reference) for 40 seconds.
or
[P+/M2] (The resistance between the sensors top electrode (directly exposed to exhaust gas) and the measuring electrode within the 2nd chamber is < 0.5 ohms AND the voltage between the measuring electrode in the 2nd chamber and reference < 120 mV) for 40 seconds.
or
[P-/M1] (The binary voltage between the electrode on the top of the sensor (exposed to the exhaust gas) and the air reference electrode > 900 mV AND the voltage across the electrode in the 1st chamber and reference = the voltage across the pumping electrode in the 2nd chamber and reference) for 40 seconds.
or
[Open M2] The resistance between the sensors measuring electrode in the 2nd chamber and ground > 1,000,000 ohms for 10 seconds.
or
[H-/Tmp] The voltage between the 3rd electrode within the sensors internal heater and ground < 0.5 V for 10 seconds.
or
[H+/Tmp] (the voltage between the 3rd electrode within the internal heater and ground < 2.19 V AND the sensors internal heater resistance < 20.97 Ohms) for 40 seconds.
or
[Ref/H+] The resistance between the air reference electrode and the sensors internal heater supply < 0.5 ohms for 10 seconds.
or
[Vbatt/Tmp] The voltage at the 3rd electrode within the sensors internal heater > 8 V for 10 seconds.
or
[Ref/H-] The resistance between the air reference electrode and ground < 0.5 ohms for 10 seconds.
or
[Ref/M1] The resistance between the sensors air reference electrode and the sensors pumping electrode in the 2nd chamber is < 0.5 ohms for 10 seconds.
or
[M1/H+] (The resistance between the pumping electrode in the 2nd chamber and the supply voltage to the sensors internal heater < 0.5 ohms AND the voltage between the electrode in the 1st chamber and the air reference electrode < 25.6 mV) for 40 seconds.
or
[P+/P-] (The resistance between the sensors top electrode (directly exposed to exhaust gas) and the pumping electrode within the 1st chamber is < 0.5 ohms AND | the current entering the pumping electrode in the 2nd chamber | > -19.5 uA AND the voltage between the pumping electrode in the 2nd chamber and the reference < 100 mV) for 40 seconds.
or
[Ref/Tmp] (The resistance between the sensors air reference electrode and the sensors 3rd electrode within its internal heater is < 0.5 ohms AND the voltage between reference line and ground < 1 V) for 40 seconds.

or
[P-/H+] The resistance between the pumping electrode in the 1st chamber and the sensors internal heater supply is < 0.5 ohms for 10 seconds.
or
[M1/H-] The resistance between the pumping electrode in the 2nd chamber and ground < 0.5 ohms for 10 seconds.
or
[P+/Tmp] The resistance between the sensors top electrode (directly exposed to exhaust gas) and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.
or
[M2/H-] The resistance between the measuring electrode in the 2nd chamber and ground < 0.5 ohms for 10 seconds.
or
[P-/H-] The resistance between the pumping electrode in the 1st chamber and ground is < 0.5 ohms for 10 seconds.
or
[M2/H+] The resistance between the measuring electrode in the 2nd chamber and the supply voltage to the sensors internal heater < 0.5 ohms for 10 seconds.
or
[H+/H-] The resistance between the sensors internal heater supply voltage line and sensor ground is < 0.5 ohms for 10 seconds.
or
[M2/Tmp] The resistance between the sensors measuring electrode in the 2nd pumping chamber and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.
or
[Vbatt/M1] The resistance between supply voltage and the sensors pumping electrode in the 2nd pumping chamber is < 0.5 ohms for 10 seconds.
or
[P+/M1] The resistance between the sensors top electrode (directly exposed to exhaust gas) and the pumping electrode within the 2nd chamber is < 0.5 ohms AND the binary voltage between the sensors top electrode and reference < 200 mV AND ((| the current entering the pumping electrode in the 2nd chamber | > -19.5 uA AND the voltage between the pumping electrode in the 2nd chamber and the reference < 100 mV) OR (binary voltage between the sensors top electrode and reference = the voltage between the pumping electrode in the 2nd chamber and reference)) for 40 seconds.
or
[Vbatt/Ref] The resistance between supply voltage and the sensors air reference electrode is < 0.5 ohms for 10 seconds.
or
[Vbatt/M2] The resistance between supply voltage and the sensors measuring electrode in 2nd chamber is < 0.5 ohms for 10 seconds.
or
[P-/Tmp] The resistance between the sensors pumping electrode in the 1st pumping chamber and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.
or
[M1/Tmp] The resistance between the sensors pumping electrode in the 2nd pumping chamber and the 3rd electrode within the sensors internal heater is < 0.5 ohms for 10 seconds.

or
[P+/H-] The resistance between the electrode in on the top of the sensor (exposed to the exhaust gas) and ground is < 0.5 ohms for 10 seconds.
or
[Ref/P-] (The resistance between the air reference electrode and pumping electrode in the 1st chamber < 0.5 ohms AND the voltage between the electrode in the 1st chamber and the air reference electrode < 25.6 mV) for 40 seconds.
or
[Vbatt/P-] The resistance between supply voltage and the sensors pumping electrode in the 1st pumping chamber is < 0.5 ohms for 10 seconds.
or
[Vbatt/P+] The resistance between supply voltage and the sensors top electrode (directly exposed to exhaust gas) is < 0.5 ohms for 10 seconds.
or
[Vbatt/H+] The resistance between supply voltage and the sensors heater supply is < 0.5 ohms for 10 seconds.
or
[M1/M2] (5 mV < the voltage between the measuring electrode in the 2nd chamber with respect to the air reference electrode < 500 mV AND the voltage between the pumping electrode in the 2nd chamber and the air reference electrode = the voltage between the measuring electrode in the 2nd chamber with respect to the air reference electrode) for 40 seconds.

458. P2BAF-SE11496: Aftertreatment 1 Outlet NOx Sensor - Root Cause Not Known

The Diagnostics will detect when the SONOx Sensor is removed from the exhaust pipe.

Monitor Operation:	
DTC	P2BAF-SE11496
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediately
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine total fueling ≥ 18 mg/stroke
Exhaust flow > 35 g/sec
Virtual SCR Inlet O2% < 17 %

Abort Conditions (any active):
P1191-SE4190, P1191-SE4746, P1192-SE484, P1193-SE486
P22A7-SE5051
P220B-SE5988
P229E-SE5990
P229E-SE5987
P220B-SE6021
U059F-SE5989
P22A7-SE5982
Ambient air pressure < 75 kPa(absolute)
Ambient air temperature < -6.7 °C
Aftertreatment Outlet NOx sensor reading is not valid due to internal control loops within the sensor being unstable, or active faults detected by the sensor, or the sensor's battery supply voltage is outside the desired range or dewpoint temperature not met. (See RefCond0044.)

Malfunction Thresholds (all active):
The fail sample percentage is above 30 %. Where the fail sample percentage is calculated as: The number of fail samples that the SCR Outlet O2 is above 18 % / The total number of the samples (600 counts) * 100%
AND
The Min/Max Delta of the sampled SCR Outlet O2% during the sampling period is below 3 %. The sampling period starts when the diagnostic was enabled for 15 sec, and ends when the number of samples reached 600 counts.

459. P229F-SE5986: Aftertreatment 1 Outlet NOx Sensor - Out of Calibration

The rated NOx sensor voltage is compared to the nominal system voltage.

Monitor Operation:	
DTC	P229F-SE5986
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediately
MIL Activation Criteria	1 trip

Pause Conditions (any active):
Aftertreatment outlet NOx Sensor Voltage status is not valid

Malfunction Thresholds (all active):
Rated NOx Sensor voltage does not match nominal system voltage

460. P1C56-SE7613: Aftertreatment 1 Outlet NOx Sensor - Data Erratic, Intermittent, or Incorrect

The system has detected that the aftertreatment outlet NOx sensor output is in-range, but not varying as expected (i.e. stuck-in-range)

Monitor Operation:	
DTC	P1C56-SE7613
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediately
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493

When NH3 slip is detected, corrective action is taken. Commanded ANR is decreased by temporarily stepping down the target SCR conversion efficiency. (See RefCond0043.)

Malfunction Thresholds (all active):
The maximum NOx sensor output - minimum NOx sensor output < 2 ppm during 3 valid monitoring events

461. U3017-SE4760: Real Time Clock - Abnormal Rate of Change

Engine Off Timer Stuck

Monitor Operation:	
DTC	U3017-SE4760
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Coolant Temperature at the prior powerdown ≥ 70 °C
Powerdown Coolant Temperature - Startup Coolant Temperature ≥ 10 °C

Abort Conditions (any active):
P2509-SE294
Battery power to the ECM has been removed since the prior power down.

Malfunction Thresholds (all active):
Number of times that the engine off timer displays the same value ≥ 10 counts

462. U3017-SE4759: Real Time Clock - Abnormal Rate of Change

ECM real time clock data has an erratic update rate.

Monitor Operation:	
DTC	U3017-SE4759
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The diagnostic monitor run time ≥ 721 sec

Abort Conditions (any active):
P2509-SE294
Battery power to the ECM has been removed since the prior power down.

Malfunction Thresholds (all active):
| Real Time clock elapsed time - 721sec | > 120 sec

463. P0524-SE74: Engine Oil Rifle Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

Engine Oil Rifle Pressure is valid but below normal operating range.

Monitor Operation:	
DTC	P0524-SE74
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Time after the engine has started ≥ 30 sec
Engine Speed ≥ 570 RPM

Pause Conditions (any active):
Engine Speed < 570 RPM

Malfunction Thresholds (all active):
Oil Pressure ≤ RefTable49

464. P0524-SE279: Engine Oil Rifle Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

Engine Oil Rifle Pressure is valid but below normal operating range.

Monitor Operation:	
DTC	P0524-SE279
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Time after the engine has started ≥ 30 sec
Engine Speed ≥ 570 RPM

Pause Conditions (any active):
Engine Speed < 570 RPM

Malfunction Thresholds (all active):
Oil Pressure ≤ RefTable49

465. P0521-SE687: Engine Oil Rifle Pressure - Data Erratic, Intermittent, or Incorrect

Oil Rifle Pressure sensor is either erratic, intermittent or incorrect.

Monitor Operation:	
DTC	P0521-SE687
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):

Abort Conditions (any active):

Malfunction Thresholds (all active):
Oil Pressure > 0 kPa (Gauge) at key on with Engine Speed = 0 RPM
Number of times the Oil Pressure Switch sensor indicates positive Oil Pressure before engine start ≥ 5 counts

466. P0257-SE3258: Engine Fuel Pump Pressurizing Assembly 2 - Mechanical System Not Responding or Out of Adjustment

The temperature of the Pressure Control Valve [PCV] driver ASIC within the ECM exceeds the monitoring threshold.

Monitor Operation:	
DTC	P0257-SE3258
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.28 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):

Pause Conditions (any active):

Malfunction Thresholds (all active):
Pressure Control Valve [PCV] Driver ASIC Temperature ≥ 160 °C

467. P0252-SE3262: Engine Fuel Pump Pressurizing Assembly 1 - Mechanical System Not Responding or Out of Adjustment

The temperature of the Volume Control Valve [VCV] driver ASIC within the ECM exceeds the monitoring threshold.

Monitor Operation:	
DTC	P0252-SE3262
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.22 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):

Pause Conditions (any active):

Malfunction Thresholds (all active):
Volume Control Valve [VCV] Driver ASIC Temperature ≥ 165 °C

468. P009E-SE4482: High Pressure Common Rail Fuel Pressure Relief Valve - Out of Calibration

The Adaptation Factor is calculated from Pressure Control Valve [PCV] Set value minus the Measured rail pressure during rail pressure control by the PCV. If the adaptation factor exceeds a calibratable maximum threshold, a PCV Adaptation Limit High error will be set.

Monitor Operation:	
DTC	P009E-SE4482
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediately
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0087-SE3236, P0087-SE3237, P0087-SE6787, P0087-SE6789, P0087-SE6790, P0088-SE3238, P0088-SE3239, P0088-SE6780, P0088-SE6783, P0088-SE6785, P009C-SE4715, P009D-SE3257, P009D-SE4714, P0252-SE3262, P0253-SE4717, P0254-SE3261, P0254-SE4716, P0257-SE3258
-7 °C ≤ Fuel Temperature ≤ 55 °C
The rate of change [gradient] of PCV set point rail pressure < 800 bar/sec
The rate of change [gradient] of PCV set point current < 300 mA/sec
Number of PCV adaptation cycles ≥ 5
The Pressure Control Valve [PCV] Adaptation Factor calculation has been completed.
The engine is running.
Fuel Level > 14.898 %

Malfunction Thresholds (all active):
PCV Adaptation factor ≥ 1.3

469. P009E-SE4485: High Pressure Common Rail Fuel Pressure Relief Valve - Out of Calibration

The Adaptation Factor is calculated from Pressure Control Valve [PCV] Set value minus the Measured rail pressure during rail pressure control by the PCV. If the adaptation factor falls below a calibratable minimum threshold, a PCV Adaptation Limit Low error will be set.

Monitor Operation:	
DTC	P009E-SE4485
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediately
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P0087-SE3236, P0087-SE3237, P0087-SE6787, P0087-SE6789, P0087-SE6790, P0088-SE3238, P0088-SE3239, P0088-SE6780, P0088-SE6783, P0088-SE6785, P009C-SE4715, P009D-SE3257, P009D-SE4714, P0252-SE3262, P0253-SE4717, P0254-SE3261, P0254-SE4716, P0257-SE3258
-7 °C ≤ Fuel Temperature ≤ 55 °C
The rate of change [gradient] of PCV set point rail pressure < 800 bar/sec
The rate of change [gradient] of PCV set point current < 300 mA/sec
Number of PCV adaptation cycles ≥ 5
The Pressure Control Valve [PCV] Adaptation Factor calculation has been completed.
The engine is running.
Fuel Level > 14.898 %

Malfunction Thresholds (all active):
PCV Adaptation factor ≤ 0.7

470. P0088-SE3238: Injector Metering Rail 1 Pressure - Data Valid But Above Normal Operating Range - Moderately Severe Level

The Pressure Control Valve [PCV] high rail pressure error is set when the measured fuel rail pressure is above the setpoint by more than a calibratable amount AND the pressure command to the Pressure Control Valve [PCV] is less than a calibratable amount.

Monitor Operation:	
DTC	P0088-SE3238
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fuel Rail Pressure control is by only Pressure Control Valve [PCV] in closed loop OR Fuel Rail Pressure control is by both Volume Control Valve [VCV] AND Pressure Control Valve [PCV] in closed loop [Coupled Pressure Control, in closed loop]

Malfunction Thresholds (all active):
Commanded Fuel Rail Pressure - Actual Fuel Rail Pressure < -200 bar
Pressure Control Valve [PCV] setpoint value < 10 bar

471. P0087-SE3236: Injector Metering Rail 1 Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

The Pressure Control Valve [PCV] low rail pressure error is set when the measured fuel rail pressure is below the setpoint by more than a calibratable amount [based on engine speed].

Monitor Operation:	
DTC	P0087-SE3236
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0087-SE3237, P0087-SE6790, P0088-SE3239, P0088-SE6783, P0252-SE3262, P0253-SE4717, P0254-SE3261, P0254-SE4716
Fuel Rail Pressure control is by only Pressure Control Valve [PCV] in closed loop OR Fuel Rail Pressure control is by both Volume Control Valve [VCV] AND Pressure Control Valve [PCV] in closed loop [Coupled Pressure Control, in closed loop]
Fuel Level > 14.898 %

Malfunction Thresholds (all active):
Commanded Fuel Rail Pressure - Actual Fuel Rail Pressure > RefTable10 bar

472. P0087-SE6790: Injector Metering Rail 1 Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

Fuel Rail Pressure falls below a calibratable minimum threshold (based on engine speed) while running in the Pressure Control Mode.

Monitor Operation:	
DTC	P0087-SE6790
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.3 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fuel Rail Pressure control is only by Pressure Control Valve [PCV] in closed loop OR Fuel Rail Pressure control is by both Volume Control Valve [VCV] AND Pressure Control Valve [PCV] in closed loop [Coupled Pressure Control, in closed loop]
Fuel Level > 14.898 %

Malfunction Thresholds (all active):
Fuel Rail Pressure < RefTable12 bar

473. P009D-SE3257: High Pressure Common Rail Fuel Pressure Relief Valve Circuit - Voltage Above Normal or Shorted to High Source

The Fuel Rail Pressure Control Valve (PCV) driver voltage is below a fixed threshold while the PWM driver is in the "OFF" state.

Monitor Operation:	
DTC	P009D-SE3257
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	280 msec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The Pressure Control Valve [PCV] Pulse Width Modulated [PWM] signal is in the "OFF" state.

Pause Conditions (any active):

Malfunction Thresholds (all active):
3 V < PCV driver voltage < 5 V

474. P009D-SE4714: High Pressure Common Rail Fuel Pressure Relief Valve Circuit - Voltage Above Normal or Shorted to High Source

The Fuel Rail Pressure Control Valve (PCV) driver current exceeds a fixed threshold when the PWM driver is in the "ON" state.

Monitor Operation:	
DTC	P009D-SE4714
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	280 msec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The Pressure Control Valve [PCV] Pulse Width Modulated [PWM] signal is in the "ON' state.

Pause Conditions (any active):

Malfunction Thresholds (all active):
PCV driver current > 10 A

475. P009C-SE4715: High Pressure Common Rail Fuel Pressure Relief Valve Circuit - Voltage Below Normal or Shorted to Low Source

The Fuel Rail Pressure Control Valve (PCV) driver voltage is below a fixed threshold while the PWM driver is in the "OFF" state.

Monitor Operation:	
DTC	P009C-SE4715
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	50 msec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The Pressure Control Valve [PCV] Pulse Width Modulated [PWM] signal is in the "OFF" state.

Pause Conditions (any active):

Malfunction Thresholds (all active):
PCV driver voltage < 3 V

476. P2509-SE294: Power Supply Lost With Ignition On - Data Erratic, Intermittent, or Incorrect

RAM image storage has not completed for every time that it has started.

Monitor Operation:	
DTC	P2509-SE294
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	OBD No MIL

Malfunction Thresholds (all active):
At powerup, the number of times RAM image storage has started does not match the number of times RAM image storage has completed.

477. P0421-SE3545: Aftertreatment Diesel Oxidation Catalyst Conversion Efficiency - Data Valid But Below Normal Operating Range - Least Severe Level

Active regeneration of the DPF aborted due to the system detecting a malfunction with the closed loop temperatue controller using up all of the adjustment allowed.

Monitor Operation:	
DTC	P0421-SE3545
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate after malfunction criteria are met
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493
P0544-SE2858, P0545-SE6730, P0546-SE6729, P0546-SE6735, P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P2031-SE2844, P2032-SE6732, P2033-SE6731, P2033-SE6736
Rate of active/intrusive injection of Hydrocarbons into exhaust > 0.2 g/sec
Ambient Air Temperature > -7 °C
Enable conditions for the algorithm that detects an ineffective regeneration of the DPF. (See RefCond0045.)
%O2 reading of Exhaust Air (See RefCond0022.)

Abort Conditions (any active):
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493
P0544-SE2858, P0545-SE6730, P0546-SE6729, P0546-SE6735, P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P2031-SE2844, P2032-SE6732, P2033-SE6731, P2033-SE6736
Rate of active/intrusive injection of Hydrocarbons into exhaust ≤ 0.2 g/sec
Ambient Air Temperature ≤ -7 °C
Abort conditions for the algorithm that detects an ineffective regeneration of the DPF. (See RefCond0046.)
NOT [%O2 reading of Exhaust Air (See RefCond0022.)].

Pause Conditions (any active):
Pause conditions for the algorithm that detects an ineffective regeneration of the DPF. (See RefCond0047.)
Torque Fueling ≥ 0 mg/stroke

Malfunction Thresholds (all active):
Malfunction criteria has occured that aborts the current active regeneration of the DPF (Ineffective regeneration). (See RefCond0024.)
3 unique occurrences of the following conditions during an active regeneration of the DPF, with each occurrence persisting for a minimum of 60 seconds: (desired DOC outlet temperature - actual DOC outlet temperature > 15 degC) AND (allowed HC injection command {limited due to tailpipe HC slip concerns} - desired HC injection command estimated from feed forward control > 0 g/sec) AND [(total HC injection rate command - allowed HC injection rate > 0 g/sec) OR (HC injection rate before feedback adjustment - actual HC injection rate after feedback adjustment > 0 g/sec)]

478. P0607-SE217: Engine Control Module Warning Internal Hardware Failure - Bad Intelligent Device or Component

ECM does not power down when the ignition is off.

Monitor Operation:	
DTC	P0607-SE217
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
The ECM stays powered on after the ignition is turned off.

479. P0088-SE6780: Injector Metering Rail 1 Pressure - Data Valid But Above Normal Operating Range - Moderately Severe Level

Fuel Rail Pressure exceeds a calibratable maximum threshold during pressure control in Combined Pressure Control [CPC] mode.

Monitor Operation:	
DTC	P0088-SE6780
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.3 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fuel Rail Pressure control is by both Volume Control Valve [VCV] AND Pressure Control Valve [PCV] in closed loop [Coupled Pressure Control, in closed loop]

Malfunction Thresholds (all active):
Fuel Rail Pressure > 2,150 bar

480. P0088-SE6783: Injector Metering Rail 1 Pressure - Data Valid But Above Normal Operating Range - Moderately Severe Level

Fuel Rail Pressure exceeds a maximum calibratable threshold during pressure control in Volume Control Valve [VCV] mode.

Monitor Operation:	
DTC	P0088-SE6783
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.3 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fuel Rail Pressure control is by only Volume Control Valve [Metering Unit] in closed loop.

Malfunction Thresholds (all active):
Fuel Rail Pressure > 2,150 bar

481. P0088-SE6785: Injector Metering Rail 1 Pressure - Data Valid But Above Normal Operating Range - Moderately Severe Level

Fuel Rail pressure exceeds a maximum calibratable threshold during pressure control in Pressure Control Valve [PCV] mode.

Monitor Operation:	
DTC	P0088-SE6785
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.3 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Fuel Rail Pressure control is by only Pressure Control Valve [PCV] in closed loop OR Fuel Rail Pressure control is by both Volume Control Valve [VCV] AND Pressure Control Valve [PCV] in closed loop [Coupled Pressure Control, in closed loop]

Malfunction Thresholds (all active):
Fuel Rail Pressure > 2,150 bar

482. P0606-SE33: Engine Control Module Critical Internal Failure - Bad Intelligent Device or Component

The write to ECM RAM imaged data block has failed.

Monitor Operation:	
DTC	P0606-SE33
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.04 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
The checksum of the flash data block does not equal to the checksum of its ram imaged data block on a separate occurrences.

483. P06B8-SE5340: Engine Control Module Calibration Memory - Bad Intelligent Device or Component

Data mismatch between non-volatile memory and its RAM image.

Monitor Operation:	
DTC	P06B8-SE5340
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Data in Flash memory does not match its image in RAM on 10 separate occurrences.

484. P2123-SE63: Accelerator Pedal or Lever Position Sensor 1 Circuit - Voltage Above Normal or Shorted to High Source

Primary Accelerator Pedal Position Out-of-Range High

Monitor Operation:	
DTC	P2123-SE63
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.8 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P2122-SE64
P06A5-SE817
P06A4-SE815

Pause Conditions (any active):
P2122-SE64
P06A5-SE817
P06A4-SE815

Malfunction Thresholds (all active):
Primary Accelerator Pedal Position Sensor Value > 4.692 V (100 %)

485. P2122-SE64: Accelerator Pedal or Lever Position Sensor 1 Circuit - Voltage Below Normal or Shorted to Low Source

Primary Accelerator Pedal Position Out-of-Range Low

Monitor Operation:	
DTC	P2122-SE64
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.8 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P06A5-SE817
P06A4-SE815

Pause Conditions (any active):
P06A5-SE817
P06A4-SE815

Malfunction Thresholds (all active):
Primary Accelerator Pedal Position Sensor Value < 0.293 V (0 %)

486. P214D-SE2889: Aftertreatment 1 SCR Outlet Temperature - Data Valid But Above Normal Operating Range - Most Severe Level

The SCR catalyst exhibits an exothermic behavior (i.e. there is a large temperature difference across the SCR catalyst) for a sustained period of time.

Monitor Operation:	
DTC	P214D-SE2889
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P1624-SE6752, P1624-SE6753, P1624-SE6755, P1624-SE6756, P1624-SE6757, P1625-SE6758, P1626-SE6759, P1628-SE7180, P2472-SE2895, P2481-SE6763, P2482-SE6762, P2482-SE6765, P2483-SE3785, U1611-SE6687, U1612-SE6685
P1624-SE6752, P1624-SE6753, P1624-SE6755, P1624-SE6756, P1624-SE6757, P1625-SE6758, P1626-SE6759, P1628-SE7180, P2470-SE6761, P2471-SE6760, P2471-SE6764, P2472-SE2895, U1611-SE6687, U1612-SE6685
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493
SCR outlet temperature ≥ 200 °C
SCR inlet temperature ≥ 200 °C

Abort Conditions (any active):
P1624-SE6752, P1624-SE6753, P1624-SE6755, P1624-SE6756, P1624-SE6757, P1625-SE6758, P1626-SE6759, P1628-SE7180, P2472-SE2895, P2481-SE6763, P2482-SE6762, P2482-SE6765, P2483-SE3785, U1611-SE6687, U1612-SE6685
P1624-SE6752, P1624-SE6753, P1624-SE6755, P1624-SE6756, P1624-SE6757, P1625-SE6758, P1626-SE6759, P1628-SE7180, P2470-SE6761, P2471-SE6760, P2471-SE6764, P2472-SE2895, U1611-SE6687, U1612-SE6685
P0102-SE3207, P0103-SE3206, P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489, P0111-SE3793, P0111-SE4067, P0111-SE4070, P0112-SE488, P0113-SE487, P040B-SE3872, P040B-SE3876, P040B-SE3877, P040B-SE3878, P0471-SE3922, P0471-SE3924, P0471-SE4442, P0472-SE494, P0473-SE493
SCR outlet temperature < 200 °C
SCR inlet temperature < 200 °C

Malfunction Thresholds (all active):

(Calculated mass flow rate of Oxidant reaching the SCR catalyst > 0.5 g/sec) AND (exhaust mass flow rate < 2,000 g/sec) for the period of 180 seconds.
OR
(Calculated mass flow rate of Oxidant reaching the SCR catalyst > 0.5 g/sec) AND (exhaust mass flow rate ≥ 2,000 g/sec) for the period of 540 seconds.

487. P1C54-SE10102: Aftertreatment 1 SCR Catalyst System Missing - Condition Exists

The system has detected that the NOx converting catalyst has no detectable amount of NOx conversion capability.

Monitor Operation:	
DTC	P1C54-SE10102
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	35 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P1613-SE6721, P1613-SE6722, P1613-SE6724, P1613-SE6725, P1613-SE6726, P1614-SE6727, P1615-SE6728, P1623-SE7168, P242B-SE2852, P242C-SE6734, P242D-SE6733, P242D-SE6737

EGR Off Engine Protection is not active
40 g/s <= Exhaust flow rate <= 150 g/s
-1 g/sec/sec <= Rate of change of estimated exhaust mass flow <= 2 g/sec/sec
Aftertreatment inlet NOx <= 1,500 PPM
Rate of change of SCR NOx In ≤ 8 ppm/sec
Aftertreatment outlet NOx <= 1,500 PPM
Aftertreatment Outlet NOx sensor reading is valid since the internal control loops within the sensor are stable, and no active faults detected by the sensor, and the sensor's battery supply voltage is within the desired range and dewpoint temperature has been met for a sufficient time to allow the sensor to light off. (See RefCond0002.)
75 kPa (absolute) <= Ambient Air pressure <= 121 kPa (absolute)
Ambient Air temperature ≥ -6.7 °C
220 degC <= estimated SCR catalyst bed temperature <= 365 degC
-0.5 degC/sec <= estimated rate of change of absolute SCR catalyst bed temperature <= 1.8 degC/sec
Ammonia to NOx Ratio (ANR) is >= 1.2 (unitless) for 150 sec. The timer to exit this enable condition is enabled if Ammonia to NOx Ratio (ANR) is less than 0.3 (unitless) for 180 sec consecutively
0.8(unitless) < Filtered Ammonia to NOx ratio < 2.5(unitless)
Deviation from mean of EONOx <= 15(unitless) for minimum RefTable50.
(ANR fraction > 0.7(unitless) AND SCR bed temperature > 150 degC AND SCR bed temperature < 400 degC AND SCR Bed temperature reset condition based on the module off time. (See RefCond0048.)) for 360 sec.
Urea injection command is > 0.02ml/sec for 150 sec. The timer to exit this condition is enabled in the event of a Key Switch OR if the Operation cycle is completed.
OR
Urea Doser Functional Response Monitor has reached the minimum number of decisions to make a pass or a fail decision AND the P202E-SE7927 is not active.
Filtered total fueling is >= 1 mg/stroke for 1 sec.

Estimated SCR catalyst bed temperature < 220 degC OR estimated SCR catalyst bed temperature > 365 degC
Aftertreatment inlet NOx > 1,500 PPM
Aftertreatment outlet NOx > 1,500 PPM
Ambient air temperature < -6.7 °C
Exhaust flow rate < 40 g/s OR Exhaust flow rate > 150 g/s
Ambient Air pressure < 75 kPa (absolute) OR Ambient Air pressure > 121 kPa (absolute)
Aftertreatment Outlet NOx sensor reading is not valid due to internal control loops within the sensor being unstable, or active faults detected by the sensor, or the sensor's battery supply voltage is outside the desired range or dewpoint temperature not met. (See RefCond0049.)
SCR Bed temperature reset condition based on the module off time. (See RefCond0050.)
Rate of change of estimated SCR bed temperature > 1.8 °C/sec
Rate of change of estimated exhaust mass flow ≥ 2 g/sec/sec
Rate of change of SCR NOx In ≥ 8 ppm/sec
Exhaust Flow Rate is <= 35g/sec for a minimum cumulative time of 135 sec. The timer to exit this pause condition is enabled if the Ammonia to NOx Ratio (ANR) feedback is greater than 35g/sec for 360 sec
Estimated SCR catalyst bed temperature rate of change is > RefTable51. Pause condition is active for a minimum cumulative time of RefTable50.The timer to exit this pause condition is enabled if the estimated SCR catalyst bed temperature has decreased by at least 50 degC from its maximum temperature value.
Estimated SCR catalyst bed temperature rate of change is > RefTable51. Pause condition is active for a minimum cumulative time of RefTable52. The timer to exit this pause condition is enabled if the estimated SCR catalyst bed temperature rate of change is < RefTable53.
Filtered Ammonia to NOx ratio (ANR) < 0.8(unitless) OR Filtered Ammonia to NOx ratio (ANR) > 2.5(unitless)

Ammonia to NOx Ratio (ANR) Feedback is <= 0.3 (unitless) for 180 sec. The timer to exit this pause condition is enabled if Ammonia to NOx Ratio (ANR) is greater than 1.2 (unitless) for 150 sec consecutively
Urea injection command is <= 0.02ml/sec for 150 sec. The timer to exit this condition is enabled in the event of a Key Switch OR if the Operation cycle is completed.
Urea Doser Functional Response Monitor has NOT reached the minimum number of decisions to make a pass or a fail decision AND the P202E-SE7927 is active.
Filtered total fueling is <= 1 mg/stroke for 1 sec.

Malfunction Thresholds (all active):
Normalized DeNOx efficiency < -20 %

488. P249E-SE10852: Aftertreatment 1 SCR Feedback Control Status - Mechanical System Not Responding or Out of Adjustment

SCR inner control loop has used up all its adjustment allowed.

Monitor Operation:	
DTC	P249E-SE10852
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	150 sec
MIL Activation Criteria	2 trips

Aftreatment operation mode is not base mode
Engine is in Power Take Off mode.

Pause Conditions (any active):
NOT[All common enable condition for control loop used up is active (See RefCond0051.)].

NOT [SCR Inner loop used up enable conditions are true. (See RefCond0052.)].

Malfunction Thresholds (all active):
Percent of time SCR Inner Loop is used up / time all enable conditions are active > 80% Where: SCR Inner Loop is used up when: (SCR Conversion Efficiency Relay feedback mode is commanding very high ANR. (See RefCond0054.) OR SCR Conversion Efficiency Relay feedback mode is commanding high dosing for accelerated ammonia storage in SCR first brick (See RefCond0055.)) AND { (Target SCR Conversion Efficiency - Final estimate SCR Conversion Efficiency) > switching threshold * 5) AND SCR Conversion Efficiency Relay feedback mode is commanding high dosing for accelerated ammonia storage in SCR first brick (See RefCond0055.) OR Actual SCR Conversion Efficiency ≤ 0% }
Where
Switching threshold =RefTable56

489. P20EE-SE10910: Aftertreatment 1 SCR Conversion Efficiency - Condition Exists

The system has detected a decrease of the NOx converting catalyst's conversion capability resulting in tailpipe out NOx emissions exceeding the applicable threshold.

Monitor Operation:	
DTC	P20EE-SE10910
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Fuel system failure is present (See RefCond0064.)

Elapsed time since last active regeneration < 120 sec
Fuel system failure is present (See RefCond0064.)

Pause Conditions (any active):
Exhaust flow < 25 g/sec
Engine Speed < 200 RPM
(SCR inlet temperature < 100 degC OR SCR inlet temperature > 400 degC) AND (SCR outlet temperature < 100 degC OR SCR outlet temperature > 400 degC)
OEM datalink requested Engine intrusive diagnostics is active
First SCR Temperature sensor reading is suspected and not yet confirmed as faulty. (See RefCond0065.)
SCR Outlet Temperature sensor reading is suspected and not yet confirmed as faulty. (See RefCond0066.)

Malfunction Thresholds (all active):
(Average of the delta temperature between SCR Inlet/Midbed and SCR Outlet over a time window of 350 sec > 80 degC) OR (average of the delta temperature between SCR Inlet/Midbed and SCR Outlet over a time window of 350 sec < -70 degC)

493. P2472-SE7288: Aftertreatment 1 SCR Intermediate Gas Temperature Sensor - Data Erratic, Intermittent, or Incorrect

Aftertreatment SCR either Inlet or Outlet temperature sensor has been tampered with.

Monitor Operation:	
DTC	P2472-SE7288
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	600 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P1624-SE6752, P1624-SE6753, P1624-SE6755, P1624-SE6756, P1624-SE6757, P1625-SE6758, P1626-SE6759, P1628-SE7180, P2470-SE6761, P2471-SE6760, P2471-SE6764, U1611-SE6687, U1612-SE6685

Engine Speed > 600 RPM for 60 seconds
Ambient Air Pressure ≥ 75 kPa(absolute)
Ambient Air Temperature ≥ -6.7 °C
Exhaust flow > 0 g/sec for 5 seconds

Abort Conditions (any active):
Engine Speed ≤ 900 RPM for 90 seconds.
Engine Fueling ≤ 22 mg/stroke for 90 seconds.

Pause Conditions (any active):
Engine Speed ≤ 900 RPM
Engine Fueling ≤ 22 mg/stroke
Diagnostic will immediately pause if either Pause Condition occurs. Once paused, diagnostic will remain paused until both limits have been exceeded for 10 seconds.

Malfunction Thresholds (all active):
SCR Inlet/Midbed Temperature < 190 °C
OR
SCR Outlet temperature < 200 °C

494. P2483-SE3785: Aftertreatment 1 SCR Outlet Temperature Sensor - Data Erratic, Intermittent, or Incorrect

Aftertreatment SCR outlet gas temperature is in-range but not rational.

Monitor Operation:	
DTC	P2483-SE3785
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	350 sec
MIL Activation Criteria	2 trips

-70 degC < average of (DPF outlet temperature - SCR inlet/midbed temperature) < 80 degC

495. P22A7-SE5982: Aftertreatment 1 Outlet NOx Sensor Heater - Abnormal Rate of Change

Aftertreatment outlet NOx sensor heater malfunction.

Monitor Operation:	
DTC	P22A7-SE5982
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	60 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P1624-SE6752, P1624-SE6753, P1624-SE6755, P1624-SE6756, P1624-SE6757, P1625-SE6758, P1626-SE6759, P1628-SE7180, P2472-SE2895, P2481-SE6763, P2482-SE6762, P2482-SE6765, P2483-SE3785, U1611-SE6687, U1612-SE6685
P220B-SE5988, P229E-SE5987, P229E-SE5990, P229F-SE5986, U029E-SE2488
Time after the sensor has reached it working temperature and has entered automatic mode > 30 sec
Exhaust gas velocity < 60 m/sec
SCR outlet temperature < 800 °C
Exhaust gas temperature is above a threshold representing the point at which there is no longer a concern of condensation on the NOx sensor element. (See RefCond0039.)
Nox sensor battery supply voltage is within the desired range of [10.8, 16.5] V for more than 0.2 seconds.

Abort Conditions (any active):
P1624-SE6752, P1624-SE6753, P1624-SE6755, P1624-SE6756, P1624-SE6757, P1625-SE6758, P1626-SE6759, P1628-SE7180, P2472-SE2895, P2481-SE6763, P2482-SE6762, P2482-SE6765, P2483-SE3785, U1611-SE6687, U1612-SE6685
P220B-SE5988, P229E-SE5987, P229E-SE5990, P229F-SE5986, U029E-SE2488
Exhaust gas velocity ≥ 60 m/sec
SCR outlet temperature ≥ 800 °C
Exhaust gas temperature is below a threshold representing that dew point is not reached (See RefCond0040.)
Nox sensor battery supply voltage is outside the desired range of [10.8, 16.5] V.

Malfunction Thresholds (all active):
(The percentage of time spent with the sensor in a heating mode other than automatic mode > 5 % of the time that the monitor takes to make a decision) OR (Number of transitions from automatic mode to other states > 5 counts)

496. P214C-SE5295: Aftertreatment 1 SCR Outlet Temperature - Data Valid But Above Normal Operating Range - Moderately Severe Level

Aftertreatment SCR outlet gas temperature is continuously above a high threshold for a calibrated period of time while active regeneration of the DPF is not occurring.

Monitor Operation:	
DTC	P214C-SE5295
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	60 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):

499. U11C1-SE8706: Aftertreatment Diesel Exhaust Fluid Controller - Received Network Data in Error

This diagnostic checks if the Variant Data Selection (VDS) message sent by the Flange Control Unit (FCU) matches with the VDS message commanded by the engine ECU (Electronic Control Unit) to the FCU. If a mismatch is detected, then an error is set provided the datalink timeout error is not active

Monitor Operation:	
DTC	U11C1-SE8706
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Time taken to successfully transmit the Vehicle Configuration Message from the ECU to the FCU < 21 sec.
A valid Vehicle Configuration Selection was received from the FCU

Malfunction Thresholds (all active):
Vehicle configuration selected by the Flange Control Unit does not match with the vehicle configuration commanded by the Engine ECM.

500. P0653-SE243: Sensor Supply 1 Circuit - Voltage Above Normal or Shorted to High Source

Sensor Supply 1 voltage reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0653-SE243
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Sensor Supply 1 Voltage > 5.356 V

501. P0652-SE225: Sensor Supply 1 Circuit - Voltage Below Normal or Shorted to Low Source

Sensor Supply 1 voltage reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0652-SE225
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Sensor Supply 1 Voltage < 4.644 V

502. P0699-SE814: Sensor Supply 3 Circuit - Voltage Above Normal or Shorted to High Source

Sensor Supply 3 voltage reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0699-SE814
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Sensor Supply 3 Voltage > 5.356 V

503. P0698-SE816: Sensor Supply 3 Circuit - Voltage Below Normal or Shorted to Low Source

Sensor Supply 3 voltage reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0698-SE816
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Sensor Supply 3 Voltage < 4.644 V

504. P06A5-SE817: Sensor Supply 4 Circuit - Voltage Above Normal or Shorted to High Source

Sensor Supply 4 voltage reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P06A5-SE817
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Sensor Supply 4 Voltage > 5.356 V

505. P06A4-SE815: Sensor Supply 4 Circuit - Voltage Below Normal or Shorted to Low Source

Sensor Supply 4 voltage reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P06A4-SE815
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Sensor Supply 4 Voltage < 4.644 V

506. P06D4-SE1893: Sensor Supply 5 Circuit - Voltage Above Normal or Shorted to High Source

Sensor Supply 5 voltage reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P06D4-SE1893
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Sensor Supply 5 Voltage > 5.356 V

507. P06D3-SE1894: Sensor Supply 5 Circuit - Voltage Below Normal or Shorted to Low Source

Sensor Supply 5 voltage reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P06D3-SE1894
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
Sensor Supply 5 Voltage < 4.644 V

508. P06D8-SE2030: Sensor Supply 6 Circuit - Voltage Above Normal or Shorted to High Source

Sensor Supply 6 voltage reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P06D8-SE2030
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Sensor Supply 6 Voltage > 5.356 V

509. P06D7-SE2031: Sensor Supply 6 Circuit - Voltage Below Normal or Shorted to Low Source

Sensor Supply 6 voltage reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P06D7-SE2031
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Sensor Supply 6 Voltage < 4.644 V

510. P057E-SE8109: Brake Pedal Position - Data Erratic, Intermittent, or Incorrect

Brake Switch 1 and Brake Switch 2 disagree.

Monitor Operation:	
DTC	P057E-SE8109
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2 (counts)
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Key Switch is ON.

Abort Conditions (any active):
Key Switch is OFF.

Malfunction Thresholds (all active):
(Brake Switch 1 is On AND Brake Switch 2 is Off) OR (Brake Switch 1 is Off AND Brake Switch 2 is On) FOR 4 (seconds)

511. P1C70-SE5496: Aftertreatment SCR Operator Inducement - Data Valid But Above Normal Operating Range - Most Severe Level

Active Severe Driver Inducement

Monitor Operation:	
DTC	P1C70-SE5496
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	See AECD Document
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Key Switch is OFF
OR
Idle Shutdown has shutdown engine
OR
Amount of time at Idle > 3,600 seconds
OR
Fuel Level has increased > 15 percent since last Key On

Malfunction Thresholds (all active):
One or more conditions exist requiring Severe Driver Inducement

512. P262D-SE11550: Switched Output #1 - Voltage Below Normal or Shorted to Low Source

The ECM has detected the voltage to a relay is less than an allowable value.

Monitor Operation:	
DTC	P262D-SE11550
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.4
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
The power supply to a relay is < 8 V.

513. P0687-SE11618: Switched Output #2 - Voltage Above Normal or Shorted to High Source

The ECM has detected the voltage to a device is in excess of an allowable value.

Monitor Operation:	
DTC	P0687-SE11618
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
The power supply to a device is > 16 V.

514. P061C-SE5023: Engine Speed Calculation - Bad Intelligent Device or Component

Compares the difference between two distinct, independently calculated Engine Speed values against a calibrated maximum difference.

Monitor Operation:	
DTC	P061C-SE5023
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Absolute value of difference between Engine RPM and an independently calculated engine speed is greater than 500 RPM.

515. P062C-SE5030: Cruise Control Set Speed - Out of Calibration

The detection of operational errors in the main vehicle speed fueling control logic and systems. This is to meet X Wire diagnostic requirements.

Monitor Operation:	
DTC	P062C-SE5030
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
The Engine ECM Cruise Control is engaged.

Malfunction Thresholds (all active):
Independently of the main control algorithms, the inputs for cruise control switches, brake pedal, road speed, and selected transmission gear are read and evaluated and a determination is made based on these that cruise control should not be engaged.
OR
An independent reading of the cruise control switch inputs produces values that do not match the nominal cruise control switch inputs.
OR
(
Independently calculated Road Speed exceeds independently calculated Cruise Set Speed by 6.214 MPH
AND
P061A-SE5020 is active
)

516. P0601-SE5354: Engine Control Module Calibration Memory Checksum - Out of Calibration

Engine Control Module Calibration Memory Checksum does not match the expected reference value.

Monitor Operation:	
DTC	P0601-SE5354
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
CRC on Cummins calibrations and unchanging trims, Cummins code block, partner-supplied code block, or partner- supplied calibrations does not equal the expected values.

517. P060B-SE7369: Analog Data Processing Support Malfunction Detected - Condition Exists

The Direct Memory Access controller (DMA) has detected an attempt to read or write low level data that is not on a proper byte boundary or it has detected an attempt to access data from two or more channels simultaneously.

Monitor Operation:	
DTC	P060B-SE7369
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.1 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Data was written to or read from an address not on a 32 bit boundary.
OR
The low level software could not read from or write to the data bus.
OR
A conflict was detected when the low level software attempted to access a memory channel.

518. P0604-SE5345: Engine Control Module Calibration Program Memory (RAM) Corruption - Condition Exists

Read/write test of off-CPU RAM has failed.

Monitor Operation:	
DTC	P0604-SE5345
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
ECM in powering down state.

Abort Conditions (any active):
ECM not in powering down state.

Malfunction Thresholds (all active):
The value read from each location of RAM by the main engine ECM microprocessor does not match the value previously written to it.

519. P0611-SE10857: Injector Power Supply - Bad Intelligent Device or Component

The main fueling calculation is compared against a system theroretical maximum fueling value, and if the main fueling exceeds the system protection fueling value, the error is set.

Monitor Operation:	
DTC	P0611-SE10857
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.1 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
The observed injector pulse duration is greater than the independently calculated theoretical injector pulse duration.

520. P061E-SE5024: Brake Inactivity - Condition Exists

Brake input inactive. This is to meet X Wire diagnostic requirements.

Monitor Operation:	
DTC	P061E-SE5024
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Independently calculated Engine Speed > 200 RPM

Abort Conditions (any active):
Independently calculated Engine Speed ≤ 200 RPM

Malfunction Thresholds (all active):
Vehicle speed and brake pedal position are read and determined independently of the normal control algorithm. The derived vehicle speed has been above 27.962 MPH for a total of 300 seconds, and decreased to less than 1.864 MPH. when this occurs 2 times with no change in the independently derived brake pedal position detected and key switch input has not been off for at least 20 seconds.

521. P062B-SE5026: Fuel System Shutdown Failure - Condition Exists

The torque converted fueling is compared against a pre-determined map of fueling value for torque, and if the observed fueling exceeds the theoretical torque map value, the error is set.

Monitor Operation:	
DTC	P062B-SE5026
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1.5 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
The observed torque fuel quantity is greater than the independently calculated theoretical torque fuel quantity limit.

522. P062B-SE5027: Fuel System Shutdown Failure - Condition Exists

The detection of non-working operation feedback for the main injection control overrun system design. This is to meet X Wire diagnostic requirements.

Monitor Operation:	
DTC	P062B-SE5027
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Engine Shutdown event is commanded.
OR
The ECM has powered up, but the engine is cranking and the test begun during the last shutdown did not complete.

Pause Conditions (any active):
Independently calculated engine speed < 50 RPM

Malfunction Thresholds (all active):
The engine fuel delivery calculated independently of the main control algorithm > 100 mg/stroke
Commanded fueling calculated independently from the main control algorithm > 4 mg/stroke
Fuel Pressure calculated independently of the main control algorithm > 200 kPa(absolute)

523. P0601-SE5357: Engine Control Module Calibration Memory Checksum - Out of Calibration

Main engine ECM microprocessor Calibration Memory Checksum does not complete before ECM powerdown.

Monitor Operation:	
DTC	P0601-SE5357
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
CRC on Cummins calibrations and unchanging trims, Cummins code block, partner-supplied code block, or partner- supplied calibrations does not complete before powerdown.

524. P060A-SE7370: Internal Monitor Processor Performance - Monitor Support Malfunction Detected - Condition Exists

The main microprocessor tests that support for the monitor micro is actively being controlled by testing the monitor microprocessor response to an incorrect input.

Monitor Operation:	
DTC	P060A-SE7370
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
At power-up with key switch on and every 30 minutes while key is on.

Abort Conditions (any active):
Key switch is OFF

Malfunction Thresholds (all active):
A known incorrect answer is provided to the monitoring microprocessor. The feedback to the main engine ECM microprocessor from the monitoring microprocessor incorrectly indicates that the known wrong answer was correct.

525. P060C-SE5362: Number of ECM Resets - Data Valid But Above Normal Operating Range - Moderately Severe Level

The monitoring engine ECM microprocessor has been requested to reset an excessive number of times.

Monitor Operation:	
DTC	P060C-SE5362
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
The monitoring microprocessor reset has been commanded 7 times.
Ignition Key switch input is on.

526. P0607-SE7383: Engine Control Module Warning Internal Hardware Failure - Bad Intelligent Device or Component

The circuits for the torque actuators on the monitor microprocessor are checked to ensure the shutdown circuit is operational.

Monitor Operation:	
DTC	P0607-SE7383
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
No external watchdog or software resets are active.
Key switch is ON.
ECM in powerup state.

Abort Conditions (any active):
External watchdog or software reset occurs.
Key switch is OFF for four seconds.
ECM not in powerup state.

Pause Conditions (any active):
Key switch is OFF.

Malfunction Thresholds (all active):
The monitoring microprocessor commands the torque actuator circuits (typically injector drivers) to shutdown, but the torque actuator circuit feedbacks indicates the circuit is still active.

527. P060C-SE10696: Number of ECM Resets - Data Valid But Above Normal Operating Range - Moderately Severe Level

The main engine ECM microprocessor has detected a reset occurred while previous engine state was run.

Monitor Operation:	
DTC	P060C-SE10696
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
(First reported Engine Speed after ECM initialization > 300 RPM
AND
Time since ECM power up is less than 2 seconds)
OR
(Engine Speed > 50 RPM
AND
ECM reset occurs (software or monitor microprocessor caused))

528. P061B-SE7386: Torque Fueling Performance Beyond Design Limits - Condition Exists

The engine fueling is in excess of what is expected for the given operational conditions.

Monitor Operation:	
DTC	P061B-SE7386
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Commanded fueling, calculated independently of the main control algorithm > 100 mg/stroke
The independently calculated engine speed <= 4,900 RPM

529. P061A-SE5020: Governor Fueling Error - Condition Exists

The engine fueling is in excess of what is expected for the engine speed conditions.

Monitor Operation:	
DTC	P061A-SE5020
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
P2299-SE5025

Malfunction Thresholds (all active):
The engine speed is > 1,200 RPM
The accelerator pedal input is < historical accelerator pedal position auto zero offset threshold %
The observed fueling value exceeds 4 mg/stroke

530. P060C-SE5346: Number of ECM Resets - Data Valid But Above Normal Operating Range - Moderately Severe Level

The main microprocessor is detecting errant operating conditions and generating incorrect responses to the monitoring microprocessor.

Monitor Operation:	
DTC	P060C-SE5346
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Any of the conditions: (the run-time response indicates an incorrect process sequence or the monitor micro new question update is <= 40 msec or the instruction path test fails) consecuitively for >= 0.5 seconds.
OR
Any of the conditions: (the run-time response indicates an incorrect process sequence or the monitor micro new question update is <= 40 msec or the instruction path test fails) for a cumulatively period of time >= 4.8 seconds.

531. P0604-SE5375: Engine Control Module Calibration Program Memory (RAM) Corruption - Condition Exists

Read/write test of on-chip RAM fail. Memory is written to and then read. If the value read does not match the value written, the error is set.

Monitor Operation:	
DTC	P0604-SE5375
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.1 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
Key switch is ON.

Abort Conditions (any active):
Key switch is OFF.

Malfunction Thresholds (all active):
The contents of the RAM as read by the main engine ECM microprocessor do not match what was written to it.

532. P0605-SE5350: Engine Control Module Calibration Memory (ROM) Corruption - Root Cause Not Known

Checksums are calculated for Read Only Memory (ROM) at keyon and compared to stored values. If the calculated checksum value does not match the stored checksum value, the error is set.

Monitor Operation:	
DTC	P0605-SE5350
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.1 sec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Key switch is ON.

Abort Conditions (any active):
Key switch is OFF.

Malfunction Thresholds (all active):
The checksum for any block of ROM as calculated by the main engine ECM microprocessor does not match the stored checksum for that block.

533. P2299-SE5025: Brake Switch and Accelerator Pedal Position Incompatible - Condition Exists

Accelerator pedal is stuck. This is to meet X Wire diagnostic requirements.

Monitor Operation:	
DTC	P2299-SE5025
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	2 sec
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
(
Accelerator Pedal Position, derived independently of normal control algorithm value ≤ 3.926 %
OR
Accelerator Pedal Position, derived independently of normal control algorithm value ≥ 24.915 %
)
AND
Independently calculated Engine Speed > 200 RPM

Abort Conditions (any active):
(
Accelerator Pedal Position, derived independently of normal control algorithm value > 3.926 %
AND
Accelerator Pedal Position, derived independently of normal control algorithm value < 24.915 %
)
OR
Independently calculated Engine Speed ≤ 200 RPM

Malfunction Thresholds (all active):
The raw analog or muxed input value for Accelerator Pedal Position, derived independently of normal control algorithm value is constant.
Accelerator Pedal Position, derived independently of normal control algorithm value > 2.114 %
Brake Switch derived independently of normal control algorithm value transitions ON

534. P0607-SE10093: Engine Control Module Warning Internal Hardware Failure - Bad Intelligent Device or Component

The micro sub-processor has a fault condition detected for its process flow, its registers or its memory that differs from the nominal or expected value.

Monitor Operation:	
DTC	P0607-SE10093
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.1 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
The checksum of the main engine ECM sub-processor memory does not equal the expected checksum
OR
The independent internal watchdog timer updated in conjunction with the subprocessors intended instructions indicates operation processing is lost > 500 microseconds.
OR
The register value of the sub-processor is not equal to the expected value in normal operation

535. P2262-SE3018: Engine Turbocharger Turbine Bypass Actuator - Mechanical System Not Responding or Out of Adjustment

The turbine bypass valve smart device actuator has determined itself to be incapable of meeting its desired position. This is communicated to the ECM via a number of status codes.

Monitor Operation:	
DTC	P2262-SE3018
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The ECM reads status codes from the turbine bypass valve smart device. Each status code has its own enable, which must be ENABLED in order for the ECM to apply the status code received from the turbine bypass valve smart device to the System Error. Only received status codes will cause this error to be set. This differs slightly from an overall algorithm enable.
As there may be a number of malfunction criteria that apply, the enable conditions may be matched to the corresponding malfunction criteria by the word or phrase at the beginning of the condition.
Slow Actuator Response: The engine conditions must be appropriate to avoid a false detect of a stuck actuator. (See RefCond0067.)

Malfunction Thresholds (all active):
If ANY of the following apply, the error will be set:
Slow Actuator Response: The TBV smart device has detected that it cannot meet its commanded position within an acceptable time. (See RefCond0068.)

536. P1A62-SE9725: Engine Turbocharger 1 Turbine Bypass Actuator 1 Position - Special Instructions

The turbine bypass valve smart device indicates it is in a condition without known calibration data.

Monitor Operation:	
DTC	P1A62-SE9725
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
The TBV device reports that it is in a state with no known calibration data.
OR
The TBV device reports that it is in the process of doing an installation.

537. P0046-SE4169: Engine Turbocharger Turbine Bypass Actuator - Received Network Data in Error

The turbine bypass valve smart device actuator has not received a command message from the controlling ECM for a calibrated period.

Monitor Operation:	
DTC	P0046-SE4169
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The following conditions apply to the specific malfunction as indicated by the first words in the description.
Message Timeout: The turbine bypass valve smart device has received at least one command message from the ECM.

Pause Conditions (any active):
The turbine bypass valve smart device is performing a self calibration - checking for span and end points.

Malfunction Thresholds (all active):
Message Timeout: The TBV smart device has not received a position command message for greater than or equal to a calibrated time after previously having received a command message. (See RefCond0069.)

538. U040D-SE9715: Engine Turbocharger Turbine Bypass Actuator - Out of Calibration

The turbine bypass valve smart device is configured incorrectly.

Monitor Operation:	
DTC	U040D-SE9715
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The ECM has received the message(s) from the turbine bypass valve smart device.

Malfunction Thresholds (all active):
The Customer ID received from the turbine bypass valve smart device does not equate to "Cummins"
OR
The motor type received from the turbine bypass valve smart device does not equate to the expected motor type.

539. P00AF-SE4166: Engine Turbocharger Turbine Bypass Actuator - Bad Intelligent Device or Component

The turbine bypass valve smart device has detected an internal error which will prevent it from functioning normally.

Monitor Operation:	
DTC	P00AF-SE4166
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
The TBV smart device has detected an internal error which will prevent it from functioning normally. (See RefCond0071.)

540. U040D-SE4172: Engine Turbocharger Turbine Bypass Actuator - Out of Calibration

The turbine bypass valve smart device is configured incorrectly.

Monitor Operation:	
DTC	U040D-SE4172
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The ECM has received the message(s) from the turbine bypass valve smart device.

Malfunction Thresholds (all active):
The Software ID received from the turbine bypass valve smart device does not equal 3032.

541. P0046-SE9724: Engine Turbocharger Turbine Bypass Actuator - Received Network Data in Error

The turbine bypass valve smart device actuator has never received a command message from the controlling ECM for a calibrated period.

Monitor Operation:	
DTC	P0046-SE9724
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The following conditions apply to the specific malfunction as indicated by the first words in the description.
Message Timeout: The turbine bypass valve smart device has nver received a command message from the ECM.

Pause Conditions (any active):
The turbine bypass valve smart device is performing a self calibration - checking for span and end points.

Malfunction Thresholds (all active):
No Source: The TBV smart device has not received a message from the ECM. (See RefCond0072.)

542. P004E-SE4165: Engine Turbocharger Turbine Bypass Actuator Temperature - Data Valid But Above Normal Operating Range - Moderately Severe Level

The turbine bypass valve smart device has detected a temperature in excess of internal limits.

Monitor Operation:	
DTC	P004E-SE4165
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1,800 sec
MIL Activation Criteria	1 trip

Malfunction Thresholds (all active):
The TBV smart device has detected a warm temperature condition. (See RefCond0073.)

543. P226C-SE9721: Engine Turbocharger 1 Turbine Bypass Actuator 1 Position - Data Erratic, Intermittent, or Incorrect

The TBV position feedback is failed in range, but not clearly "in range high" or "in range low."

Monitor Operation:	
DTC	P226C-SE9721
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Number of in range turbine bypass valve failures this drive cycle < 1.
Turbine bypass valve not failed (except for in-range failures as described by other enable condition)
Turbine bypass valve smart device is in closed loop control state.
The engine is running.
Coolant Temperature * 0.8 + Charge Temperature * 0.2 > -10 deg C

Malfunction Thresholds (all active):
(Maximum value of TBV In Range High Error Cumulative Sum plus the maximum value of In Range Low Error Cumulative Sum) within a 75 second period is ever > 3,750%, which is equivalent to (Average of In Range High Error - Tolerance) + (Average of In Range Low Error – Tolerance) > 1% Where In Range High Error is defined as (Measured Value – Commanded Value), In Range Low Error is defined as (Commanded Value – Measured Value) and Tolerance is defined as 0%.

544. P0047-SE4170: Engine Turbocharger Turbine Bypass Actuator - Condition Exists

The turbine bypass valve smart device has detected a low voltage condition.

Monitor Operation:	
DTC	P0047-SE4170
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	30 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The turbine bypass valve smart device is operable and in communication with the ECM.
Engine Speed >= 575 RPM

Malfunction Thresholds (all active):
The voltage for the TBV smart device is less than a calibrated value. (See RefCond0074.)

545. P0630-SE7946: Vehicle Identification Number - Out of Calibration

The error is set when an unprogrammed VIN has been detected.

Monitor Operation:	
DTC	P0630-SE7946
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	0.02 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Time elapsed after power up ≥ 0 sec

Malfunction Thresholds (all active):
All the values in the VIN are ASCII 0 (HEX 30).

546. P2579-SE12073: Engine Turbocharger 1 Speed - Mechanical System Not Responding or Out of Adjustment

Turbo shaft is seized.Turbo Speed sensor value is zero when engine is running

Monitor Operation:	
DTC	P2579-SE12073
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	1 trip

Pause Conditions (any active):
P22CB-SE7829, P22CC-SE7828
Engine Speed ≤ 1,200 RPM
Total Torque Fueling is ≤ 0mg/stroke
Engine is not in run state.
Compressor bypass valve is open

Malfunction Thresholds (all active):
Cumulative sum of error (15 KRPM - Turbo Speed) in a 30 second period is ever > 4,000 KRPM, which is equivalent to Average of Error >= 13.333 KRPM.

547. P0049-SE3641: Turbocharger 1 Speed - Data Valid But Above Normal Operating Range - Moderately Severe Level

Turbo speed sensor reading greater than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P0049-SE3641
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	5 sec
MIL Activation Criteria	2 trips

Malfunction Thresholds (all active):
Raw Turbo Speed value > 5,500 Hz (220 KRPM)

548. P2580-SE3642: Turbocharger 1 Speed - Data Valid But Below Normal Operating Range - Moderately Severe Level

Turbo speed sensor reading less than specified operating range for a calibrated amount of time.

Monitor Operation:	
DTC	P2580-SE3642
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Pause Conditions (any active):
P22CB-SE7829, P22CC-SE7828
P0106-SE3651, P0106-SE3652, P0106-SE4439, P0107-SE490, P0108-SE489
TBV driver failure (See RefCond0075.)
Ratio of Charge Pressure and Ambient Air Pressure < 1.25 (ratio)
Filtered Engine Speed < 500 RPM
Turbine bypass valve command > 100 %
Bypass Compressor valve is on

Malfunction Thresholds (all active):
Raw Turbo Speed < 250 Hz (10 KRPM), for 5 seconds.

549. P0049-SE2023: Turbocharger 1 Speed - Data Valid But Above Normal Operating Range - Least Severe Level

Turbo Speed above normal engine operating range

Monitor Operation:	
DTC	P0049-SE2023
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	Non-OBD

Abort Conditions (any active):

Malfunction Thresholds (all active):
No Derate Torque > RefTable63 Nm for RefTable64 where No Derate Torque is maximum torque at which engine can run without any derate.

550. P206D-SE8691: Aftertreatment Diesel Exhaust Fluid Quality Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Urea Quality Sensor (UQS) concentration sensing element has been shorted to a high voltage source

Monitor Operation:	
DTC	P206D-SE8691
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the enable conditions for the diagnostic are specified as follows (See RefCond0077.).

Abort Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the disable conditions for the diagnostic are specified as follows (See RefCond0078.).

Pause Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the SSI sensors: (UQS Concentration detection element voltage shorted out of range high. (See RefCond0079.) is not satisfied, AND Unknown failure of the UQS concentration detection element, or UQS Concentration detection element voltage shorted out of range low. (See RefCond0080.) is satisfied).

Malfunction Thresholds (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the SSI sensors: UQS Concentration detection element voltage shorted out of range high. (See RefCond0079.) is cumulatively satisfied for > 5 seconds, since the last time that (UQS Concentration detection element voltage shorted out of range high. (See RefCond0079.) is not satisfied, AND Unknown failure of the UQS concentration detection element, or UQS Concentration detection element voltage shorted out of range low. (See RefCond0080.) is not satisfied).
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the WEMA sensors: UQS Concentration detection element voltage shorted out of range high. (See RefCond0082.) is cumulatively satisfied for > 5 seconds, since the last time that (UQS Concentration detection element voltage shorted out of range high. (See RefCond0082.) is not satisfied, AND UQS Concentration detection element voltage shorted out of range low. (See RefCond0083.) is not satisfied, and UQS sensor internal temperature is above the maximum operating range (See RefCond0084.) is not satisfied).

551. P206B-SE6996: Aftertreatment Diesel Exhaust Fluid Quality - Root Cause Not Known

The Urea Quality Sensor (UQS) concentration sensing element has been detected to have an unspecific error.

Monitor Operation:	
DTC	P206B-SE6996
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the enable conditions for the diagnostic are specified as follows (See RefCond0085.).

Abort Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the disable conditions for the diagnostic are specified as follows (See RefCond0086.).

Pause Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the SSI sensors: (Unknown failure of the UQS concentration detection element, or UQS Concentration detection element voltage shorted out of range low. (See RefCond0080.) is not satisfied, AND UQS Concentration detection element voltage shorted out of range high. (See RefCond0079.) is satisfied).

Malfunction Thresholds (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the SSI sensors: Unknown failure of the UQS concentration detection element, or UQS Concentration detection element voltage shorted out of range low. (See RefCond0080.) is cumulatively satisfied for > 5 seconds, since the last time that (UQS Concentration detection element voltage shorted out of range high. (See RefCond0079.) is not satisfied, AND Unknown failure of the UQS concentration detection element, or UQS Concentration detection element voltage shorted out of range low. (See RefCond0080.) is not satisfied).

552. P207F-SE7282: Aftertreatment Diesel Exhaust Fluid Quality - Data Valid But Below Normal Operating Range - Moderately Severe Level

The Urea Quality Sensor (UQS) has measured the concentration of DEF in the tank to be below the minimum concentration threshold.

Monitor Operation:	
DTC	P207F-SE7282
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the enable conditions for the diagnostic are specified as follows (See RefCond0087.).

Abort Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the disable conditions for the diagnostic are specified as follows (See RefCond0088.).

Pause Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the pause conditions for the diagnostic are specified as follows (See RefCond0089.).

Malfunction Thresholds (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and The DEF concentration ≤ 22.5 % for a percentage of time > 50 % within a monitoring time window. The monitoring time window is 300 seconds when the initial DEF Tank Temperature at keyon > 10 °C, and 300 seconds, otherwise.

553. P207F-SE7286: Aftertreatment Diesel Exhaust Fluid Quality - Abnormal Rate of Change

The Urea Quality Sensor (UQS) has been unable to generate a concentration estimate for longer than the maximum wait time threshold, due to unsuitable measurement conditions.

Monitor Operation:	
DTC	P207F-SE7286
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	300 seconds when the initial DEF Tank Temperature at keyon > 10 °C, otherwise 300 seconds
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then The enable conditions for the diagnostic are specified as follows (See RefCond0090.).

Abort Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then The disable conditions for the diagnostic are specified as follows (See RefCond0091.).

Pause Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then The pause conditions for the diagnostic are specified as follows (See RefCond0092.).

Malfunction Thresholds (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the SSI sensors: (The Urea Quality Sensor (UQS) smart device controller is in the process of initializing, OR the DEF fluid is frozen or not present).
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the WEMA sensors: (The Urea Quality Sensor (UQS) smart device controller is unable to detect the fluid type and concentration due to unsuitable operating conditions).

554. P2044-SE6981: Aftertreatment 1 Diesel Exhaust Fluid Temperature 2 Sensor Circuit - Voltage Above Normal or Shorted to High Source

The Urea Quality Sensor (UQS) temperature sensing element has been shorted to a high voltage source

Monitor Operation:	
DTC	P2044-SE6981
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the enable conditions for the diagnostic are specified as follows (See RefCond0093.).

Abort Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the disable conditions for the diagnostic are specified as follows (See RefCond0094.).

Pause Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the SSI sensors: (Urea Quality Sensor (UQS) temperature sensor element shorted to a high source. (See RefCond0095.) is not satisfied) AND (Unknown failure of the UQS concentration detection element, or UQS Concentration detection element voltage shorted out of range low. (See RefCond0080.) is satisfied OR Urea Quality Sensor (UQS) temperature sensing element shorted to a low source. (See RefCond0096.) is satisfied)

Malfunction Thresholds (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the SSI sensors: Urea Quality Sensor (UQS) temperature sensor element shorted to a high source. (See RefCond0095.) is cumulatively satisfied for longer than 5 seconds, since the last time that (Urea Quality Sensor (UQS) temperature sensor element shorted to a high source. (See RefCond0095.) is not satisfied, AND Urea Quality Sensor (UQS) temperature sensing element shorted to a low source. (See RefCond0096.) is not satisfied).
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the WEMA sensors: Urea Quality Sensor (UQS) temperature sensor element shorted to a high source. (See RefCond0097.) is cumulatively satisfied for longer than 5 seconds, since the last time that (Urea Quality Sensor (UQS) temperature sensor element shorted to a high source. (See RefCond0097.) is not satisfied, AND Urea Quality Sensor (UQS) temperature sensor element shorted to a low source. (See RefCond0098.) is not satisfied).

555. P2045-SE6982: Aftertreatment 1 Diesel Exhaust Fluid Temperature 2 Sensor Circuit - Voltage Below Normal or Shorted to Low Source

The Urea Quality Sensor (UQS) temperature sensing element has been shorted to a low voltage source.

Monitor Operation:	
DTC	P2045-SE6982
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the enable conditions for the diagnostic are specified as follows (See RefCond0099.).

Abort Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the disable conditions for the diagnostic are specified as follows (See RefCond0100.).

Malfunction Thresholds (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the SSI sensors: Urea Quality Sensor (UQS) temperature sensing element shorted to a low source. (See RefCond0096.) is cumulatively satisfied for longer than 5 seconds, since the last time that (Urea Quality Sensor (UQS) temperature sensor element shorted to a high source. (See RefCond0095.) is not satisfied, AND Urea Quality Sensor (UQS) temperature sensing element shorted to a low source. (See RefCond0096.) is not satisfied).
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the WEMA sensors: Urea Quality Sensor (UQS) temperature sensor element shorted to a low source. (See RefCond0098.) is cumulatively satisfied for longer than 5 seconds, since the last time that (Urea Quality Sensor (UQS) temperature sensor element shorted to a high source. (See RefCond0097.) is not satisfied, AND Urea Quality Sensor (UQS) temperature sensor element shorted to a low source. (See RefCond0098.) is not satisfied).

556. P207F-SE8690: Aftertreatment 1 Diesel Exhaust Fluid Property - Root Cause Not Known

The Urea Quality Sensor (UQS) has determined that the fluid type in the DEF tank is something other than DEF.

Monitor Operation:	
DTC	P207F-SE8690
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the enable conditions for the diagnostic are specified as follows (See RefCond0101.).

Abort Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the disable conditions for the diagnostic are specified as follows (See RefCond0102.).

Pause Conditions (any active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) then the pause conditions for the diagnostic are specified as follows (See RefCond0103.).

Malfunction Thresholds (all active):
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the SSI sensors: The fluid type has been detected to be the sensor has completed the DEF type detection process, and has determined that the fluid in the DEF tank is not DEF (See RefCond0104.) for a percentage of time > 50 % for a monitoring time window. The monitoring time window is 300 seconds when the initial DEF Tank Temperature at keyon > 10 °C, and 300 seconds otherwise.
When The Urea Quality Sensor (UQS) is located in tank. (See RefCond0076.) and the OEM has installed the WEMA sensors: The fluid type has been detected to be The sensor has completed the DEF type detection process, and has determined that the fluid in the DEF tank is not DEF. (See RefCond0105.) for a percentage of time > 50 % for a monitoring time window. The monitoring time window is 300 seconds when the initial DEF Tank Temperature at keyon > 10 °C, and 300 seconds otherwise.

557. P20E8-SE6980: Aftertreatment 1 Diesel Exhaust Fluid Dosing Unit Input Lines - Condition Exists

The diagnostic checks whether the Flange Control Unit (FCU) DEF dosing system fails to prime after a calibrated number of attempts.

Monitor Operation:	
DTC	P20E8-SE6980
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
The Flange Control Unit (FCU) DEF Supply Module has begun filling with DEF (See RefCond0106.)

Abort Conditions (any active):
The Flange Control Unit (FCU) DEF Supply Module has aborted filling with DEF (See RefCond0107.)
Key switch is turned OFF
Engine is not running

Malfunction Thresholds (all active):
DEF supply pressure does not reach 500 kPa (gauge) within a time window of 20 sec from the time that The Flange Control Unit (FCU) DEF Supply Module has begun filling with DEF (See RefCond0106.) for a number of occurrences > 10 counts

558. P202E-SE7927: Aftertreatment 1 Diesel Exhaust Fluid Dosing Valve 1 - Mechanical System Not Responding or Out of Adjustment

The diagnostic checks whether the Flange Control Unit (FCU) DEF Dosing Module Injector valve is mechanically stuck closed or mechanically stuck open based on the minimum pressure variation observed during On/ Off cycle at each injection period.

Monitor Operation:	
DTC	P202E-SE7927
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediately
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P2048-SE5102
Exhaust temperature >= 200 °C for 10 seconds AND The Engine is in Derate and Urea Doser Functional Response Monitor fault is active (See RefCond0108.) is not active
Exhaust Mass flow rate > = 30 g/sec AND The Engine is in Derate and Urea Doser Functional Response Monitor fault is active (See RefCond0108.) is not active
The engine is running
Dosing Not Allowed Flag indicating Dosing command is out of nominal range for Urea Doser Functional Monitor (See RefCond0012.)
The Engine is in Derate and Urea Doser Functional Response Monitor fault is active (See RefCond0108.) is not active
The DEF Flange Control Unit (FCU) Supply Module (SM) has completed priming and is actively maintaining the target DEF pressure for dosing (See RefCond0109.)
Supply Module Pressure ≥ 400 kPa(gauge)
The OBD arbitrator allows the diagnostic to run

Abort Conditions (any active):
P2048-SE5102
Exhaust Mass flow rate < 30 g/sec OR The Engine is in Derate and Urea Doser Functional Response Monitor fault is active (See RefCond0108.) is active
The engine is not running
Not [Dosing Not Allowed Flag indicating Dosing command is out of nominal range for Urea Doser Functional Monitor (See RefCond0012.)]
The Engine is in Derate and Urea Doser Functional Response Monitor fault is active (See RefCond0108.) is active
NOT [The DEF Flange Control Unit (FCU) Supply Module (SM) has completed priming and is actively maintaining the target DEF pressure for dosing (See RefCond0109.)]
Supply Module Pressure < 400 kPa(gauge)
The OBD arbitrator does not allow the diagnostic to run

Malfunction Thresholds (all active):
When (Maximum DEF Supply Pressure - Minimum DEF Supply Pressure) within one injection cycle < 15 kPa(gauge) for ≥ 2 out of 3 times within each set of diagnostic tests. Diagnostic tests are performed 300 seconds apart. There is a delay between each set of 3 tests. When diagnostic test has run 3 times it will wait for the delay of ((4 hours) OR (120 seconds if (Urea doser functional response error is active. (See RefCond0011.)) is active)).

559. P2048-SE5102: Aftertreatment 1 Diesel Exhaust Fluid Dosing Valve 1 Circuit - Current Below Normal or Open Circuit

DEF Dosing Valve Driver Control Line is shorted to ground, shorted to high voltage or open circuit.

Monitor Operation:	
DTC	P2048-SE5102
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
For malfunction criteria #1, the DEF Dosing Valve command is OFF.
For malfunction criteria #4, the DEF Dosing Valve command is OFF.
For malfunction criteria #5, the DEF Dosing Valve command is OFF.
For malfunction criteria #6, the DEF Dosing Valve command is ON.

Abort Conditions (any active):
For malfunction criteria #1, #3, #4 and #5, the DEF Dosing Valve command is ON.
For malfunction criteria #6, the DEF Dosing Valve command is OFF.

Malfunction Thresholds (all active):
#2 - For shorted to ground detection on the high side, the resistance between DEF Dosing Valve Control High Side Driver Line and Ground < 0.2 Ohms
#5 - For shorted to ground detection on the low side, the resistance between DEF Dosing Valve Control Low Side Driver line and ground < 0.2 Ohms

560. P209F-SE2962: Aftertreatment 1 Diesel Exhaust Fluid Tank Heater - Data Valid But Below Normal Operating Range - Moderately Severe Level

The monitor checks whether the Flange Control Unit (FCU) DEF tank temperature has failed to reach a target threshold within a time window after the heating is commanded on.

Monitor Operation:	
DTC	P209F-SE2962
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P202B-SE7134, P202B-SE7135, P202B-SE7136, P202C-SE7131, P202C-SE7132, P202C-SE7137, P202C-SE7138
P20B7-SE7217, P20B8-SE7100
P205C-SE7124, P205D-SE7122, P205E-SE3650, U029D-SE2487
-30 °C < DEF initial tank temperature < -11 °C
Ambient air temperature > -20 °C
DEF tank heater is reported active, as disclosed in AECD 13-3.
The engine is running
Diagnostic has not already completed or aborted in this key cycle

Abort Conditions (any active):
P202B-SE7134, P202B-SE7135, P202B-SE7136, P202C-SE7131, P202C-SE7132, P202C-SE7137, P202C-SE7138
P20B7-SE7217, P20B8-SE7100
P205C-SE7124, P205D-SE7122, P205E-SE3650, U029D-SE2487

Pause Conditions (any active):
(DEF tank temperature ≤ -30 °C) OR (DEF tank temperature ≥ -11 °C)
Ambient air temperature ≤ -20 °C
DEF tank heater is not reported active, as disclosed in AECD 13-3.
The engine is not running

Malfunction Thresholds (all active):
(The DEF Tank Temperature remains < -6 °C AND The DEF Supply Module (SM) has completed pump pressure control and is ready to dose. (See RefCond0110.) is NOT active) after the Engine Control Module (ECM) has sent the SAE Aftertreatment 1 SCR Dosing System Requests 1 (PGN 61476)

message to the Flange Control Unit (FCU) < 20 seconds AND the DEF Tank Heating is commanded active for RefTable66 seconds

561. P2BA7-SE5279: Aftertreatment Diesel Exhaust Fluid Tank Empty - Condition Exists

The monitor checks whether the level of DEF in the tank is low and so inducement to refill the tank is applied

Monitor Operation:	
DTC	P2BA7-SE5279
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
P203B-SE7112, P203B-SE7113, P203C-SE7110, P203D-SE7107, P203F-SE4189, U010E-SE2290

562. P203F-SE2906: Aftertreatment 1 Diesel Exhaust Fluid Tank Level - Data Valid But Below Normal Operating Range - Most Severe Level

The monitor checks whether the DEF tank is empty

Monitor Operation:	
DTC	P203F-SE2906
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
P203B-SE7112, P203B-SE7113, P203C-SE7110, P203D-SE7107, U010E-SE2290

Pause Conditions (any active):
P203B-SE7112, P203B-SE7113, P203C-SE7110, P203D-SE7107, U010E-SE2290

Malfunction Thresholds (all active):
DEF tank level < 0 %

563. P203F-SE4189: Aftertreatment 1 Diesel Exhaust Fluid Tank Level - Data Valid But Below Normal Operating Range - Most Severe Level

The monitor checks whether there is insufficient DEF in the DEF tank

Monitor Operation:	
DTC	P203F-SE4189
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
P203B-SE7112, P203B-SE7113, P203C-SE7110, P203D-SE7107, U010E-SE2290

Pause Conditions (any active):
P203B-SE7112, P203B-SE7113, P203C-SE7110, P203D-SE7107, U010E-SE2290

Malfunction Thresholds (all active):
DEF tank level ≤ an OEM defined value which is confined to the range of [19,35]%

564. P203F-SE2907: Aftertreatment 1 Diesel Exhaust Fluid Tank Level - Data Valid But Below Normal Operating Range - Least Severe Level

The monitor checks whether the DEF tank is low

Monitor Operation:	
DTC	P203F-SE2907
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Entry Conditions (all active):
P203B-SE7112, P203B-SE7113, P203C-SE7110, P203D-SE7107, U010E-SE2290
P203F-SE2906
P203F-SE4189

Abort Conditions (any active):
P203F-SE2906
P203F-SE4189

Pause Conditions (any active):
P203B-SE7112, P203B-SE7113, P203C-SE7110, P203D-SE7107, U010E-SE2290

Malfunction Thresholds (all active):
DEF tank level <= an OEM defined value which is confined to the range of [22,65]%

565. P205E-SE3650: Aftertreatment 1 Diesel Exhaust Fluid Tank Temperature - Data Erratic, Intermittent, or Incorrect

The monitor indicates whether the Flange Control Unit (FCU) DEF tank temperature signal is in-range but not rational

Monitor Operation:	
DTC	P205E-SE3650
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	2 trips

Entry Conditions (all active):
P205C-SE7124, P205D-SE7122, U029D-SE2487
P0117-SE76, P0118-SE75
P0111-SE3793, P0112-SE488, P0113-SE487
A block heater is not detected (See RefCond0111.)
The engine is cold soaked (See RefCond0112.)

Abort Conditions (any active):
P205C-SE7124, P205D-SE7122, U029D-SE2487
P0117-SE76, P0118-SE75
P0111-SE3793, P0112-SE488, P0113-SE487

Malfunction Thresholds (all active):
|DEF tank temperature - Charge temperature measured at keyon| > 30 °C
|DEF tank temperature - coolant temperature measured at keyon| > 30 °C

566. P2263-SE9751: Engine Intake Manifold Pressure System Monitor - Condition Exists

EGR Flow higher or lower than EGR flow target when EGR Flow Controller used up all adjustment allowed.

Monitor Operation:	
DTC	P2263-SE9751
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate.
MIL Activation Criteria	2 trips

Entry Conditions (all active):
Engine is in run state.
Ambient Air Temperature > -6.67 °C
Ambient Air Pressure > 80 kPa(absolute)
Time which all Enable Conditions have been TRUE ≥ 60 sec

Pause Conditions (any active):
P22CB-SE7829, P22CC-SE7828
P245C-SE2767, P245D-SE2766, P245D-SE3563, P2493-SE4118, P2493-SE4119, P2494-SE3184, P2495-SE3185

Engine Speed < 550 RPM
Engine Speed > 3,600 RPM
Total Fueling < 0 mg/stroke
Total Fueling > 1,000 mg/stroke
Charge Flow Controller has not used up all adjustments allowed.

Malfunction Thresholds (all active):
Cumulative sum of absolute error (|Measured Charge Flow - Charge Flow Target|) over a 60 seconds period is ever > 600 kg/min, which is equivalent to [Average of absolute Error - Tolerance] >= 1 kg/min, where Tolerance is defined as: RefTable70

569. P0088-SE3239: Injector Metering Rail 1 Pressure - Data Valid But Above Normal Operating Range - Moderately Severe Level

During Volume Control Valve [VCV] control mode, the VCV high rail pressure error is set when the measured fuel rail pressure exceeds the setpoint by more than a calibratable amount [based on Engine Speed] AND the setpoint value of fuel volume flow through the VCV is less than or equal to a calibratable value.

Monitor Operation:	
DTC	P0088-SE3239
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P009C-SE4715
P0182-SE1024, P0183-SE1023
Fuel Rail Pressure control is only by Volume Control Valve in closed loop.
Service procedure for high pressure test should not be running.
Fuel Temperature > 15 °C
Injection Quantity > 4 mg/stroke

Malfunction Thresholds (all active):
Commanded Fuel Rail Pressure - Actual Fuel Rail Pressure > RefTable9 bar
High Pressure Pump Delivery Volume Set Point ≤ -0 m3/sec

570. P0087-SE3237: Injector Metering Rail 1 Pressure - Data Valid But Below Normal Operating Range - Moderately Severe Level

The Volume Control Valve [VCV] low rail pressure error is set when the measured fuel rail pressure is below the setpoint by more than a calibratable amount [based on engine speed] AND the setpoint value of fuel volume flow through the VCV exceeds a calibratable threshold during pressure control in VCV mode.

Monitor Operation:	
DTC	P0087-SE3237
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
P0087-SE3236, P0087-SE6789, P0088-SE3238, P0088-SE6785, P009C-SE4715
Fuel Rail Pressure control is only by Volume Control Valve in closed loop.
Service procedure for high pressure test should not be running.
Fuel Level > 14.898 %

Malfunction Thresholds (all active):
Commanded Fuel Rail Pressure - Actual Fuel Rail Pressure > RefTable10 bar
High Pressure Pump Delivery Volume Set Point ≥ 0 m3/sec

571. P0254-SE3261: Engine Fuel Pump Pressurizing Assembly 1 Circuit - Voltage Above Normal or Shorted to High Source

The Fuel Rail Volume Control Valve (VCV) driver voltage is below a fixed threshold while the PWM driver is in the "OFF" state.

Monitor Operation:	
DTC	P0254-SE3261
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	220 msec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The Volume Control Valve [PCV] Pulse Width Modulated [PWM] signal is in the "OFF" state.

Pause Conditions (any active):

Malfunction Thresholds (all active):
2.7 V < VCV driver voltage < 5 V

572. P0254-SE4716: Engine Fuel Pump Pressurizing Assembly 1 Circuit - Voltage Above Normal or Shorted to High Source

The Fuel Rail Volume Control Valve (VCV) driver voltage is above a fixed threshold while the PWM driver is in the "ON" state.

Monitor Operation:	
DTC	P0254-SE4716
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	220 msec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The Volume Control Valve [VCV] Pulse Width Modulated [PWM] signal is in the "ON" state.

Pause Conditions (any active):

Malfunction Thresholds (all active):
VCV driver voltage > 600 mV

573. P0253-SE4717: Engine Fuel Pump Pressurizing Assembly 1 Circuit - Voltage Below Normal or Shorted to Low Source

The Fuel Rail Volume Control Valve (VCV) driver voltage is below a fixed threshold while the PWM driver is in the "OFF" state.

Monitor Operation:	
DTC	P0253-SE4717
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	280 msec
MIL Activation Criteria	2 trips

Entry Conditions (all active):
The Volume Control Valve [PCV] Pulse Width Modulated [PWM] signal is in the "OFF" state.

Pause Conditions (any active):

Malfunction Thresholds (all active):
VCV driver voltage < 2.7 V

574. P0501-SE4361: Wheel-Based Vehicle Speed - Data Erratic, Intermittent, or Incorrect

Vehicle Speed Sensor Stuck In Range Error.

Monitor Operation:	
DTC	P0501-SE4361
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	600 sec
MIL Activation Criteria	1 trip

Entry Conditions (all active):
Road speed governor is inactive
Cruise control is inactive
Remote accelerator is inactive
Vehicle Speed > 0 mph
Accelerator pedal position ≥ 10 %
Auxiliary device is not in control of the engine.
Vehicle Speed < 37.282 mph

Abort Conditions (any active):
P0501-SE130
Vehicle Speed = 0 mph
Road speed governor is active
Cruise control is active
Remote accelerator is active
Accelerator pedal position < 10 %
Auxiliary device is in control of the engine.
Vehicle Speed ≥ 37.282 mph

Malfunction Thresholds (all active):
Difference between min and max vehicle speeds attained within a time window is less than 0.621 mph, while pedal position has changed by 20 % atleast 50 number of times in the time window.

575. P0501-SE130: Wheel-Based Vehicle Speed - Data Erratic, Intermittent, or Incorrect

Vehicle Speed Signal is lost while vehicle is stationary or while vehicle is moving.

Monitor Operation:	
DTC	P0501-SE130
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	1 sec
MIL Activation Criteria	1 trip

Pause Conditions (any active):
Auxiliary device is in control of the engine.
Remote accelerator is active

Malfunction Thresholds (all active):
For Physical Sensors and Datalink sensors: Vehicle Speed = 0 mph
Engine Speed > 10 RPM
((Boost transition counter >= 60 counts) OR (Net Brake Torque > 150 Nm FOR ≥ 15 sec))
Idle Validation counter >= 10 counts
Where Idle Validation Counter is incremented on Idle transitions from idle to non-idle, and Boost transition counter is incremented when Boost goes above 20 kPa(gauge) FOR ≥ 5 sec.
Additional check for physical sensors: After the engine has been running for ≥ 300 sec, (Engine Torque > 116 Nm) AND (Unfiltered Vehicle Speed = 0 mph) AND (Filtered Vehicle Speed > 9.942 mph)

576. P2269-SE280: Water in Fuel Indicator - Data Valid But Above Normal Operating Range - Least Severe Level

Water has been detected in the fuel filter

Monitor Operation:	
DTC	P2269-SE280
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	20 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Water In Fuel Sensor Voltage ≤ 2.891 V

577. P0169-SE1612: Water in Fuel Indicator - Data Valid But Above Normal Operating Range - Moderately Severe Level

The Water In Fuel sensor indicates that water has been detected in the fuel filter for an extensive amount of time or distance traveled.

Monitor Operation:	
DTC	P0169-SE1612
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Distance Traveled with Water In Fuel Detected ≥ 500.203 miles

578. P2267-SE660: Water in Fuel Indicator Sensor Circuit - Voltage Above Normal or Shorted to High Source

Water In Fuel Out of Range Error High

Monitor Operation:	
DTC	P2267-SE660
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	10 sec
MIL Activation Criteria	Non-OBD

Malfunction Thresholds (all active):
Filtered output value of the Water in Fuel sensor > 4.912 V

579. P262A-SE7697: Engine Emissions Closed Loop Fueling Adjustment - Data Erratic, Intermittent, or Incorrect

The Zero Fuel Calibration [ZFC] function is not learning the injector deviation for a calibrated time duration.

Monitor Operation:	
DTC	P262A-SE7697
Monitor Execution	Continuous
Monitor Sequence	None
Sensors OK	None
Typical Monitoring Duration	Immediate
MIL Activation Criteria	1 trip

Entry Conditions (all active):
A-type: Engine Motoring time ≥ 0 sec
A-type: P262A-SE7697 has not made a decision at anytime during the driving cycle
A-type: Ambient Air pressure > 0 kPa(absolute)
A-type: Intake Air temperature > -10 °C
A-type: Battery voltage > 10 V
A-type: The combustion chamber is warm: The commanded injection quantity > 5 mg/stroke for 10 sec
B-type: (Rate of change of Engine speed) to (average Engine speed) ratio < 0.012 (ratio)
B-type: Duration after gear change ≥ 0 sec

Abort Conditions (any active):
P262A-SE7697 has made a decision at anytime during the driving cycle
Ambient Air pressure ≤ 0 kPa(absolute)
Intake Air temperature ≤ -10 °C
Battery voltage ≤ 10 V
The combustion chamber has cooled: The duration of Motoring ≥ RefTable71

Malfunction Thresholds (all active):
ZFC learning not happening for 120 sec (short timer) while all A-type and B-type enable conditions have been met

580. RefCond0001: Aftertreatment Outlet NOx sensor O2 reading is valid since the internal control loops within the sensor are stable, and no active faults detected by the sensor, and the sensor's battery supply voltage is within the desired range and dewpoint temperature has been met for a sufficient time to allow the sensor to light off.

Aftertreatment Outlet NOx sensor O2 reading is valid since the internal control loops within the sensor are stable, and no active faults detected by the sensor, and the sensor's battery supply voltage is within the desired range and dewpoint temperature has been met for a sufficient time to allow the sensor to light off.

Conditions (all active):
P220B-SE5988, P229E-SE5987, P229E-SE5990, P229F-SE5986, U029E-SE2488
The aftertreatment outlet NOx sensor has reached its internal working temperature of 800 degC.
NOx sensor O2 reading is valid since the internal control loops within the sensor have stabilized. (See RefCond0114.) for 0 seconds
(10.8 V < Aftertreatment outlet NOx sensor battery supply voltage is < 16.5 V) for 0.2 seconds.
Exhaust gas temperature is above a threshold representing the point at which there is no longer a concern of condensation on the NOx sensor element. (See RefCond0039.) AND sensor supply power >= 6 V for 150 seconds

581. RefCond0002: Aftertreatment Outlet NOx sensor reading is valid since the internal control loops within the sensor are stable, and no active faults detected by the sensor, and the sensor's battery supply voltage is within the desired range and dewpoint temperature has been met for a sufficient time to allow the sensor to light off.

Aftertreatment Outlet NOx sensor reading is valid since the internal control loops within the sensor are stable, and no active faults detected by the sensor, and the sensor's battery supply voltage is within the desired range and dewpoint temperature has been met for a sufficient time to allow the sensor to light off.

Conditions (all active):
P220B-SE5988, P229E-SE5987, P229E-SE5990, P229F-SE5986, U029E-SE2488
The aftertreatment outlet NOx sensor has reached its internal working temperature of 800 degC.
NOx sensor reading is valid since the internal control loops within the sensor have stabilized. (See RefCond0041.) for 0.2 seconds
(10.8 V < Aftertreatment outlet NOx sensor battery supply voltage is < 16.5 V) for 0.2 seconds.
Exhaust gas temperature is above a threshold representing the point at which there is no longer a concern of condensation on the NOx sensor element. (See RefCond0039.) AND sensor supply power >= 6 V for 150 seconds

582. RefCond0003: Fault Inhibit Time has elapsed

Fault Inhibit Time has elapsed

Conditions (all active):
Time since Key On > 2,000 msec

583. RefCond0005: Any Active Air Temperature System Errors

Any Active Air Temperature System Errors

Conditions (all active):
P1191-SE4190, P1192-SE484, P1193-SE486

584. RefCond0006: The in-tank mounted measurement of the DEF tank temperature is Data Valid.

The in-tank mounted measurement of the DEF tank temperature is Data Valid.

Conditions (all active):
P205C-SE7124, P205D-SE7122, P205E-SE3650, U029D-SE2487
Keyswitch is ON since 1 seconds.
1 seconds elapsed since datalink sensor starts communicating with DCU (Dosing Control Unit).

585. RefCond0007: The in-tank mounted measurement of the DEF tank temperature is suspect

The in-tank mounted measurement of the DEF tank temperature is suspect

Conditions (all active):
P205C-SE7124, P205D-SE7122, P205E-SE3650, U029D-SE2487
(Keyswitch is OFF OR Time elapsed since Keyswitch is ON < 1 seconds.)
1 seconds are not elapsed since datalink sensor starts communicating with Dosing Control Unit.
The in-tank mounted measurement of the DEF tank temperature is Data Valid. (See RefCond0006.) at previous sample.

586. RefCond0008: Reset for Urea Delivery Monitor Diagnostic Cumulative Sum (CUSUM) calculation.

Reset for Urea Delivery Monitor Diagnostic Cumulative Sum (CUSUM) calculation.

Conditions (all active):
(DEF dosing pump speed new Offset value - Adjusted Offset value) < -30 rpm.
Urea Delivery Monitor Pump Speed Offset Update. (See RefCond0115.)

587. RefCond0009: Urea Delivery Monitor Key Switch/Operation Cycle Enable.

Urea Delivery Monitor Key Switch/Operation Cycle Enable.

Conditions (all active):
Key Switch is triggered ON OR there is change in Operation Cycle.
P218F-SE8289 test not completed.

588. RefCond0010: Urea Delivery Monitor Cusum Enable.

Urea Delivery Monitor Cusum Enable.

Conditions (all active):
Urea Delivery Monitor Pre-Enable (Based on input sensor prerequisites and limit considerations). (See RefCond0116.)
Urea Delivery Monitor Pre-Enable (Based on input sensor prerequisites and limit considerations). (See RefCond0116.) for < 120 seconds OR Urea Delivery Monitor Pump Speed Offset Update. (See RefCond0115.) .
Number of prior occurrences of Urea Delivery Monitor Pump Speed Offset Update. (See RefCond0115.) event ≥ 1 count.

589. RefCond0011: Urea doser functional response error is active.

Urea doser functional response error is active.

Conditions (all active):
P202E-SE7927

590. RefCond0012: Dosing Not Allowed Flag indicating Dosing command is out of nominal range for Urea Doser Functional Monitor

Dosing Not Allowed Flag indicating Dosing command is out of nominal range for Urea Doser Functional Monitor

Conditions (all active):
The calculated intrusive dosing command injection period > 6 sec
OR
The calculated intrusive dosing command injection period < 1 sec

591. RefCond0013: DOC Inlet Temperature sensor reading is suspected and not yet confirmed as faulty.

DOC Inlet Temperature sensor reading is suspected and not yet confirmed as faulty.

Conditions (all active):
DOC Inlet Temperature sensor signal contains invalid data.
DOC Inlet temperature sensor value is out of range.

599. RefCond0023: the system considers that the DPF is new, or "green". New DPF temporarily exhibits high backpressure during their first hours of use which can lead to a false high estimation of soot load.

the system considers that the DPF is new, or "green". New DPF temporarily exhibits high backpressure during their first hours of use which can lead to a false high estimation of soot load.

Conditions (all active):
Regeneration of DPF has not been completed over the life of the DPF.
Over the life of the DPF, engine speed has not been > 1,000 rpm for 60 seconds.

600. RefCond0024: Malfunction criteria has occured that aborts the current active regeneration of the DPF (Ineffective regeneration).

Malfunction criteria has occured that aborts the current active regeneration of the DPF (Ineffective regeneration).

Conditions (all active):
DPF inlet temperature < regeneration target temperature - 50 °C
Rate of active/intrusive injection of hydrocarbons in exhaust ≥ 0.3 g/sec
Sum of the calculated soot oxidation rate and calculated soot NOx-idation rate ≤ 54 g/hr. (NOx-idation refers to the oxidation of soot from nitric oxides (NO2), which generally occurs at temperatures between about 250 degC and 400 degC)
When the above conditions for an Ineffective regeneration exists for a persistence time, the regeneration is considered as ineffective. The persistence time to detect an ineffective DRP Regeneration is based on the type of Regeneration and takes one of the following value: 3,600 seconds for Timer based regeneration. 3,600 secondsfor DPF High Back Pressure based regeneration. 3,600 seconds for high Soot load based regeneration . 3,600 seconds for Deep Clean based regeneration. 3,600 seconds for Special Non-Mission Regeneration. 3,600 seconds is the default time. 6,000 seconds for DRP Regeneration. 3,000 seconds for DOC Regeneration. If more than 1 trigger is active, duration time is the maximum of the respective regeneration time.

SCR Conversion Efficiency Relay feedback mode is commanding high dosing for accelerated ammonia storage in SCR first brick

Conditions (all active):
Actual SCR Conversion Efficiency ≤ 0% AND Target SCR Conversion Efficiency ≥ 100% AND SCR In temperature ≤ 260°C AND Estimated SCR Catalyst Bed temperature ≤ 250°C
OR
Regen is not active AND SCR In temperature ≤ 260°C AND Estimated SCR Catalyst Bed temperature <= 250°C AND Ambient air temperature >= 0°C AND Ammonia Storage Accumulation Timer < 50ml. Where: Ammonia Storage Accumulation Timer resets to zero when Auto non mission regen is active. Ammonia Storage Timer increments when estimated SCR Catalyst Bed temperature <= 300 °C Ammonia Storage Accum Timer Increments when (Actual dosing command - stoichiometric dosing command) is in the intervals of 0.2 seconds.

628. RefCond0056: Urea Doser Functional Response Monitor is ready to update the fault.

Urea Doser Functional Response Monitor is ready to update the fault.

Conditions (all active):
Urea Doser Functional Response Monitor has reached the minimum number of 3 (unitless) decisions to make a pass or a fail decision.

629. RefCond0057: Engine control module off time is greater thean a calibrated threshold.

Engine control module off time is greater thean a calibrated threshold.

Conditions (all active):
Engine control Module Off Time > 864,000 sec

630. RefCond0059: DeNOx reference dip maneuver for limiting NH3 slip is active.

DeNOx reference dip maneuver for limiting NH3 slip is active.

Conditions (all active):
NH3 slip is detected.
Control catalyst efficiency is < Target catalyst efficiency for more than 0.2 seconds.

631. RefCond0064: Fuel system failure is present

Fuel system failure is present

632. RefCond0065: First SCR Temperature sensor reading is suspected and not yet confirmed as faulty.

First SCR Temperature sensor reading is suspected and not yet confirmed as faulty.

Conditions (all active):
First SCR Temperature sensor signal contains invalid data.
First SCR temperature sensor value is out of range.

633. RefCond0066: SCR Outlet Temperature sensor reading is suspected and not yet confirmed as faulty.

SCR Outlet Temperature sensor reading is suspected and not yet confirmed as faulty.

Conditions (all active):
SCR Outlet Temperature sensor signal contains invalid data.
SCR Outlet temperature sensor value is out of range.

634. RefCond0067: Slow Actuator Response: The engine conditions must be appropriate to avoid a false detect of a stuck actuator.

Slow Actuator Response: The engine conditions must be appropriate to avoid a false detect of a stuck actuator.

Conditions (all active):
The Engine is Running.

635. RefCond0068: Slow Actuator Response: The TBV smart device has detected that it cannot meet its commanded position within an acceptable time.

Slow Actuator Response: The TBV smart device has detected that it cannot meet its commanded position within an acceptable time.

Conditions (all active):
(The difference between the TBV smart device's received commanded position and its internally measured position is greater than 9.3 %) AND (the TBV smart device's motor effort is greater than 0 % Motor Effort (at standard voltage for the application)) for 1.5 seconds.

636. RefCond0069: Message Timeout: The TBV smart device has not received a position command message for greater than or equal to a calibrated time after previously having received a command message.

Message Timeout: The TBV smart device has not received a position command message for greater than or equal to a calibrated time after previously having received a command message.

Conditions (all active):
Message Timeout: The TBV smart device actuator has not received a command message from the controlling ECM for 4.075 seconds after previously having received a command message.

637. RefCond0071: The TBV smart device has detected an internal error which will prevent it from functioning normally.

The TBV smart device has detected an internal error which will prevent it from functioning normally.

Conditions (all active):
The TBV smart device detects any of the conditions:
Invalid Hall Effect sensor state or sequence. Three Hall Effect sensors are used, and are expected to move within a known series of valid sequences. Valid Hall Effect sensors may not report HHH or LLL (all high or all low). If either the state or the sequence is invalid, the error condition is active
OR
The measured motor current indicates a short circuit condition within driver circuit.
OR
Invalid position calibration data detected during the turbocharger smart device initialization.
OR
Microprocessor internal error - the TBV smart device has detected an internal error such as an invalid ROM checksum, Watchdog Reset, or other similar error relating to a failed CPU or module.
OR
Severe over-temperature indicated within the TBV smart device Motor Driver Circuit. The TBV smart device has been disabled for a condition representing eminent hardware physical shutdown.

638. RefCond0072: No Source: The TBV smart device has not received a message from the ECM.

No Source: The TBV smart device has not received a message from the ECM.

Conditions (all active):
No Source: The TBV smart device has never received a message from the ECM for > 12 seconds.

639. RefCond0073: The TBV smart device has detected a warm temperature condition.

The TBV smart device has detected a warm temperature condition.

Conditions (all active):
The TBV smart device actuator has detected a temperature in excess of 150 deg C.

640. RefCond0074: The voltage for the TBV smart device is less than a calibrated value.

The voltage for the TBV smart device is less than a calibrated value.

Conditions (all active):
The TBV smart device voltage is < 9 V for > 10 seconds.

641. RefCond0075: TBV driver failure

TBV driver failure

Conditions (all active):
P0046-SE4169, P0046-SE9724, P00AF-SE4166, P1A62-SE9725, P2262-SE3018, U040D-SE4172, U040D-SE9715
P226C-SE9721

642. RefCond0076: The Urea Quality Sensor (UQS) is located in tank.

The Urea Quality Sensor (UQS) is located in tank.

Conditions (all active):
A Urea Quality Sensor (UQS) DEF concentration update has not been received from the sensor within 0 mSec after key-on.

643. RefCond0077: the enable conditions for the diagnostic are specified as follows

the enable conditions for the diagnostic are specified as follows

Conditions (all active):
The in-tank mounted Urea Quality Sensor (UQS) detected as active. (See RefCond0137.) is true

644. RefCond0078: the disable conditions for the diagnostic are specified as follows

the disable conditions for the diagnostic are specified as follows

Conditions (all active):
NOT [The in-tank mounted Urea Quality Sensor (UQS) detected as active. (See RefCond0137.)]

645. RefCond0079: UQS Concentration detection element voltage shorted out of range high.

UQS Concentration detection element voltage shorted out of range high.

Conditions (all active):
The voltage measured across the concentration detection element at the diagnostic charge voltage < 0.15 volts for > 4 update counts.

646. RefCond0080: Unknown failure of the UQS concentration detection element, or UQS Concentration detection element voltage shorted out of range low.

Unknown failure of the UQS concentration detection element, or UQS Concentration detection element voltage shorted out of range low.

Conditions (all active):
The voltage measured across the concentration detection element charge pump < 7.5 volts for > 8 update counts.

647. RefCond0082: UQS Concentration detection element voltage shorted out of range high.

UQS Concentration detection element voltage shorted out of range high.

Conditions (all active):
The voltage measured at the UQS concentration sensing element > 1.195 volts for > 5 seconds.

648. RefCond0083: UQS Concentration detection element voltage shorted out of range low.

UQS Concentration detection element voltage shorted out of range low.

Conditions (all active):
The voltage measured at the UQS concentration sensing element < 0.047 volts for > 5 seconds.

649. RefCond0084: UQS sensor internal temperature is above the maximum operating range

UQS sensor internal temperature is above the maximum operating range

Conditions (all active):
(The internal temperature of the UQS > 100 °C) for > 5 seconds.

650. RefCond0085: the enable conditions for the diagnostic are specified as follows

The DEF Flange Control Unit (FCU) Supply Module (SM) has completed priming and is actively maintaining the target DEF pressure for dosing

Conditions (all active):
The Flange Control Unit (FCU) DEF Supply Module has begun filling with DEF (See RefCond0106.)
DEF supply pressure > 500 kPa (gauge) within a time window of 50 sec from the time that The Flange Control Unit (FCU) DEF Supply Module has begun filling with DEF (See RefCond0106.) is entered.

675. RefCond0110: The DEF Supply Module (SM) has completed pump pressure control and is ready to dose.

The DEF Supply Module (SM) has completed pump pressure control and is ready to dose.

Conditions (all active):
After the system enters The Flange Control Unit (FCU) DEF Supply Module has begun filling with DEF (See RefCond0106.), DEF supply pressure is > 50 kPa (gauge) for a time > 75 seconds
Engine is running

676. RefCond0111: A block heater is not detected

A block heater is not detected

Conditions (all active):
The temperature drop detected on Coolant Temperature Sensor ≤ 1 °C for a time period of 30 seconds after the engine is started up.

677. RefCond0112: The engine is cold soaked

The engine is cold soaked

Conditions (all active):
Engine off time ≥ 480 min

678. RefCond0114: NOx sensor O2 reading is valid since the internal control loops within the sensor have stabilized.

NOx sensor O2 reading is valid since the internal control loops within the sensor have stabilized.

Conditions (all active):
[Ref/M2] The absolute difference of the voltage between the sensor measuring electrode in the 2nd pumping chamber and the air reference electrode is < 40 mV of its setpoint for over 0.2 seconds.
OR [P+/M2] The rate of change in current from the sensor measuring electrode in the 2nd pumping chamber to the sensor top electrode(directly exposed to exhaust gas) is within 42.6 nA/msec for over 20 ms.
OR [M1/P+] The current from the sensor measuring electrode in the 2nd pumping chamber to the sensor top electrode (directly exposed to exhaust gas) is less than 19 uA or greater than -40 uA for over 0.2 seconds.
OR [M1/P+] The current from the sensor pumping electrode in the 2nd pumping chamber to the sensor top electrode (directly exposed to exhaust gas) is within 2.4 uA of its setpoint for over 2 seconds.

679. RefCond0115: Urea Delivery Monitor Pump Speed Offset Update.

Urea Delivery Monitor Pump Speed Offset Update.

Conditions (all active):
(Maximum DEF pump speed - Minimum DEF pump speed) <= 40 rpm.
DEF dosing command exceeds minimum DEF calibratable value or minimum time has elapsed. (See RefCond0154.)

680. RefCond0116: Urea Delivery Monitor Pre-Enable (Based on input sensor prerequisites and limit considerations).

Urea Delivery Monitor Pre-Enable (Based on input sensor prerequisites and limit considerations).

Conditions (all active):
DEF Dosing command >= 0.1 ml/sec AND DEF Dosing command <= 0.7 ml/sec.
Rate of change of DEF dosing command <= 1.75ml/sec/sec for 2seconds.
Exhaust temperature >= 190 °C for 10 seconds.
Engine is running.
The DEF Supply Module (SM) has completed priming and is actively maintaining the target DEF pressure for dosing. (See RefCond0155.) for 300 seconds.
5 seconds elapsed after Key-On.
P202E-SE7927 test is not active.
DEF tank temperature >= -5 °C AND DEF tank temperature <= 60 °C.
Ambient Air pressure >= 75 kPa(absolute) AND Ambient Air pressure <= 160 kPa(absolute).

681. RefCond0117: Indicates the time duration at which the inlet temperature must be above the high hysteresis threshold before dew point is exceeded.

Indicates the time duration at which the inlet temperature must be above the high hysteresis threshold before dew point is exceeded.

Conditions (all active):
5 seconds

682. RefCond0118: The SCR Out temperature as measured by the sensor closest to the SONOx sensor is above a processed threshold for a calculated period of time.

The SCR Out temperature as measured by the sensor closest to the SONOx sensor is above a processed threshold for a calculated period of time.

Conditions (all active):
The SCR Out temperature as measured by the thermistor closest to the SONOx sensor > 200 deg C for RefTable83. Where processed ambient air temperature is calculated as: Ambient air temperature sensor value when Ambient Air status is Data Valid. (See RefCond0120.) else -10 deg C. Where processed SCR out temperature is calculated as: The minimum SCR out temperature captured after the rising event of (Exhaust gas temperature is below a threshold representing that dew point is not reached (See RefCond0040.) AND Engine is running AND SCR out temperature status valid. (See RefCond0157.))

683. RefCond0119: NOx Outlet sensor SCR hot start delay logic is allowed to run.

NOx Outlet sensor SCR hot start delay logic is allowed to run.

Conditions (all active):
SCR Out temperature as measured by the thermistor closest to the SONOx sensor ≥ 200 °C
SCR out temperature status valid. (See RefCond0157.)
Engine just started running
Hot start slope calculation of the SCR Outlet temperature has not been completed

684. RefCond0120: Ambient Air status is Data Valid.

Ambient Air status is Data Valid.

Conditions (all active):
P1191-SE4190, P1191-SE4746, P1192-SE484, P1193-SE486

685. RefCond0123: NH3 Slip Detection module to detect if NH3 slip is causing a drop in SCR conversion efficiency

NH3 Slip Detection module to detect if NH3 slip is causing a drop in SCR conversion efficiency

Conditions (all active):
Conditions are met for SCR dosing (See RefCond0158.)
Estimated SCR Catalyst bed temperature > 210 °C
Aftertreatment Outlet NOx sensor reading is valid since the internal control loops within the sensor are stable, and no active faults detected by the sensor, and the sensor's battery supply voltage is within the desired range and dewpoint temperature has been met for a sufficient time to allow the sensor to light off. (See RefCond0002.)
NOx sensor reading is valid since the internal control loops within the sensor have stabilized. (See RefCond0041.)
Exhaust gas mass flow rate > 25 g/sec

686. RefCond0125: Threshold for ammonia storage timer based on ANR compensation in feedback control

Threshold for ammonia storage timer based on ANR compensation in feedback control

Conditions (all active):
800 seconds when SCR Conversion Efficiency Relay feedback mode is commanding high dosing for accelerated ammonia storage in SCR first brick (See RefCond0055.) else 150 seconds when (SCR Conversion Efficiency Relay feedback mode is commanding high ANR. (See RefCond0159.) OR SCR Conversion Efficiency Relay feedback mode is commanding very high ANR. (See RefCond0054.)). else 150 seconds.

687. RefCond0127: NH3 storage used up counter is reset

NH3 storage used up counter is reset

Conditions (all active):
NOT [NOx sensor reading is valid since the internal control loops within the sensor have stabilized. (See RefCond0041.)]
OR
Aftertreatment Outlet NOx sensor reading is not valid due to internal control loops within the sensor being unstable, or active faults detected by the sensor, or the sensor's battery supply voltage is outside the desired range or dewpoint temperature not met. (See RefCond0049.)
OR
NOT[Conditions are met for SCR dosing (See RefCond0158.)]
OR
Estimated SCR Catalyst bed temperature < 180 °C

688. RefCond0128: Closed loop control of DEF dosing is allowed

Closed loop control of DEF dosing is allowed

Conditions (all active):
Conditions are met for SCR dosing (See RefCond0158.)
Estimated SCR Catalyst bed temperature ≥ 180 °C
Aftertreatment Outlet NOx sensor reading is valid since the internal control loops within the sensor are stable, and no active faults detected by the sensor, and the sensor's battery supply voltage is within the desired range and dewpoint temperature has been met for a sufficient time to allow the sensor to light off. (See RefCond0002.)
NOx sensor reading is valid since the internal control loops within the sensor have stabilized. (See RefCond0041.)
When NH3 slip is detected, corrective action is taken. Commanded ANR is decreased by temporarily stepping down the target SCR conversion efficiency. (See RefCond0043.) is not active

689. RefCond0129: Ammonia storage counter decrement enable condition

Ammonia storage counter decrement enable condition

Conditions (all active):
DEF dosing command <= 0.005 ml/sec AND (Closed loop control of DEF dosing is allowed (See RefCond0128.) is not active OR Commanded Ammonia NOx Ratio > 0 (unitless))

690. RefCond0137: The in-tank mounted Urea Quality Sensor (UQS) detected as active.

The in-tank mounted Urea Quality Sensor (UQS) detected as active.

Conditions (all active):
U02A2-SE6447
30 seconds has elapsed since the last keyon and the time since engine cranking ended.

691. RefCond0138: The in-tank mounted measurement of DEF concentration quality is Data Valid.

The in-tank mounted measurement of DEF concentration quality is Data Valid.
