Precautions for Supplemental Restraint System (SRS) “AIR BAG” and “SEAT BELT PRE-TENSIONER”

EKS00EIB

The Supplemental Restraint System such as “AIR BAG” and “SEAT BELT PRE-TENSIONER”, used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted. Information necessary to service the system safely is included in the SRS and SB section of this Service Manual.

WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the SRS section.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.**

General precautions for service operations

EKS00EIC

- Never work with wet hands.
- Turn the lighting switch OFF before disconnecting and connecting the connector.
- When checking the headlamp on/off operation, check it on vehicle and with the power connected to the vehicle-side connector.
- Do not touch the headlamp bulb glass surface with bare hands or allow oil or grease to get on it. Do not touch the headlamp bulb just after the headlamp is turned off, because it is very hot.
- When the bulb has burned out, wrap it in a thick vinyl bag and discard. Do not break the bulb.
- Leaving the bulb removed from the headlamp housing for a long period of time can deteriorate the performance of the lens and reflector (dirt, clouding). Always prepare a new bulb and have it on hand when replacing the bulb.
- Do not use organic solvent (paint thinner or gasoline) to clean lamps and to remove old sealant.

System Description

EKS00EIF

Control of the headlamp system operation is dependent upon the position of the combination switch (lighting switch). When the lighting switch is placed in the 2ND position, the BCM (body control module) receives input requesting the headlamps (and tail lamps) illuminate. This input is communicated to the IPDM E/R (intelligent power distribution module engine room) across the CAN communication lines. The CPU (central processing unit) of the IPDM E/R controls the headlamp high and headlamp low relay coils. When energized, these relays direct power to the respective headlamps, which then illuminate.

OUTLINE

Power is supplied at all times

- to headlamp high relay, located in the IPDM E/R, and
- to headlamp low relay, located in the IPDM E/R, and
- to ignition relay, located in the IPDM E/R, and
- through 20A fuse (No. 52 and 53, located in the IPDM E/R)
- to CPU of the IPDM E/R, and
- through 10A fuse [No. 18, located in the fuse block (J/B)]
- to BCM terminal 57, and
- through 50A fusible link (letter **g** , located in the fuse and fusible link box)
- to BCM terminal 70.

With the ignition switch in the ACC or ON position, power is supplied

- through 10A fuse [No. 4, located in the fuse block (J/B)]
- to BCM terminal 11.

With the ignition switch in the ON or START position, power is supplied

- to ignition relay, located in the IPDM E/R, and
- through 10A fuse [No. 1, located in the fuse block (J/B)]
- to BCM terminal 38.

Ground is supplied

- to BCM terminal 67
- through grounds M57, M61 and M79, and

- to IPDM E/R terminals 38 and 59
- through grounds E9, E15 and E24.

Low Beam Operation

With the lighting switch in 2ND position, the BCM receives input requesting the headlamps to illuminate. This input is communicated to the IPDM E/R across the CAN communication lines. The CPU of the IPDM E/R controls the headlamp low relay coil. When energized, this relay directs power

- through 15A fuse (No. 41, located in the IPDM E/R)
- through IPDM E/R terminal 54
- to front combination lamp RH (headlamp) terminal 3, and
- through 15A fuse (No. 40, located in the IPDM E/R)
- through IPDM E/R terminal 52
- to front combination lamp LH (headlamp) terminal 3.

Ground is supplied

- to front combination lamp LH and RH (headlamp) terminal 2
- through grounds E9, E15 and E24.

With power and ground supplied, low beam headlamps illuminate.

High Beam Operation/Flash-to-Pass Operation

With the lighting switch in 2ND position and placed in HIGH or PASS position, the BCM receives input requesting the headlamp high beams to illuminate. This input is communicated to the IPDM E/R across the CAN communication lines. The CPU of the combination meter controls the ON/OFF status of the HIGH BEAM indicator. The CPU of the IPDM E/R controls the headlamp high relay coil. When energized, this relay directs power

- through 10A fuse (No. 34, located in the IPDM E/R)
- through IPDM E/R terminal 56
- to front combination lamp RH (headlamp) terminal 1, and
- through 10A fuse (No. 35, located in the IPDM E/R)
- through IPDM E/R terminal 55
- to front combination lamp LH (headlamp) terminal 1.

Ground is supplied

- to front combination lamp LH and RH (headlamp) terminal 2
- through grounds E9, E15 and E24.

With power and ground supplied, the high beam headlamps illuminate.

BATTERY SAVER CONTROL

When the combination switch (lighting switch) is in the 2ND position (ON), and the ignition switch is turned from ON or ACC to OFF, the battery saver control feature is activated.
Under this condition, the headlamps remain illuminated for 5 minutes, unless the combination switch (lighting switch) position is changed. If the combination switch (lighting switch) position is changed, then the headlamps are turned off.

System Description

EKS00EJ0

Daytime light system turns on daytime light lamps while driving. Daytime light lamps are not turned on if engine is activated with parking brake on. Take off parking brake to turn on daytime light lamps. The lamps turn off when lighting switch is in the 2ND position (Headlamp is "ON") and when lighting switch is in the PASSING position. (Daytime light lamps are not turned off only by parking brake itself.)
A parking brake signal and engine run or stop signal are sent to BCM (body control module) by CAN communication line.

OUTLINE

Power is supplied at all times

- to ignition relay, located in the IPDM E/R (intelligent power distribution module engine room), and
- through 10A fuse [No. 19, located in the fuse block (J/B)]
- to combination meter terminal 3, and
- through 20A fuse [No. 52 and 53, located in the IPDM E/R (intelligent power distribution module engine room)]
- to CPU (central processing unit) of IPDM E/R, and
- to headlamp high relay, located in the IPDM E/R, and
- to headlamp low relay, located in the IPDM E/R, and
- through 50A fusible link (letter **g** , located in the fuse and fusible link box)
- to BCM terminal 70,
- through 10A fuse [No. 18, located in the fuse block (J/B)]
- to BCM terminal 57, and
- through 10A fuse (No. 45, located in the IPDM E/R)
- to daytime light relay 1 terminals 2 and 5.

When the ignition switch is in ACC or ON position, power is supplied

- through 10A fuse [No. 4, located in the fuse block (J/B)]
- to BCM terminal 11.

When the ignition switch is in ON or START position, power is supplied

- to ignition relay, located in the IPDM E/R, and
- through 10A fuse [No. 14, located in the fuse block (J/B)]
- to combination meter terminal 16, and
- through 10A fuse [No. 1, located in the fuse block (J/B)]
- to BCM terminal 38.

Ground is supplied

- to BCM terminal 67 and
- to combination meter terminals 13 and 23
- through grounds M57, M61 and M79, and
- to IPDM E/R terminals 38 and 59
- through grounds E9, E15 and E24.

Low Beam Operation

With the lighting switch in 2ND position, the BCM receives input requesting the headlamps to illuminate. This input is communicated to the IPDM E/R across the CAN communication lines. The CPU of the IPDM E/R controls the headlamp low relay coil. When energized, this relay directs power

- through 15A fuse (No. 41, located in the IPDM E/R)
- through IPDM E/R terminal 54
- to front combination lamp RH (headlamp) terminal 3, and
- through 15A fuse (No. 40, located in the IPDM E/R)
- through IPDM E/R terminal 52
- to daytime light relay 2 terminals 2 and 5, and
- through daytime light relay 2 terminal 3
- to front combination lamp LH (headlamp) terminal 3.

Ground is supplied

- to front combination lamp RH (headlamp) terminal 2
- to daytime light relay 1 terminal 4
- to daytime light relay 2 terminal 1
- through grounds E9, E15 and E24.

When the CPU of the IPDM E/R energizes the headlamp low relay, it de-energizes daytime relay 1. When de-energized, this relay supplies ground

- to front combination lamp LH (headlamp) terminal 2
- through daytime light relay 1 terminal 3.

With power and ground supplied, low beam headlamps illuminate.

High Beam Operation/Flash-to-Pass Operation

With the lighting switch in 2ND position and placed in HIGH or PASS position, the BCM receives input requesting the headlamp high beams to illuminate. This input is communicated to the IPDM E/R across the CAN communication lines. The CPU of the combination meter controls the ON/OFF status of the HIGH BEAM indicator. The CPU of the IPDM E/R controls the headlamp high relay coil. When energized, this relay directs power

- through 10A fuse (No. 34, located in the IPDM E/R)
- through IPDM E/R terminal 56
- to front combination lamp RH (headlamp) terminal 1, and
- through 10A fuse (No. 35, located in the IPDM E/R)
- through IPDM E/R terminal 55
- to front combination lamp LH (headlamp) terminal 1.

Ground is supplied

- to front combination lamp RH (headlamp) terminal 2, and
- to daytime light relay 1 terminal 4, and
- to daytime light relay 2 terminal 1
- through grounds E9, E15 and E24.

When the CPU of the IPDM E/R energizes the headlamp high relay, it de-energizes daytime relay 1. When de-energized, this relay supplies ground

- to front combination lamp LH (headlamp) terminal 2
- through daytime light relay 1 terminal 3.

With power and ground supplied, the high beam headlamps illuminate.

DAYTIME LIGHT OPERATION

With the engine running, the lighting switch in the OFF or 1ST position and parking brake released, the IPDM E/R receives input requesting the daytime lights illuminate. This input is communicated across the CAN communication lines. The CPU of the IPDM E/R controls daytime light relay 1 which supplies ground

- to daytime light relay 1 terminal 1
- through IPDM E/R terminal 44.

When energized, daytime light relay 1 directs power

- through daytime light relay 1 terminal 3
- through front combination lamp LH (headlamp) terminal 2
- through front combination lamp LH (headlamp) terminal 1
- through IPDM E/R terminal 55
- through 10A fuse (No. 35, located in the IPDM E/R)
- through 10A fuse (No. 34, located in the IPDM E/R)
- through IPDM E/R terminal 56
- to front combination lamp RH (headlamp) terminal 1.

Ground is supplied

- to front combination lamp RH (headlamp) terminal 2
- through grounds E9, E15 (all) and E24 (VQ40DE engine only).

With power and ground supplied, the daytime lights illuminate. The high beam headlamps are now wired in series and illuminate at a reduced intensity.

System Description

EKS00EJU

Control of the fog lamps is dependent upon the position of the combination switch (lighting switch). The lighting switch must be in the 2ND position (LOW beam is ON) for front fog lamp operation. When the lighting switch is placed in the fog lamp position, the BCM (body control module) receives input signal requesting the fog lamps to illuminate. When the headlamps are illuminated, this input signal is communicated to the IPDM E/R (intelligent power distribution module engine room) across the CAN communication lines. The CPU (central processing unit) of the IPDM E/R controls the front fog lamp relay coil. When activated, this relay directs power to the front fog lamps.

OUTLINE

Power is supplied at all times

- to front fog lamp relay, located in the IPDM E/R, and
- to ignition relay, located in the IPDM E/R, and
- through 20A fuse (No. 52 and 53, located in the IPDM E/R)
- to CPU of the IPDM E/R, and
- through 50A fusible link (letter **g** , located in the fuse and fusible link box)

When the ignition switch is in the ACC or ON position, power is supplied

- through 10A fuse [No. 4, located in the fuse block (J/B)]
- to BCM terminal 11.

When the ignition switch is in ON or START position, power is supplied

FOG LAMP OPERATION

The fog lamp switch is built into the combination switch. The lighting switch must be in the 2ND position (LOW beam is ON) and the fog lamp switch must be ON for fog lamp operation.
With the fog lamp switch in the ON position, the CPU of the IPDM E/R grounds the coil side of the fog lamp relay. The fog lamp relay directs power

- through 20A fuse (No. 56, located in the IPDM E/R)
- through IPDM E/R terminal 50
- to front fog lamp LH terminal 1, and
- through IPDM E/R terminal 51
- to front fog lamp RH terminal 1.

Ground is supplied

- to front fog lamp LH and RH terminal 2
- through grounds E9, E15 and E24.

With power and ground supplied, the front fog lamps illuminate.

COMBINATION SWITCH READING FUNCTION

Refer to BCS-3, "COMBINATION SWITCH READING FUNCTION" .

EXTERIOR LAMP BATTERY SAVER CONTROL

When the combination switch (lighting switch) is in the 2ND position (ON), the fog lamp switch is ON, and the ignition switch is turned from ON or ACC to OFF, the battery saver control feature is activated.
Under this condition, the fog lamps (and headlamps) remain illuminated for 5 minutes, then the fog lamps (and headlamps) are turned off.
Exterior lamp battery saver control mode can be changed by the function setting of CONSULT-II.

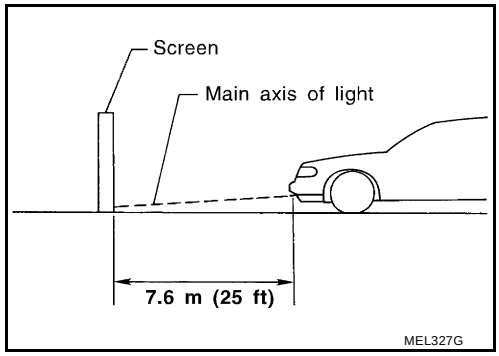
The fog lamp is a semi-sealed beam type which uses a replaceable halogen bulb. Before performing aiming adjustment, make sure of the following.

- Keep all tires inflated to correct pressure.
- Place vehicle on level ground.
- See that vehicle is unloaded (except for full levels of coolant, engine oil and fuel, and spare tire, jack, and tools). Have the driver or equivalent weight placed in driver seat.

1. Set the distance between the screen and the center of the fog lamp lens as shown.
2. Turn front fog lamps ON.
3. Remove front portion of fender protector(s) for adjustment screw access. Refer to EI-20, "Rear Fender Protector"



4. Adjust front fog lamps.
   - When performing adjustment, if necessary, cover the headlamps and opposite fog lamp.
   - Adjust aiming in the vertical direction by turning the adjustment screw, as shown.

     NOTE:
     Use a Phillips screwdriver to adjust. Turn screw clockwise to raise pattern and counterclockwise to lower pattern.

System Description

EKS00EL3

Control of the parking, license plate, and tail lamp operation is dependent upon the position of the lighting switch (combination switch). When the lighting switch is placed in the 1ST position, the BCM (body control module) receives input signal requesting the parking, license plate, side marker and tail lamps to illuminate. This input signal is communicated to the IPDM E/R (intelligent power distribution module engine room) across the CAN communication lines. The CPU (central processing unit) of the IPDM E/R controls the tail lamp relay coil. This relay, when energized, directs power to the parking, license plate and tail lamps, which then illuminate.

Power is supplied at all times

- to tail lamp relay, located in the IPDM E/R, and
- through 20A fuse (No. 52 and 53, located in the IPDM E/R)
- to CPU of the IPDM E/R, and
- to ignition relay, located in the IPDM E/R, and
- through 50A fusible link (letter **g** , located in the fuse and fusible link box)
- to BCM terminal 70, and
- through 10A fuse [No. 18, located in the fuse block (J/B)]
- to BCM terminal 57.

With the ignition switch in the ACC or ON position, power is supplied

- through 10A fuse [No. 4, located in the fuse block (J/B)]
- to BCM terminal 11.

With the ignition switch in the ON or START position, power is supplied

- to ignition relay, located in the IPDM E/R, and
- through 10A fuse [No. 1, located in the fuse block (J/B)]
- to BCM terminal 38.

Ground is supplied

- to BCM terminal 67
- through grounds M57, M61 and M79, and
- to IPDM E/R terminals 38 and 59
- through grounds E9, E15 and E24.

OPERATION BY LIGHTING SWITCH

With the lighting switch in the 1ST or 2ND position (or if the auto light system is activated), the BCM receives input signal requesting the parking, license plate, side marker and tail lamps to illuminate. This input signal is communicated to the IPDM E/R across the CAN communication lines. The CPU of the IPDM E/R controls the tail lamp relay coil, which when energized, directs power

- through 10A fuse (No. 37, located in the IPDM E/R)
- through IPDM E/R terminal 57
- to license plate lamp terminal 1
- to rear combination lamp LH and RH terminal 1, and
- through 10A fuse (No. 36, located in the IPDM E/R)
- through IPDM E/R terminal 28
- to front combination lamp LH (side marker) terminal 7
- to front combination lamp LH (parking) terminal 4, and
- through IPDM E/R terminal 49
- to front combination lamp RH (side marker) terminal 7
- to front combination lamp RH (parking) terminal 4.

Ground is supplied

- to front combination lamp LH and RH (side marker) terminal 8
- to front combination lamp LH and RH (parking) terminal 5
- to license plate lamp terminal 2
- through grounds E9, E15 and E24, and
- to rear combination lamp LH terminal 5
- through ground B85, and
- to rear combination lamp RH terminal 5
- through ground B160.

With power and ground supplied, the parking, side marker, license plate and tail lamps illuminate.

COMBINATION SWITCH READING FUNCTION

Refer to BCS-3, "COMBINATION SWITCH READING FUNCTION" .

EXTERIOR LAMP BATTERY SAVER CONTROL

When the combination switch (lighting switch) is in the 1ST (or 2ND) position, and the ignition switch is turned from ON or ACC to OFF, the battery saver control feature is activated.
Under this condition, the parking, side marker, license and tail lamps remain illuminated for 5 minutes, then the parking, side marker, license plate and tail lamps are turned off.
Exterior lamp battery saver control mode can be changed by the function setting of CONSULT-II.

When the rear door RH is opened, ground is supplied

- to BCM terminal 13
- through rear door switch RH terminal 2
- through case ground of rear door switch RH.

When the back door is open, ground is supplied

- to BCM terminal 43
- through back door switch terminal 3
- through back door switch terminal 1

- through grounds D406 and D652.

When the front door LH or RH is unlocked by the door lock/unlock switch, BCM receives ground signal

- to BCM terminal 46
- through main power window and door lock/unlock switch terminal 11 or power window and door lock/unlock switch RH terminal 2
- through main power window and door lock/unlock switch terminal 14 or power window and door lock/unlock switch RH terminal 3
- through grounds M57, M61 and M79.

When the front door LH is unlocked by the key, the BCM receives ground signal

- to BCM terminal 7
- through front door lock assembly LH (key cylinder switch) terminal 3
- through front door lock assembly LH (key cylinder switch) terminal 4
- through grounds M57, M61 and M79.

When the back door is unlocked by the key, the BCM receives ground signal

- to BCM terminal 7
- through back door switch terminal 3
- through back door switch terminal 2
- through grounds D406 and D652.

When a signal, or combination of signals is received by BCM, ground is supplied

- to front room/map lamp assembly terminal 2
- to room lamp 2nd row terminal 1
- through BCM terminal 63, and
- to cargo lamp terminal 1
- through BCM terminal 49.

With power and ground supplied, the lamps illuminate.

Switch Operation

When any door switch is ON (door is opened), ground is supplied

- to front room/map lamp assembly terminal 2
- to room lamp 2nd row terminal 1
- through BCM terminal 63, and
- to ignition keyhole illumination terminal 2
- through BCM terminal 1.

Power is supplied

- through BCM terminal 56
- to ignition keyhole illumination terminal 1
- to front room/map lamp assembly terminal 1
- to vanity lamp LH and RH terminal 1 (with vanity lamps)
- to room lamp 2nd row terminal 2, and
- to cargo lamp terminal 2.

When front room/map lamp assembly switch is ON, ground is supplied

- through front room/map lamp assembly terminal 3
- to grounds M57, M61 and M79.

When vanity lamp (LH and RH) is ON, ground is supplied

- to vanity lamp LH and RH terminal 2
- through grounds B7 and B19.

When the cargo lamp switch is ON, ground is supplied through case ground of cargo lamp.
When room lamp 2nd row is ON, ground is supplied through room lamp case ground.
With power and ground supplied, the lamps illuminates.

Room Lamp Timer Operation

When lamp switch is in DOOR position, and when all conditions below are met, BCM performs timer control (maximum 30 seconds) for interior room lamp and map lamp ON/OFF.
Power is supplied

- through 10A fuse (No. 25, located in the fuse and fusible link box)]
- to key switch terminal 2.

Key is removed from ignition key cylinder (key switch OFF), power will not be supplied to BCM terminal 37.
Ground is supplied

- to BCM terminal 46
- through main power window and door lock/unlock switch terminal 11.

At the time that front door LH is opened, BCM detects that front door LH is unlocked. It determines that interior room lamp and map lamp timer operation conditions are met, and turns the interior room lamps ON for 30 seconds.
Key is in ignition key cylinder (key switch ON), power is supplied

- through key switch terminal 1
- to BCM terminal 37.

When key is removed from key switch (key switch OFF), power supply to BCM terminal 37 is terminated. BCM detects that key has been removed, determines that interior room lamp and map lamp timer conditions are met, and turns the interior room lamps ON for 30 seconds.
When front door LH opens → closes, and the key is not inserted in the key switch (key switch OFF), BCM terminal 47 changes between 0V (door open) → 12V (door closed). The BCM determines that conditions for interior room lamp operation are met and turns the interior room lamp ON for 30 seconds.
Timer control is canceled under the following conditions.

- Front door LH is locked [when locked by keyfob, main power window and door lock/unlock switch, or front door lock assembly LH (key cylinder switch)]
- Front door LH is opened (front door switch LH turns ON)
- Ignition switch ON.

Interior Lamp Battery Saver Control

If interior lamp is left ON, it will not be turned off even when door is closed.
BCM turns off interior lamp automatically to save battery 30 minutes after ignition switch is turned off.
BCM controls interior lamps listed below:

- Vanity lamp (with vanity lamps)
- Front room/map lamp
- Room lamp 2nd row
- Ignition keyhole illumination
- Cargo lamp

After lamps turn OFF by the battery saver system, the lamps illuminate again when

- signal received from keyfob, main power window and door lock/unlock switch or front door lock assembly LH (key cylinder switch) is locked or unlocked
- door is opened or closed
- key is removed from ignition key cylinder or inserted in ignition key cylinder.

Interior lamp battery saver control period can be changed by the function setting of CONSULT-II.

System Description

EKS00ELZ

Control of the illumination lamps operation is dependent upon the position of the lighting switch (combination switch). When the lighting switch is placed in the 1ST or 2ND position (or if the auto light system is activated) the BCM (body control module) receives input signal requesting the illumination lamps to illuminate. This input signal is communicated to the IPDM E/R (intelligent power distribution module engine room) across the CAN communication lines. The CPU (central processing unit) of the IPDM E/R controls the tail lamp relay coil. This relay, when energized, directs power to the illumination lamps, which then illuminate.
Power is supplied at all times

- to ignition relay, located in the IPDM E/R, and
- to tail lamp relay, located in the IPDM E/R, and
- through 50A fusible link (letter **g** , located in the fuse and fusible link box)
- to BCM terminal 70, and
- through 10A fuse [No. 18, located in the fuse block (J/B)]
- to BCM terminal 57, and
- through 20A fuse (No. 52 and 53, located in the IPDM E/R)
- to CPU of the IPDM E/R, and
- through 10A fuse [No.19, located in fuse block (J/B)]
- to combination meter terminal 3.

With the ignition switch in the ACC or ON position, power is supplied

- through 10A fuse [No. 4, located in the fuse block (J/B)]

- to BCM terminal 11.

With the ignition switch in the ON or START position, power is supplied

- to ignition relay, located in the IPDM E/R, and
- through 10A fuse [No. 1, located in the fuse block (J/B)]
- to BCM terminal 38.

Ground is supplied

- to BCM terminal 67 and
- to combination meter terminal 13 and 23
- through grounds M57, M61 and M79, and
- to IPDM E/R terminals 38 and 59
- through grounds E9, E15 and E24.

ILLUMINATION OPERATION BY LIGHTING SWITCH

With the lighting switch in the 1ST or 2ND position (or if the auto light system is activated), the BCM receives input signal requesting the illumination lamps to illuminate. This input signal is communicated to the IPDM E/R across the CAN communication lines. The CPU of the IPDM E/R controls the tail lamp relay coil, which, when energized, directs power

- through 10A fuse (No. 37, located in the IPDM E/R)
- through IPDM E/R terminal 57
- to hazard switch terminal 3
- to audio unit terminal 8
- to differential lock switch terminal 4 (with electronic locking rear differential)
- to 4WD shift switch terminal 7 (with 4-wheel drive)
- to front air control terminal 8
- to clutch interlock cancel switch terminal 5 (with clutch interlock cancel switch)
- to door mirror remote control switch terminal 16 (with power outside mirrors)
- to electric brake (pre-wiring) terminal 4 (with trailer tow)
- to A/T device terminal 3 (with A/T)
- to VDC OFF switch terminal 3
- to HDC switch terminal 5 (with hill descent control and hill start assist).

The BCM directs power

- through BCM terminal 68
- to main power window and door lock/unlock switch terminal 5,
- to power window and door lock/unlock switch RH terminal 8,
- to rear power window switch LH terminal 8,
- to rear power window switch RH terminal 8.

Illumination is controlled

- through combination meter terminal 22
- to hazard switch terminal 4
- to audio unit terminal 7
- to differential lock switch terminal 5 (with electronic locking rear differential)
- to 4WD switch terminal 8 (with 4-wheel drive)
- to front air control terminal 9
- to clutch interlock cancel switch terminal 6 (with clutch interlock cancel switch)
- to door mirror remote control switch terminal 15 (with power outside mirrors)
- to A/T device terminal 5 (with A/T)
- to VDC OFF switch terminal 4
- to HDC switch terminal 6 (with hill descent control and hill start assist).

Ground is supplied

- to electric brake (pre-wiring) terminal 1,

- to main power window and door lock/unlock switch terminal 14,
- to power window and door lock/unlock switch RH terminal 3
- through grounds M57, M61 and M79,
- to rear power window switch LH terminal 2
- through grounds B7 and B19,
- to rear power window switch RH terminal 2
- through grounds B117 and B132.

With power and ground supplied, illumination lamps illuminate.

EXTERIOR LAMP BATTERY SAVER CONTROL

When the combination switch (lighting switch) is in the 1ST or 2ND position (or if auto light system is activated), and the ignition switch is turned from ON or ACC to OFF, the battery saver control function is activated. Under this condition, the illumination lamps remain illuminated for 5 minutes, then the illumination lamps are turned off.
When the lighting switch is turned from OFF to 1ST or 2ND position (or if auto light system is activated) after illumination lamps are turned off by the battery saver control, the illumination lamps illuminate again.
